Logarithmic difference

"No additional contribution is considered for the areas marked with a dash (-).

Unsigned and unsealed reports are invalid. Cannot be copied and reproduced without the written consent of Hidrotek Mim. Müh. Tic. Ltd. Şti.

When the tables are examined, it is seen that for the measured points;

It is seen that the noise level of 7 dB(A), which is the limit value in addition to the background noise defined in Table 5.1, 5.2. 5.3 and 5.4 in the day and evenning time period in the RENC -Table 2.1, is exceeded in Sarıbalı region when compared with the calculated noise level.

It is seen that the noise level of 5 dB(A), which is the limit value in addition to the background noise defined in Table 5.1, 5.2. 5.3 and 5.4 in the nighttime time period in the RENC -Table 2.1, is exceeded in Sarıbalı region when compared with the calculated noise level.

For construction site and motorway construction noise according to IFC, the limit values specified in Table 2.2 for construction site and motorway construction noise are compared with 55 dB(A) and background noise.

According to the IFC regulation; it is seen that the noise level of 55 dB(A), which is the limit value defined in Table 2.2 during the daytime, is exceeded in all regions when compared with the measured noise level. When the calculation result is compared with the background noise and the limit value of 55 dB(A) noise level, there will be a high noise level increase for Sarıbalı region.

For construction site and motorway construction noise according to IFC, the limit values specified in Table 2.2 for construction site and motorway construction noise are compared with 45 dB(A) and background noise.

According to the IFC regulation; it is seen that the noise level of 45 dB(A), which is the limit value defined in Table 2.2 during the daytime, is exceeded in all regions when compared with the measured noise level. When the calculation result is compared with the background noise and the limit value of 55 dB(A) noise level, there will be a high noise level increase for Sarıbalı region.

5.3.2 Motorway Operation Noise

According to the RENC, the limit values stated in Table 2.1 for motorway operation noise are 65 dB(A) during the daytime, 60 dB(A) during the evening and 55 dB(A) during the night time. These limit values and the calculated values with background noise level are compared in Table 5.5, 5.6, 5.7, and 5.8 .

Unsigned and unsealed reports are invalid. Cannot be copied and reproduced without the written consent of Hidrotek Mim. Müh. Tic. Ltd. Şti.

RENC -Table 2.1 shows that the noise levels calculated with the defined limit values and background noise levels in the day, evening and night time periods are exceeded in Bucakşeyhler and Emişbeleni areas.

According to IFC, the limit values stated in Table 2.2 for motorway operation noise are 55 dB(A) for daytime, 45 dB(A) for nighttime and compared with background noise.

IFC -Table 2.2 shows that the noise levels calculated with the defined limit values and background noise levels in the day, evening and night time periods are exceeded in Bucakşeyhler and Emişbeleni.

Unsigned and unsealed reports are invalid. Cannot be copied and reproduced without the written consent of Hidrotek Mim. Müh. Tic. Ltd. Şti.

6 NOISE CONTROL MEASURES

6.1 Construction Site and Construction

During the construction of the motorway in Sarıabalı region, it was found that the background noise level increased by more than 7 dB(A) during the daytime. It is recommended that the machinery and equipment that will work in this area should consist of machines with low noise levels and that noise measurements should be carried out regularly.

6.2 Noise control measures in Bucakşeyhler and Emişbeleni

Calculations are based on the traffic load in 2040. Therefore, whether this noise level is reached should be checked by regular noise measurements.

Noise control measures such as noise barrier or earth pallet systems, which are accepted in the world and in our country, can be applied.

When the physical conditions were examined, it was determined that there was no area to build a pallet system on the side of the motorway. Therefore; high absorption aluminum noise barrier is recommended as noise barrier (Figure 6.2.1).

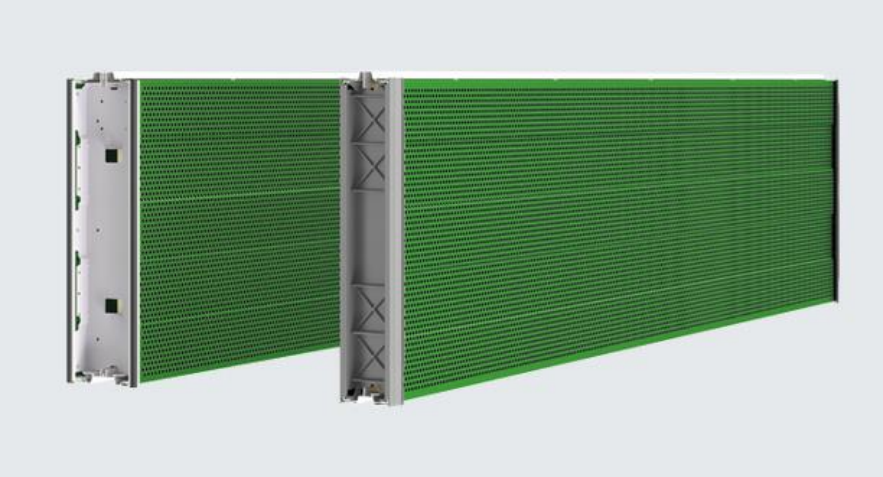

Figure 6.1 Absorption type aluminum noise barrier

High absorption wall cladding is recommended for tunnel portal entrances and exits (Figure 6.2.2).

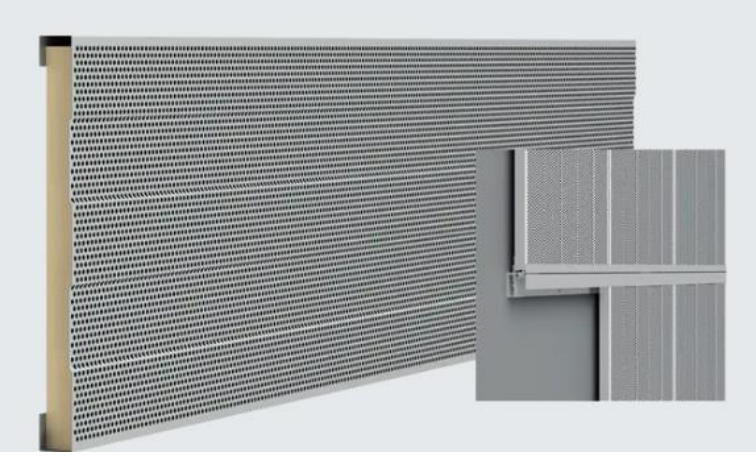

Figure 6.2 Absorption type aluminum noise barrier

Unsigned and unsealed reports are invalid. Cannot be copied and reproduced without the written consent of Hidrotek Mim. Müh. Tic. Ltd. Şti.

Technical specifications for aluminum noise barrier;

FEATURES OF THE ABSORBER TYPE NOISE BARRIER:

- **According to EN 1793-1: Single number rating of sound absorption: $DL_\alpha \geq 25$ dB A3**
- **According to EN 1793-2: Insulation performance class $DL_R \geq 8$ dB B3**

Standards for barriers to be used to reduce road noise:

- **TS EN 14388:** Traffic noise reduction devices - Technical specifications
- **TS EN 1793-1:** Road traffic noise reduction devices - Test method for determining acoustic performance - Part 1: Actual characteristics of sound absorption under diffuse sound field conditions
- **TS EN 1793-2:** Road traffic noise attenuation systems - Test method for the determination of acoustic performance - Part 2: Basic properties of airborne sound insulation under uniformly distributed sound field conditions
- **TS EN 1793-3:** Road traffic noise reduction systems - Test method for the determination of acoustic performance - Part 3: Normalized traffic noise spectrum
- **TS EN 1793-4:** Road traffic noise attenuation systems - Test method for the determination of acoustic performance - Part 4: Basic properties - Sound refraction values
- **TS EN 1793-5:** Road traffic noise attenuation systems - Test method for the determination of acoustic performance - Part 5: Basic properties - Sound reflection values under direct sound field conditions
- **TS EN 1793-6:** Road traffic noise attenuating devices - Test methods for the determination of acoustic performance - Part 6: Basic characteristics - In situ values of the insulation of airborne sound under direct field conditions
- **TS EN 1794-1+AC**: Road traffic noise reduction devices - Non-acoustic performance - Part 1: Mechanical performance and stability requirements
- **TS EN 1794-2:** Road traffic noise attenuation systems - Non-acoustic performance - Part 2: General safety requirements and environmental requirements
- **TS EN 1794-3:** Road traffic noise reducing devices - Non-acoustic performance - Part 3: Reaction to fire - Combustion behavior and classification of noise reducing devices
- **TS EN 14389-1** Road traffic noise attenuation systems - Methods for assessing long-term performance Part 1: Acoustic characteristics
- **TS EN 14389-2** Road traffic noise attenuation systems - Methods for assessing long-term performance Section 2: Acoustic external characteristics

An action plan has been developed for both areas.

Noise maps prior to the action plan are provided in Figures 6.3 to 6.6 in accordance with the Environmental Noise Directive, and in Figures 6.7 and 6.10 in accordance with IFC.

Unsigned and unsealed reports are invalid. Cannot be copied and reproduced without the written consent of Hidrotek Mim. Müh. Tic. Ltd. Şti.

Unsigned and unsealed reports are invalid. Cannot be copied and reproduced without the written consent of Hidrotek Mim. Müh. Tic. Ltd. Şti.

When the tables are examined, it can be seen that the limit values according to Environmental Noise Directive and IFC are not exceeded.

Noise barrier locations used in action plans;

The dimensions for the Bucakşeyhler are given in Figure 6.11. The material to be used is a noise barrier with an absorption coefficient of 4.5 m high and approximately 750 m long, which complies with "**TS EN 14388:** Traffic noise reduction devices - Technical specifications ". The approximate cost for this noise barrier is calculated to be 850,000.- Euro (part of this noise barrier is located on a viaduct).

For Emişbeleni, it is shown in Figure 6.12. The material to be used is a noise barrier with sound absorption properties compliant with "**TS EN 14388:** Traffic noise reduction devices - Technical specifications " measuring 4.5 meters in height and a total length of 3 kilometers (1.5+1+0.5 kilometers). The approximate cost for this noise barrier is calculated as 3,500,000.- Euro

There are a total of 5 tunnels (10 double-sided tunnels) within the scope of the project. There is an increase in noise at the entrances and exits of the tunnels. To prevent this increase, the tunnel entrance and exit portals should be covered with "High absorption wall cladding". The cladding to be used must comply with **TS EN 14388:** Traffic noise reduction devices - Technical specifications. The estimated total cost for the 5 tunnels (10 in total for two-way traffic, including entrance and exit portals) is approximately 6,000,000.- Euro.

Unsigned and unsealed reports are invalid. Cannot be copied and reproduced without the written consent of Hidrotek Mim. Müh. Tic. Ltd. Şti.

7 RESULTS

Noise emission impacts of the AAM Project have been assessed using SoundPLAN V 9.1 (64 bit) program within the scope of the RENC and IFC- regulation. Projected traffic data for 2040 was used for noise level predictions. Existing noise levels were measured at 21 points along the motorway route and construction sites, and noise levels were calculated by assigning virtual receivers for these points. During the construction phase of the Motorway, according to the legislation, the limit values are exceeded at Quarries and Construction Site. It is calculated that there will be exceedance of the limit value due to the motorway in two regions after the motorway becomes operational and in the following period. Noise barriers have been proposed for Bucakşeyhler and Emişbeleni sections. Monitoring activities should be carried out for both regions in the future.

7.1 Action Plan Recommendations

According to the modeling results, afforestation is foreseen in the region in order to keep the noise levels within the limit value.

In order for afforestation to be used in noise mitigation, some conditions must be met. In the area where afforestation will be planted, at least 30 m wide from the motorway, winter and summer evergreen and dense trees should be planted. The selected tree type should also be selected from the category of trees whose leaves are absorptive in order to have an effect on noise reduction.

Another action plan envisages the use of earthen embankments to provide elevation. Earthen embankments are an artificial retaining application created by applying an elevation higher than natural piles. They can be made of wooden/concrete pieces, steel nets or woven grasses into which tree saplings can be planted. Earthen embankments provide the motorway environment with a visually aesthetic structure with flowering works.

Where there is not enough free space, noise barriers can be applied. For the implementation of noise barriers and other measures, background noise measurements should be carried out in sensitive receiving environments during the construction and operation phases and such applications should be realized in cases where the results exceed the environmental noise limit values. In this respect, it is recommended that measurement, evaluation and measure taking (implementation) processes should be monitored and decided upon.

I. INTRODUCTION

This Stakeholder Engagement Plan ("the Plan" or "SEP") has been prepared by ENCON Environmental Consultancy Co. (Consultant) for Antalya-Alanya Motorway Project (the "Project or AAMP") in Türkiye. This SEP will be updated in the event of significant changes in the Project and will be reviewed and updated at least annually.

Ministry of Transport, and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project, has tendered for a contract in May 2010 in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). As a result of the tendering process, KGM has awarded Limak (the Project Sponsor) with a Build, Operate and Transfer (BOT) contract for the implementation of the Project. In this regard, Limak is referred as Project Sponsor in the scope of the plan, and in the ESIA studies.

In accordance with the provisions of the BOT contract, the Project encompasses financing, planning/design, construction, operation, maintenance, and all repair works throughout the operation period, including the transfer of the Motorway to the KGM at the end of the contract period. It is also expected that at the end of the contract period, the Motorway will be handed over to KGM free of any debt or obligation, in a well-maintained and operational condition, without any charges. The Project Sponsor's rights to operate maintain, and repair the Motorway will expire at the end of the contract period specified in the BOT contract.

Stakeholder engagement is the basis for establishing sustainable, constructive, and responsive relationships that are essential for successfully managing a project's environmental and social impacts. The purpose of stakeholder engagement is to establish and maintain a constructive relationship with a various external stakeholders thought the duration of the project. Initiating the engagement process in the early phases of the project helps ensure timely public access to all relevant information. It provides the stakeholders with an opportunity to input into the project design and the assessment of impacts.

The SEP should be easy to understand and straightforward. Its primary focus should be describing the project and identifying the stakeholders involved. It is crucial to determine the information available to the public and where it can be accessed. The SEP must also explain how the public can share their views and opinions, provide a deadline for requirements, and outline how individuals will be notified about any new information or opportunities for feedback or comments. The plan also aims to establish a project-based structure and approach to prevent Gender-Based Violence (GBV) and Sexual Exploitation, Abuse and Harassment (SEAH) throughout the project's entire lifecycle. SEP will be designed to enable the Project Sponsor, Contractor Company, affected local communities, and all other stakeholders to identify and establish an effective engagement strategy.

In addition to this SEP, to provide people affected by Project-related land acquisition ("Project Affected People" or "PAPs") with a clear and concise overview of the expropriation process carried out by KGM in accordance with the Expropriation Law, and summarise the key principles of Project's Resettlement Action Plan (RAP), particularly regarding additional compensation and assistance measures that go beyond the legally mandated cash compensation to ensure alignment with international standards and Lender requirements, stand-alone Guide to Land Acquisition and Compensation (GLAC) documents have been prepared for the Project and finalised in October 2025 for distribution in affected settlements. There are three versions of the GLAC: (i) for affected lands, (ii) for affected houses, and (iii) for affected businesses (see ANNEX-5.A, ANNEX-5.B, ANNEX-5.C). In addition, the Project information brochure (ANNEX-4) has been distributed during Public Consultation Meetings (PCMs) and continues to be distributed in subsequent meetings. It will be updated and re-distributed throughout the process as needed. Kurdish and Arabic versions of the brochure has also been prepared and shared when necessary. Also, to support the information process related to expropriation and RAP, the SPV distributed printed copies of KGM's booklet on procedural steps of expropriation in affected settlements (presented in RAP – Appendix F) in all affected settlements in May 2025. Distribution of additional copies will continue in line with the Project's expropriation and construction schedules, as needed.

I.1 Purpose and the Scope of the Stakeholder Engagement Plan

The SEP is a public document which presents plans for stakeholder engagement, information disclosure and consultation. This Plan is valid for the both construction and operation phase of the Project.

SEP covers the following aspects:

- Applicable national and international regulations and IFC requirements on stakeholder engagement, particularly IFC PS1;
- Project plans to engage with stakeholders during the construction phase and the operation phase of the Project;
- Key Project stakeholders that will be identified and will be interacted with;
- Strategy for consultation and information disclosure;
- Timetable for various stakeholder engagement activities;
- Resources and responsibilities for the implementation of the SEP;
- Means of monitoring and reporting on consultation and disclosure activities; and
- A grievance mechanism for stakeholders and the public to raise concerns, provide feedback and comments about the Project operations and how complaints/comments will be handled.

The main goal of this SEP is to ensure that project-affected people and other stakeholders are provided relevant, timely and accessible information so that they have an opportunity to express their views and concerns about the Project and its impacts. Stakeholder engagement process helps to:

- Identify the stakeholders that are affected, and/or able to influence the Project and its activities;
- Identify their particular interests and requirements related to the Project;
- Generate a good understanding of the Project among those that will be affected;
- Identify issues early in the Project cycle that may pose risks to the Project or its stakeholders;
- Provide to these groups opportunities to voice their concerns and opinions;
- Define a consultation approach for stakeholders in relation to operation of the Project;
- Ensure that comments are received in a timely manner so that they can be taken into account during the decision-making process;
- Ensure that mitigation measures are appropriate (implementable, effective and efficient);
- Ensure that adequate and timely information is provided to those potentially affected by a project;
- Ensure a technically and culturally appropriate approach to engagement with all key stakeholders;
- Establish a system for long-term communication between the Project and communities that is of benefit to all parties.
- Identify resources and responsibilities for implementation and monitoring of the consultation program; and
- Set up a grievance mechanism for the stakeholders, including a process to address views and concerns.

The ultimate purpose of this SEP is to establish and maintain constructive relationships with the local community and other interested stakeholders that are essential for the successful management of the Project's environmental and social impacts. The SEP is the responsibility of Project Sponsor and Project Sponsor is fully committed to undertaking necessary engagement activities in a manner that is consistent with international standards and national legislation as outlined in next sections.

The SEP encompasses planned stakeholder consultation activities and the process of stakeholder engagement. The SEP is prepared in compliance with IFC Performance Standards and international requirements and best practices, in addition to Turkish legislation.

I.2 Project Description

The Project (Antalya-Alanya Motorway Project) is one of the two sub-projects that constitute the Afyonkarahisar-Alanya Motorway Project and is designed to connect Serik and Alanya districts through Manavgat district of Antalya province. The project aims to improve transportation services and connectivity to surrounding provinces such as Burdur, Muğla, Konya, Isparta, Karaman, and Mersin. As of April 2025, the motorway is designed to be 117.8 kilometers long and will mainly consist of three lanes, with some sections having two lanes (3x2 and 2x2) in each direction.

Figure I.1 presents the current design of Antalya-Alanya Motorway Project's route.

The current Project design includes a total of 117.8 km of road, comprising 84 kilometers of main road (motorway) and 33.8 kilometers of access roads (see Table I.1)

Table I-1. Antalya-Alanya Motorway Sections in the scope of the Project

Project	Start and End Locations of the Section (Km)		Length of the Road (Km)		
	Start Location	End Location	Main Road (Motorway)	Access Roads	Total
Antalya-Alanya Motorway	Km 52+000	Km 136+000	84+000	33+800	117+800

Figure I-l The Route of the Antalya-Alanya Motorway Project

.

II. PUBLIC CONSULTATION/STAKEHOLDER ENGAGEMENT REQUIREMENTS

Implementation of the Project will follow the framework laws and regulations of the Republic of Türkiye as well as applicable international standard, IFC requirements. In this context, stakeholder engagement activities will conform to relevant IFC Performance Standards (i.e. IFC PS1) Equator Principles 4 (EPFI 5 Stakeholder Engagement, Principle 6 Grievance Mechanism and EU Directives).

Further details of the relevant Turkish legislation and applicable international requirements are provided in the following sections.

II.1. National Regulations and Requirements

Under Article 10, Environmental Law sets out the general scope of the Environmental Impact Assessment (EIA) procedure in Türkiye, indicating that institutions, agencies and establishments that lead to environmental problems as a result of their planned activities are obliged to prepare environmental impact assessment report or Project Information File. Based on this legal framework, the EIA Regulation was put into force for the first time after being published in the Official Gazette numbered 21489 and dated on February 7, 1993. Since then there had been several amendments in the first regulation and new EIA regulations were published in 2008, 2013 and 2014 repealing the former regulations in force. The latest EIA Regulation (2022 EIA Regulation) has been published in the Official Gazette dated 29.07.2022 and numbered 31907, which repealed the 2014 EIA Regulation.

Under its annexes, the EIA Regulation categorizes investments as projects subject to full EIA (Annex-1) and projects subject to screening-elimination criteria (Annex-2). This categorization is done based on the type of activity and/or plant capacity. If the planned investment is defined as an activity under Annex-1 of the EIA Regulation, a full EIA Report is required. For Annex-2 activities, first a Project Information File is prepared in accordance with a limited format specified in the Annex-4 of the EIA Regulation and the MoEUCC evaluates the need for a full EIA process for the project.

The categorization for motorway projects under Turkish EIA regulation is done according to the type or length of the road (km) as follows:

- Full EIA process is required for the following Annex-1 activities;
  - Highways and state motorways (Article 9-c).
- Limited EIA process is required to be conducted for the following Annex-2 activities;
  - Facilities with a production capacity of 5 tons/hour and above, producing shaped materials using cement or other binding materials (Article 18-c),
  - Asphalt plants (Article 22),
  - Provincial roads and ring roads (except neighborhood/village roads; Article 28-d),
  - Addition of tunnels to highways or railways (Article 28-e).

The Project's EIA Report had been prepared in March 2016, submitted to the MoEUCC, reviewed by the evaluation committee and EIA Positive decision had issued in June 2018 In accordance with the EIA legislation in force on the date when the Project EIA Positive Decision was given (2014 EIA Regulation), the EIA Report of the Project has the vested right of upholding its EIA Positive Decision validity for 7 years before the start of the construction works for the Project.

In accordance with the related article, it is the legal responsibility of a project owner to organize an official Public Consultation Meeting for the projects that are included in Annex 1 of the Regulation (as the case in the EU EIA Directive).

As a result, Project Sponsor aims to develop a communication plan to inform relevant stakeholders about the Project activities in operation phase in line with this SEP.

Turkish national policy on protection of environment, cultural heritage and conservation of biological resources has been constituted on the base of relevant international agreements that Türkiye has signed or ratified.

Freedom of Thought and Opinion (Part 2, Fundamental Rights and Duty- Article 25)

Everyone has the right to freedom of thought and opinion and should not be compelled to reveal or be blamed for them.

Freedom of Expression and Dissemination of Thought (Part 2, Fundamental Rights and Duty- Article 26)

Everyone has the right to express and share their thoughts and opinions through speech, writing, pictures, or other media, individually or collectively, and to receive and communicate information and ideas freely without interference from official authorities.

Right of Petition, Right to Information, and Appeal to the Ombudsperson (Part 2, Fundamental Rights and Duty- Article 74)

Citizens and foreign residents can submit their requests and complaints in writing to the authorities and the Turkish Grand National Assembly based on the principle of reciprocity.

Other main national laws/regulations:

Civil Law (Law No. 4721 (Issued on 08.12.2001, Official Gazette No. 24607))

Real property rights and restrictions are defined under the relevant section of Civil Law and will be considered and met throughout the Project according to Turkish Civil Law.

Law on the Right to Information (Law No. 4982 (Issued on 24.10.2003, Official Gazette No. 25269)

The Right to Information Law ensures access to information based on the principles of equality, impartiality, and openness. Everyone has the right to information about public institutions and qualifying professional organizations.

Law on the Use of Right to Petition (Law No.3071 (Issued on 10.11.1984, Official Gazette No. 18571)

Under Article 3 of the Law on the Use of Right to Petition, Turkish citizens and foreign residents have the right to submit written requests and complaints in Turkish to the Turkish Grand National Assembly and relevant authorities.

Expropriation Law (Law No: 2942 (Issued on 04.11.1983, Official Gazette No. 18215))

Another law related to the involvement of stakeholders in the Project is the Expropriation Law.

The Expropriation Law requires public disclosure and a meeting process. It starts with the approval of the relevant authority for the expropriation works in the public interest. This decision is made public for 15 days at the village or neighborhood mukhtars' office, after which it becomes the "cut-off date."

The administration action of the expropriation process is performed in line with the Expropriation Law according to its purpose, authorization, procedure, reason, and the subject of the action.

The responsible agency for Antalya-Alanya Motorway Project (the expropriation procedures will be carried out by KGM) establishes a Valuation Commission to determine the values of assets and resources. Subsequently, a negotiation commission is established to negotiate with property owners on the value. Each negotiation commission consists of at least three members. The Commission sends an official invitation letter to each property owner without disclosing the previously estimated value of the asset.

The Environmental Impact Assessment Regulation (Official Gazette No: 31907, Article 9)

The EIA Regulation, originally from 1998, has had revisions and was most recently amended on July 29th, 2022. It is based on the EU EIA Directive but includes Turkish laws, making it distinct.

1. The meeting to inform the public about the investment and receive their opinions is held at a central place and time determined by the provincial directorate, with the participation of qualified institutions/organizations, the Ministry, and the project owner.
2. An announcement with the meeting details must be published in a newspaper at least 10 days before the meeting and in a local periodical specific to the region where the Project will be carried out.
3. A public meeting will be chaired by the provincial director or an appointed official to inform and consult with the public about a project. Attendees will be informed about the Project, and their opinions, suggestions, and objections will be recorded in meeting minutes. The minutes will be sent to the Ministry, with a copy kept by the provincial directorate.
4. Before finalizing the format, the Commission members should visit the planned project area and participate in the public information and consultation meeting on the specified date.
5. Stakeholder Engagement Plan (SEP) is prepared by authorized institutions to inform the public about the Project, receive their opinions and suggestions, and is presented in the EIA application file annex. Authorized institutions may request additional activities, such as distributing brochures, conducting surveys and seminars, or preparing a website. The plan may be updated if requested by the Ministry during the EIA process.

The lead government agency responsible for environmental protection in Türkiye is the Ministry of Environment, Urbanization and Climate Change ("MoEUCC"). MoEUCC is the responsible organization for the issuing and implementation of policies and legislation adapted for the protection and conservation of the environment and sustainable development and management of natural resources.

The main responsibilities of the MoEUCC, relevant to the Project, are:

- Implementation of the EIA regulations and decision-making in the EIA approval processes,
- Setting policies and principles for environmental management in Türkiye, including the administrative framework for environmental enforcement,
- Defining and applying environmental quality standards,
- Supervision of the network of environmental laboratories in Türkiye,
- Pollution control and inspection activities,
- Agroforestry support, soil management and erosion control, and
- Protection of Türkiye's natural heritage, including national parks, areas of conservation interest, biodiversity, and wildlife.
- The Gender Based Violence (GBV) Regulation The laws in force in Türkiye related to GBV issues are listed below with publication dates and numbers;
  - Labor Law (Law No. 4857, Issued on 10.06.2003)
  - Turkish Criminal Law (Law No. 5237, Issued on 12.10.2004)
  - Law of Protection of Family and Prevention of Violence Against Women (Law No. 6284, Issued on 20.03.2012)

The purpose of Labor Law (4857) is to govern the rights and responsibilities of workers employed under an employment contract and the working conditions provided by employers. This law applies to all workplaces, employers, employer representatives, and their employees, regardless of their field of activity. According to Articles 24 and 25, termination of the contract is permissible in the event of Sexual Harassment (SH) in the workplace, allowing the employee or employer to terminate the contract before the term's expiration or without waiting for the notification period.

Turkish Criminal Law aims to prevent crimes and safeguard the rights and freedoms of individuals, public order, security, public health, the environment, and community peace. Articles 102, 103, 104, and 105 in Section 6 detail GBV-related offenses and their penalties, including sexual assault, sexual abuse of children, sexual intercourse with a minor, and sexual harassment.

Law on Protection of Family and Prevention of Violence against Women (6284) is the cornerstone of Türkiye's response to violence against women. This law aims to regulate procedures and principles for the protection of women, children, all family members, and individuals subjected to persistent pursuit. It is rooted in the Turkish Constitution, international conventions to which Türkiye is a state party and relevant legal regulations.

Some key features of the Law No. 6284 include:

- Empowering local authorities to issue injunctions swiftly and efficiently in emergencies.
- Providing support services for survivors and perpetrators of violence, establishing Violence Prevention and Monitoring Centers and outlining the basics for temporary financial aid and medical expenses.
- Introducing preventive and protective measures for survivors, including forced imprisonment in case of a violation of preventive measures, and establishing a mechanism for monitoring the effective implementation of measures.
- Designating the Ministry as an active agent in the prevention of violence against women, granting it various responsibilities, including involvement in judicial cases.
- Basic principles to be observed in the implementation of this law include:
- Providing support and services to victims of violence through a fair, effective, and swift procedure based on basic human rights and equality between men and women.
- Fulfilling measures for victims and perpetrators of violence in a manner consistent with human dignity.
- Ensuring that special measures preventing gender-based violence against women and protecting women from such violence are not interpreted as discrimination under this law.

II.2. International Requirements and Best Practices

International financial institutions follow certain policies and procedures regarding assessment and management of environmental and social impacts of the projects to be financed. The relevant environmental and social requirements of these institutions are mainly based on World Bank Group (WBG) Safeguard Policies. For the private sector financing, WBG/International Finance Corporation's (IFC) Environmental Health and Safety Guidelines and Performance Standards on Environmental and Social Sustainability, as well as the Environmental and Social Policy and Standards of the Asian Infrastructure Investment Bank (AIIB), have become some of the most important international requirements. These standards have also been adopted by the major international private banks through the so called Equator Principles (EPs). These principles aim to ensure that projects to be financed by these banks are developed in a socially and environmentally sound manner.

The Project is intended to meet applicable international standards and best practices of the International Finance Institutions (IFIs). IFIs consider community engagement as being central to the successful management of risks and impacts on communities affected by projects, as well as central to achieving enhanced community benefits. In this context, SEP follows the requirements of EU directives, IFC PS1 and EPFI Principle 5 and EPFI Principle 6. The IFC PS1 Assessment and Management of Environmental and Social Risks and Impacts covers public consultation and disclosure and in this respect, required consultation and disclosure activities have to be conducted taking the scale and nature of the Project into account covering the following:

- Identifying the range of stakeholders;
- Providing affected communities with access to relevant project information;
- Implementing and maintaining a grievance mechanism; and
- Engaging with and providing information to project-affected and other interested parties throughout the life-cycle of the Project.

II.2.1. AIIB Environmental and Social Policy and Standards

The Asian Infrastructure Investment Bank (AIIB) applies its Environmental and Social Policy (ESP, 2016) and the accompanying Environmental and Social Standards (ESSs) to ensure that all projects it finances are implemented in a manner that is environmentally and socially sustainable. The ESP sets out AIIB's vision to integrate environmental and social considerations into all aspects of its operations and requires borrowers to identify, assess, and manage the environmental and social risks and impacts associated with their projects.

The AIIB's three Environmental and Social Standards (ESSs) define the mandatory requirements for borrowers:

ESS 1: Environmental and Social Assessment and Management

Establishes the process for assessing and managing environmental and social risks and impacts, including stakeholder engagement and information disclosure.

ESS 2: Involuntary Resettlement

Aims to avoid or minimize physical and economic displacement and requires fair compensation and livelihood restoration for affected persons.

ESS 3: Indigenous Peoples

Ensures respect for the rights, dignity, and culture of Indigenous Peoples and promotes their full participation in project design and implementation.

Stakeholder engagement is a core requirement under ESS 1, which obliges the client to establish and maintain a Stakeholder Engagement Plan (SEP) proportional to project risks and impacts, ensuring continuous, inclusive, and transparent dialogue with affected communities.

In addition, AIIB provides affected communities with access to its Project-affected People's Mechanism (PPM) — an independent accountability mechanism through which individuals or groups who believe they are or may be adversely affected by an AIIB-financed project can raise their concerns directly with the Bank.

II.2.2. Equator Principles IV

Principle 5: Stakeholder Engagement

For all Category A and Category B Projects, the EPFI will require the client to demonstrate effective Stakeholder Engagement as an ongoing process in a structured and culturally appropriate manner with Affected Communities and, where relevant, Other Stakeholders. For Projects with potentially significant adverse impacts on Affected Communities, the client will conduct an Informed Consultation and Participation process. The client will tailor its consultation process to: the risks and impacts of the Project; the Project's phase of development; the language preferences of the Affected Communities; their decision-making processes; and the needs of disadvantaged and vulnerable groups. This process should be free from external manipulation, interference, coercion and intimidation.

Principle 6: Grievance Mechanism

For all Category A and, as appropriate, Category B Projects, the EPFI will require the client, as part of the Environmental and Social Management System, to establish a grievance mechanism designed to receive and facilitate resolution of concerns and grievances about the Project's environmental and social performance. The grievance mechanism is required to be scaled to the risks and impacts of the Project and have Affected Communities as its primary user.

Principle 10: Reporting and Transparency

In addition, regarding reporting and transparency, Principle 10 requires the client to make at a minimum, a summary of the ESIA that includes a summary of Human Rights and climate change risks and impacts when relevant accessible and available online for all Category A and, as appropriate, Category B Projects.

II.2.3. IFC's Standards and Guidelines

IFC published its current Policy on Environmental and Social Sustainability in 2012. Within the framework of this Policy, it applies a comprehensive set of Performance Standards to manage social and environmental risks and impacts and to enhance development opportunities in its private sector financing in the member countries eligible for financing. The Performance Standards may also be applied by other financial institutions electing to apply them to projects in emerging markets.

The following eight Performance Standards establish the requirements that the client has to meet throughout the life of an investment supported by IFC or other relevant financial institution using these Standards:

PS 1: Assessment and Management of Environmental and Social Risks and Impacts
PS 2: Labor and Working Conditions
PS 3: Resource Efficiency and Pollution Prevention
PS 4: Community Health, Safety and Security
PS 5: Land Acquisition and Involuntary Resettlement
PS 6: Biodiversity Conservation and Sustainable Management of Living Natural Resources
PS 7: Indigenous Peoples
PS 8: Cultural Heritage

PS 1 defines Stakeholder engagement as an ongoing process that may involve, in varying degrees, the following elements: stakeholder analysis and planning, disclosure and dissemination of information, consultation and participation, grievance mechanism, and ongoing reporting to Affected Communities. According to IFC PS 1;

- Clients should identify the range of stakeholders that may be interested in their actions and consider how external communications might facilitate a dialogue with all stakeholders. Where projects involve specifically identified physical elements, aspects and/or facilities that are likely to generate adverse environmental and social impacts to Affected Communities the client will identify the Affected Communities and will meet the relevant requirements.
- The client will develop and implement a Stakeholder Engagement Plan that is scaled to the project risks and impacts and development stage, and be tailored to the characteristics and interests of the Affected Communities.
- The client will provide Affected Communities with access to relevant information on (i) the purpose, nature, and scale of the project; (ii) the duration of proposed project activities; (iii) any risks to and potential impacts on such communities and relevant mitigation measures; (iv) the envisaged stakeholder engagement process; and (v) the grievance mechanism.
- The client will undertake a process of consultation in a manner that provides the Affected Communities with opportunities to express their views on project risks, impacts and mitigation measures.
- The client will conduct an Informed Consultation and Participation (ICP) process that will build upon the steps outlined above in the Consultation and will result in the Affected Communities' informed participation. ICP involves a more in-depth exchange of views and information, and an organized and iterative consultation, leading to the client's incorporating into their decision-making process the views of the Affected Communities on

matters that affect them directly, such as the proposed mitigation measures, the sharing of development benefits and opportunities, and implementation issues.

IFC PS2 (Labor and Working Conditions) specifically relates to harassment, intimidation, and/or exploitation. According to IFC PS 2;

- The client will take measures to prevent and address harassment, intimidation, and/or exploitation, especially in regard to women.

Retaliation Risk Prevention and Safe Stakeholder Participation

The Project is committed to ensuring that all stakeholders can freely express their concerns without fear of retaliation. In alignment with the IFC Good Practice Note for the Private Sector: Addressing the Risks of Retaliation Against Project Stakeholders (2021), a series of practical measures have been integrated into the Stakeholder Engagement Plan (SEP) to safeguard stakeholder participation.

As part of the stakeholder identification and mapping process, the Project conducts a risk assessment to identify potential threats of retaliation, particularly toward vulnerable or marginalized groups. This assessment is used to design safe and inclusive engagement approaches tailored to local sensitivities. To further support this, the Grievance Mechanism (GRM) offers multiple anonymous reporting options-such as locked suggestion boxes and secure hotlines-ensuring that all personal data is managed with strict confidentiality in line with national data protection laws and IFC Performance Standard 1.

Sensitive issues, especially those related to gender-based violence and harassment (GBVH), are handled by trained female Social Chief and Community Liaison Officers (CLOs), who adopt a survivor-centered approach and ensure privacy and trust throughout the reporting process. In addition, project staff and grievance handlers receive specific training to recognize and respond to signs of intimidation or retaliation, using appropriate internal protocols to ensure timely and secure handling of such cases.

Allegations or risks of retaliation are closely monitored and promptly escalated to senior management, where necessary. The Project has adopted a zero-tolerance policy for retaliation in any form-whether by project personnel, contractors, or third parties-reinforcing a culture of safety, respect, and open dialogue for all stakeholders involved.

II.2.4. IFI Joint Statement on Continuous Advancement of Standards to Prevent Sexual Harassment, Abuse, and Exploitation

Recognizing the important role they play in both the example they set in their own institutional practices and in the high standards they adopt in their projects and operations, in April 2018, the IFIs reaffirmed their commitment to advance standards to prevent sexual harassment, abuse and exploitation through seven principles. According to IFIs reaffirm their commitment to (Principle 2) establish and maintain standards aimed at preventing sexual harassment, abuse, exploitation and other forms of misconduct. Implementation of this principle can be seen in the following:

- All IFIs maintain codes of ethics/conduct which embed high ethical standards and include provisions on harassment and misconduct including sexual misconduct which are applicable to staff behavior both within and outside the institution. Some IFIs have also adopted specific policies aimed at preventing and responding to sexual harassment, exploitation and abuse. These are applicable to all staff and are reviewed periodically and strengthened as needed.
- Some IFIs include behavioral clauses in contracts of appointment for non-staff members (including consultants, and contractors) to ensure that they too adhere to expected high standards of behavior. Breach of such provisions would provide an IFI with a right to terminate the underlying contract.

III. PREVIOUS STAKEHOLDER ENGAGEMENT ACTIVITIES

In the scope of Antalya-Alanya Motorway Project, various studies were carried out with both internal and external stakeholders before the planned Public Consultation activities in the scope of this SEP. The Project Sponsor recognizes the importance of the stakeholder engagement activities and will carry out the activities planned under this SEP in order to make these activities more efficient, inclusive and continuous. Both internal and external previous stakeholder engagement activities are described in this section.

III.1. Public Consultation Meetings (PCMs) in the Scope of EIA Process

Within the scope of the EIA studies, one public consultation meetings were held alongside the route. The aim of the public participation meeting is to inform people who may be potentially affected about the Project and to understand their concerns, opinions and suggestions about the project. This process is the only formal requirement for stakeholder participation according to Turkish legislation.

The stakeholder engagement activities specific to the Project started at the time of the national EIA process. In this context, Antalya Provincial Directorate of Environment and Urbanization, relevant district Municipalities, District Governorships and Neighborhood/Village mukhtars were contacted in March 2016 to organize the stakeholder engagement activities. The formal stakeholder engagement meetings (public consultation meeting), a requirement of the Turkish EIA Regulation, were held on April 7th, 2016, at Ekşili Village Coffeehouse, Alanya Municipality Çıplaklı Wedding Hall, and Manavgat Chamber of Commerce and Industry Assembly Meeting Hall. Therefore, a total of three consultation meetings were held at three different districts of the Project route (based on EIA report, 2018): Döşemealtı, Alanya, and Manavgat districts of Antalya Province. Table III.1 shows the meetings were announced in one local and one national newspaper as per the regulatory requirements. The meetings comprise the presentation of the Project details such as construction and operation activities, and noted the comments and suggestions by participants during the meetings. The relevant opinions and suggestions are presented in Table III.2.

Table III-1. Information of PCMs in EIA Process

PCMs	Districts	Date	Time	Location
1	Döşemealtı	07.04.2016	09:30	Ekşili Village Coffeehouse
2	Alanya	07.04.2016	11:00	Alanya Municipality Çıplaklı Wedding Hall
3	Manavgat	07.04.2016	15:00	Manavgat Chamber of Commerce and Industry Assembly Meeting Hall

Table III-2. Questions, Opinions, and Suggestions Submitted During the Public Consultation Meeting

Location – Date – Time	Question, Comment, or Suggestion	Response	Main Discussion Points & Feedback Summary
Ekşili Village Coffeehouse / 07.04.2016 – 09:30	A specific location along the project route was mentioned, and concerns were raised regarding the expropriation of houses and pastures. A question was asked about the possibility of changing the route.	It was explained that due to elevation differences and geometric conditions at the connection point, the current route had been selected.	Local concern over property loss and desire for route revision; project constraints due to topography. This issue explained in the Institutional and Legal Framework Chapter.
	A question was raised about whether there is a railway project along the route.	The presence of a railway project was acknowledged, and it was explained that it is a separate and unrelated project.	Clarification requested regarding interaction with other infrastructure projects. This issue explained in the

Location – Date – Time	Question, Comment, or Suggestion	Response	Main Discussion Points & Feedback Summary
			Cumulative Impact Assessment Chapter.
	Questions were asked regarding the expropriation process (e.g., number of affected properties, areas involved, and procedures).	It was stated that the entire process would be carried out in accordance with the Expropriation Law.	Community members requested clarification regarding the legal procedures and scope of land acquisition. This matter is addressed in detail within the Institutional and Legal Framework section and throughout the RAP.
Çıplaklı Wedding Hall / 07.04.2016 – 11:00	Concerns were raised about the environmental pollution that may occur during construction and operation phases, and its potential impact on nearby settlements and agricultural products. A request was made to change the route.	The route was shown on a map, and it was emphasized that expropriation is necessary to complete the road. Despite the increased cost, alternative solutions such as tunnels were considered in order to safeguard the well-being of the local community.	Participants raised concerns about environmental and agricultural risks and acknowledged the consideration of alternatives such as tunnels. These aspects are addressed in the Land Use and Property section and the Project Description chapter.
	It was stated that the road would divide the village by passing through its center, and a request was made to shift the route 200–300 meters northward (towards the forest).	It was explained that the requested area falls within a wildlife conservation zone and therefore cannot be used.	Route modification options are addressed in the Analysis of Alternatives section, with conservation considerations further discussed in the Protected Areas and Cultural Heritage chapters.
	Participants cited tunnels used in other villages and requested a similar tunnel for their own. They also expressed concerns about an inappropriate route selection for expropriation purposes.	Three participants submitted written statements (recorded in the minutes). No response was provided.	Tunnel requests were raised by the community. Relevant design adjustments are considered in the Project Description and Analysis of Alternatives sections.
Manavgat Chamber of Commerce and Industry – Assembly Hall / 07.04.2016 – 15.00	Negative environmental, agricultural, and tourism impacts were expressed.	It was stated that mitigation measures would be taken during construction, and that during the operation phase, the project would contribute positively to the transportation of agricultural products and increase tourism circulation.	The ESIA comprehensively assesses potential impacts during both construction and operation phases. Specific mitigation measures have been developed accordingly. Additionally, the potential benefits of the Project are also evaluated within the ESIA.
	Negative feedback regarding the project route was shared (e.g., adverse impacts, expropriation issues).	Responses were provided, and it was mentioned that the route could be revised in coordination with relevant authorities, depending on stakeholder feedback.	Route modifications are considered in the Analysis of Alternatives section, based on stakeholder requests and in coordination with relevant authorities.
	Questions were raised regarding potential negative impacts on settlements and the mitigation measures to be taken.	It was explained that measures such as road watering to prevent dust, covering truck trailers, and installing noise barriers would be implemented.	Project routes are defined in the Project Description section of the ESIA, and potential impacts during construction and operation in these locations are addressed in detail throughout the report. Specific mitigation

Location – Date – Time	Question, Comment, or Suggestion	Response	Main Discussion Points & Feedback Summary
			measures are developed in Chapter 15: Community Health and Safety.

During the Public Consultation Meetings (PCMs), the majority of questions, comments, and complaints were related to the proposed route of the Project. Local stakeholders expressed concerns about the potential impacts of land acquisition activities along the route, particularly regarding their effects on the agriculture and tourism sectors. Accordingly, a significant portion of the complaints received from local residents focused on the loss of agricultural lands and restricted access to tourism facilities.

In the meetings held in and around Manavgat, tourism-related questions predominated, as the proposed Project route passes near touristic areas. Participants frequently requested revisions to the route and raised concerns about the expropriation process. In response, representatives of the relevant authorities emphasized that all procedures will be carried out in compliance with the Expropriation Law No. 2942, ensuring full adherence to national legal frameworks.

Topics such as archaeological sites and protected cultural heritage areas were mentioned less frequently. However, for the questions raised on these matters, project officials clarified that appropriate mitigation measures will be implemented, and coordination with relevant heritage protection authorities will be ensured throughout the project lifecycle.

In June 2024, ENCON conducted a comprehensive four-day field study aimed at gathering qualitative data from a wide range of stakeholders across various regions in Antalya province. The study included interviews and focus group discussions with academics, local authorities, and community members, targeting diverse demographic and occupational groups. The detailed breakdown of the activities conducted during the field study is presented in Table III.3. The feedback received during the interviews and how they were responded to is presented in Table III.4.

Table III-4. Summary of Field Study Interview Conducted by Encon in June

Interview Type and Location	Summary of the Interview	Main Discussion Topics and Responses
Akdeniz University / Faculty of Agriculture – Academic Interview	Emphasis was placed on the protection of agricultural lands, prevention of zoning pressure, and continued support for small-scale producers. Protection of underground water resources was also requested.	Agricultural lands will be preserved, and monitoring and preventive measures for water resources will be implemented to support farmers' activities.
Akdeniz University / Faculty of Tourism and Biology – Academic Interview	Recommendations included preventing fragmentation of natural habitats, using local plant species (olive, carob) in medians, and declaring the Alarahan area a nature park.	The route was planned to avoid habitat fragmentation. Local species will be used in landscaping, and coordination with relevant institutions will be ensured.
Serik District Governorate – Official Institution Interview	The project is viewed positively; however, it was requested that construction not coincide with tourism and agricultural seasons.	Efforts will be made to ensure that construction activities do not overlap with peak tourism and harvest periods.
Serik Chamber of Tradesmen and Craftsmen – NGO Interview	The road is expected to benefit tradespeople and farmers; it was requested that rest areas be designed to support commercial activities.	Rest facilities will be made accessible to local producers and tradespeople to support commercial activities.
Serik / Merkez Neighborhood – Mukhtar Interview and Focus Group	Requests included ensuring road access to villages, controlling dust/noise, and increasing information dissemination.	Noise and air quality control measures will be implemented and monitored. Village access will be maintained with planned connection roads. An inclusive grievance mechanism has also been developed.

Interview Type and Location	Summary of the Interview	Main Discussion Topics and Responses
Manavgat / Taşağıl Neighborhood – Focus Group and Elderly Group	Elderly individuals face challenges accessing information; it was suggested to use audio announcements.	Information access for the elderly will be provided through public announcements in spaces such as mosques and mukhtar offices.
Manavgat / Kalemler Neighborhood – Focus Group and Women Group	The road's positive contribution to health and agricultural access was noted; women expressed social support needs.	Social support requests specific to women will be considered.
Manavgat / Ulukapı Neighborhood – Focus Group, Women Group, Mukhtar	Requested the preservation of field roads and uninterrupted access during construction.	Field roads and connections between settlements will be maintained with underpasses and overpasses ensuring uninterrupted access.
Manavgat Chamber of Agriculture – NGO Interview	Support for producers and participation in decision-making processes were requested.	Regular coordination and information meetings will be held with producer unions.
Manavgat Directorate of Technical Affairs – Official Institution Interview	Requested compatibility with urban planning and integration with public infrastructure.	Planning will be coordinated with municipalities, and infrastructure transitions will be integrated into the project.
Manavgat / Hacıisalı Neighborhood – Focus Group and Elderly Group	Requested reduction of social isolation and safe crossings.	Safe pedestrian crossings and transport services will be provided.
Manavgat / Karakaya Neighborhood – Mukhtar and Focus Group Interview	Suggested preventing the village from being divided and constructing tunnels/underpasses.	Underpasses and bridges will be evaluated for critical crossing areas.
Alanya / Akdam, Toslak, Konaklı, Alara – Focus Group and Mukhtars	Requested support for loss of agricultural land, routing away from residential areas, and eco-tourism-oriented rest areas.	Support will be provided to affected producers and alternative route scenarios have been evaluated. Eco-tourism-focused designs will be considered for rest areas.

The EIA Review and Evaluation Commission set up by the MoEUCC; General Directorate of EIA, Permit and Inspection at the scoping stage of the national EIA processes included the governmental stakeholders listed in Table III.5 .

Table III-5. Governmental Stakeholders Involved in the Scoping, Review and Evaluation of the National EIA Process

Organization	Directorate/ Administration
General Directorate of Highways	General Directorate of Highways 13th Regional Directorate
Governorship of Antalya	Investment Monitoring And Coordination Department Antalya Governorship Repealed Provincial Directorate of Agriculture Antalya Governorship Provincial Directorate of National Education
Antalya Metropolitan Municipality	Department of Housing and Urbanization Department of Real Estate and Expropriation
Ministry of Transport and Infrastructure	Antalya Airport Chief Directorate
General Directorate of Mineral and Research and Exploration	General Directorate of Mining Affairs, Exploration Department
Ministry Of Agriculture And Forestry	General Directorate of State Hydraulic Works Department of Survey, Planning and Allocations Directorate General of Agricultural Reform General Directorate of Nature Conservation and National Parks General Directorate of Forestry Department of Permits and Easements
Ministry of Forestry And Water Affairs	Repealed Ministry of Forestry and Water Affairs 6th Regional Directorate Antalya Branch Directorate
Repealed Electricity Generation-Transmission Inc. (TEAŞ)	General Directorate of Electricity Generation Corporation
Ministry of Culture and Tourism	Directorate General of Investments and Enterprises Regional Board of Protection of Cultural Heritage
Ministry of Environment, Urbanization and Climate Change	General Directorate of Conservation of Natural Assets Provincial Directorate of Environment, Urbanization and Climate Change
Ministry of Interior	Provincial Directorate of Disaster and Emergency
Ministry of National Defense	General Directorate of Machinery and Chemical Industry Corporation
Ministry Of Industry And Technology	Directorate General for Industrial Zones

The EIA Application File was prepared on behalf of General Directorate of Highways and submitted to the Ministry of Environment and Urbanization by the e-EIA system on 04.03.2016, and the EIA process was initiated. During the preparation of the Project's EIA Report, the comments and opinions expressed by the local communities during the Public Participation Meeting, and the official views of the governmental stakeholders that formed the EIA Review and Evaluation Commission, were incorporated. Following the finalization of the report, the EIA was disclosed to the public via the MoEUCC and the Provincial Directorate of the Environment, Urbanization and Climate Change as per the requirements of the national EIA Regulation.

III.2. Stakeholder Engagement as part of the ESIA Process

The expert team in Encon held two separate field studies as part of the ESIA study, as summarized in Table III.6 . The first one was a reconnaissance study carried out on May 2-3, 2024 with the main objective of identifying the environmental and social features and sensitivities of the Project. This included planned art structures along the motorway route, campsites, quarries, and facilities such as the concrete plant, asphalt, and mechanical plan.

The second field study, conducted on 3-6 June 2024, focused on key informant, focus group, vulnerable groups, and other stakeholders (NGOs, Academicians, Communities, etc., in the region) interviews. During the social field study, key informative interviews were conducted with the mukhtars of four (4) settlements previously determined. Focus group interviews were held in eight (8) settlements, including mukhtars and households of 12 neighborhoods in the impact areas. Focus group interviews in Serik Merkez, Taşağıl, Kalemler, Ulukapı, Hacıisalı, Karakaya-Çakallar-Alara, Akdam, and Toslak-Konaklı-Alara neighborhoods; and vulnerable group interviews were conducted in those areas. Additionally, other stakeholders such as academics, local officials, and local communities were interviewed to gather expert opinions on the socio-economic impacts of the Project.

Table III-6. Summary of the Social Field Studies Conducted as part of the ESIA

Tasks	Date of the Field Study	Scope of the Field Study
Site visit	May 2024	● The reconnaissance study started at Km: 52+000, and ended at Km: 135+000 ● Visiting the license area: planned tunnel, viaduct, quarry, facility area, and construction site and storage area.
Key Informant Interviews Focus Group Interviews, Other Stakeholder Meetings	June 2024	● Four (4) key informant interviews in Serik/Merkez, Manavgat/Ulukapı, Manavgat/Karakaya, and Alanya/Toslak neighborhoods ● Eight (8) Focus group interviews in Serik Merkez, Taşağıl, Kalemler, Ulukapı, Hacıisalı, Karakaya-Çakallar-Alara, Akdam, and Toslak-Konaklı-Alara ● Interviews with Academics, local officials, and local communities
Road Trip Study Public Consultation Meetings (PCMs)*	August 2025	● Informing the local community about the Project and collecting feedback from stakeholders, including complaints, suggestions, and opinions.

**Shuttle vehicles were arranged for appropriate residential areas in order to facilitate access to the Public Participation Meetings and to increase attendance rates.*

In parallel to the ESIA studies, the Company has started to establish close relationships. In this scope, Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş participate the reconnaissance study in the project area May, 2024.

A Stakeholder/Public Consultation Meeting (PCM) had been organized after the finalization of the expropriation plan by the General Directorate of Highways (KGM). During the meeting, details about the project, its potential environmental and social impacts/risks, mitigation measures to be taken, and implementation/ monitoring/reporting responsibilities of different parties had been shared with the stakeholders; and then their opinions and suggestions received during the question-answer (Q&A) session are recorded and included in Table III.9.

III.2.1. Road Trip

In December 2024, Public Consultation Meetings (PCMs) was planned to be held in the four most affected locations related to the "Road Trip" study. However, due to delays in the completion of expropriation procedures, these meetings had been postponed and were organized once sufficient progress has been made. These meetings aimed to disclose Project impacts and planned mitigation measures, while creating a space for meaningful public feedback prior to the commencement of construction.

For the Project, four Public Consultation Meetings (PCMs) were held in selected locations: Orta (Serik, Antalya), Yukarıpazarcı (Manavgat, Antalya), Avsallar (Alanya, Antalya), and Konaklı (Alanya, Antalya). Venues within local neighborhoods, which possess adequate capacity and appropriate physical conditions, were used for these meetings. This preference was based on the observation that participation levels are generally higher in such local venues, according to past experiences. Moreover, selecting the exact place/location were considered to create a more inclusive environment that enables women and vulnerable groups to participate. Figure III.1 and Figure III.2 shows the locations of the conducted PCMs and those that social field study was conducted.

To ensure broad awareness and community participation, announcements regarding the PCMs were made through multiple channels, including: public bulletin boards in central neighborhood locations, local mukhtars' offices, municipality websites, and local radio broadcasts where feasible. Additionally, printed invitations and visual materials such as posters and leaflets will be distributed, and mobile messaging applications (e.g., WhatsApp groups commonly used in local communities) may also be utilized to reach wider audiences. In addition to those the announcement at the national newspaper will also be done. All announcements will be made at least two weeks prior to the meetings and will be provided in Turkish, with Arabic translations where needed to ensure inclusivity for refugee or migrant populations.

PCMs took place along the entire Motorway route from the Serik district to the Alanya district of Antalya province. Table III.8 displays details about the planning of PCMs. The meeting locations were selected based on findings from key informant and focus group interviews conducted in the region by a social expert employed in ENCON. The overall motorway route spans 117.8 km, including the main carriageway and the access roads. Since it would not be possible to organize a meeting in every settlement that is located within the study area, in the selection of the settlements at which the public consultation meetings were planned, it was aimed that a meeting location is determined every 30 (plus minus) km along the Motorway route to ensure to the extent possible that the meeting location was accessible for the local people from the surrounding settlements and in order to acquire a more inclusive Road Trip for all different stakeholders.

The meetings were held with the participation of representatives of Limak as Project Sponsors (senior officials and technical Project team members including design and expropriation), authorities from the 13th Regional Directorate of KGM, and the Environmental and Social Impact Assessment (ESIA) Consultant (ENCON Environmental Consultancy Co.).

The ESIA Consultant moderated the meetings. The meetings commenced with an introduction and an explanation of the meeting's purpose and scope. This was followed by a presentation from the ESIA consultant and a final discussion session to address any questions, concerns, and suggestions. The main topics covered in the presentations were as follows:

- What is the Antalya-Alanya Motorway Project?
- Who are the project sponsor and ESIA Consultant?
- What are roles of the Project Sponsor and ESIA Consultant?
- What are the Anticipated Benefits of the Project?
- What is the Environmental and Social Impact Assessment Process?
- Stakeholder Engagement: How to Participate in the Process?
- Discussion (Questions and Answers) Session

Large-scale (in A0 format) maps showing the relevant part of the route in each meeting were posted on the walls of the meeting venue. In addition, project information brochures (see ANNEX-4) was shared the participants. Different parties participated, including government officials or (significantly) from adjacent neighborhoods.

Table III.7 shows the expected local representatives of participant profile in planned PCMs. A list of participants will be maintained at the meeting.

Table III-7. Summary of Participants Profiles

PCM No	Meeting Location	Adjacent Neighborhoods from which Representatives (Mukhtar or Local People) will Participated in the Meeting
1	Serik / Merkez	Cumalı, Burmahancı, Deniztepesi, Kayaburnu, Çandır, Üründü, Aşağıkocayatak, Yukarıkocayatak, Sarıabalı, Aşağıçatma, Dikmen and Belpınarı neighbourhoods
2	Manavgat / Merkezı	Çakış, Taşağıl, Gündoğdu, Hocalar, Yavrudoğan, Çolaklı, Seki, Kalemler, Evren, Ilıca, Yeniköy, Şişeler, Evrenleryahşi, Dolbazlar, Yukarıışıklar, Dikmen, Bucakşeyhler, Ulukapı, Aşağıışıklar, Demirciler, Karaöz, Aksaz, Hacıali, Cevizler, Sülek, Hacıisalı, Hacıobası, Kızılot, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Odaönü, Karakaya neighborhoods
3	Alanya / Avsallar	Avsallar, Akdam, İncekum, Alara, and Çakallar neighbourhoods
4	Alanya / Konaklı	Türkler, Emişbeleni, Toslak, Konaklı, Elikesik, Payallar neighbourhoods

Table III-8. Organizational Details of the Planning Public Consultation Meetings in Antalya

PCM No	Province	District	Neighborhood	Km Chain age	Population (TURKSTAT, 2024)	Date of the Meeting	Time of the Meeting	Meeting Venue	Number of Participants
1	Antalya	Serik	Merkez	Km 52+000 (Access Road)	17,969	27.08.2025	09.00 - 12.00	Serik Multipurpose Cultural Hall	80-
2	Antalya	Manavgat	Merkez	Km 87+000	6,374	27.08.2025	15.00 - 18.00	Manavgat İbrahim Sözen Youth Center	187-
3	Antalya	Alanya	Avsallar	Km 125+000	16,118	26.08.2025	09.00 - 12.00	Avsallar Kör Ali Baysal Wedding Hall	200-
4	Antalya	Alanya	Konaklı	Km 141+000	17,927	26.08.2025	15.00 - 18.00	Alanya Municipality Konaklı Cultural Center	300-

**To facilitate access to the Public Participation Meetings and to increase attendance rates, shuttle vehicles were arranged for the eligible residential areas specified in Table III.7*

III.2.2. Field Study with Women

As part of the Project, Community Liaison Officers (CLOs) conducted a series of focus group discussions specifically with women in different districts and villages located along the Project corridor. These meetings were held between late July and late August 2025, covering Serik, Manavgat, and Alanya districts. The purpose of the discussions was to collect women's perspectives, identify their specific concerns, and ensure that their voices are incorporated into the Project's social assessment and engagement process. The record list of the meetings is presented in Table III.9

Table III-9. Focus Interviews Conducted by CLOs

No	Date	District	Village / Neighborhood	Facilitator	Meeting Status
1	7/28/2025	Serik	Sarıabalı	CLOs	Held
2	8/23/2025	Serik	Cumalı	CLOs CLOs	Held
3	8/24/2025	Serik	Üründü	CLOs	Held
5	8/24/2025	Manavgat	Taşağıl	CLOs	Held
6	8/22/2025	Manavgat	Yukarıışıklar	CLOs	Held
7	8/23/2025	Manavgat	Bucakşeyhler	CLOs	Held
8	8/24/2025	Manavgat	Ulukapı (Araplar Street)	CLOs CLOs CLOs	Held
			Ulukapı (Isparta Street)		
			Ulukapı (Alibazlı Street)		
9	8/23/2025	Alanya	Konaklı	CLOs CLOs	Held
10	8/23/2025	Alanya	Türkler	CLOs	Held
11	8/24/2025	Alanya	Avsallar	CLOs	Held

Each session was facilitated by a designated CLOs and provided an opportunity for women community members to share their expectations, highlight potential gender-related impacts, and discuss measures to address them. The outcomes of these meetings will serve as an important input for shaping the Project's Stakeholder Engagement Plan and informing mitigation strategies that are responsive to women's needs and priorities.

III.2.3. Public Consultation Meetings Summary

A detailed review of the PCMs held on August 26-27 as part of the project's ESIA process is presented below. Figure III.3 shows the shuttle vehicle arranged to facilitate access to the PCM and used participation list form. The neighborhoods designated as shuttle points are listed under the meeting locations with transportation demand.

Figure III-III Shuttle for PCM

Avsallar

The Public Consultation Meeting was held on August 26, between 9 and 11 a.m, at the Kör Ali Baysal Avsallar Wedding Hall. To facilitate access to the PCM and to increase attendance rates, shuttle vehicles were arranged for the Alara, Akdam, Çakallar and Türkler. The headmans of Akdam and Çakallar stated that the residents would provide transportation using their own resources. A total of 200 people attended the meeting, 34 of whom were women. It was observed that the majority of participants were between the ages of 35 and 64. It was also noted that 4-5 participants were aged 75+, and one physically disabled individual was present at the meeting. Before the meeting began, conversations were held with participants who had contacted, and their concerns were listened to. The project presentation began at 10 a.m. after which complaints, questions, and opinions were received. While the village heads and participants expressed their complaints, tensions arose among the participants from time to time. While a group of questions were being answered by project officials, the participants expressed their reactions by protesting the meeting, and as a result, the meeting could not be completed.

Figure III.4 shows the venue where the meeting took place, the layout of the meeting room, the project route maps hung on the walls for informational purposes, and the presentation made during the meeting. Figure II I.5 shows the informational brochures (see ANNEX-4). These include the Project information

brochures distributed during the meetings and the informational brochures created regarding expropriation.

At the Avsallar - Kör Ali Baysal Wedding Hall, during part of the meeting and in the pre-meeting discussions, the main requests included shifting the route over the Alara River or constructing a tunnel through the forest corridor. Participants also emphasized the need to protect agricultural lands and to avoid adverse impacts on parks, greenhouses, irrigation canals, and residential houses. In addition, greater transparency was requested regarding information on quarries and their permitting processes. On the other hand, the main concerns expressed were the increase in the number of houses affected due to the route change, grievances caused by the quarries, inappropriate working hours, and the risk posed to drinking water sources resulting from drillings. Concerns were also raised that expropriation compensation amounts would be too low. Prior to the meeting, the Expropriation Director provided information about the legal procedures, while ENCON Environmental Consultancy explained the compensation mechanisms foreseen within the RAP framework. The participants' Q&A table is presented in Table III.9.

Figure III-IV PCM in Avsallar

Figure III-V The Informational Brochures in PCM

Konaklı

The Public Consultation meeting was held on August 26, between 3 and 6 p.m., at the Alanya Municipality Konaklı Cultural Center. The local headmen and residents stated that they would arrange their own transportation for the meeting held here. A total of 300 people attended the meeting, 26 of whom were women. Since the meeting in Avsallar could not be completed, some participants attended the meeting in Konaklı.

Figure III.6 shows the venue where the meeting took place, the layout of the meeting room, the project route maps hung on the walls for informational purposes, and the presentation made during the meeting. Figure III.7 shows the informational brochures.

At the meeting held at the Alanya Municipality Konaklı Culture Center, the main requests included ensuring the continuity of the Konaklı–Alanya road, extending the road to Gazipaşa, and improving the design of the Konaklı junction. Tunnel and alternative crossing options were also suggested in order to prevent damage to agricultural lands. Complaints were mainly focused on the Konaklı junction dividing the neighborhood into two, the connection road design increasing traffic load, uncertainties regarding expropriation compensations and procedures, and concerns about 2B lands. In addition, the negative impacts of the Project on agricultural production and livelihoods were emphasized. Questions from participants regarding parcel and compensation information were answered by the AAOİAŞ Expropriation Director, while social impacts and measures under the RAP were explained by ENCON Environmental Consultancy and the AAOİAŞ Environment and Social Manager. CLOs conducted interview with local stakeholders prior to the session and also collected the contact information of participants who raised sensitivities during the meeting. The participants' Q&A Table is presented in Table III.9.

Figure III-VI PCM in Konaklı

Figure III-VII The Informational Brochures in PCM

Serik / Orta Neighborhood

The Public Consultation meeting was held on August 27, between 9 and 12 a.m., at the Antalya Metropolitan Municipality Multi-purpose Cultural Hall. The mukhtars and residents stated that they would arrange their own transportation for the meeting held here. A total of 80 people attended the meeting, 15 of whom were women.

At the meeting held at the Serik Multipurpose Cultural Center, the most frequently raised requests included a route change to protect the cemetery, the widening of the culvert under the D400 road, and ensuring access to greenhouses and houses through underpasses and connection roads.

The main complaints focused on the low level of expropriation compensations, the loss of value of payments due to inflation, the loss of fertile agricultural lands, and the risks faced by greenhouses built through loans. In addition, the absence of representatives from the General Directorate of Highways (KGM) was criticized. Questions related to the cemetery were addressed by AAOİAŞ representatives, who provided explanations on technical reasons and the inspections to be carried out. Details regarding expropriation compensations and legal procedures were provided by the Expropriation Director, while social impacts and livelihood losses were evaluated by the AAOİAŞ Environment and Social Manager. CLOs collected the addresses and contact numbers of households they had engaged with prior to the meeting as well as those who expressed sensitivities during the session.

The participants' Q&A Table is presented in Table III.9, while the meeting photos are presented in Figure III.8.

Figure III-VIII PCM in Serik / Orta Neighborhood

Manavgat / Yukarı Pazarcı Neighborhood

The Public Consultation meeting was held on August 27, between 3 and 6 p.m., at the Ibrahim Sözen Youth Center. To facilitate access to the PCM and to increase attendance rates, shuttle vehicles were arranged for the Yavrudoğan, Yeniköy, Dolbazlar, Karaöz, Hacıobası and Karakaya. A total of 187 people attended the meeting, 39 of whom were women.

At the meeting held at the Manavgat İbrahim Sözen Youth Center, the main complaints included uncertainties regarding expropriation negotiations and the payment schedule, issues related to fragmented parcels, risks of dust and asbestos as well as negative impacts from blasting, the risk of yield loss in olive trees, and the absence of representatives from the General Directorate of Highways (KGM). Questions concerning parcels and inherited properties were addressed by the AAOİAŞ Expropriation Director, while issues related to livelihood losses and vulnerable groups were answered by ENCON Environmental Consultancy and the AAOİAŞ Environment and Social Manager. Prior to the meeting, CLOs carried out information activities, and during the meeting, the addresses and contact details of participants who expressed sensitivities were collected in order to plan further engagements. The participants' Q&A Table is presented in Table III.9, while the meeting photos are presented in Figure III.9.

Figure III-IX PCM in Manavgat / Yukarı Pazarcı Neighborhood

Figure III-X Questions, Opinions, and Suggestions Submitted During the Public Consultation Meeting

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
Avsallar Kör Ali Baysal Wedding Hall / 26.08.2025 09:00-11.00	Headman of Akdam Neighborhood	It was emphasized that the Project would have negative impacts on agriculture and that both the local community and individuals would suffer losses.	A few questions, requests, and opinions were received first. Afterwards, while a representative from the General Directorate of Highways (KGM) was responding on behalf of the Project Officials, the meeting was interrupted and ended prematurely.	
	Resident	It was noted that the number of houses affected by the route change increased from 5 to 40, and a request was made to shift the route over the Alara River. It was also stated that parks, greenhouses, irrigation canals, and houses would be affected by the route.		
	Headman of Çakallar Neighborhood	It was stated that no prior notification had been provided regarding construction works, and that permission would not be granted once construction reached the village. A request was made for the Project route to pass through the forest instead of the settlement, including the construction of a tunnel if necessary. Objections to the quarries and the current route were reiterated, which were supported by applause from the community. Concerns were also expressed that the Project would not create employment, that people whose livelihoods depend on agriculture would lose their income sources, and that they would only be employed as cleaning staff.		
	Resident	It was stated that the local community did not want expropriations to be carried out. The procedures and legal processes related to expropriation were shared. It was also expressed that participants believed the compensation		

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		amounts for expropriation would be low.		
	Headman of Saburlar Neighborhood	It was stated that the motorway and quarries caused serious grievances and that the working hours were inappropriate. Questions were raised about whether EIA reports had been obtained for the quarries and who had granted the approvals. Concerns were expressed about the muddy water resulting from the drillings, noting that the Saburlar Quarry is located 200 meters upstream of the water source. It was further stated that a complaint petition had been submitted to the General Directorate of Highways (KGM) regarding this issue, but no action had been taken.		
Alanya Municipality Konaklı Culture Center / 26.08.2025 15:00-18.00	Resident	It was stated that there is a need for a road and that no alternative route exists, which causes heavy traffic. A request was made for the continuation of the Konaklı–Alanya road, noting that there is no entrance to Alanya after Konaklı.		
	Resident in Toslak Neighborhood	It was asked why the Project route had recently been changed and what the justification for this change was.	Representative of AAOİAŞ	Minor changes were made at the D-400 connection section in order to ease traffic.
	CHP District Chairman	It was stated that while the road is needed, it should not be constructed in its current form. The route passes through agricultural lands in Alarahan and Toslak, which constitute the livelihood of local people. It was requested that the complaints be taken into consideration, emphasizing that the destruction of agricultural lands would have significant impacts on climate and water scarcity. It	Representative of ENCON	It was explained that in line with international standards, different solutions for expropriation activities and the associated costs are also being taken into account.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		was also noted that it currently takes one hour to travel 15 km, but congestion will still occur with the proposed connection roads.		
	Mayor of Konaklı (2014–2019)	It was stated that if the road is planned to be extended up to Gazipaşa, then the connection road in Konaklı (behind the New Hospital) should be cancelled. A concern was raised about whether it would first be constructed and then cancelled, emphasizing that people are already being adversely affected by the Konaklı connection road.	Representative of ENCON and AAOİAŞ	Reference was made to the Erdemli–Kızkalesi Project, where an extension was carried out as described. It was further explained that in addition to the motorway, certain connections are also included in the General Directorate of Highways' plans and will likely be expanded.
	Resident	Questions were raised regarding when the construction will take place and when it will be completed. Concerns were expressed about ongoing agricultural activities and related expenses (e.g., irrigation costs of 11,000 TL) as well as newly built structures (houses and buildings), and whether they would be demolished and compensated if affected.	Representative of AAOİAŞ	It was explained that initial assessments are being carried out, with inspections conducted by the General Directorate of Highways (KGM). The value of the land is determined based on the 2019 Expropriation Plan, taking into account unit costs and tax calculations. If any errors are identified during the assessments, these will be corrected. Notifications will be issued starting from March. Those seeking earlier information were advised to contact KGM directly. It was also stated that prices offered do not have to be accepted, and that lawsuits can be filed under Articles 27 and 10. Article 27 corresponds to an approximately two-month process, while Article 10 (Action for Price Determination and Registration) may take longer.
	Young Farmer Mustafa	A request was made for the service to be carried out properly, rejecting the route passing through fertile lands. It was stated that this is a wrong decision in the midst of a food crisis. It was	Representative of ENCON	It was stated that the concerns will be duly considered.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		further noted that ending the route in Konaklı would not solve the traffic problem, and that if the road is constructed in its current form, outward migration and unemployment will increase.		
	Resident	It was stated that the area is not well known, and that traffic congestion occurs between Okurcular and Alanya. It was suggested that the Emişbeleni–Gazipaşa Tunnel Project should be implemented.	Representative of AAOİAŞ	It was stated that the concerns will be duly considered.
	Farmer, Resident	It was questioned whether this meeting would have been more effective if it had been held before the route was determined, and whether complaints would be taken seriously after the route has already been set.	Representative of ENCON	Complaints and requests will be taken into consideration to improve mitigation measures and the RAP. The necessary revisions and updates will continue to be implemented.
	Lawyer, Resident of Emişbeleni	It was stated that the Konaklı junction passes through the neighborhood, leading to the loss of greenhouses and damaging the efforts invested. It was questioned whether there is any land of equal value, emphasizing that the Project harms farmers.	Representative of ENCON	A RAP is being prepared within the scope of the Project, and losses will be compensated in line with international practices.
	Headman of Konaklı Neighborhood	It was stated that the approved Project route, particularly the junction on the Konaklı side, would negatively affect community life and divide the settlement into two.	Representative of AAOİAŞ	The settlement pattern is taken into account in the Project design, and necessary adjustments will be reviewed to minimize potential social impacts of the route.
		Concerns were raised that vehicles coming from the Alanya direction would increase the existing traffic load when connecting to the main route through the connection road due to the current design.	Representative of AAOİAŞ	Traffic impact analyses are being carried out, and measures to reduce traffic congestion will be considered in the junction designs.
		A request was made for the improvement of the junction design for these reasons.	Representative of AAOİAŞ	The matter will be re-evaluated with the relevant engineering design team, and appropriate technical

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
				solutions will be explored.
		An objection was expressed to the approved design, and an alternative route was requested.	Representative of AAOİAŞ	The approved route has been determined in line with national plans. However, the requests communicated will be recorded and forwarded to the relevant authorities.
		Questions were raised regarding the recent change in the Project route and the justification for this change.	Representative of AAOİAŞ	Route changes have been made by considering technical requirements and issues such as traffic safety.
		The possibility of further changes to the approved route was brought up.	Representative of AAOİAŞ	The Project route has been approved by the relevant authorities, and no substantial changes are foreseen.
		It was noted that the previous markings were more functional compared to the current design, and that the subsequent changes were negatively received.	Representative of ENCON	All markings and signages are implemented in compliance with national standards, and feedback received during implementation will be taken into account.
		It was emphasized that if improvements are made to the route, the community would show satisfaction, otherwise the reactions would continue.	Representative of ENCON	Stakeholder views will be regularly collected, and possible improvements will be made. The aim is to ensure community satisfaction.
		Participants expressed their discontent regarding the absence of representatives from the General Directorate of Highways (KGM) at the meeting.	Representative of AAOİAŞ	Participants' views in this regard have been recorded, and necessary steps will be taken to ensure the participation of the relevant authority representatives in future meetings.
	Resident in Emişbeleni	The local community stated that they did not want expropriations to be carried out.	Representative of AAOİAŞ	Expropriation will be carried out in accordance with the relevant national legislation and legal procedures, and the necessary information is being provided.
	Resident in Emişbeleni	Participants expressed their concern that the compensation amounts for expropriation would be low.	Representative of AAOİAŞ	Compensation amounts are determined through independent valuation studies, and participants were informed about the available legal appeal mechanisms.
	Resident in Akdam	The local community requested the implementation of the initial project design.	Representative of AAOİAŞ	The Project route has been updated considering technical requirements and traffic safety; however,

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
				the requests have been recorded and will be conveyed to the relevant authorities.
	Resident in Emişbeleni	Participants expressed concern about the potential loss of fertile agricultural lands.	Representative of AAOİAŞ	While determining the route, efforts were made to preserve fertile agricultural lands as much as possible; potential losses will be addressed through compensation mechanisms under the RAP.
	Resident	Participants mentioned that there are 2B lands in the area and stated that they did not know how to claim their rights.	Representative of AAOİAŞ	Processes related to 2B lands are carried out in line with the existing national legislation, and the rights holders have been provided with the necessary information.
	Resident	It was asked whether a new EIA Report would be required for route changes, noting that the road is shifted by 2 meters after the EIA Report is obtained.	Representative of AAOİAŞ	It was explained that before the tender, limited drilling works are carried out for design purposes. However, once the contractor takes over after the tender, the design cannot be finalized. Further drilling works are then conducted, and if the ground conditions are found unsuitable, route changes may occur.
	Resident in Akdam	Concerns were raised that the operating authorities did not act with due consideration and that construction works continued despite the complaints.	Representative of AAOİAŞ	Before construction, the headmen are informed and the CLOs provide relevant information. The address has been obtained and will be communicated to the CLOs.
	Resident in Emişbeleni	A question was raised regarding the possibility of reaching a settlement for the expropriation of the remaining portion of the land, as 73% has already been acquired.	Representative of AAOİAŞ	It was explained that a petition should be submitted for the expropriation of the remaining part. Depending on the assessment of the situation, the remaining portion may also be expropriated. For example, if access to the land is restricted, the petition would likely result in a favorable outcome.
	Resident in Konaklı	It was stated that the Konaklı junction has no benefit, and a request was made to return to the previous route. In addition, a	Representative of AAOİAŞ	The Konaklı junction and route designs have been prepared by taking into account traffic safety and transportation needs.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		request was made for the road to be extended to Gazipaşa. It was also suggested that Aksu should be connected to the Isparta road.		Returning to the previous route is not technically feasible. The requests for extending the road to Gazipaşa and for connecting Aksu to the Isparta road have been noted and will be considered within the planning framework of the relevant authorities.
Serik Multipurpose Cultural Center / 27.08.2025 09.00-12.00	Headman of Yukarıkocayatak	A request was made for a route change due to the Mektebirli Cemetery located on parcel no. 1101. It was stated that 14–15 graves would be affected under the current route.	Representative of AAOİAŞ	It was explained that cancellation of the route is not possible. Following the meeting, a site inspection will be carried out to clarify the exact number of affected graves, as the figure was initially thought to be lower. It was further explained that the proposed route change does not comply with motorway standards; therefore, the current design must be maintained. A separate meeting will be organized with the headman and the concerned parties to share technical details, including why a change cannot be made and how the existing procedures will be followed. Further contact with the headman will be established at the beginning of the week.
	Headman of Kayaburnu	It was stated that the existing culvert under the D400 road is insufficient and needs to be widened. It was noted that the culvert is used by three neighborhoods, currently barely meets the demand, and may pose an overflow risk during sudden rainfall. It was asked whether the culvert could be widened during the D400 road expansion works. It was also stated that a petition had been submitted to KGM regarding this issue.	Representative of AAOİAŞ	It was noted that the issue will be reviewed with the relevant technical teams.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
	Headman of Deniztepesi	Concerns were raised that expropriation payments are too low and will lose value due to inflation by the time they are paid. A request was also made for land consolidation.	Representative of AAOİAŞ	It was clarified that there is a misunderstanding, as prices will be updated in the new year and payments will be made based on 2026 rates. It was also explained that land consolidation will not be possible after this stage of the process.
	Resident	It was asked whether compensation would be paid for greenhouses and structures.	Representative of AAOİAŞ	It was explained that compensation will be paid for structures. In the case of jointly owned lands, agreements may be reached through negotiation, or the matter can proceed to court.
	Resident	The public requested a clear timeline for the payment of expropriation compensations.	Representative of AAOİAŞ	It was stated that compensation amounts will be determined and paid according to the applicable legal schedule, and affected landowners will be informed individually.
	Resident	Information was requested regarding the size of the parcels to be expropriated.	Representative of AAOİAŞ	It was explained that the total area along the route has been calculated and that landowners of the affected parcels will be provided with specific information.
	Resident	Participants expressed that the offered expropriation compensations are significantly below market value.	Representative of AAOİAŞ	It was clarified that the compensations are determined through independent valuation studies, and landowners retain the right to appeal through legal mechanisms.
	Resident	Concerns were raised about the absence of representatives from the General Directorate of Highways (KGM) at the meeting.	Representative of AAOİAŞ	It was noted that this feedback has been recorded and will be conveyed to the relevant authority to ensure future participation.
	Resident	It was asked how payments would be made in parcels with multiple heirs.	Representative of AAOİAŞ	It was explained that payments will be made in accordance with inheritance shares, as determined under applicable legislation.
	Resident	Citizens requested adequate underpasses, culverts, and connection roads to ensure access to houses and greenhouses.	Representative of AAOİAŞ	It was stated that existing culverts will be extended and widened where necessary to maintain access.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
	Resident	Concerns were raised that cemeteries should not be affected by the Project.	Representative of AAOİAŞ	It was noted that measures will be taken to avoid impacts on cemeteries as far as possible, and any unavoidable cases will follow due procedures.
	Resident	It was stated that some parcels, houses, and greenhouses will be adversely affected by expropriation.	Representative of AAOİAŞ	It was explained that these impacts are recognized, and compensations will be provided in line with national legislation and the RAP framework.
	Resident	Concerns were expressed that expropriation payments would be insufficient to purchase new land.	Representative of AAOİAŞ	It was explained that compensations are based on independent valuations and legal requirements; however, concerns have been noted for further consideration in the RAP.
	Resident	It was noted that some greenhouses were built through loans, leading to additional grievances.	Representative of AAOİAŞ	It was explained that such cases will be reviewed on an individual basis, and compensation procedures will take account of legally recognized investments.
	Resident	Concerns were raised that certain routes may damage cemeteries and drinking water resources.	Representative of AAOİAŞ	It was stated that the Project design aims to avoid such sensitive areas; in cases where impacts are unavoidable, mitigation measures will be implemented in line with environmental and social standards.
	Resident in Kayaburnu (Parcel: 39 / 102)	Owns a single land plot of 11.5 decares with no other property. Stated that citrus trees planted in 2013 (12–13 years old) will be entirely affected, estimating a loss of 600–700 trees. Highlighted that the land is adjacent to a zoned area, making it highly valuable, and that acquiring new land under these conditions is impossible. Mentioned an annual income of 1,500–2,000 TL and stated that the road will not provide any benefit to him.	Representative of AAOİAŞ	The valuation of trees and land will be carried out through independent expert assessments. The proximity of the land to zoned areas, its current use, and agricultural productivity will be taken into account. Lost income and livelihoods will be addressed under the RAP.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
	Resident in Burmahancı (Parcel: 102 / 88)	Raised concern that the KMZ is outdated at the location of the DSİ canal and needs to be checked. Noted that in the Ministry of Environment's e-Plan, the zoning plan attached to the EIA report is updated, and the problem stems from the outdated report. Stated that there is already a DSİ road where lands are being taken, and that the additional T-junction road is unnecessary. Referred to the DSİ irrigation canal built in the 1970s.	Representative of AAOİAŞ	The DSİ canal and existing roads will be reviewed by the technical teams. Discrepancies between the KMZ and the EIA plans will be checked, and the request regarding the additional connection road will be conveyed to the relevant authorities.
	Resident in Üründü	sked about the Project's start date. Stated that his greenhouse was divided and asked how water and electricity will be provided. Asked when he should stop agricultural activities, noting: "Should I plant or not?" Asked whether underpasses or culverts would be built since the route cuts through greenhouses and orange orchards. Asked how long before construction notification would be given.	Representative of AAOİAŞ	Notification will be given at least three months before construction begins.
		Asked whether there would be support for dismantling and transporting his greenhouse.	Representative of AAOİAŞ	Dismantling and transportation will be the responsibility of the landowner, but labor support may be provided.
	Resident in Cumalı (Parcel: 102 / 41)	Asked when the payments will be made and when construction will begin in their neighborhood.	Representative of AAOİAŞ	Expropriation payments and construction start dates will be determined in line with the official schedule, and landowners will be informed accordingly.
	Resident in Sarıbalı (Parcel: 249 / 5)	Stated that 10 households in the neighborhood are affected, 8 of which are in economic difficulty. Reported that 5 decares of his land will be lost, affecting his house and trees. Noted the presence of a tunnel passage on the route	Representative of AAOİAŞ	Yes, such a study is underway. Although the land is occupied, additional solutions are being explored.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		and asked whether there is a viaduct project to save his house.		
	Resident in Üründü (Parcel: 135 / 6-4)	Noted that they are 5 co-heirs and the land originally belonged to their grandfather. Stated that the house, greenhouse, and orange orchard (approx. 300 trees, 20 years old) will be affected. Explained that this orchard is his livelihood, generating 2 million TL annually, and that selling for 1 million TL is unacceptable. Emphasized that in 3 meetings held within 6 months, no clear information was provided about construction start dates or expropriation payments.	Representative of AAOİAŞ	Üründü is not included in this year's construction plan.
	Resident in Burmahancı (Parcel: 102 / 40)	Reported that their 15-decare greenhouse will be completely lost and that they are 3 co-owners. Stated that their house and sources of income will disappear and that they had not been directly consulted before.	Representative of AAOİAŞ	Valuations will be carried out for greenhouses and houses affected by expropriation, and individual consultations will be held with the landowners. Loss of income will be considered under the RAP.
	Resident in Burmahancı	Asked why fertile agricultural lands are not being preserved as in countries like Germany. Stated that the Project design was made without consulting the local people and emphasized that fertile soils should not be lost. Noted that the local people are not involved in tourism but rely entirely on agriculture.	Representative of AAOİAŞ	Efforts have been made to avoid fertile agricultural lands as much as possible when determining the route. Public consultation meetings are being held to collect stakeholder opinions, and feedback from these meetings will be communicated to the relevant authorities.
	Resident in Üründü (Parcel: 117 / 5)	Reported that the 130-meter greenhouse is cut in half by the route, leaving unusable land on both sides. Noted that they took a 7-year loan from Ziraat Bank in 2021 and payments are still ongoing. Stated that the land represents years of labor, and despite	Representative of AAOİAŞ	Investments made with loans and agricultural facilities will be taken into account during expropriation valuation. Compensation mechanisms under the RAP will be evaluated to prevent grievances for landowners.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		health challenges (platinum in arm), agricultural production continues, but the Project disregards their efforts.		
	Resident in Cumalı	Noted that apart from their 5-decare land on the route (Cumalı neighborhood, Antalya side), they have no other property. Previously, 10 decares had been requested for a hospital project (5 decares from a relative, 5 from themselves), but this project was later canceled due to the motorway. Requested that expropriation compensation reflect not only the land value but also the economic losses from the canceled hospital project. Ali Bey added that his wife is a cancer patient who has undergone chemotherapy.	Representative of AAOİAŞ	Expropriation compensation will be determined through independent expert assessments. Although losses arising from the cancellation of the hospital project cannot be considered under the official process, existing grievances will be assessed within the RAP framework. Social sensitivities have been conveyed to the project team.
Manavgat İbrahim Sözen Youth Center/ 27.08.2025 15.00-18.00	Resident	It was noted that there is no liaison office in Manavgat, and the Serik liaison office is not accessible for local citizens.	Representative of AAOİAŞ	Different communication channels (phone, email, CLO) will be used to facilitate citizens' access. Requests regarding office accessibility will be evaluated.
	Resident	Two lawyers attended the meeting and asked questions about expropriation processes.	Representative of AAOİAŞ	Answered questions regarding expropriation processes by Expropriation Director.
	Resident	The public requested a clear timeline for when expropriation negotiations and payments would be made.	Representative of AAOİAŞ	Expropriation payments and construction start dates will be determined in line with the official schedule, and landowners will be informed accordingly.
	Resident	Information was requested about the parcel sizes to be expropriated.	Representative of AAOİAŞ	It was explained that the total area along the route has been calculated and specific information will be provided to affected landowners.
	Resident	Participants stated that the offered expropriation compensations are far below market value.	Representative of AAOİAŞ	It was explained that landowners retain the right to appeal.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
	Resident	Participants criticized the absence of representatives from KGM at the meeting.	Representative of AAOİAŞ	This feedback has been recorded; the necessary steps will be taken to ensure the participation of institutional representatives in future meetings.
	Resident in Örenşehir	Raised concerns about 15 years of income loss, asking who would cover this. Asked why shifting the road north is not possible, noting there are technical solutions. Asked what people will do for their livelihood after construction, emphasizing that they will not benefit from the motorway.	Representative of AAOİAŞ	Income losses and impacts on livelihoods will be assessed within the scope of the RAP. The road route has been determined based on technical requirements, and alternative requests will be recorded and forwarded to the relevant institutions.
	Resident in Hacıobası	Their house and business are affected. Asked why expropriation compensation is divided among all co-owners and how they can ensure that only they receive payment.	Representative of AAOİAŞ	Explained that consent must be obtained from other co-owners; if not, proof of ownership (e.g., bills) can be used. If necessary, a lawsuit can be filed to prove ownership.
	Resident in Taşağıl	Asked whether a study was carried out on dust and asbestos risks due to construction. Reported being close to the tunnel entrance and affected by blasting, leading to repeated complaints to the gendarmerie. Highlighted the presence of four elderly people (80+) and vulnerable individuals (Alzheimer's, visually impaired, broken arm), emphasizing negative impacts.	Representative of AAOİAŞ	Measures are being taken for dust control and blasting safety during the construction process, and regular measurements and inspections are being carried out. Vulnerable groups (the elderly, disadvantaged individuals) will be specifically assessed under the RAP and EIA.
	Headman of Taşağıl	Stated that the Taşağıl headman did not provide sufficient information about the meeting, and that they had difficulty learning about it.	Representative of AAOİAŞ	Meeting announcements were made through various channels (village council, public notice, website, newspaper). Feedback in this regard has been recorded. More frequent updates will be provided at subsequent meetings.
	Resident	Reported that her house and workplace at the Akseki road junction are affected by expropriation and that she has no other source of income.	Representative of AAOİAŞ	Payments for inherited land will be made in accordance with legal procedures. Loss of livelihood and damages will be

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		Asked how expropriation would be handled for inherited property. Expressed concern about losing her livelihood from running a roadside greengrocery.		addressed under the RAP.
	Headman of Gündoğdu	Reported that an electricity pole was placed on his land without official notification or expropriation information. Suggested that the route should pass 300–500 meters above the settlement to reduce impacts. Mentioned that high-voltage towers were initially placed in the middle of the road but later shifted to the side after consultations. Requested the installation of a low-voltage line. Another citizen reported that only 2 decares of land remained after expropriation and asked how the process would proceed. Criticized the absence of KGM at the meeting. Raised concerns that construction dust would prevent olive trees from yielding crops and asked how this would be compensated.	Representative of AAOİAŞ	The expropriation processes for power lines and poles will be carried out in coordination with the relevant institutions, and official notifications will be made to the rightful owners. The route has been determined in accordance with current design engineering and safety standards. Requests for low-voltage lines will be forwarded to the relevant institutions and evaluated based on technical suitability. Dust control measures are being taken for trees, and compensation mechanisms will be activated under the RAP in case of damage.
	Resident in Çolaklı	Reported having olive groves on land with 42 inheritance division agreements, where his mother is a co-owner. Requested that compensation for his mother's share be paid directly to her.	Representative of AAOİAŞ	Provided an explanation regarding the process.
	Lawyer	Stated that her clients learned about the expropriation by chance rather than through official notification. Requested information specifically about parcel 138/1530.	Representative of AAOİAŞ	Provided an explanation regarding the parcel.
	Headman of Aksaz	Reported that he had given consent for the service road route and was promised a stabilized road in return. Requested a dedicated information meeting for Aksaz.	Representative of AAOİAŞ	The request for a stabilized road has been recorded, and coordination with the relevant institutions will be ensured. Holding a special information meeting

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		Reiterated demand for route changes, suggesting the route should pass 20 meters above the settlement to reduce impacts.		for Aksaz will be evaluated. The route has been determined according to engineering criteria; requests will be recorded and forwarded to the relevant institutions.
	Headman of Ulukapı	Noted that sociologists, engineers, and foremen were assigned for community information, but there is a lack of legal support. Suggested that lawyers should also be involved in the process to ensure that both community and company rights are properly understood.	Representative of AAOİAŞ	The necessary legal information will be provided so that stakeholders understand the process correctly. A proposal to include lawyers in the fieldwork has been recorded.

Across the four meetings, the most frequently raised issue was the demand for route changes. In particular, participants consistently emphasized the need to protect agricultural lands, cemeteries, and water resources. The view that the Konaklı junction would affect community life was also expressed. Concerns about level of expropriation payments and the process were among the asked questiontions. On the other hand, some participants stressed the clear need for the road and the necessity of a new arrangement to reduce the heavy traffic load in the region. In addition, repeated requests were made to ensure adequate underpasses, culverts, and connection roads to maintain access to houses, greenhouses, and agricultural lands.

During the meetings, questions regarding parcel information, payment schedules, and compensation mechanisms were answered by the Expropriation Director and the Environment & Social Manager. Furthermore, CLOs engaged in one-on-one communication with vulnerable groups both prior to and during the meetings. This approach ensured that the meetings were conducted in line with the principle of participation.

III.2.4. Internal Stakeholder Engagement Activities

Employee Satisfaction Survey

The internal stakeholders of a project are crucial for its healthy progress. The largest group of internal stakeholders in terms of quantity is the employees. Employees of the project sponsor and subcontractors are involved in all stages of the Project's life cycle. Therefore, engaging with internal stakeholders through stakeholder engagement activities is an essential and crucial key performance indicator criterion. The project sponsor is expected to conduct various stakeholder engagement activities with internal stakeholders.

As part of internal stakeholder engagement activities, the Project Sponsor may conduct an employee survey to gather feedback on the overall operation of the Project. This survey aims to identify areas for improvement in management and the workplace and emphasize the importance of gender equality. By doing so, the Project aspires to promote inclusivity and create a better working environment for all employees, ensuring that everyone's views are valued and considered in the quest to enhance workplace dynamics and fairness.

The suggested employee questionnaire is prepared with at least a 5-point Likert scale. The survey study is set up to analyze the answers given by the employees to the given statements. The answers are categorized as strongly disagree (1), disagree (2), partially agree (3), agree (4), and strongly agree (5). The statements given to the employees to express their opinions within the scope of the survey are as follows:

1. I am satisfied with the cafeteria and the food served.
2. In the workplace, cleanliness, organization, and order are given importance.
3. The company attaches great importance to occupational health and safety issues.
4. The company provides the personal protective equipment required for the job.
5. I am satisfied with the working hours.
6. The behavior of the employees towards each other is good.
7. I have access to the things I need to do my job well.
8. My salary makes me satisfied.
9. In general, I am happy with my supervisor/top manager.
10. I am satisfied with the Company's Management.
11. Necessary security measures (other than occupational health and safety issues) are taken in our company.
12. I recommend this company to work with.
13. I am satisfied with the possibilities offered for the service.
14. Social areas within the construction site where we can spend time outside work are sufficient.
15. I am happy with the laundry and dormitory conditions.
16. The company promotes gender equality and ensures equal opportunities for all employees.

This survey will be conducted separately by the female CLO for the female employees, and in order to avoid trust issues, it will be stated that the female employees will share all their problems except for the questions and that these will remain anonymous if they wish. How the process of complaints or requests received here will work is explained in the Grievance Mechanism section.

Provide SEAH and GBV training or develop a safety plan for women workers before the construction starts. It is detailed at Labor and Working Conditions chapter at ESIA.

IV. STAKEHOLDER IDENTIFICATION

In order to develop an effective SEP, it is necessary to determine who is likely to be affected (both directly and indirectly) by the Project ("affected parties"); who may have an interest in the Project ("interested parties"); and have the potential to influence project outcomes or operations.

An important stage of the stakeholder identification is the groups that are likely to be affected by the Project more or differently than other stakeholders, and whose influence on these possible impacts is expected to be relatively low. These groups are defined as "vulnerable groups" in the literature. One of the aims of the stakeholder engagement plan is to carry out an effective and sustainable communication, information and consultation process with these vulnerable groups. For this purpose, this SEP covers the following objectives related to vulnerable groups:

- Identifying vulnerable groups,
- The method and frequency of communication with vulnerable groups,
- Opportunities and priorities for vulnerable groups,
- Monitoring process,

IV.1. Stakeholder Identification Methodology

Stakeholders were identified through a structured and participatory methodology aligned with international best practices, including IFC Performance Standard 1, the Equator Principles.

The identification process aimed to ensure the inclusion of all individuals, groups, and organizations who may be directly or indirectly affected by the project or who may influence its outcomes. The detailed methodological steps followed during this process are presented in Table IV.1 .

Table IV-1. Methodological Steps for Stakeholder Identification Aligned with International Standards

Method	Description	Key Focus Areas	Target Groups / Sources
Desk-Based Review	Review of existing documentation and spatial data	Identification of affected areas, land parcels, community assets	ESIAs, Resettlement Frameworks and Baseline Studies, Local government records and cadastral maps, Previous stakeholder engagement records
Field Visits & Observations	On-site visits along proposed motorway corridor	Land use, mobility, seasonal migration (e.g., Yörük routes), presence of informal or unregistered groups	Local terrain and communities along the corridor
Key Informant Interviews (KIIs)	Semi-structured interviews with diverse local actors	Local insights on social dynamics, vulnerabilities, potential project impacts	Mukhtars, women, elderly, farmers, Yörük communities, seasonal workers, NGOs, CSOs
Vulnerability Mapping	Identification and assessment of at-risk populations	Vulnerability related to land acquisition, access to information, livelihood risks, social marginalization	Illiterate adults, women-headed households, seasonal workers, elderly, disabled, refugees

IV.1.1. Stakeholder Categorization

Stakeholders were categorized into Project-Affected People, Vulnerable Groups, Interested Parties, and Governmental and Regulatory Stakeholders. This multi-tiered classification ensured a comprehensive and inclusive approach focused on human rights risks related to displacement, participation, and access to remedies (see Table IV.2).

Table IV-2. Stakeholder Categorization

Category	Description / Details
Project-Affected People (PAPs)	Individuals and households directly impacted by land acquisition or construction activities; business owners
Vulnerable Groups	Those with limited capacity to participate in decision-making or to absorb adverse impacts
Interested Parties	Institutions, NGOs, unions, academic groups, business owners, or the general public with a stake in the project outcomes. This includes civil society actors and service organizations supporting local communities, including those involved in health, social welfare, gender-based violence response, shelter, or community development.
Governmental and Regulatory Stakeholders	Local, provincial, and national-level authorities responsible for project permitting and oversight. This also includes emergency response units (e.g., disaster management authorities, fire brigades), public health services, municipal utilities, and security or protection bodies involved in addressing GBV and community safety.

The vulnerable groups identified in the Project are as follows:

- Children
- Children with special needs
- Out-of-school children (school-age children who cannot attend school)
- Elderly people (75+)
- Elderly people requiring care and social assistance (65+)
- Illiterate adults
- Persons with chronic illness (e.g., heart, diabetes, kidney)
- Persons with other serious health conditions (e.g., cancer, Alzheimer)
- Disabled persons (physical / mental)
- Unemployed people (even though they are actively seeking work)
- Seasonal agricultural workers
- Households dependent on natural resources (agriculture, livestock, forest products)
- Green Card holders
- State aid beneficiaries
- Informally employed workers (without social security)
- Physically and economically displaced households
- Female-headed households
- Landless households
- Low-income households (below minimum wage)
- Migrant and refugee households (e.g., Syrian, Afghan)
- Ethnic or linguistic minority groups
- Semi-nomadic Yörük communities
- Households previously affected by expropriation

Gender inequality may be seen in stakeholder engagement process. Although it is not defined as a vulnerable group on its own, it is necessary to be sensitive to situations where women cannot take part in these stakeholder engagement activities. Project Sponsor should consider gender equality in the stakeholder engagement processes of the project and should approach with sensitivity to the problems that may arise in this regard. Project Company will take short and long-term steps towards resolving these problems. Arranging time and space so that women can participate in meetings and other events

equally is one of the simplest and most effective steps that can be taken in this regard. In addition to the above-mentioned vulnerable groups, gender equality will be considered in the process of stakeholder identification, consultation with stakeholders and grievance management process.

In the context of the Project, women are identified as a vulnerable group due to a combination of socio-economic, cultural, and spatial dynamics that influence their exposure to project-related impacts. Because the location area of the project is rural and peri-urban areas, women often rely on informal or subsistence-based economic activities - such as agriculture, livestock care, and seasonal labor - which are typically unregistered and under-recognized in compensation and livelihood restoration schemes. Moreover, women may face mobility restrictions due to gender norms and lack of access to private transportation, which can be further exacerbated if the motorway alters local routes, increases travel distances, or reduces public transportation availability. In areas like Manavgat, where tourism and agriculture are dominant, women's economic roles are often linked to place-based activities (e.g., local markets, childcare close to home), making them more vulnerable to displacement or disruption. Additionally, the influx of a temporary male workforce during construction may elevate risks of gender-based violence and harassment, particularly in communities with limited protective infrastructure or social services. For these reasons, it is crucial that the project incorporates a gender-sensitive approach in its impact assessments, stakeholder engagement processes, and mitigation strategies to ensure that women's voices are heard, their specific risks addressed, and their livelihoods and well-being protected.

In the neighborhoods within the impact area of the project, especially in the Central neighborhood of Serik district, it was determined in the field study conducted by Encon in June 2024 that Syrians under temporary protection status and Syrian Migrants live. According to Refugees Association's May 2025 Report, the number of Syrians living in Antalya is 6,839. Attacks against Syrian refugees, especially in Serik district, were reported in the news.

On the other hand, nomads living in the Antalya region go to the plateau at certain times of the year. Antalya-Serik-Ovacık plateau visited by Yoruks is located within the project area. Nomads who will pass through this region are a vulnerable group both in terms of the impact of construction on their journeys and in terms of accommodation. The migration pathway of nomads is given in FigureVII.1 as referenced to the motorway alignment.

On the other hand, nomads living in the Antalya region go to the yayla at certain times of the year. A section of the migration route to the Antalya-Serik-Ovacık yayla, which is visited by the Yörüks, is located 1,200 meters from the project area. Nomads passing through this region are a vulnerable group in terms of both the impact of construction on their journeys and accommodation. The migration route of the nomads is given in Figure IV.1 according to the highway route.

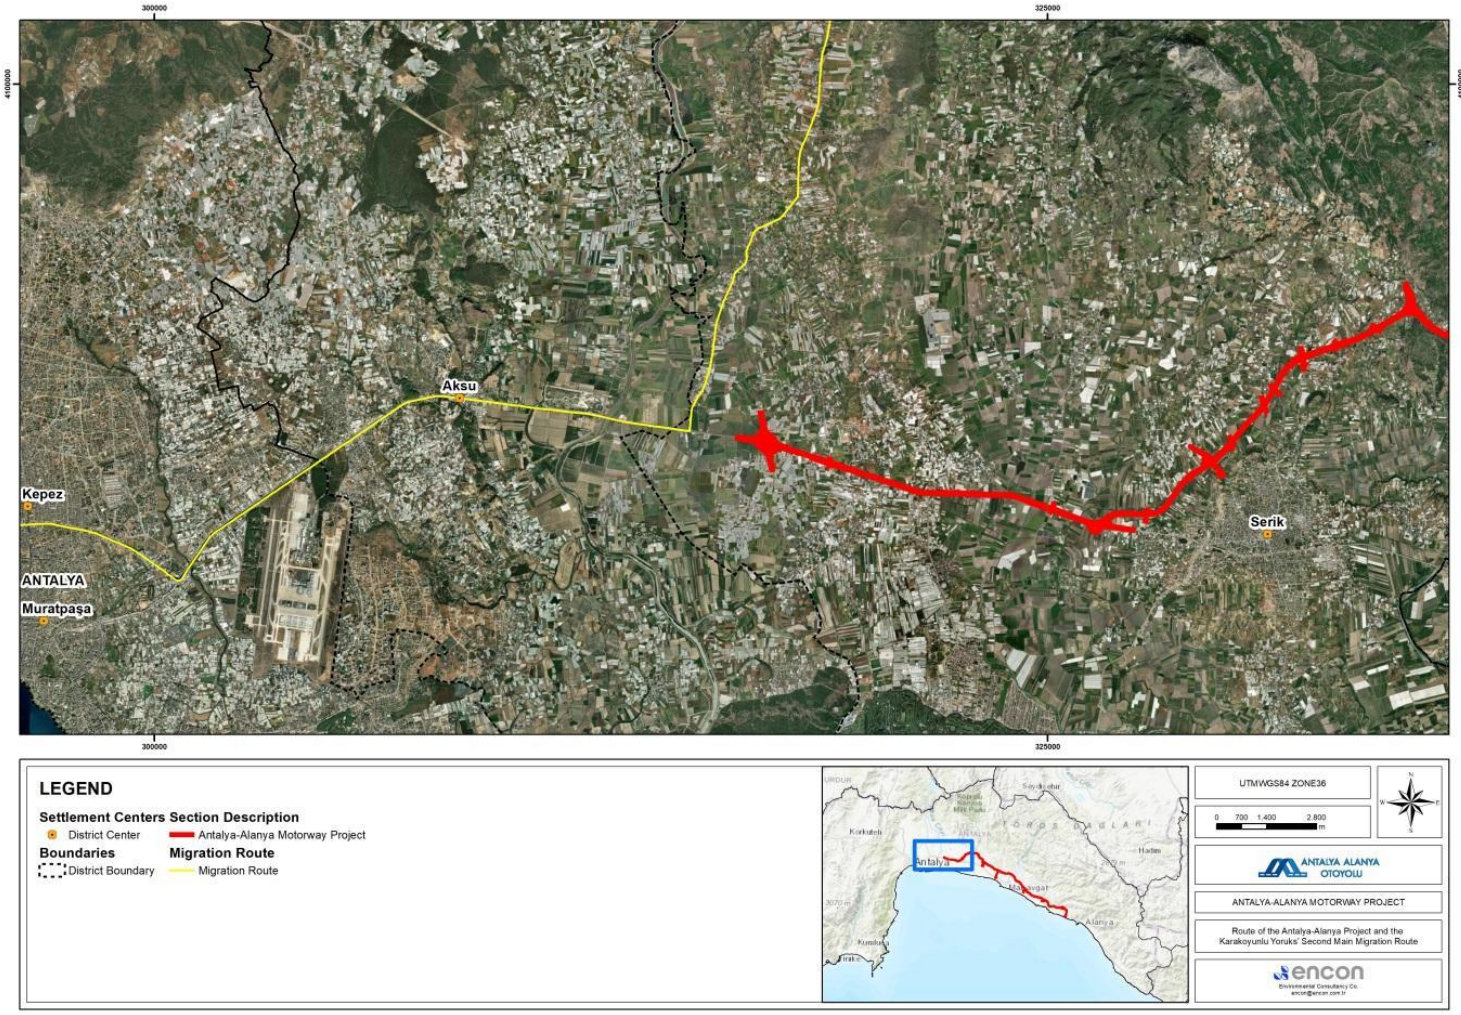

Figure IV-I The Migration Pathway of Nomads in the Region

IV.1.1.1. Project-Affected People (PAPs)

Project-Affected People (PAPs) are defined as individuals, households, or communities who will experience either physical or economic displacement as a result of the Antalya–Alanya Motorway Project. The identification of PAPs is based on expropriation plans (as of April–May 2025), site-specific scoping studies, and preliminary stakeholder consultations. Impacts vary by geography, land tenure, land use, and vulnerability status. The categories of Project-Affected People (PAPs) identified for the Antalya–Alanya Motorway Project are summarized in Table IV.3, based on expropriation plans, scoping studies, and preliminary consultations, reflecting variations in land tenure, land use, and vulnerability.

Table IV-3. Categories of Project-Affected People (PAPs) for the Antalya–Alanya Motorway Project

Category	Description / Key Details
1. Landowners and Land Users	Privately-owned parcels will be subject to expropriation. These include agricultural fields, orchards, greenhouses, and constructible plots. Some parcels may become "orphaned land," and in addition, there are lands informally used by non-owners such as farmers or tenants.
2. Structure Owners	299 houses, 599 greenhouses, 37 business structures affected - many with multiple structures - Includes small-scale agricultural and informal businesses
3. Livelihood-Dependent Farmers	Households losing >20% of productive land, especially greenhouse/orchard farmers, at high economic displacement risk - Parcels <500 m² post-expropriation considered unviable for farming
4. Residents in Fragmented or Severed Parcels	Parcels divided by motorway causing difficult or impossible internal access - Planned engineering solutions (underpasses, culverts) to mitigate access loss; effectiveness to be confirmed via RAP consultations
5. Vulnerable and Marginalized Groups	Illiterate adults unable to comprehend expropriation/compensation - Elderly with limited mobility/access - Women without land title or informal income earners - Migrants, refugees, seasonal workers with undocumented tenure - Semi-nomadic Yörük communities with migration routes crossing project area, children
6. Users of State-Owned and Public Lands	Greenhouses/agricultural plots on state treasury or forest lands used informally by locals - May qualify for compensation or assistance under national policies or livelihood restoration programs

Project-Affected People by Settlement

Based on the expropriation data and field surveys from April–May 2025, the following neighborhoods are most significantly affected. In addition, specific findings on Migratory Status and Nomadic Populations (Yörük Communities) have been presented separately below the table, as the former draws on both ENCON fieldwork and data from the Refugees Association, while the latter was identified during the desk study stage.

Table IV-4. Vulnerability Groups in the Expropriation Corridor

District	Neighbourhood	Vulnerable Groups
Serik	**Deniztepesi**	Other significant health issues, Economically displaced household
	Sarıabalı	Physically displaced household, Economically displaced household, Landless household, Household s who lose more than 20 percent of their total productive area, Women-headed household, Low income household, Unemployed (Although looking for a job), Chronic diseases, Children of school age who do not attend school, Illiterate, Mental Disability/ Issues, People who do not speak and/or understand Turkish
	Çandır	Economically displaced household, Household s who lose more than 20 percent of their total productive area
	Cumalı	Economically displaced household, Chronic diseases, Physical Disability, Mental Disability/ Issues
	Burmahancı	Economically displaced household, Landless household, Low income household, Household s who lose more than 20 percent of their total productive area
	Üründü	Economically displaced household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases
Manavgat	**Çakış**	Economically displaced household, Low income household, Households who lose more than 20 percent of their total productive area, Elderly (over 65) in need of care, Illiterate, Physical Disability

District	Neighbourhood	Vulnerable Groups
	Taşağıl	Economically displaced household, Landless household, Household s who lose more than 20 percent of their total productive area, Women-headed household, Low income household, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases, Other significant health issues
	Gündoğdu	Economically displaced household, Low-income households, Chronic diseases
	Hocalar	Economically displaced household, Landless household, Household s who lose more than 20 percent of their total productive area, Low-income households, Elderly (over 65) in need of care, Illiterate, Chronic diseases, Unemployed (Although looking for a job)
	Yavrudoğan	Economically displaced household, Households who lose more than 20 percent of their total productive area, Women-headed household, Low income household, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Illiterate, Chronic diseases
	Çolaklı	Physically displaced household, Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area, Women-headed household, Low income household, Seasonal agricultural worker, Illiterate, Chronic diseases
	Seki	Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Chronic diseases
	Kalemler	Economically displaced household, Households who lose more than 20 percent of their total productive area, Landless household, Women-headed household, Low income household, Elderly (over 65) in need of care, Chronic diseases, Physical Disability
	Evren	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases
	Yeniköy	Economically displaced household, Elderly (over 65) in need of care, Chronic diseases
	Şişeler	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Children with special needs, Chronic diseases
	Evrenleryavşi	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Children with special needs, Chronic diseases, Unemployed (Although looking for a job)
	Yukarıışıklar	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Illiterate, Physical Disability, Chronic diseases, Mental Disability/ Issues, Seasonal agricultural workers
	Dikmen	Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area
	Bucakşeyhler	Economically displaced household, Low income household, Illiterate, Physical Disability, Chronic diseases
	Ulukapı	Economically displaced household, Low income household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Aşağıışıklar	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Physical Disability, Chronic diseases, Other significant health issues
	Karaöz	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Aksaz	Economically displaced household, Landless household, Low income household, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Chronic diseases
	Hacıali	Economically displaced household, Low income household, Household resettled in the neighborhood after earthquake or other disasters (Fire), Households who lose more than 20 percent of their total productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Illiterate, Chronic diseases
	Cevizler	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Chronic diseases
	Hacıisalı	Economically displaced household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases, Other significant health issues
	Hacıobası	Economically displaced household, Women-headed household, Landless household, Low income household, Households who lose more than 20 percent of their total

District	Neighbourhood	Vulnerable Groups
		productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75, Chronic diseases, Physical Disability, Other significant health issues
	Uzunlar	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75, Chronic diseases, Elderly (over 65) in need of care, Physical Disability, Other significant health issues
	Kadılar	Economically displaced household, Women-headed household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases, Other significant health issues, Beneficiary of governmental aid
	Örenşehir	Economically displaced household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Yalçıdibi	Economically displaced household, Women-headed household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75, Chronic diseases, Elderly (over 65) in need of care, Illiterate, Physical Disability, Other significant health issues
	Odaönü	Economically displaced household, Low income household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Karakaya	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases, Seasonal agricultural workers
Alanya	**Alara**	Economically displaced household, Women-headed household, Landless household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Illiterate, Chronic diseases
	Çakallar	Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Chronic diseases, Mental Disability/ Issues, Beneficiary of governmental aid
	İncekum	Economically displaced household
	Türkler	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Chronic diseases, Physical Disability
	Emişbeleni	Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area, Illiterate
	Toslak	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Elderly (over 65) in need of care, Illiterate, Chronic diseases, Physical Disability, Mental Disability/ Issues, Employed without social security
	Telatiye	Economically displaced household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Elikesik	Economically displaced household, Landless household, Low income household, Illiterate, Chronic diseases, Seasonal agricultural workers

Migratory Status: Field research conducted by Encon in June 2024 identified Syrian citizens and other migrant groups under temporary protection, particularly in the Central District of Serik. Greenhouse owners in Serik, Manavgat, and Alanya districts have stated that they employ migrant workers. Seasonal workers are primarily Afghan and Syrian nationals. According to the RAP Report, registered and unregistered migrant workers are present in the neighborhoods of Emişbeleni, Aşağıçatma, Evren (registered), Toslak, and Çakış. According to the Refugees Association, as of May 2025, there are approximately 6,839 Syrians residing in Antalya. Tensions toward refugees have been reported, particularly in Serik. Project materials will be provided in Arabic to support inclusive participation. Additionally, necessary information will be communicated specifically by CLOs.

Nomadic Populations (Yörük Communities): Seasonal nomadic groups such as the Yörüks were identified along migration routes passing near the project alignment (~1,200 m away at times). Semi-nomadic communities are also present in Toslak, Ulukapı, and Karakaya. These groups often:

- Rely heavily on livestock grazing and pasture access
- Have low literacy rates and limited access to health services
- Are excluded from formal consultation due to their mobile lifestyle

To support them, the project will incorporate culturally sensitive engagement methods, preserve grazing corridors where feasible, and consider compensation or assistance through the Livelihood Restoration Plan.

Within the scope of the Project, it is important to identify stakeholders at the beginning of the process to inform key stakeholders (local people, relevant state institutions and NGOs) about the Project and provide effective participation of the stakeholders. To this end, the following individuals and groups should be considered specifically:

- People who are likely to be affected, directly or indirectly by the Project,
- People or institutions may have an interest in the Project,
- People or institutions that have the potential to influence
- Project outcomes or company operations.

Besides it is an important process to identify vulnerable or disadvantaged people or groups, who are likely to be affected by the Project in certain phases, accurately during the identification of stakeholders. Possible stakeholders who are likely to be affected by the Project or have an influence on the Project are listed below:

- Project employees, including Contractors. Project parties;
- National governmental and non-governmental organizations (NGOs);
- Local governmental organizations and NGOs;
- Local residents (potentially project affected persons including vulnerable groups); and
- Local businesses and universities

The stakeholders listed in Table IV.5 are the most prominent in the Project. Organizations or groups not listed can contact the Project Sponsor and provide their contact information to be informed about the Project.

People living in residential areas near the Project will be considered as potential Project affected people/population (PAP) in this Stakeholder Engagement Plan (SEP). These settlements are also listed in Table IV.5 . Therefore, one of the objectives of the SEP is to effectively consult and share information with these groups and address their concerns.

Table IV-5. Project's Stakeholders List

Level	Category	Organization / Entity
Internal	**Appointed Company**	Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş

		Antalya Bilim University
		Antalya Belek University
		Alanya University

IV.1.2. Field Study Report

The result of the field study is shown in the Table IV.6 . Processes like expropriation, public consultation meetings, working conditions will be advanced according to these results.

Table IV-6. The Result of the Field Study

District	Neigborhood	Findings About Vulnerable Gruops
Serik	Merkez	There is no vulnerable group that does not receive support within the knowledge of the mukhtar. There is a high proportion of Syrian refugees/immigrants living in this neighborhood.

District	Neigborhood	Findings About Vulnerable Gruops
Manavgat	Taşağıl	Since the elderly population in the neighborhood is high and the elderly population in need of care and social assistance is the dominant group, a focus group study was conducted.
Manavgat	Kalemler	A focus group study was conducted since the female population of the neighborhood is dominated by divorced/divorced women. Generally, female heads of households and single women work or their children provide care for those who are unable to work. **It was identified that the house and adjacent agricultural land in the potential impact area of the highway project belongs to a physically disabled household head (male). This person stated that he lives on his own. He stated that there is a risk of losing 95% of his land due to expropriation. Parcels: 136/6, 136/7.
Manavgat	Ulukapı	Considering the neighborhood population, the female household head vulnerable group is in the majority. A vulnerable focus group interview was conducted with female participants.
Manavgat	Hacıisalı	A focus group study was conducted in the neighborhood as the population of women who have lost their spouses/divorced and elderly people in need of care are the dominant group. It was informed that there are 3 people who will lose more than 20% of their total productive area in this neighborhood in the potential impact area of the motorway project. Two people have olive groves and one person has a glass greenhouse on the project route. It was informed that the land and residence of the female-headed household will probably be affected by the project.
Manavgat	Karakaya	Considering the neighborhood population, no dominant vulnerable group has been identified. It was informed that the route of the highway passes through the agricultural land and residence of the disabled person.
Alanya	Alara	There may be farmers who have lost more than 20% of their total productive area due to expropriation.
Alanya	Çakallar	There may be farmers who have lost more than 20% of their total productive area due to expropriation.
Alanya	Akdam	There may be farmers who have lost more than 20% of their total productive area due to expropriation. It was also informed that the land and residence of the female-headed household would likely be affected by the project.
Alanya	Toslak	There may be farmers who have lost more than 20% of their total productive area due to expropriation.
Alanya	Konaklı	There may be farmers who have lost more than 20% of their total productive area due to expropriation.

V. STAKEHOLDER ENGAGEMENT PLAN

This part of the SEP introduces the stakeholder engagement plan for the Project Company and gives a detailed description of the disclosure process and timeline. It then presents AAMP's methods and frequencies for stakeholder engagement, along with the proposed stakeholder engagement plan for the construction and operation phases.

V.1. Methods and Tools for Information Dissemination and Stakeholder Engagement

Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. used appropriate methods to disclose information about the planned Project, consult with stakeholders on potential benefits and risks of the planned project and potential adverse impact mitigation measures. Disclosure of relevant project information helps stakeholders better understand the risks, impacts and opportunities associated with the proposed projects. Information will be disclosed using methods, which is suitable for various groups of stakeholders at all project implementation stages. For all disclosure attempts IFC PS1 and EPFI Principle 5 is followed and by doing so, the Project is kept in international standards. The relevant means for consultations with stakeholders with possible timing are provided in Table V.1 .

Different engagement methods are proposed and cover different stakeholder needs as stated below:

- Formal/ informal face-to-face meetings,
- Focus group meetings,
- One-on-one interviews,
- Digital communication tools (including web pages, correspondence by phone/email, WhatsApp, short message service),
- Written materials,
- Grievance mechanism,
- Social Media promotions.

A range of tools are beingutilized for stakeholder engagement under this Project. Stakeholder engagement will continue to utilize these already established communication mechanisms, along with new mechanisms to be used as needed to ensure efficient and effective engagement throughout the lifetime of the Project. The project has and will continue to use the following methods for interacting with stakeholders:

Table V-1. Stakeholder Engagement Plan - Communication Methods with Timing

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
MoTI – General Directorate of Highways (KGM)	●To exchange information and build understanding and consensus on the project progress, implementation of ESIA, SEP, RAP, and other project specific E&S management action plans and procedures. ●To establish implementation responsibilities and coordination mechanism related to project progress and project E&S documents ●To provide necessary information and reporting on relevant and important stakeholder engagement activities and address issues that concern local communities and stakeholders	●Through digital copies of E&S documentation published on Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Through hard copies of E&S documentation (in the format requested by the authority) ●Face-to-face meetings ●Information disclosure and reports, monitoring, permit requests	●KGM (Ankara) ●SPV offices ●Project site offices ●Official correspondence (monthly reports and permits) Project website (https://www.antalyaalanyaotoyolu.com.tr/)	Monthly	●Corporate Senior Management ●SPV – General Manager ●SPV – E&S Manager

[1] The frequency indicated will be valid for the construction phase. Prior to operation phase, the frequency will be updated in consultation with Lenders and IESC.

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
13th Regional Directorate of KGM			●13th Regional Directorate of KGM (Antalya) ●Project site offices ●Official correspondence (monthly reports and permits) ●Project website (https://www.antalyaalanyaotoyolu.com.tr/)	Bi-weekly	●Corporate Senior Management ●SPV – General Manager ●SPV – E&S Manager ●SPV – Expropriation Manager ●EPC – Project Director

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Antalya Regional Heritage Board	●Coordination on the protection and management of tangible cultural heritage during construction and operation stages ●Continuous engagement regarding management, monitoring and assurance of Project impacts on cultural heritage assets, including vibration impacts of blasting and grave relocation ●To notify the ARHB about the cultural heritage sites found in project corridor ●To obtain permits on conducting trial pits, salvage excavations on the cultural heritage sites ●To work in coordination with Board's experts on excavation works as requested by Board	●Face-to-face meetings with the ARHB ●Regular monitoring and reporting by the Project Archaeologist ●Joint review meetings in case of vibration-related findings or heritage risks Joint meetings in case of grave relocation	●Related Cultural Heritage Sites ●Project site offices ●Official correspondence (meeting, permits, letters, reports)	Meetings whenever required (Ongoing throughout Project's construction phase – at least monthly communication)	●Corporate Senior Management ●SPV – General Manager ●SPV – E&S Manager ●EPC – E&S Manager ●EPC - Archaeologist

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Local and Central Governmental Institutions/Agencies (District Governorates, DSI, Forestry and etc.) (see Table IV.5 for other Local Governments)	●To inform regarding Project progress and undertake official correspondence ●To obtain necessary approvals/permits/opinions during project execution	●Through digital copies published on Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Through hard copies (in the format requested by the authority) ●Official correspondence (letters, etc.) ●Face-to-face meetings Information disclosure and reports, monitoring, permit requests	●Official correspondence (permits, letters, reports) ●Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●SPV offices ●Project site offices	Meetings whenever required (Ongoing throughout Project's construction phase – at least monthly communication in case of permits)	●Corporate Senior Management ●SPV – General Manager ●SPV – E&S Manager ●SPV – Expropriation Manager ●EPC – Project Director
AFAD Local emergency services, fire brigades, utility owners and operators, local police, coast guard, health services	●To inform relevant local authorities about Project and undertake official correspondence when needed ●Coordinate on emergency preparedness and response.	●Through digital copies published on Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Official correspondence ● Face-to-face meetings	●Meetings in person and official letters ●Project website (https://www.antalyaalanyaotoyolu.com.tr/)	On a periodic basis and whenever coordination is required for safety or emergency planning	●SPV – HS Manager ●EPC – HS Manager

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Settlement Heads (Mukhtars)	●To provide/exchange up-to-date information about the project in a timely, understandable, manner regarding the following; - Project progress - Potential E&S impacts of the activities (such as blasting) - Expropriation process - Planned stakeholder engagement events ●To collect feedback, grievances, suggestions related with the Project ●To identify specific concerns/issues related to vulnerable persons and women, including gender-based violence and harassment (GBVH).	●Through digital copies published on Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Through hard copies distributed to the offices of the settlement heads and other public places, as appropriate ●Face-to-face meetings ●Phone calls and messaging applications Related brochures and booklets	●Project site offices ●Offices of the settlement heads or other mutually agreed locations in affected settlements ●Project website (https://www.antalyaalanyaotoyolu.com.tr/)	Monthly in each settlement throughout the construction phase Grievance boxes and feedback will be checked on a weekly basis throughout the Project's construction phase	●SPV – E&S Manager ●SPV – Expropriation Manager ●EPC – Project Director SPV – CLOs

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Affected Households		●Through digital copies published on Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Through hard copies distributed to the offices of the settlement heads and other public places, as appropriate ●Face-to-face individual or group meetings Phone calls and messaging applications	●Affected house plot or mutually agreed locations in affected settlements Project website (https://www.antalyaalanyaotoyolu.com.tr/)	Periodically in each settlement throughout the construction phase Grievance boxes and feedback will be checked on a weekly basis throughout the Project's construction phase	●SPV – E&S Manager ●SPV – Expropriation Manager ●EPC – Project Director SPV – CLOs
Women and Vulnerable and members of the local/affected households (see Section IV.1.1 Stakeholder Categorization for vulnerable groups)		●Face-to-face individual meetings Phone calls and messaging applications	Residences of vulnerable households or women or mutually agreed locations in affected settlements	Periodically in each settlement throughout the construction phase Grievance boxes and feedback will be checked on a weekly basis throughout the Project's construction phase	●SPV – E&S Manager ●SPV – Expropriation Manager ●EPC – Project Director SPV – CLOs

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Local/affected businesses		●Through digital copies published on Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Through hard copies distributed to the offices of the settlement heads and other public places, as appropriate ●Face-to-face individual or group meetings Phone calls and messaging applications	●Affected business structures or other mutually agreed locations ●Project website (https://www.antalyaalanyaotoyolu.com.tr/)	In accordance with RAP	●SPV – E&S Manager ●SPV – Expropriation Manager ●EPC – Project Director SPV – CLOs

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Households / local communities / businesses near blasting areas	●To inform residents about upcoming blasting activities and schedules To ensure public safety and awareness regarding vibration, noise, and access restrictions	●Posting blasting schedule on public bulletin boards, in tea/coffee houses, and at mosques. ●Audible announcements through mosques or local loudspeakers. ●Messages or calls via local messaging platforms (e.g., WhatsApp). ●Face-to-face or one-to-one notification meetings with residents of nearby settlements, if any.	●Conducted in person to residents of nearby settlements communication channels, including: ●Bulletin boards ●Mosques or local speakers ●Calls or messaging applications (e.g., WhatsApp)	Prior to each blasting at all relevant sites/settlements: - Public posting: Before blasting starts in each settlement - Messages via messaging platforms: 1–2 days before each blasting - Audible announcements: On the blasting day, before each blasting	●EPC - Basting Chies ●SPV – E&S Manager ●EPC – E&S Manager ●SPV CLOs
Lenders	●To inform and update the Lenders about the project Project's E&S Performance	●Through digital copies published on Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Reporting ●E-mail correspondence ●Phone calls ●Face to face meetings	●Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Project site offices ●Other venues to be agreed upon	Quarterly monitoring site visits during construction (by Lenders or their IESC) Periodic monitoring site visits during operation (by Lenders or their IESC)	●Corporate Senior Management ●SPV – General Manager ●SPV – E&S Manager

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Interested national and local NGOs (see Table IV.5 for NGOs) (Other interested organizations will be added, as identified throughout the life of the Project)	●To provide information on the nature of the Project, duration of the Project, potential environmental, social and economic impacts (positive and negative) ●To potentially help to identify key issues pertaining to the local community (vulnerable groups) and the local environment	●Special engagement methods to be developed based on relevance and interest of stakeholders	●Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Other venues to be agreed upon ●NGO Offices ●Public bulletin boards	As required throughout construction	●Corporate Senior Management
Engagement with the relevant authorities (such as municipal departments, Cemetery Guardian / religious leader, etc.) (for grave relocation)	●To engage with relevant authorities about their responsibilities related to grave relocation ●To have official correspondence, etc., with participation from relevant authorities as needed	●Official correspondence (meetings, phone calls, etc.) ● Face-to-face meetings	●Meetings in person with relevant authorities ●Official correspondence (letter, permits) with relevant authorities	During the gravel relocation planning phase – prior to grave relocation	●Corporate Senior Management ●SPV – General Manager ●SPV – E&S Manager ●EPC – E&S Manager ●EPC - Archaeologist

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Engagement with grave owners (for grave relocation)	●To communicate (one to one) with grave owners and obtain signed consent forms	●Face-to-face meetings	●Mutually agreed locations with grave owners	During the gravel relocation planning phase – prior to grave relocation	●Corporate Senior Management ●SPV – General Manager ●SPV – E&S Manager ●EPC – E&S Manager ●EPC - Archaeologist

Stakeholder	Purpose of Communication / Areas of Information Disclosure	Engagement / Communication Method	Platform	Frequency of Engagement[1]	Responsible
Internal Stakeholders (Contractor and Subcontractor employees)	●To share information on; - Project Standards including Project specific E&S policy and ESMS Documentation - Project-related news - Workers rights and working conditions, - Occupational health and safety requirements ●Ensure successful implementation of the Project SEP including the internal and external grievance and feedback mechanisms (covering in ternal GBVH issues)	●Sharing relevant written documentation with the Project employees (at the time of hiring ●Induction and orientation trainings (at the time of hiring) Toolbox trainings ●Job-specific trainings ●Training on E&S Management System Emergency Preparedness Drills	●Project website (https://www.antalyaalanyaotoyolu.com.tr/) ●Contractor/subcontractor construction camp/facility sites, Camp site accommodation facilities	At the time of hiring At frequencies specified for each engagement method	●Corporate Senior Management ●SPV – General Manager ●SPV – E&S Manager ●EPC – E&S Manager ●SPV – HS Manager ●EPC – HS Manager ●SPV - CLOs

To ensure inclusive and equitable participation in the project lifecycle, the following gender-sensitive engagement measures are being implementing:

- **Targeted Outreach to Women**: Separate consultation meetings with women in each affected settlement, facilitated by female staff at every neigborhood in the Project area without exception from beginning of the construction. .It is defined below at the Stakeholder Engagement Plan Section.
- **Accessible Meeting Formats**: The meetings are organized to start at 10.00 - 11.00 a.m. the most convenient time of the day for women,
- **Trusted Local Channels**: Utilize existing women's networks, cooperatives, health centers, and neighborhood heads to disseminate project-related information.
- **Language and Literacy Considerations**: Use visual materials and oral communication methods to accommodate illiterate and semi-literate women.
- **Safe Reporting Mechanisms**: Design grievance systems that allow confidential reporting of gender-based risks and ensure that women feel secure using these channels.
- The call center with the Grievance Mechanism will have a dedicated contact number for women and ensure that the staff listening to the complaint/request are women.
- **Continuous Feedback Loops**: Review and, where appropriate, integrate women's feedback into project decisions, and provide tailored updates to explain how their input has been addressed.

These measures aim to strengthen social inclusion and minimize unintended harms by addressing the gender-specific barriers that may prevent full participation and benefit sharing.

All neighborhood mukhtars (names of neighborhoods are given below) within the project impact area will be interviewed, active communication will be maintained throughout the construction phase, withthe mukhtars approved, separate Whatsapp groups are established for each district and active communication is ensured.

Before the Public Participation Meetings, meetings held with the neighborhood headmen of each district in Alanya, Manavgat and Serik districts, and information was given about both the project and the public participation meetings.

The WhatsApp groups with Muhtars are been used to inform about the meetings, monitoring the complaint boxes and unexpected developments.

V.2. Specific Communication Strategies

Neigborhoods:

Antalya/Serik: Yukarıkocayatak, Aşağıkocayatak, Kayaburnu, Çandır, Aşağıçatma, Burmahancı, Cumalı, Üründü, Deniztepesi, Sarıabalı, Belpınarı, and Dikmen neighborhoods
Antalya/Manavgat: Çakış, Taşağıl, Gündoğdu, Hocalar, Yavrudoğan, Çolaklı, Seki, Kalemler, Evren, Ilıca, Yeniköy, Şişeler, Evrenleryahşi, Dolbazlar, Yukarıışıklar, Dikmen, Bucakşeyhler, Ulukapı, Aşağıışıklar, Demirciler, Karaöz, Aksaz, Hacıali, Cevizler, Sülek, Hacıisalı, Hacıobası, Kızılot, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Odaönü, Karakaya

Antalya/Alanya: Alara, Çakallar, İncekum, Avsallar, Akdam, Türkler, Payallar, Emişbeleni, Toslak, Telatiye (Konaklı), Elikesik

Table V-2. Serik- Merkez Neigborhood

Category	Details
Target Groups	Local women, refugee women (especially Syrians), elderly residents, small-scale farmers
Identified Barriers and Risks	Women have limited access to formal consultation mechanisms, language barriers (Arabic speakers), time limitations due to domestic responsibilities, and discomfort attending mixed-gender meetings
Recommended Meeting Frequency	Every 3 months during the construction phase
Suggested Venue	S.S. Serik Boğazkent Women's Initiative Production and Business Cooperative or another trusted, central, and accessible space for women such as a municipal social center
Suggested Time	Weekday mornings (e.g., 10:00–11:00) or early afternoon for increased flexibility
Pre-Meeting Notification Method	Physical announcements (posters) at mukhtar offices, women's cooperative, and local grocery stores Bilingual printed materials (Turkish–Arabic) to reach refugee women Coordination with NGOs experienced in refugee engagement and women participation
Suggested Partners |	S.S. Serik Boğazkent Women's Cooperative Serik Municipality's Women and Family Services Unit Local NGOs working with refugee or displaced populations (e.g. Refugees Association, SGDD-ASAM if active locally)

Table V-3. Manavgat- Taşağıl Neigborhood

Category	Details
Target Groups	Women, elderly, low-income households, informal agricultural workers
Identified Barriers and Risks	Strong gendered norms discourage women's active participation; women may perceive they are not allowed or not qualified to speak; informal workers lack official channels to express concerns
Recommended Meeting Frequency	Every 3 months, especially before and after major project milestones
Suggested Venue	Municipal social hall, women's training center (if any), or a local school building temporarily adapted for community meetings
Suggested Time	Mid-morning or early afternoon (when domestic obligations are lower)
Pre-Meeting Notification Methods	Leaflets/posters in Turkish displayed at local market, health centers, mosque entrance, and mukhtar's Office Mosque loudspeaker announcements coordinated with the mukhtar Verbal reminders during market days or in front of local bakeries Tea/snack service and seating arrangement that reduces formality Any active women-led cooperatives or school-parent associations (if discovered later)

Table V-4. Manavgat- Kalemler and Hacısali Neigborhoods

Category	Details
Target Groups	Women, elderly, subsistence farmers, seasonal workers
Identified Barriers and Risks	GBV/SEAH risks due to incoming male construction workers Literacy barriers, especially among elderly women

Category	Details
Recommended Meeting Frequency	Every 3 months, especially in coordination with seasonal work cycles i.e. April-May
Proposed Meeting Venue(s)	Local school building, Open-air gathering space (market place)
Notification Methods (Pre-Meeting)	• Mosque loudspeaker announcements coordinated with the mukhtar • Printed flyers distributed at local markets and shops • Word-of-mouth through health workers or midwives • WhatsApp messages forwarded via local grocery shop owners
Suggested Partners	• Mukhtar's office • Local schoolteachers or volunteers • Community health workers or nurses • Religious leaders or imams (to increase neutrality and reach)

Table V-5. Alanya- Toslak and Konaklı Neigborhoods

Category	Details
Target Groups	Refugee/migrant women (Arabic speakers), seasonal workers, low-income families, elderly
Identified Barriers and Risks	• Language barrier (Arabic speakers with limited or no Turkish) •Limited mobility for women due to social norms and safety concerns • GBV and SEAH risks related to incoming male labor force
Recommended Meeting Frequency	Every 3 months; more frequently during peak construction or labor influx periods
Proposed Meeting Venue(s)	Local school building, Open-air gathering space (market place)
Notification Methods (Pre-Meeting)	Bilingual flyers (Turkish–Arabic) distributed at grocery shops, mosque entrance, and via female market vendors Mosque loudspeaker announcements coordinated with the mukhtar In-person outreach by social workers, local women representatives, or trusted Arabic-speaking NGO staff Door-to-door info sharing by female CLO or female municipal outreach staff
Suggested Partners	• Municipality's Women and Family Services • Local Arabic-speaking outreach volunteers • NGOs working with refugee/migrant communities (e.g. ASAM, IBC, CARE if present) • Local health unit or midwife, local female health staff network

Table V-6. Serik- Çandır, Aşağıkocayatak and Kayaburnu Neigborhoods

Category	Details
Target Groups	Yörük families (especially women), agricultural workers, elderly residents
Identified Barriers and Risks	• Seasonal mobility due to Yörük transhumance (yayla migration) • Low formal education and digital connectivity • Limited visibility of women in public consultation processes • Male-dominated decision-making structures • Safety concerns during yayla migration especially for women
Recommended Meeting Frequency	Twice per year: once before migration (spring) and once after return (early autumn) Also, every 3 months for stayers
Proposed Meeting Venue(s)	• Mukhtar's garden or shaded outdoor space • Mosque courtyard (off-prayer hours) • Nearby school building or mobile tent

Notification Methods (Pre-Meeting)	• Personal outreach via mukhtar and Yörük elders (aksakallar) • Announcements via mosque and village gatherings • Informal visits by community liaison team a few days before the meeting • Verbal invitation delivered through animal feed sellers or shepherds' network • Women-to-women verbal invitations via relatives
Suggested Partners	• Mukhtar and community elders • Local agricultural cooperatives • Nomadic family associations (if any) • Female outreach staff or locally respected women (e.g., imam's wife, elder women)

Special communication channels may need to be developed for some disadvantaged groups. Different disadvantaged groups can be targeted through home visits or phone calls for individuals who cannot leave their homes; visually oriented leaflets and phone calls for illiterate individuals; leaflets and posters in different languages.

Among the vulnerable groups potentially affected by the Project are nomadic Yörük families, refugee/migrant women, the elderly, subsistence farmers, and seasonal workers, all of whom face various social, cultural, and economic barriers.

The seasonal migration patterns of the Yörük communities make it difficult for them to access information meetings, while women's participation in public consultation processes is often limited by traditional gender norms. Therefore, it is planned to hold at least two information meetings annually-before and after migration-and to organize these meetings in familiar community spaces such as the village head's (mukhtar's) yard, mosque courtyards, or mobile tents. The notification process will be conducted through mukhtars, community elders, herder networks, and verbal communication among women. Additionally, mobile teams will visit highland settlements (yaylas), safe transportation support will be provided for women, and female CLO will be actively involved in the process.

For refugee and migrant women, the main barriers identified are language limitations, restricted mobility, and the risk of gender-based violence (GBV/SEAH). Meeting announcements will be made via bilingual Turkish-Arabic-Kurdish brochures, and face-to-face outreach will be carried out by trusted local Arabic-speaking actors. In addition, special consultation sessions for women will be organized, focus group discussions with interpreter support will be held, and mobile support teams and psychosocial assistance mechanisms will be introduced to address SEAH risks.

Among elderly individuals and low-income women, low literacy rates and traditional norms that discourage women from speaking publicly reduce active participation. Therefore, meetings are already planned to be held in the late morning or near noon, with tea/snack services provided to create an informal and welcoming atmosphere. In addition to brochure distribution, home visits will be conducted. Furthermore, to increase women's participation, neighborhood-based mini women's advisory groups will be established and regular women-only information sessions will be organized.

A common challenge for all these groups is the hesitancy and distrust related to accessing grievance and feedback mechanisms. Therefore, it is essential to enhance awareness of the Grievance Mechanism (GM), with installed locked complaint boxes to allow for anonymous submissions, and introduce female CLO members who handles complaints submitted by women. Additionally, it is recommended to display simplified visual explanations of the grievance process, including the follow-up, resolution, and feedback loops, on community bulletin boards.

V.3. Operation Phase Community Engagement Plan (Post-Construction)

The stakeholder engagements developed during the construction process will be used effectively both in terms of public participation and authorized institutions, like NGOs and trade unions, and the communication and relations will continue to be used during the operation phase.

Table V-7. Operation Phase Focus Category

Category	Operation Phase Focus
Communication Objective	Ensure that vulnerable community members (women, elderly, children, pastoralist groups) are informed and can provide feedback on operational impacts such as traffic safety, access restrictions, and long-term social concerns.
Frequency of Communication	Twice per year (at minimum): Spring (prior to tourism and migration season) Autumn (after peak seasonal activity) Additional ad-hoc meetings in case of complaints or operational disruptions.
Communication Methods	Posters and flyers at local hubs (muhtar, mosque, health centers) WhatsApp messages and voice notes via community focal points Public information sessions when relevant (e.g., new signage, access road changes) Mobile info team visit once a year per settlement (if available)
Ongoing Risks / Key Topics	Road safety (especially for children, elderly, school routes) Access to agricultural land for women and small farmers Yörük livestock migration coordination and crossing points Street lighting needs in isolated or unlit areas Gender-based violence (GBV) risks around roadside zones Bus stop placements and pedestrian safety for women and elderly
Feedback & Grievance Channels	Maintain grievance redress mechanism (GRM) Add suggestion box in local gathering points (especially for women) Use female CLO or trusted female intermediary for verbal reporting
Partners and Outreach Actors	Mukhtar offices School teachers and health workers Local women's cooperatives Elder women or pastoralist representatives Municipal transport and safety units

V.4. Schedule and Timetable

The method, timing and form of activities for stakeholder engagement activities given in the previous section are detailed in Table V.1 .

In addition to this SEP, the RAP prepared for the Project separately includes a detailed Stakeholder Engagement Action Plan for RAP disclosure and implementation phases, which will be implemented in alignment with this Project SEP.

VI. ROLES AND RESPONSIBILITIES

The anticipated activities in the SEP will be conducted and completed by Project Company and KGM. In activities such as the grievance mechanism, Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. will be responsible for following requests, suggestions and complaints, and in the upcoming process, AAOİAŞ will fulfil the requirements by being responsible for this mechanism in accordance with the IFC PS1, EPFI Principle 5 and Principle 6.

The implementation of this SEP will be conducted and monitored by Project Sponsor's Environmental and Social Manager who is responsible to appoint the Social Chief and the Environment and Social Deputy Manager to be responsible for the stakeholder engagement for the Project, implementation of this SEP and grievance management. The Social Chef and the Environment and Social Deputy Manager will perform the following functions:

- Information disclosure and obtaining feedback;
- Processing, managing and tracking grievances, including ensuring timely responses to and closure of grievances;
- Control over the implementation of the corrective actions to remedy grievances;
- Regular review and if necessary, update of the SEP and stakeholder engagement mechanism to ensure it is effective and reflects Project circumstances;
- Participation in discussion on responses and the resolution of disputes, and
- Assistance in the preparation of the Environmental and Social Performance Reports.

Depending on the complexity of issues, Project Sponsor's project management and experts of KGM may also be involved.

VII. GRIEVANCE MECHANISM

VII.1. Purpose of the Grievance Mechanism

The purpose of this mechanism is to establish a system for handling, evaluation and resolution of all kinds of internal and external grievances, concerns, queries and proposals of the affected communities and other stakeholders, such as construction workers, regarding the project activities.

Managing grievances, including avoiding and minimizing them as well as effective handling, is an integral part of a sound stakeholder engagement strategy. Experience shows that significant numbers of grievances arise from misunderstandings, and that such grievances can be avoided, or their numbers reduced, through proactive and consistent engagement with communities. Engagement also helps anticipate and review community concerns to prevent them from escalating into grievances.

In accordance with IFC PS 2 and EPFI Principle 6, a process is established by which people who deem that they have been adversely affected by the Project during planning, construction or operation can bring grievances to the Project for consideration and, if required, resolution. A specific Project grievance mechanism (GM) is beneficial in addressing community and individual concerns and complaints before they escalate beyond control.

VII.2. Responsible Stakeholders

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. is responsible for implementing the grievance mechanism during the land preparation and construction and operation phases.AAOİAŞ has to ensure that the grievance mechanism is implemented effectively.

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. Community Liaison Officers (CLOs), under the supervision of the Social Chief and Environment and Social Manager, are responsible for receiving and managing grievances, coordinating the actions to be taken for resolution, and keeping proper records. The Environment and Social Manager is responsible for compiling and reporting grievance-related information to the General Directorate of Highways (KGM).

VII.2.1. Grievance Mechanism at the National Level

Presidency's Communication Centre:

The Presidency's Communication Centre (CIMER) provides a centralized complaint system for Turkish citizens, legal persons and foreigners. CIMER only allow applications in Turkish. Contact details of CIMER are given in Table VII.1 .

Through CIMER, applicants can direct their requests directly to the relevant authorities. The requests submitted to CIMER are resolved within 30 days. If the applicants do not receive feedback within this period, they can re-submit their grievance to CIMER or elevate it to the Ombudsman Institution (www.ombudsman.gov.tr).

Table VII-1. Contact Details of CIMER

Webpage:	www.CIMER.gov.tr/ www.turkiye.gov.tr/
Call Centre (hotline):	150
Phone number:	+90 312 590 20 00
Fax number:	+90 0312 473 64 94
Official Letter/Petition:	Republic of Türkiye, Directorate of Communications T.C. Cumhurbaşkanlığı Külliyesi 06560 Beştepe/ Ankara
Individual Application:	Community relations desks at governorates, ministries and district governorates.

CIMER will be available to Project stakeholders as an alternative and well-known channel for conveying their Project-related grievances and feedback directly to state authorities.

Foreigners Communication Centre:

The Foreigners Communication Centre (YIMER) provides a centralized complaint system for foreigners. YIMER will be available to Project stakeholders as an alternative and well-known channel for conveying their Project-related grievances and feedback directly to state authorities. Contact details of YIMER are given in Table VII.2 .

Table VII-2. Contact Details of YIMER

Webpage:	www.YIMER.gov.tr
Email:	YIMER@goc.gov.tr
Call Centre (hotline):	157
Phone number:	+90 312 515 11 22
Fax number:	+90 312 920 06 09
Official Letter/Petition:	Republic of Türkiye General Directorate of Migration Management, Çamlıca Mahallesi 122. Sokak No: 4 Yenimahalle/ Ankara
Individual Application:	Republic of Türkiye General Directorate of Migration Management

VII.2.2. Community Grievance Mechanism at the Project Level

The main aim of the community grievance mechanism is to assist in resolving complaints and grievances in a timely, effective, and efficient manner that satisfies all parties involved. The GM is intended to serve as a mechanism to:

- Allow identification and impartial, timely and effective resolution of issues affecting the project,
- Strengthen accountability of the beneficiaries, including project-affected stakeholders, and,
- Provide channels for the stakeholders to provide feedback and raise concerns.

External stakeholders can initiate the grievance/comment mechanism by using the following methods:

- Grievance/comment boxes and forms have been placedin public places including places commonly/ comfortably visited by women)
- Verbally during face-to-face meetings/visits to be held by the Project personnel (e.g. chiefs/ managers, CLOs)
- CLO's contact numbers have been shared with the mukhtars and also information leaflets have been hanged in each neighborhood sharing the contach information of the CLO's.
- E-mail (the e-mail address for the submittal of grievances/comments have been shared with the local communities.
- Website (with the anonymous option)

On the website of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. there is a Contact page which is available in Turkish and English (https://www.antalyaalanyaotoyolu.com.tr/). The grievances/requests related to Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş activities can be communicated through this page and the resolution process is followed. The page includes information on email, phone number and mailing address of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. Name e-mail address, telephone number and explanation/message/grievance could be entered in the online platform. Notification that the application has been received is made via e-mail address.

If the grievance/comment holder would like to fill out the form Annex-1 anonymously, the form will allow the grievance/comment holder to file it without any personal contact information. For grievances/comments received verbally in person, the Project representatives will request the grievance/comment holder to fill in the form himself/herself by providing the required guidance, where necessary. If the grievance/comment holder wishes the form to be filled out by the Project representatives, they will fill the form on behalf of the grievance/comment holder. In such cases, the grievance/comment holder will be required to read the filled form and both the grievance/comment holder and the Project representative who filled in the form will be required to approve and sign the form. The Project representative will provide a copy of the filled form to the grievance/ comment holder stakeholder. The CLO will ensure that the grievance/comment forms are collected from the grievance/comment boxes weekly.

Grievance boxes and information leaflets were placed in all affected neighborhoods at mukhtar's offices and the installation have been completed. An example of the installed grievance mechanism is shown in Figure VII.1.

Figure VII-I The Grievance Box and Information Leaflets at Mukhtar's Office

The office in Serik, where the address is written, also works as an information office: ORTA, BELEK CADDESI, NO: 7, IÇ KAPI NO: 9 SERIK/ANTALYA. The temporary construction site can also be used as an information office.

Within the scope of the project, Community Liaison Officers (CLOs) started to work within SPV. In addition, a call center has been established and can be reached at 0850 202 07 07.

The roles and responsibilities of Community Liaison Officers (CLOs) are presented in Table VII.3.

Table VII-3. Roles and Responsibilities of the Community Liaison Officer (CLO)

Role	Responsibilities
Community Liaison Officer (CLO)	• Inform the public about the scope, progress, and potential impacts of the Project. • Organize and facilitate regular community meetings, focus group discussions, and engagement forums. • Maintain open communication channels with project-affected persons (PAPs), community leaders, and local institutions. • Develop and distribute communication materials tailored to various community audiences. • Ensure that all internal and external complaints, including those under the Stakeholder Engagement Plan (SEP), are managed in line with the Grievance Mechanism (GM). • Log, track, and resolve complaints and appeals in a timely and respectful manner. • Provide regular training to site personnel during the construction phase. • Conduct regular internal audits and report non-conformities. • Ensure that non-conformities are recorded and promptly addressed. • Participate in the development and follow-up of corrective and/or improvement actions. • Report on the implementation performance of this Plan. • Support the review and update processes of this Plan. • Ensure that lessons learned and field experiences are reflected in plan revisions and training updates. • Collaborate with Health & Safety (H&S) and Social teams to address cross-cutting issues. • Facilitate resolution of community disputes or concerns related to project activities. • Assess how vulnerable or marginalized groups may be affected by the Project.

Role	Responsibilities
	• Propose mitigation measures or tailored engagement approaches for at-risk or underrepresented populations. • Ensure equitable participation in consultation processes, particularly for women, youth, elders, and people with disabilities. • Support the monitoring and recording of the implementation of the social related issues, including activities carried out by subcontractors. • Support the evaluation of the SEP's implementation performance and community feedback • Contribute to regular internal audits and the reporting of non-conformities. • Ensure that relevant non-conformities are recorded and addressed immediately. • Participate in the development of corrective and/or improvement actions and support their follow-up. • Support the periodic review and update of the SEP and related procedures in coordination with the E&S Manager. • Provide input to lessons learned from engagement outcomes and grievance trends. • Maintain up-to-date records of all stakeholder meetings, grievances, resolutions, and community commitments. • Submit routine reports to the Social Chief and/or E&S Manager summarizing community feedback, grievance status, and engagement Milestones. Ensure confidentiality and proper data handling, especially for sensitive community issues.
Social Chief	• Supervise and mentor CLOs, ensuring their work aligns with project priorities and stakeholder engagement strategy. • Develop and implement work plans and schedules for the CLO team. • Ensure consistent messaging, processes, and reporting methods across all field teams. • Conduct regular team meetings to review community issues, grievances, engagement outcomes, and field updates. • Lead the implementation of the Stakeholder Engagement Plan (SEP) and ensure it reflects community realities. • Oversee the planning and execution of community consultations, public meetings, and disclosure activities. • Ensure that engagement activities are inclusive of vulnerable and marginalized groups. • Build and maintain positive, trust-based relationships with local communities, leaders, and institutions. • Supervise the effective functioning of the grievance mechanism (GM) at community and project levels. • Ensure all grievances are recorded, processed, and resolved in a timely and transparent manner. • Analyse grievance trends and escalate systemic issues to the E&S Manager. • Contribute to the continuous improvement of the GRM process based on community feedback and internal review. • Monitor the performance of social engagement activities and their compliance with SEP objectives. • Ensure accurate, timely, and complete reporting of CLO activities, stakeholder interactions, and grievance outcomes. • Review and validate weekly/monthly reports from CLOs and prepare consolidated updates for senior management. • Ensure all engagement activities meet national regulations and international standards (e.g., IFC PS, Equator Principles). • Identify training needs and deliver or coordinate training for CLOs on stakeholder engagement, conflict resolution, and field documentation. • Promote professional development and capacity building within the social team. • Train subcontractors and relevant staff on community interaction protocols and grievance management. • Contribute to the development, review, and periodic updating of the SEP and related social management plans. • Ensure CLOs support the implementation and documentation of these plans at the field level. • Support the integration of lessons learned into updated plans and engagement strategies. • Coordinate with the E&S Manager, E&S Specialists, H&S, legal, and construction teams to address community-related impacts.

Role	Responsibilities
	• Support alignment between community concerns and project execution through proactive communication with technical departments. • Contribute social performance inputs to reports for lenders, regulators, and corporate leadership.

The Community Liaison Officers (CLOs) appointed within the Project hold undergraduate and/or postgraduate degrees in disciplines such as sociology, social policy, public relations, and other social sciences. With both strong academic backgrounds and practical experience, they significantly contribute to the effective implementation of environmental and social management processes. In total, three experts are expected to undertake the role of CLOs within the scope of the Project.The CLOs work under the supervision of the Social Chief, who has extensive experience in stakeholder engagement, coordination with local NGOs and public institutions, gender-sensitive approaches, and the implementation of social development and awareness-raising initiatives in line with national legislation and IFC Performance Standards.

In addition to meeting the above-mentioned qualifications, the current CLOs also possess practical knowledge of social performance management in accordance with World Bank and IFC standards. These experts play an active role in areas such as social impact management, establishment and monitoring of grievance mechanisms, stakeholder engagement processes, gender-sensitive approaches, field research, reporting, and communication. Their key competencies include reporting, problem-solving, leadership, data processing with SPSS, engaging with communities, expertise in child and women's rights programs, and compliance with relevant national and international regulations.

Furthermore, the experts have completed various training and certification programs in areas such as "Community Engagement and Gender-Based Violence Prevention," "Stakeholder Engagement," "Digital Literacy," "Family Counseling," "NLP," and "Play Therapy," thereby enhancing their professional skill sets. The Social Chief has also received adequate training in handling sensitive grievances, ensuring that such cases are managed with professionalism, confidentiality, and care.

In addition to the Project-level Grievance Mechanism, affected people may also raise concerns regarding the Project's compliance with AIIB's Environmental and Social Policy through the *AIIB Project-affected People's Mechanism (PPM)*.

The PPM provides an independent and impartial channel for project-affected people to submit complaints if they believe they have been, or are likely to be, adversely affected by AIIB-financed projects. Complaints can be submitted in writing, by email, or online through AIIB's official website.

Information about the PPM, including submission procedures and contact details, will be made available to local communities through the regular community meetings held monthly and through printed materials (e.g. grievance mechanism brochures, notice boards).

Complaints can be submitted online via the official PPM webpage https://www.aiib.org/en/about-aiib/who-we-are/project-affected-peoples-mechanism, by email to ppm@aiib.org, or in writing to the following address:

Managing Director, Complaints-resolution, Evaluation & Integrity Unit (CEIU)
Asian Infrastructure Investment Bank (AIIB)
Tower A, Asia Financial Center, No. 1 Tianchen East Road,
Chaoyang District, Beijing 100101, People's Republic of China

Detailed information on the PPM's procedures, submission form, and eligibility criteria is available on the AIIB website. Affected people are generally encouraged to first utilize the Project's community grievance mechanism before contacting the AIIB, unless there are valid reasons to believe that doing so would be ineffective or unsafe.

VII.2.3. Worker's Grievance Mechanism

The main aim of the worker's grievance mechanism is to ensure that all project workers have access to a fair, transparent, and accessible process for raising and resolving workplace-related concerns in a timely, effective, and confidential manner. The worker's grievance mechanism is intended to:

- Enable workers to raise employment-related concerns, complaints, or suggestions and ensure their impartial, timely, and effective resolution,
- Promote accountability of the employer and management towards fair treatment and workplace rights,
- Provide clear channels for workers to safely provide feedback and report issues without fear of retaliation.

Workers who report violations such as forced labor, mistreatment, or wage exploitation within the scope of the Project shall be protected against any form of retaliation in line with IFC Performance Standard 2 and IFC's Good Practice Note: Addressing Risks of Retaliation Against Project Stakeholders (2021). To this end, the grievance mechanism is designed to allow for anonymous submissions. Workers will be able to submit grievances safely either through anonymous online forms available on the Project website or via locked complaint boxes installed at the Temporary Const. Site, Viaduct 4, Viaduct 8, T-5 Entry, Viaduct 12, and in HRM32 - Registered Archaeological Site. As part of this process, the Internal Grievance Form provided in Annex-2 will be used to ensure that complaints are collected and evaluated in a standardized format. Additionally, the procedural steps established for the grievance mechanism will apply to both internal and external complaints (Table VII.5). In addition, workers may submit their grievances and feedback by calling the toll-free line 0850 202 07 07 or by visiting the Information Office.

During the grievance review process, the identity of the complainant will remain strictly confidential and will be stored in encrypted systems accessible only to designated Community Liaison Officers (CLOs), and will not be shared with other managers under any circumstances. Meetings related to sensitive issues will be conducted exclusively by authorized social specialists, in private and secure settings, to ensure the safety and privacy of the complainant. Any adverse actions taken against a complainant following the submission of a grievance - such as reassignment, wage deduction, intimidation, or exclusion - will be treated as retaliation. In such cases, disciplinary proceedings will be initiated against the responsible individuals, and contracts with subcontractors may be suspended or terminated if necessary. The effectiveness of these procedures will be monitored by CLOs, and any potential retaliation incidents following grievance submissions will be tracked, documented, and reviewed.

VII.2.4. Gender-Sensitive Accessibility to the Grievance Mechanism

To ensure equitable access to the Grievance Mechanism (GM), gender-specific challenges have been identified across affected communities in Serik, Manavgat, and Alanya. Women, especially those in rural or conservative settings, often face social, mobility, and communication barriers that limit their ability to file formal complaints.

Barriers identified include:

- Limited mobility due to unpaid care work and household responsibilities
- Lack of awareness of complaint channels, particularly among refugee or elderly women
- Discomfort speaking in male-dominated spaces or to male project staff
- Low literacy or digital skills
- Cultural norms discouraging women from voicing dissatisfaction publicly

Table VII-4. Gender-Sensitive Accessibility to the Grievance Mechanism

Measure	Description
Female CLOs or trusted intermediaries	Women will have the option to submit grievances through female liaison officers or locally respected women (e.g., women cooperative members or mukhtar's wife)
Anonymous feedback channels	Lockable complaint boxes in women-accessed locations (e.g., cooperatives, health centers) and verbal relay via trusted mediators
Outreach using local networks	Use of female-focused WhatsApp groups and word-of-mouth messaging to raise awareness of the GM
Language support	Bilingual grievance forms (Turkish and Arabic) for refugee women in areas like Serik and Toslak
Verbal grievance intake	Women will be allowed to submit complaints orally, especially in low-literacy or elderly populations (e.g. Kalemler, Hacısali)
Culturally appropriate meeting spaces	Women-only consultation sessions where grievances and concerns can be voiced safely and privately
Communication Line	A separate hotline will be set up for women, and it will be explained through CDCs and leaflets that the person answering the phone is a woman and will listen to complaints anonymously, without prejudice or comment, and that complaints will be recorded according to the request

Table VII-5. Procedural Steps of Grievance Mechanism

Step	Description of Process	Time Frame	Responsibility
GM implementation structure	There exist two Grievance Mechanism at the National Level: ● Presidency's Communication Centre and ● Foreigners Communication Centre	-	Presidency's Communication Centre, and Foreigners Communication Centre and related authorities, CLO
Grievance uptake	Grievances can be submitted via the following channels: ● Telephone ● Verbally ● E-mail ● Website ● Grievance/comment boxes ● Letter to Grievance focal points at local facilities Complaint form to be logged via any of the above channels ● Walk-ins may register a complaint in a grievance logbook at a facility or suggestion box Anonymous Grievances can be submitted via the following channels: ● Telephone ● Letter to Grievance focal points at local facilities ● Grievance box in headman's office and the camp sites ● Website	CLO must open grievance boxes every week during the construction phase and every 30 working days during the operational phase	CLO
Sorting, processing	Any complaint received is forwarded to Environment and Social Manager and SPV General Manager, Logged in the Grievance	Within 3 business days of receipt	CLO

Step	Description of Process	Time Frame	Responsibility
	Log, and categorized according to the complaint types[2]: If the complaint is assessed to be out of the scope of the Grievance Mechanism, a grievant will be notified through the desired communication method and an alternative mode of solution will be suggested.		
Acknowledgement and follow-up	Receipt of the grievance is acknowledged to the complainant by CLO through a personal meeting, phone call or letter as appropriate, within a target of 3 business days after submission. If the grievance is not well understood or if additional information is required, clarification will be sought from the complainant.	Within 3 business days of receipt	CLO
Verification, investigation, action	Investigation of the complaint is led by Environment and Social Manager and SPV General Manager. The SPV General Manager s notified of Level 1, 2 or 3 grievances. The Social Chief, as appropriate, support the Environment and Social Manager in deciding who should deal with the grievance and determines whether additional support for the response is necessary. A proposed resolution is formulated by Social Chief, as appropriate, supports the Environment and Social Manager and is communicated to the complainant by CLO through the grievance/comment close-out form.	Responses within 30 business days of receipt	SPV General Manager, E&S Manager, Social Chief, Community Liaison Officers
Monitoring and evaluation	Data on complaints are collected in a database and reported to SPV General Manager, Environment and Social Manager and AAOİAŞ HQ every three months	Quarterly	CLO

[2] *Level 1 Complaint: A complaint that is isolated or 'one-off' (within a given reporting period - one year) and essentially local in nature.*

Note: Some one-off complaints may be significant enough to be assessed as a Level 3 complaint e.g., when a national or international law is broken (see Level 3).

Level 2 Complaint: A complaint that is widespread and repeated (e.g., noise from the facilities, dust, etc.).

Level 3 Complaint: A one-off complaint, or one which is widespread and/or repeated that, in addition, has resulted in a serious breach of the Project's policies or National law and/or has led to negative national/international media attention, or is judged to have the potential to generate negative comment from the media or other key stakeholders (e.g., inadequate waste management).

Step	Description of Process	Time Frame	Responsibility
Provision of feedback	Feedback from complainants regarding their satisfaction with complaint resolution is collected by CLO through phone calls or face-to-face interviews.	15 business days after the implementation of the resolution	CLO

Once all possible means to resolve the complaint have been proposed and if the complainant is still not satisfied, then they should be advised of their right to legal recourse including the right of petition, right to information and appeal to the ombudsperson (constitution, article 74) and right to constitutional complaint (constitution, article 148).

In addition to the project's GM for its internal and external stakeholders, EP 6: Grievance Mechanism requires the establishment of a Workers' Grievance Mechanism (WGM) for the project workers. The project workers will use the WGM to convey their concerns or suggestions regarding their working conditions and workplace. The Worker Grievance Mechanism is defined as the mechanism that receives complaints from Project employees (including both direct and indirect employees).

Any comments or concerns will be brought to the Company's attention verbally or in writing (by post or e-mail) or by filling in a grievance form. The grievance form is available on the Company website, at the Project site, at the mukhtar's office, alongside a description of the grievance mechanism. All grievances will be:

- Acknowledged within seven days after receipt;
- Responded no later than within 30 business days after receipt, and
- Specifically, nominated and trained members of staff will record grievance information in a grievance register. The information in the grievance register will include Stakeholder name and contact details and details of the grievance and how and when it was submitted, acknowledged, responded to and closed out.

Individuals can request the right to have their names kept confidential, and this mechanism does not preclude the right for stakeholders to process grievances through other judicial means.

- Step 1: Receipt of grievance and registering of grievance (3 business days),
- Step 2: Assessment,
- Step 3: Acknowledgement of grievance (acknowledged within 3 business days after receipt),
- Step 4: Investigation and resolution of grievance,
- Step 5: Closure; and (3 0 business days)
- Step 6: Outcome of the corrective action (15 business days after completion).

Appeals Committee

In case the complainants are not satisfied with the decision of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş and/or EPC on their complaints, they can refer to the Appeals Committee via Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş social impact team.

Appeals Committee consisting of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş management teams is responsible for ensuring grievance mechanism is effectively managed. Furthermore, the committee will directly investigate and respond grievances as well as grievances that are not closed when complainant refuses the corrective actions, or the actions are not closed on time.

The mandate of the Appeals Committee covers considering complaints on the issues listed below (excluding those related with Labor Law and Expropriation Law):

- Unsolved grievance related to damage to environment,
- Unsolved grievance related to damage to public assets and infrastructure,
- Unsolved grievance related to damage to private assets (land, crops, houses etc.),
- Unsolved grievance related to impacts on livelihood.

The Appeals Committee carries out the following tasks:

- Meeting at least once a month or more often depending upon the existence of unresolved disputes,
- Reviewing the complaints by hearing both complainants and LİMAK and/or EPC
- Investigating the complaints in accordance with project requirements, LİMAK Policies, legal framework and referring to relevant expertise where required,
- Preparing an evaluation report based on the inquiries,
- Making a proposal on resolution of the disputes between parties.

The decision of the Appeals Committee is not binding and if parties do not agree on the Appeals Committee proposal, they still have the opportunity to either negotiate or litigate.

The Appeals Committee consists of the following members:

- SPV General Manager
- Health and Safety Manager
- Environment and Social Manager
- Expropriation Manager
- Social Chief
- Community Liaison Officer
- Matter Expert, if required
- Relevant NGO officer or village leaders

The grievance mechanism will be widely announced to the public with stakeholder meetings held for project affected communities. Additional meetings will be organized to target women PAPs and vulnerable groups for sharing information on grievance mechanism that also allows anonymous grievances. The grievances will be reviewed by the team according to the Project human rights and grievance mechanism.

The relationships developed through effective stakeholder engagement activities and the involvement of local organizations in the appeals committee will reduce concerns about objectivity and ensure a more transparent process for the grievance mechanism and the right to appeal.

Rules and Procedures of the Appeals Committee

1. Purpose and Scope

This manual outlines the procedures and operating rules of the Appeals Committee established under the grievance mechanism of the Antalya-Alanya Motorway Project. The purpose of the Appeals Committee is to ensure an effective, transparent, and fair review of grievances that remain unresolved or are not accepted by the complainant after the initial resolution process.

The Committee is responsible for investigating grievances that fall under its mandate, ensuring alignment with project policies, applicable legislation, and international environmental and social standards.

The Appeals Committee shall consider complaints unresolved by Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş and/or EPC, specifically on the following issues (excluding matters under Labor Law or Expropriation Law):

- Environmental damage
- Damage to public assets and infrastructure
- Damage to private property (land, crops, houses, etc.)
- Impacts on livelihood

2. Committee Structure and Responsibilities

The Appeals Committee includes the following members:

- SPV General Manager (Chair)
- Health and Safety Manager
- Environment and Social Manager
- Expropriation Manager
- Social Chief
- Community Liaison Officer
- Subject Matter Expert (as needed)
- Representative of local NGOs or village leadership

The Committee may invite additional stakeholders or technical advisors as needed, based on the nature of the grievance under review.

The Committee is responsible for the following tasks:

- Reviewing unresolved or escalated grievances submitted via the Social Impact Team.
- Ensuring complainants are heard fairly and respectfully.
- Conducting investigations in line with project requirements, legal frameworks, and LİMAK Group's environmental and social policies.
- Seeking input from technical experts and community representatives where appropriate.
- Developing reasoned proposals to resolve disputes.
- Preparing detailed evaluation reports for each reviewed grievance.

3. Implementation

- Appeals must be submitted to the CLOs, which will forward them to the Appeals Committee Secretariat.
- Appeals are logged, assigned a case number, and acknowledged within 5 working days.
- The Committee shall meet at least once a month, or more frequently if required by the number or urgency of unresolved grievances.
- The Committee verifies the grievance falls under its mandate.
- Both the complainant and the project/EPC representatives are given the opportunity to present their perspectives.
- The Committee may conduct site visits, consult experts, and review relevant documentation.
- Committee members engage in internal review processes in a confidential manner and aim to reach decisions through consensus wherever possible."
- A written resolution proposal is shared with both parties within three (3) business days following the Committee meeting.
- The grievance case documentation, including the Committee's findings, rationale, and resolution recommendations, is securely archived and integrated into the project's grievance monitoring and reporting system.
- All Committee members shall maintain strict confidentiality.
- Any member with a potential conflict of interest must recuse themselves from the specific case.
- The effectiveness of the Appeals Committee and its procedures will be reviewed annually.
- Lessons learned will be incorporated into future updates of this manual and SEP revisions.

Grievances Related GBV/SH/SEA

To properly address SEA/SH risks, the GM will be in place prior to contractors mobilizing. For GBV- and particularly SEA/SH-complaints, there are risks of stigmatization, rejection and reprisals against complainant. This creates and reinforces a culture of silence so complainant may be reticent to approach the project directly. To enable women to safely access the GM, multiple channels through which complaints will be registered in a safe and confidential manner will be enabled. These channels will be designed to respect privacy, ensure accessibility, and allow for anonymous reporting, using approaches such as - but not limited to - confidential verbal reporting, written submissions, or digital tools, depending on the local context and available resources.Anonymous submissions are accepted and processed with the same level of seriousness.

The Social Chef and CLO is ensure on how to collect SEA/SH cases confidentially and empathetically (with no judgement). Where possible, at least one female CLO shall be available to receive SEA/SH-related complaints.

The Project has multiple complaint channels. No identifiable information on the survivor will be stored in the GM and all data related to GBV/SH/SEA grievances will be handled and stored securely in accordance with applicable data protection laws and the AAOİAŞ's confidentiality policies. The GM will not ask for, or record, information on more than the following related to the SEA/SH allegation:

- The nature of the complaint (what the complainant says in her/his own words without direct questioning);
- If, to the best of the survivor's knowledge, the perpetrator was associated with the project;
- If possible, the age and sex of the survivor; and
- If possible, information on whether the survivor was referred to services.

In line with IFC's Good Practice Note: Addressing Risks of Retaliation Against Project Stakeholders (2021),the information in the GM will be confidential-especially when related to the identity of the complainants or witnesses. Any form of retaliation against individuals submitting GBV/SH/SEA grievances is strictly prohibited. Such actions may result in disciplinary measures for company personnel and, where applicable, appropriate contractual follow-up or escalation with third-party actors, including contractors and service providers.

Complainants will be informed about and referred to appropriate support services, such as medical care, psychosocial support, legal aid, or protection services. AAOİAŞ will maintain an up-to-date referral list of local service providers for this purpose.

GBV/SH/SEA grievances will be acknowledged within 3 business days and resolved as quickly as possible, with sensitivity to the emotional and physical needs of the Complainants. Complainants shall be informed of outcomes or steps taken, as appropriate and with their consent.

All GBV/SH/SEA grievances will be documented separately and securely, with access limited to authorized personnel. Non-identifiable summary data may be used for monitoring, evaluation, and reporting purposes only.

VII.3. MONITORING AND REPORTING

The SEP is a living document that will be updated periodically (at least annually) to document consultations conducted, issues raised, actions taken, and change materials. It will also include lessons learned, any modifications to the consultation process, and a schedule for ongoing future interaction.

VII.4. Internal Monitoring

The Project Sponsor will monitor the participation of the stakeholders in the planned engagement activities. Through the evaluation of outcomes and the effect of engagement, LİMAK intends to obtain regular feedback from stakeholders and to learn if the planned outcomes are achieved or if there is a need to change the approach.

Throughout the Project, Project Sponsor will communicate with stakeholders and inform them about any significant issues, such as changes in the Project schedule.

Monthly summaries/reports of grievances, queries, and related incidents, together with the implementation status of corrective/preventive actions, will be prepared by the CLOs and submitted to Environmental and Social Manager. The monthly summaries/reports will be a means to assess both the number and nature of complaints (if any), along with the Project Sponsor's ability to address complaints in a timely and effective manner.

During the operation phase, the Environmental and Social Manager will also prepare quarterly overall performance reports.

VII.5. External Monitoring

In addition to internal monitoring, external monitoring activities will be carried out quarterly- in the construction phase and biannually during the operation phase of the project by lenders IESC (ESAP monitoring experts) to verify environmental and social monitoring information and perform monitoring services.

As part of the external monitoring process, a final evaluation will be conducted to determine whether the implementation of the ESMS/ESMP complies with national environmental laws, international agreements, protocols, environmental and social standards such as the Equator Principle, IFC Policy (2012) and related Performance Standards on Environmental and Social Sustainability applicable to the Antalya-Alanya Motorway Project.

Besides, local authorities and the Ministry of Environment, Urbanization and Climate Change (MoEU) have the authority to execute monitoring and inspection activities to follow up on the conformity of the Project activities with the environmental requirements as per the relevant legislation.

VII.6. Phase-Differentiated Monitoring

Monitoring requirements differ between the construction and operation phases due to the evolving nature of impacts and stakeholder interactions.

During Construction Phase:

- **Indicators:**
    - Number and frequency of community consultations held
    - Percentage of women, elderly, and vulnerable groups reached
    - Number of grievances received and resolved within defined timelines
    - Occupational health and safety incidents reported and addressed
    - Number of disruptions to access/mobility and mitigations implemented
- **Methods:**
    - Site-level monitoring by social and environmental officers
    - Community feedback sessions and grievance intake
    - Weekly reporting by contractors

During Operation Phase:

- **Indicators:**
    - Road safety incident reports and follow-up actions
    - Long-term noise and air quality measurements
    - Accessibility improvements for vulnerable groups (e.g., crossings, lighting)
    - Continued functionality of grievance mechanism (response rate, satisfaction)
    - Periodic satisfaction surveys with local residents and road users
- **Methods:**
    - Bi-annual monitoring reports submitted to financing institutions
    - Independent audits and third-party verifications (if required)
    - Coordination with local authorities and CSOs for long-term oversight

VII.6.1.1. Vulnerability-Focused Monitoring

Special attention will be given to tracking how the project affects vulnerable groups identified in this HRA:

- Sex- and age-disaggregated data will be maintained for all engagement and grievance records.
- Gender-based violence (GBV) indicators will be tracked in coordination with local NGOs.
- Mobility/access concerns for the elderly and disabled will be assessed during site visits.

VII.6.1.2. Reporting and Disclosure

- Monitoring results will be disclosed in an accessible format (e.g., summary brochures, radio announcements, community meetings).
- Reports will be prepared in Turkish and, where relevant, simplified formats or visualized to ensure comprehension by illiterate or semi-literate populations.
- An annual Stakeholder Monitoring Summary will be shared with local authorities, community representatives, and the public.

This structured and adaptive monitoring and reporting system ensures transparency, learning, and responsiveness throughout the project duration.

ANNEX -3 Key Performance Indicator

KPI	Target	Frequency	Responsible	Data Source
Number of meetings conducted with the relevant	1 per 30 km stretch	Semiannually / construction phase Annually / operational phase	CLO, E&S Manager	Meeting reports, photos
Number of regular community meetings held to disclose Project progress, E&S performance, and RAP implementation updates	Minimum 1 per month during construction; 1 per quarter during operation	Monthly / Quarterly	CLO, E&S Manager	Meeting minutes, attendance records, photos, feedback forms
% of meetings with at least one female facilitator	100%	Each meeting	CLO, Female Staff	Participant list
% of female participants in community meetings	At least 40% (if not seperate female meeting will be conducted)	Semiannually / construction phase Annually / operational phase	CLO	Disaggregated participant data
Number of WhatsApp / digital announcements posted	Min. 2/month/region	Monthly	CLO	Screenshots, message logs
Number of grievances received from women	Separate tracking required	Monthly	Female CLO	GM logs
% of grievances resolved within 30 days	75%	Monthly	Environment and Social Manager	GM logs
Number of grievance channels accessible to illiterate or elderly PAPs	At least one in each sub-region (Serik, Manavgat, Alanya)	Ongoing	CLO	Field visits, GM audit
Number of GBV or SEAH trainings held	one per campsite before construction	Pre-construction	H&S Manager, Female CLO	Training logs
Number of engagement events for vulnerable groups (women, Yörüks, refugees)	Min. One per group per year	Annual	CLO, E&S Manager	Meeting records
Number of satisfaction surveys conducted (incl. gender focus)	2/year	Biannual	Female CLO	Survey results maintained by the SPV General Manager
% of brochures/materials with visual/auditory accessibility	90%	Before dissemination	E&S Manager, Social Chief	Outreach records
Increase women's participation in employment by 2029	30%	Annual (2029–2032)	SPV General Manager	Personnel records maintained by SPV General Manager
Increase women's participation in employment by 2032	35%	Annual (2032–2035)	SPV General Manager	Personnel records maintained by SPV General Manager

Increase women's participation in employment by 2035	40%	Annual (2035–2040)	SPV General Manager	Personnel records maintained by SPV General Manager
Maintain women's participation at Board level by 2035	40%	Annual (2029–2040)	SPV General Manager	Board composition records maintained by SPV General Manager

ANNEX-4: Project Information Brochure: Turkish, Arabic and Kurdish

Turkish Version

ÇEVRESEL ve SOSYAL ETKİ DEĞERLENDİRMESİ (ÇSED) ÇALIŞMALARI

Antalya-Alanya Otoyolu Projesi kapsamında, Çevresel ve Sosyal Etki Değerlendirmesi (ÇSED) süreci başlamıştır. Proje'nin çevre ve sosyal hayat üzerindeki olası etkileri tespit edilmiş, değerlendirilmiş ve bu etkileri azaltmaya yönelik önlemler önerilmiştir.

Projeyi yürüten Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ), bu çalışmayı yürütmek üzere ENCON Çevre Danışmanlık Ltd. Şti.'yi görevlendirmiştir.

Mevcut çevresel ve sosyal koşullar, Proje süresince göz önünde bulundurulmaya devam edilecektir.

ÇSED çalışmaları kapsamında detaylı olarak incelenen temel çevresel ve sosyal konular aşağıda özetlenmektedir:

- ✓ Mevcut arazi kullanımı ve gelir kaynaklarında bölgesel değişimler
- ✓ Gürültü ve hava kalitesinde yaşanabilecek değişiklikler
- ✓ İnşaat faaliyetleri nedeniyle oluşabilecek rahatsızlıklar
- ✓ İnşaat malzemelerinin temini ve atık bertarafı
- ✓ Yol ve trafik güvenliği ile ilgili konular
- ✓ Doğal habitatlar ile bu habitatlarda bulunan hayvanlar ve bitki örtüsü üzerindeki etkiler
- ✓ Kültürel miras açısından önemli yerler ve bilinmeyen arkeolojik kalıntıların keşif potansiyeli
- ✓ Kadınlar, yaşlılar gibi hassas gruplar öncelikli olmak üzere halkın yaşam koşullarının korunması
- ✓ Proje'nin yerel ekonomi, tarım ve geçim kaynakları üzerindeki etkileri
- ✓ Halk sağlığı ve güvenliği açısından oluşabilecek riskler ve alınacak önlemler

GÖRÜŞ BİLDİRME OLANAKLARI

Antalya-Alanya Otoyolu Projesi kapsamında yürütülen ÇSED süreci, projeden etkilenebilecek veya projeye ilgi duyan tüm kişi ve kurumların görüşlerini alma esasına dayanmaktadır.

Bu kişiler ve kuruluşlar "paydaş" olarak tanımlanmakta olup, şunları kapsamaktadır:

- ✓ Ulusal ve yerel düzeyde kamu kurumları
- ✓ Çevresel, sosyal veya ekonomik konularla ilgilenen sivil toplum kuruluşları
- ✓ Projeden doğrudan etkilenebilecek yerel halk ve geçimini bu bölgelerden sağlayan bireyler

Bu broşür, paydaş katılım sürecinin bir parçası olarak hazırlanmıştır. Amaç, Proje hakkında mümkün olduğunca çok sayıda kişiye bilgi sunmak ve görüşlerini paylaşmaya davet etmektir. Böylece öneriler geliştirilirken ve etki azaltma önlemleri tespit edilirken, paydaşların görüşlerini de değerlendirmeye alabilmek amacıyla hazırlanmıştır.

Antalya-Alanya Otoyolu Projesi'ne ilişkin görüş, öneri ve fikirlerinizi yerleşim birimlerinde bulunan şikayet ve öneri kutuları ile birlikte aşağıdaki kanallar vasıtası ile bize iletebilirsiniz:

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş.

ANTALYA ALANYA OTOYOLU

ANTALYA-ALANYA OTOYOLU PROJESİ

BİLGİLENDİRME BROŞÜRÜ

AĞUSTOS 2025

PROJE' NİN BİLEŞENLERİ NELERDİR?

Antalya-Alanya Otoyolu, Serik Kavşağı'ndan başlamakta, daha sonra doğuya yönelerek Serik ve Manavgat ilçeleri sınırları içerisinde Toros Dağları'nın eteklerindeki koridoru takip etmekte ve Konaklı'nın kuzeyinde Alanya Kavşağı'nda sonlanmaktadır.

Sözleşmeye Esas Otoyol Kesimleri

Ana Yol (Otoyol) : 84 km
Bağlantı Yolları : 33.8 km
Toplam Uzunluk : 117.8 km

Ana Yapı Bileşenleri

- ✓ Viyadükler
- ✓ Köprüler
- ✓ Kavşaklar
- ✓ Altgeçitler ve Üstgeçitler
- ✓ Menfezler
- ✓ Otoyol Gişeleri
- ✓ Servis Alanları
- ✓ Bakım ve İşletme Merkezleri

PROJE HANGİ AŞAMADADIR?

Proje kapsamında kamulaştırma planları çıkarılmış ve belirli bölgelerde kamulaştırma çalışmalarına başlanmıştır.

İnşaat faaliyetlerine başlanmış ve ilgili kesimlerde şantiyeler kurulmuştur.

Proje inşaat faaliyetlerinin Ekim 2028 içerisinde tamamlanması planlanmaktadır.

PROJE' NİN BEKLENEN FAYDALARI NELERDİR?

Ulaşım Ağlarına ve Yol Kullanıcılarına Sağlayacağı Faydalar:

- ✓ Burdur, Isparta, Konya, Karaman ve Mersin gibi çevre illere ulaşımın kolaylaştırılması
- ✓ Antalya ile Alanya arasında kesintisiz, güvenli ve hızlı ulaşım sağlanması
- ✓ Mevcut D-400 Karayolu'nun trafik yükünün azaltılarak yoğunluğun hafifletilmesi
- ✓ Yolculuk sürelerinin önemli ölçüde kısaltılması ve seyahat konforunun artırılması
- ✓ Turizm sezonunda yaşanan trafik sıkışıklığına karşı yüksek kapasiteli alternatif bir güzergâh oluşturulması
- ✓ Güzergâh boyunca farklı bölgelere erişimin artırılarak bölgesel entegrasyonun desteklenmesi

Sosyal ve Ekonomik Faydalar:

- ✓ Proje'nin inşaat ve işletme aşamalarında yerel istihdam olanakları
- ✓ Otoyol aracılığıyla eğitim, sağlık, turizm ve ticaret merkezlerine daha hızlı ve kolay erişim
- ✓ Tarım ürünlerinin (özellikle narenciye, sebze ve çiçek) pazarlara daha kısa sürede ulaştırılmasıyla ürün tazeliği korunması ve ekonomik değer artışı
- ✓ Yol güvenliğinin artırılmasıyla birlikte trafik kazalarının ve buna bağlı can kayıplarının azaltılması
- ✓ Köy yolları ve bağlantılar üzerindeki ağır araç trafiği azalacağı için ulaşımda güvenliğin artması
- ✓ Seyahat süresinin kısalması sonucu yakıt tüketimi ve hava emisyonlarında azalma
- ✓ Şehir içi trafik yükünün, özellikle kamyon ve otobüs gibi ağır araç trafiğinin azalmasıyla, gece saatlerinde yaşanan gürültü seviyesinin düşmesi
- ✓ Modern bir ulaşım altyapısı sayesinde yerel kalkınmanın teşvik edilmesi ve yatırım cazibesinin artırılması
- ✓ Acil durumlarda (örneğin yangın, trafik kazası vb.) müdahale süresinin kısalmasıyla toplumsal güvenlik düzeyinin artırılması

ANTALYA ALANYA OTOYOLU

مشروع الطريق السريع أنطاليا-ألانيا

بروشور المعلومات

أغسطس 2025

إمكانيات التعبير عن الرأي

تعتمد عملية تقييم الأثر البيئي والاجتماعي لمشروع طريق أنطاليا-ألانيا السريع على مبدأ جمع آراء جميع الأفراد والمؤسسات المتأثرة بالمشروع أو المهتمة به.

يُعرَف هؤلاء الأفراد والمنظمات بـ"أصحاب المصلحة"، وهم:

- ✓ المؤسسات العامة الوطنية والمحلية
- ✓ منظمات المجتمع المدني الوطنية المعنية بالقضايا البيئية والاجتماعية والاقتصادية
- ✓ المجتمعات المحلية والأفراد المتأثرين مباشرةً بالمشروع والذين يكسبون رزقهم في هذه المناطق

أُعدّ هذا الكتيب كجزء من عملية إشراك أصحاب المصلحة. والهدف هو توفير معلومات حول المشروع لأكبر عدد ممكن من الناس، وحثّهم على إبداء آرائهم. تضمن هذه العملية مراعاة آراء أصحاب المصلحة عند وضع التوصيات وتحديد تدابير التخفيف.

يمكنكم إرسال آرائكم ومقترحاتكم وأفكاركم بخصوص مشروع الطريق السريع أنطاليا-ألانيا من خلال صناديق الشكاوى والاقتراحات الموجودة في المناطق السكنية، وكذلك من خلال القنوات التالية:

شركة طريق أنطاليا ألانيا السريع للإنشاءات والاستثمار والتشغيل المساهمة

- مركز الاتصال: **08502020707**
- عنوان مكتب الاستشارات: حي أورتا، شارع بيليك الرقم 7، الباب الداخلي رقم 9، سيريك، أنطاليا، تركيا
- البريد الإلكتروني: **info@antalyaalanyaotoyolu.com.tr**

www.antalyaalanyaotoyolu.com.tr

دراسات تقييم الأثر البيئي والاجتماعي

بدأت عملية تقييم الأثر البيئي والاجتماعي لمشروع طريق أنطاليا-ألانيا السريع. وتم تحديد وتقييم الآثار البيئية والاجتماعية المحتملة للمشروع، واقتراح تدابير للتخفيف من حدتها.

وقد كلفت شركة طريق أنطاليا-ألانيا السريع للإنشاءات والاستثمار والتشغيل المساهمة (AAOİAŞ)، الجهة التنفيذية للمشروع، شركة إنكون ENCON للاستشارات البيئية المحدودة بإجراء هذه الدراسة.

سيستمر مراعاة الظروف البيئية والاجتماعية الحالية طوال مدة المشروع.

فيما يلي ملخص للقضايا البيئية والاجتماعية الرئيسية التي دُرست بالتفصيل في نطاق دراسات تقييم الأثر البيئي والاجتماعي:

- ✓ التغيرات الإقليمية في استخدامات الأراضي الحالية ومصادر الدخل
- ✓ التغيرات المحتملة في الضوضاء وجودة الهواء
- ✓ الاضطرابات التي قد تنشأ عن أنشطة البناء
- ✓ توريد مواد البناء والتخلص من النفايات
- ✓ القضايا المتعلقة بسلامة الطرق والمرور
- ✓ التأثيرات على الموائل الطبيعية وحيواناتها ونباتاتها
- ✓ إمكانية اكتشاف مواقع ذات أهمية تراثية ثقافية وبقايا أثرية مجهولة
- ✓ حماية الظروف المعيشية للسكان، وخاصة الفئات الضعيفة مثل النساء وكبار السن
- ✓ آثار المشروع على الاقتصاد المحلي والزراعة وسبل العيش
- ✓ المخاطر المحتملة على الصحة والسلامة العامة والتدابير الواجب اتخاذها

ما هي الفوائد المتوقعة من المشروع؟

الفوائد لشبكات النقل ومستخدمي الطرق:

- ✓ تسهيل الوصول إلى المحافظات المحيطة مثل بوردور، وإسبرطة، وقونيا، وكرمان، ومرسين.
- ✓ توفير نقل متواصل وآمن وسريع بين أنطاليا وألانيا.
- ✓ تخفيف الازدحام المروري على الطريق السريع D-400 الحالي.
- ✓ تقصير أوقات الرحلات بشكل ملحوظ وتحسين راحة السفر.
- ✓ إنشاء طريق بديل عالي السعة لتخفيف الازدحام المروري خلال الموسم السياحي.
- ✓ دعم التكامل الإقليمي من خلال زيادة إمكانية الوصول إلى مختلف المناطق على طول الطريق.

الفوائد الاجتماعية والاقتصادية:

- ✓ فرص عمل محلية خلال مرحلتي بناء وتشغيل المشروع.
- ✓ وصول أسرع وأسهل إلى مراكز التعليم والرعاية الصحية والسياحة والتجارة عبر الطريق السريع.
- ✓ الحفاظ على نضارة المنتجات وزيادة قيمتها الاقتصادية من خلال توصيل المنتجات الزراعية (وخاصة الحمضيات والخضراوات والزهور) إلى الأسواق بسرعة أكبر.
- ✓ الحد من حوادث المرور والوفيات الناجمة عنها من خلال تحسين السلامة على الطرق.
- ✓ زيادة سلامة النقل بفضل انخفاض حركة مرور المركبات الثقيلة على طرق القرى والتقاطعات.
- ✓ خفض استهلاك الوقود والانبعاثات الهواء بفضل تقصير أوقات السفر.
- ✓ خفض مستويات الضوضاء الليلية بفضل انخفاض حركة المرور في المناطق الحضرية، وخاصة حركة مرور المركبات الثقيلة مثل الشاحنات والحافلات.
- ✓ تعزيز التنمية المحلية وزيادة جاذبية الاستثمار من خلال بنية تحتية حديثة للنقل.
- ✓ تعزيز السلامة العامة من خلال تقليل أوقات الاستجابة في حالات الطوارئ (مثل الحرائق وحوادث المرور، إلخ).

ما هي مكونات المشروع؟

يبدأ طريق أنطاليا-ألانيا السريع عند تقاطع سيريك، ثم ينعطف شرقًا، متتبعًا الممر على طول سفوح جبال طوروس ضمن حدود مقاطعتي سيريك ومانافغات، وينتهي عند تقاطع ألانيا شمال كوناكلي.

أقسام الطريق السريع التعاقدية

الطريق الرئيسي (الطريق السريع): **84** كم
الطرق المتصلة: **33.8** كم
الطول الإجمالي: **117.8** كم

مكونات الهيكل الرئيسي

- ✓ الجسور العلوية
- ✓ الجسور
- ✓ التقاطعات
- ✓ الأنفاق السفلية والعلوية
- ✓ القنوات المائية
- ✓ كبائن تحصيل الرسوم
- ✓ مناطق الخدمة
- ✓ مراكز الصيانة والتشغيل

إلى أي مرحلة وصل المشروع؟

تم إعداد خطط نزع الملكية للمشروع، وبدأت أعمال نزع الملكية في بعض المناطق.

بدأت أعمال البناء، وتم تحديد مواقع البناء في المناطق المعنية.

من المقرر الانتهاء من بناء المشروع في أكتوبر **2028**.

ANTALYA ALANYA OTOYOLU

ئۆتۆبانی ئەنتالیا-ئالانیا

نامیلکەی زانیاری

نابی 2025

دەرئەنجامەکانی دەرپڕینی ڕا و بۆچوون

پرۆسەی ÇSED کە لە چوارچێوەی پرۆژەی ئۆتۆبانی نەنتالیا-نالانیادا پەڕیوەدەچێت، لەسەر بنەمای وەرگرتنی ڕا و بۆچوونی هەموو لایەنە کەس و دامەزراوانەی کە ڕەنگە کاریگەریی پرۆژەکەیان لەسەر بێت یان گرنگی پێ پرۆژەکە دەدەن.

ئەم کەس و ڕێکخراوانە وەک "لایەنی پەیوەندیدار" پێناسە دەکرێن و ئەمانە لەخۆدەگرن:

- ✓ دامەزراوە گشتییەکان لەسەر ناستی نیشتمانی و ناوخۆیی
- ✓ ڕێکخراوەکانی کۆمەڵگەی مەدەنی کە گرنگی بە بابەتە ژینگەیی، کۆمەڵایەتی یان نابووریییەکان دەدەن
- ✓ خاڵکی ناوچەکە کە ڕاستەوخۆ کاریگەریی پرۆژەکەیان لەسەرە و ئەو کەسانەی کە بڕیوییان لەسەر ئەم ناوچانەیە

ئەم نامیلکەیە وەک یەکێک لە پرۆسەی پەشداربێنکردنی لایەنە پەیوەندیدارەکان ئامادەکراوە. ئامانج لێی پێشکەشکردنی زانیارییە بە زۆرترین ژمارەی خاڵک سەبارەت بە پرۆژەکە و بانگهێشتکردنیانە بۆ هاویەشیکردنی ڕا و بۆچوونەکانیان. بەم شێوەیە، بۆ ئەوە ئامادەکراوە کە لە کاتی گەشەپێدانی پێشنیارەکان و دیاریکردنی ڕێوشوێنەکانی کەمکردنەوەی کاریگەرییەکاندا، ڕا و بۆچوونی لایەنە پەیوەندیدارەکان لەبەرچاو بگیرێت.

ڕا و پێشنیار و بیرۆکەکانتان سەبارەت بە پرۆژەی ئۆتۆبانی نەنتالیا-نالانیا دەتوانن لە ڕێگەی سندوقەکانی سکاڵا و پێشنیار لە یەکە نیشتەجێبوونەکان و هەروەها لە ڕێگەی ئەم کەناڵانەی خوارەوە پێمان بگەیەنن:

کۆمپانیای پشکی هاوبەشی وەبەرهێنان و کارپێکردنی دروستکردنی ڕێگاوبانی نەنتالیا نالانیا (Antalya Alanya (Otoyolu İnşaat Yatırım ve İşletme A.Ş.

کارەکانی هەڵسەنگاندنی کاریگەریی ژینگەیی و کۆمەڵایەتی(ÇSED)

لە چوارچێوەی پرۆژەی ئۆتۆبانی نەنتالیا-نالانیا، پرۆسەی هەڵسەنگاندنی کاریگەریی ژینگەیی و کۆمەڵایەتی (ÇSED) دەستی پێکردووە. کاریگەرییە نەگەرییەکانی پرۆژەکە لەسەر ژینگە و ژیانی کۆمەڵایەتی دیاریکراون، هەڵسەنگاندنیان بۆ کراوە و ڕێوشوێنی پێویست بۆ کەمکردنەوەی ئەم کاریگەرییانە پێشنیار کراون.

کۆمپانیای وەبەرهێنان و پەڕیوەبردنی دروستکردنی ئۆتۆبانی نەنتالیا-نالانیا (AAOİAŞ) (Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ) کە پرۆژەکە پەڕیوە دەبات، کۆمپانیای ئینکۆن بۆ ڕاوێژکاری ژینگەیی سنووردارای ENCON Çevre (Danışmanlık Ltd. Şti. بۆ ئەنجامدانی ئەم کارە ڕاسپاردووە.

بارودۆخی ژینگەیی و کۆمەڵایەتیی ئێستا، لە ماوەی پرۆژەکەدا یەردەوام لەبەرچاو دەگیرێت.

بابەتە سەرەکییەکانی ژینگەیی و کۆمەڵایەتی کە لە چوارچێوەی کارەکانی ÇSED بە وردی لێکۆڵینەوەیان لەسەر کراوە، لە خوارەوە کورتکراوەتەوە:

- ✓ گۆڕانکارییە هەرێمییەکان لە یەکارهێناتی زەوی و سەرچاوەکانی داهاتی نیستا
- ✓ گۆڕانکارییە نەگەرییەکان لە ناستی ژاوەژاو و کوالێتیی هەوا
- ✓ ناڕاحەتییەکانی نەگەری یەهۆی چالاکییەکانی دروستکردنەوە
- ✓ دابینکردنی کەرەستەکانی دروستکردن و قرتدانی باشماوەکان
- ✓ بابەتەکانی پەیوەست بە سەلامەتیی ڕێگا و هاتووچۆ
- ✓ کاریگەرییەکان لەسەر نشینگەی سروشتی و نازەڵان و ڕووەکی ناو ئەم نشینگانە
- ✓ شوێنە گرنگەکان لە ڕووی میراتی کولتوورییەوە و نەگەری دۆزینەوەی باشماوە شوێنەوارییە نەزانراوەکان
- ✓ باراستنی بارودۆخی ژیانی خاڵک، بەتایبەتی گرووپە هەستیارەکان وەک ژنان و پەسالاچووان
- ✓ کاریگەرییەکانی پرۆژەکە لەسەر نابووریی ناوخۆیی، کشتوکاڵ و سەرچاوەکانی بژێوی
- ✓ مەترسییە نەگەرییەکان لە ڕووی تەندروستی و سەلامەتیی گشتییەوە و ڕێوشوێنەکانی پێویست

سوودە چاوەڕوانکراوەکانی پڕۆژەکە چین؟

سوودەکانی بۆ تۆڕەکانی گواستنەوە و بەکارهێنەرانی ڕێگا:

- ✓ ناسانکردنی گەیشتن بە پارێزگا دراوسێکان وەک بوردور، نیسپارتا، قۆنیا، کارامان و مێرسین
- ✓ دابینکردنی گواستنەوەی بێ بچران، سەلامەت و خێرا لە نێوان نەتنالیا و نالانیا
- ✓ کەمکردنەوەی بارى هاتووچۆی سەر ڕێگای D-400ی نێستا و سووکردنی قەرەبالغی
- ✓ کورتکردنەوەی بەرچاوی ماوەی گەشتکردن و زیادکردنی ناسوودەیی گەشت
- ✓ دروستکردنی ڕێڕەوێکی جێگرەوەی بەتوانای بەرز بۆ بەرەنگاربوونەوەی قەرەبالغی هاتووچۆ لە وەرزی گەشتیاریدا
- ✓ پشتگیریکردنی یەکگرتنی هەرێمی لە ڕێگەی زیادکردنی دەرفەتی گەیشتن بە ناوچە جیاوازەکان بە درێژایی ڕێڕەوەکە

سوودە کۆمەڵایەتی و نابووریيەکان:

- ✓ دابینکردنی هەلی کاری ناوخۆیی لە قۆناغەکانی دروستکردن و بەڕێوەبردنی پڕۆژەکەدا
- ✓ گەیشتنی خێراتر و ئاسانتر بە ناوەندەکانی خوێندن، تەندروستی، گەشتیاری و بازرگانی لە ڕێگەی نۆتۆبانەوە
- ✓ پاراستنی تازەیی بەرهەمە کشتوکاڵییەکان (بەتایبەتی مزرەمەنییەکان، سەوزە و گوڵ) و زیادبوونی بەهای نابووریيان لە ڕێگەی گەیاندنیان بە بازارەکان لە ماوەیەکی کورتتردا
- ✓ کەمکردنەوەی ڕووداوەکانی هاتووچۆ و گیانلەدەستدانی بەهۆیانەوە لە ڕێگەی زیادکردنی سەلامەتیی ڕێگا
- ✓ زیادبوونی سەلامەتی لە گواستنەوەدا بەهۆی کەمبوونەوەی هاتووچۆی نۆتۆمبێلی بارهەڵگری قورس لەسەر ڕێگای گوندەکان و ڕێگا گرێدەرەکان
- ✓ کەمبوونەوەی بەکارهێنانی سووتەمەنی و دەرهاوێشتە هەواییەکان بەهۆی کورتبوونەوەی ماوەی گەشت
- ✓ کەمبوونەوەی ئاستی زاوەزاو لە کاتەکانی شەودا بەهۆی کەمبوونەوەی بارى هاتووچۆی ناو شار، بەتایبەتی هاتووچۆی نۆتۆمبێلە قورسەکان وەک بارهەڵگر و پاس
- ✓ هاندانی گەشەپێدانی ناوخۆیی و زیادکردنی سەرنجڕاکێشیی وەبەرهێنان بەهۆی بوونی زێرخانێکی گواستنەوەی مۆدێرن
- ✓ بەرزبوونەوەی ئاستی سەلامەتیی کۆمەڵایەتی لە ڕێگەی کورتکردنەوەی ماوەی وەڵامدانەوە لە حاڵەتە لەناکاوەکاندا (بۆ نموونە ئاگرکەوتنەوە، ڕووداوی هاتووچۆ و هتد.)

پێکهاتەکانی پڕۆژەکە چین؟

نۆتۆبانی نەتنالیا-نالانیا لە یەکترپڕی سێرکەوە دەست پێدەکات، پاشان ناراستەی پڕۆژەهەڵات دەگرێتەبەر و بەدوای ئەو ڕێڕەوەدا دەڕوات کە دەکەوێتە بنارى چیاکانی تۆرۆس لە ستووری قەڕاکانی سێرک و ماناڤگات، و لە یاکووری کۆناکلی لە یەکترپڕی نالانیادا کۆتایی دێت.

بەشەکانی نۆتۆبان بەپێی گرێبەستە

ڕێگای سەرەکی (نۆتۆبان): 84کم
ڕێگا گرێدەرەکان: 33,8 کم
کۆی گشتی درێژی: 117,8 کم

پێکهاتە سەرەکییەکانی بیناسازی

- ✓ پردە دۆڵییەکان (ڤیادەکت)
- ✓ پردەکان
- ✓ ژێرپارەکان و سەرپارەکان
- ✓ کاتاڵەکانی ناو
- ✓ خاڵەکانی وەرگرتنی باجی نۆتۆبان
- ✓ ناوچەکانی خزمەتگوزاری
- ✓ ناوەندەکانی چاککردنەوە و بەڕێوەبردن

پڕۆژەکە لە چ قۆناغێکدایە؟

لە جوارچێوەی پڕۆژەکەدا، پلانەکانی یەخاوەنکردنی گشتی (نیستملاک) نامادەکراون و لە هەندێک ناوچەدا کارەکانی یەخاوەنکردنی گشتی دەستپان پێکردووە.

چالاکییەکانی دروستکردن دەستپان پێکردووە و لە یەشە یەیوەندیدارەکاندا شوێنی کار (شەنتیە) دامەزراون.

پلان وایە چالاکییەکانی دروستکردنی پڕۆژەکە لە تشرینی یەکەمی 2028 دا تەواو بن.

ANNEX-5.A: GLAC – Affected Lands

ANTALYA ALANYA MOTORWAY

ANTALYA – ALANYA MOTORWAY PROJECT

RESETTLEMENT ACTION PLAN (RAP)

GUIDE TO LAND ACQUISITION AND COMPENSATION (GLAC)

– AFFECTED LANDS –

OCTOBER 2025

REVISION 1

CONTENT

A.	INTRODUCTION
B.	PROJECT DESCRIPTION
C.	LAND ACQUISITION STATUS AND DISPLACEMENT IMPACTS

G.	PROJECT GRIEVANCE MECHANISM
H.	CONTACT INFORMATION FOR STAKEHOLDERS

APPENDIX: GENERAL DIRECTORATE OF HIGHWAYS' (KGM) BOOKLET REGARDING PROCEDURAL STEPS IN EXPROPRIATION ACTIVITIES

A. INTRODUCTION

1. What is Antalya-Alanya Motorway Project?

The **Antalya-Alanya Motorway** Project (the "**Project**") is a Public-Private Partnership (PPP), with the **Public Partner** – being the Republic of Türkiye Ministry of Transportation and Infrastructure (MoTI), represented by the **Directorate General of Highways (KGM)**, and the **Private Partner** – being the **Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş.** (the Assigned Company).

Implemented under a **Build-Operate-Transfer (BOT)** model, the Project is one of two sub-projects that constitute the broader Afyonkarahisar-Alanya Motorway Project, which was initially tendered in 2010.

The Project is located in **Antalya province,** southern Türkiye and traverses the boundaries of **three districts** – **Serik, Manavgat and Alanya** – which are key touristic and commercial hubs of the country.

2. Who is the Granting Authority under the BOT Contract?

Within the context of the BOT Implementation Contract, the **Granting Authority** is the **Republic of Türkiye Ministry of Transportation and Infrastructure** (MoTI), represented by the **Directorate General of Highways (KGM)**. KGM is responsible for implementing the land acquisition and expropriation works required for the Project in accordance with the Expropriation Law of Türkiye.

3. Who is the Assigned Company under the BOT Contract?

The Company assigned under the BOT Implementation Contract is **Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş**. – a Special Purpose Vehicle (SPV) established by **Limak İnşaat Sanayi ve Ticaret A.Ş., an affiliate of Limak Holding**.

The Assigned Company is responsible for the **design, construction, financing, operation, and maintenance** of the Motorway until its transfer to KGM at the end of the BOT concession period.

4. What are the Project's Applicable International Standards

The Project is financed by international financial institutions (IFIs) and commercial banks. A Finance Agreement was signed between the Assigned Company and the Lenders on 6 October 2025.

The following international standards are applicable to the Project:

- **International Finance Corporation (IFC)** Performance Standards (PSs) (2012),
- **Equator Principles (EP) 4** (2020), and
- **Asian Infrastructure Investment Bank (AIIB) Environmental and Social Framework** (2019)**.**

5. Why has a Resettlement Action Plan (RAP) been prepared, and how will it be implemented?

The land acquisition required for the Project results in risks and impacts related to both physical and economic displacement. Accordingly, a **Resettlement Action Plan (RAP)** has been prepared in line with applicable international standards, with the objective of developing and implementing measures to mitigate these risks and impacts on individuals owning and/or or using the affected lands and houses, as well as on the employers and employees of impacted businesses.

The entitlements, measures, and livelihood restoration and improvement programs under RAP are in addition to the compensation provided by KGM in accordance with the Expropriation Law. The additional costs associated with RAP implementation will be covered by the SPV **through the RAP Fund, which is allocated and managed by the SPV –** separate from KGM's Expropriation Budget.

The **RAP is a living document** and will be updated as necessary.

It is disclosed in Turkish and English under the Project's ESIA Package at the Project website (www.antalyaalanyaotoyolu.com.tr).

The RAP will be implemented by the SPV in collaboration with KGM. The RAP implementation period will cover a duration of **36 months**, commencing from the singing of finance agreement, though **implementation of the key principles by the SPV has already commenced.**

6. What other Environmental and Social (E&S) studies have been undertaken for the Project?

The Project secured an **EIA Positive Decision** on 17 August 2018, in accordance with the Environmental Impact Assessment (EIA) Regulation in force at the time.

Additionally, an **Environmental and Social Impact Assessment (ESIA) package,** including a Non-technical Summary (NTS), Stakeholder Engagement Plan (SEP) and E&S Management Plans, compliant with the applicable international standards, has been prepared for the Project and disclosed in Turkish and English at the Project website (www.antalyaalanyaotoyolu.com.tr).

7. How the RAP has been reviewed independently?

Potential Lenders of the Project retained an independent **Environmental and Social Consultant (IESC)** in October 2024 to carry out an **Environmental and Social Due Diligence (ESDD)** review.

The purpose of the ESDD was to conduct an independent review of the Project's ESIA package – including the RAP – and to evaluate the compliance of land acquisition activities with the standards and requirements of the Lenders. Based on this review, the IESC also developed an **Environmental and Social Action Plan (ESAP).**

The RAP implementation will be periodically monitored by the **Lenders' IESC.**

8. Why this Guide to Land Acquisition and Compensation (GLAC) has been prepared?

This GLAC has been prepared to provide people affected by Project-related land acquisition ("Project Affected People" or "PAPs") with a clear and concise overview of **the expropriation process carried out by KGM** in accordance with the Expropriation Law, and summarise the **key principles of the RAP,** particularly regarding additional compensation and assistance measures that go beyond the legally mandated cash compensation to ensure alignment with international standards and Lender requirements.

In addition, this GLAC outlines how affected people can apply to the SPV to access RAP entitlements and convey their grievances, inquiries, and feedback to the Project parties.

There are three versions of the GLAC: (i) for affected lands, (ii) for affected houses, and (iii) for affected businesses. This version is the GLAC concerning affected lands.

B. PROJECT DESCRIPTION

9. What are the key Project Components?

The Project, designed as a **dual carriageway**, has a total length of **117.8 km**, encompassing both the main Motorway (84 km – 2x3 lanes) and connection roads (33.8 km – 2x2 lanes).

Other key Project components include **7** main interchanges, **5** tunnels, **16** viaducts, **22** bridges, **56** overpasses, **43** underpasses, and **308** culverts, with **auxiliary features** including an Operational and Maintenance (O&M) Centre, four Motorway Service Facilities, toll collection areas and temporary construction facilities.

10. Are there any associated facilities of the Project?

There are no additional associated facilities in the current design. Please refer to Question 15 for information regarding temporary facilities to be used during construction.

11. What is Motorway Expropriation Corridor?

The **expropriation corridor** defines the boundaries within which land acquisition, expropriation and all construction activities are carried out for the Motorway and associated connection roads.

The width of the expropriation corridor varies along the route, with the minimum and maximum widths as follows?

- **Minimum width: ~ 55 m**
- **Maximum width: ~450 m** (at the location of service areas)

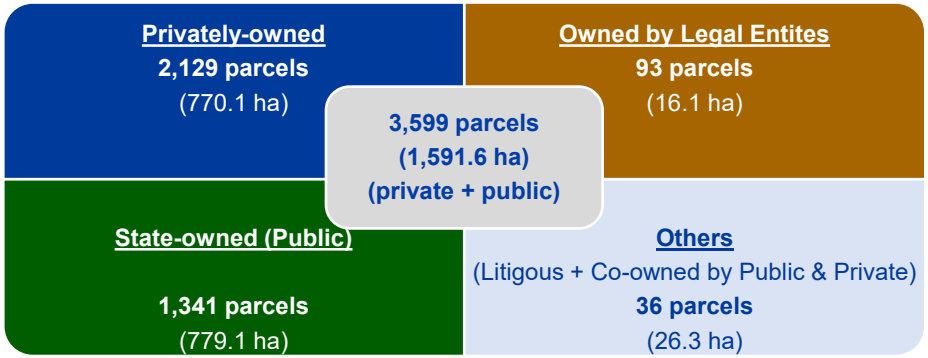
12. Which Settlements are affected within the Expropriation Corridor?

The land acquisition for the Project affects 3 districts and 57 neighbourhoods.

- **Serik (12 neighbourhoods):** Deniztepesi, Sariabali, Yukarikocayata, Asagikocayatak, Kayaburnu, Dikmen, Candir, Asagicatma, Cumali, Burmahanci, Urundu, Belpinar
- **Manavgat: (34 neighbourhoods):** Cakis, Tasagil, Gundogdu, Hocalar, Yavrudogan, Colakli, Seki, Kalemler, Evren, Ilica, Yenikoy, Siseler, Evrenleryahsi, Dolbazlar, Yukariisiklar, Dikmen, Bucakseyhler, Ulukapi, Asagisiklar, Demirciler, Karaoz, Aksaz, Haciali, Cevizler, Sulek, Haciisali, Haciobası, Kızılot, Uzunlar, Kadilar, Orensehir, Yalcidibi, Odaonu, Karakaya
- **Alanya (11 neighbourhoods):** Alara, Cakallar, Incekum, Avsallar, Akdam, Turkler, Payallar, Emisbeleni, Toslak, Telatiye, Elikesik

13. How many Parcels are Affected?

There are **3,599 private, legal entity, and public (state-owned)** parcels to be acquired **within Project's expropriation corridor.**



14. What is the land registry type of affected parcels?

The majority of the affected parcels are registered as **agricultural land**, **road**, and **forest**.

Number of Parcels per Land Registry Type (3,599 parcel)	Area of Parcels per Land Registry Type (1,591.6 ha parcel)
• **Agricultural** (2,507 parcel)	• **Agricultural** (825.6 ha)
• **Road** (258 parcel)	• **Forest** (553.5 ha)
• **Forest** (149 parcel)	• **Road** (53 ha)
• **Land with structures** (148 parcel)	• **Land with structures** (42.2 ha)
• **Constructible plot** (87 parcel)	• **Constructible plot** (9.1 ha)
• **Orchard** (101 parcel)	• **Orchard** (21.7 ha)
• **Raw soil** (83 parcel)	• **Raw soil** (15.8 ha)
• **Litigous** (13 parcel)	• **Litigous** (12.2 ha)
• **Pasture** (3 parcel)	• **Pasture** (0.2 ha)
• **Others** (250 parcel)	• **Others** (58.3 ha)

15. Which temporary facilities will be required during construction?

During the **construction phase**, the Project will utilise various temporary facilities, including **construction camp sites**, **production plants and facilities** (such as concrete batching plants, crushing/mechanical plants, and asphalt plants), as well as **quarries** and **excavated material storage sites**.

A list of planned facilities is included in the RAP.

Construction Camp Sites	• Temporary Construction Camp (KM 59+500) • Main Construction Camp Site (KM 64+500) • Manavgat Construction Camp Site (KM 87+500) • Alanya Construction Camp Site (124+300)
Plants and Facilities	• 7 concrete plants • 4 crushing/mechanical plants • 3 asphalt plants
Quarries	• 11 potential quarries
Excavated Material Storage Sites	• 20 potential excavated material storage sites

16. How is the private land for temporary facilities acquired by the Project?

Private parcels required for temporary facilities are acquired by the SPV/EPC through rental agreements, mutual protocols, or other similar arrangements made with the landowners or shareholders. Upon completion of temporary use, the land is rehabilitated and returned to the owner in accordance with the agreed terms.

17. What are key milestones in the Project schedule?

No	Key Milestones / Tasks	Date
0	**BOT Contract Signing, Site Delivery**	14 October 2024
1	**Expropriation**	
1.1	Start of inventory of assets and valuation study commenced by appointed valuation contractor	November 2024
1.2	Start of expropriation procedures – through Article 8 negotiations – by KGM	February 2025
1.3	Completion of valuation	Q4 2025 (*target*)
1.4	Completion of Article 8 negotiations as part of expropriation procedures undertaken by KGM	
	Phase 1: KM 52 – 56; KM 74 – 104; KM ~64 (O&M Centre), KM ~80 (Concrete Plant)	February – August 2025 (***completed***)
	Phase 2: KM 56 – 74; KM 104 – 116; Connection Roads: Manavgat East, D-400, Serik	September 2025 – January 2026 (*target*)
	Phase 3: KM 116 – 141; Connections roads: Taşağıl, Manavgat, Alarahan and Konaklı	April 2026 (*target*)
2	**E&S Studies and Finance Agreement**	
2.1	Start of ESIA Package studies	March 2024
2.2	Start of RAP studies	April 2025
2.3	ESIA Package Disclosure by SPV, Lenders (60 days)	Q2 and Q3 2025
2.4	Finance Agreement Signing	6 October 2025
3	**Construction Works**	36 months after Signing
3.1	Land entry by the Project for design-related activities	November 2024
3.2	Site Mobilisation and Start of Construction	March 2025
3.3	Earthworks and Construction of Engineering Structures (incl. Connection Roads)	January 2028
	KM 52+000 – 80+000	November 2027 (*target*)
	KM 80+000 – 114+750	January 2028 (*target*)
	KM 114+750 – 141+705	November 2027 (*target*)
3.4	Tunnels, Viaducts, Superstructure, O&M Centre, Motorway Service Facilities (MSFs) and Other Secondary Works	March 2028
4.	**Motorway Commissioning**	Within 36 months from the date of signing the finance agreement

C. LAND ACQUISITION STATUS AND DISPLACEMENT IMPACTS

18. What is the status of land acquisition?

A **Public Benefit Decision** (No: 2023/371) for the Project was declared by the MoTI on **28 November 2023.**

A Presidential Decree (No. 9708) concerning the **Accelerated Expropriation** of certain immovable properties under the scope of the Project (located within the settlements covered by the Decree) by the KGM in line with **Article 27 of the Expropriation Law of Türkiye** (Law No. 2942, 1983) was published in the Official Gazette (No. 32857) on **30 March 2025.**

The **Expropriation Decisions** were taken for the Project by KGM between December 2024 and May 2025.

Pursuant to these decisions, **land acquisition activities for the Project commenced in February 2025**.

- Between February and August 2025, expropriation procedures were initiated for 22% of the **private parcels through Article 8 invitations and negotiation meetings.** and
- KGM has resorted to the **accelerated expropriation** for **3%** of the **private parcels.**
- Forestry permits have been obtained for over 75% of the forest lands located within the Motorway's expropriation corridor.

Planned Schedule of Article 8 Negotiation Meetings

Negotiation Meeting Date	Settlements
Completed between February – September 2025	Serik: Deniztepesi, Sarıabalı
	Manavgat: Şişeler, Taşağıl, Aksaz, Cevizler, Demirciler, Hacıali, Hacıisalı, Hacıobası, Karaöz, Sülek, Aşağıışıklar, Bucakşeyhler, Dikmen, Ulukapı, Yukarıışıklar, Dolbazlar, Evrenleryavşi, Kalemler, Seki, Yeniköy, Şişeler
October 2025 *(planned)*	Manavgat: Kadılar, Karakaya, Odaönü, Örenşehir, Uzunlar, Yalçıdibi
November 2025 *(planned)*	Serik: Aşağıkocayatak, Çandır, Dikmen, Kayaburnu, Yukarıkocayatak
	Manavgat: Çakış, Çolaklı, Gündoğdu, Hocalar, Taşağıl, Yavrudoğan
November 2025 *(planned)*	Manavgat: Hacıobası, Kızılot
January – February 2026 *(planned)*	Serik: Deniztepesi, Sarıabalı, Üründü, Belpınarı, Burmahancı, Cumalı, Aşağıçatma
February – April 2026 *(planned)*	Manavgat: Evren, Ilıca
	Alanya: Alara, Çakallar, Akdam, İncekum, Avsallar, Türkler, Payallar, Emişbeleni, Toslak, Telatiye, Elikesik

19. What is the status of land entry and construction?

The site was officially delivered by KGM to the SPV in October 2024, following the signing of the BOT Contract.

After site delivery, design-related activities – including drilling operations– were initiated in **November 2024**.

Site mobilisation for Project construction began in **March 2025**, financed through the Company's own equity.

Currently, **construction works are ongoing primarily on forest parcels**, for which forestry permits have been obtained.

As the expropriation of privately owned parcels is finalised, construction activities are also initiated by the SPV and EPC on those parcels following the compensation payments by KGM, in line with the national Expropriation Law, and the provision of additional support by the SPV under the RAP.

20. What are the potential displacement impacts of the Project and who would be affected?

Permanent or temporary land acquisition for the Project will lead to **physical or economic displacement** for the **owners and/or users (formal or informal)** of the affected lands and structures.

The land acquisition-related impacts are primarily classified under the following:

(i) **Affected lands** (may include non-residential and non-commercial structures)
(ii) **Affected houses** (299 building on 231 parcels with 341 households)
(iii) **Affected greenhouses** (599 greenhouse units on 347 parcels)
(iv) **Affected businesses** (29 businesses to be relocated + 8 roadside local product vendors operating on lands already expropriated by KGM)
(v) **Impacts on vulnerable people**
(vi) **Temporary losses/impacts during construction**, and
(vii) **Impacts during operation**

21. Will there be further land acquisition beyond the current expropriation Corridor?

The Project may require **further land acquisition** beyond the currently defined expropriation corridor, either during construction or, on a limited basis, after commissioning.

In case of future land acquisition requirements, the required land will be acquired by KGM in line with the Expropriation Law. Potential displacement impacts and access restrictions associated with such land acquisition or expropriation will be managed by the SPV – in collaboration with KGM – in accordance with the RAP principles.

22. What are the cumulative land acquisition and resettlement impacts of the Project?

Cumulative land acquisition impacts may arise when landowners or users are affected by multiple, overlapping land-related acquisitions linked to the Project or other developments in the region or directly to the Project.

During RAP implementation, a field-based cumulative impact assessment study will be conducted by the SPV, with support from third-party technical consultants, to make parcel-based identification of affected owners and users, assess and address these impacts under the specific budget allocated by the SPV.

D. EXPROPRIATION PROCESS IN LINE WITH EXPROPRIATION LAW

23. What is the legal basis of the expropriation process?

In the Republic of Türkiye, expropriation is carried out in accordance with **Article 46 of the Constitution** and implemented through the provisions of **Expropriation Law (No. 2942).**

The **Directorate General of Highways (KGM)** is responsible for the expropriation of privately-owned parcels in accordance with Türkiye's Expropriation Law (No. 2942), as well as coordinating the allocation of public parcels.

According to the BOT Contract, the SPV is responsible for covering a portion of the expropriation costs for the Project. The amount to be covered by the SPV is specified in the BOT Contract. Any costs exceeding this specified amount will be covered by KGM.

24. Which procedures does KGM carry out under the Expropriation Law?

Land acquisition is conducted through either negotiated settlement (Article 8) or judicial expropriation.

For detailed information on the expropriation process carried out by the KGM and its procedural steps, please refer to the booklet titled *"**Procedural Steps in Expropriation Activities Conducted by the General Directorate of Highways**"*, which has been distributed by the SPV alongside this GLAC.

25. Who is eligible for compensation under the Expropriation Law?

Under national legislation, the following categories of PAPs are eligible for compensation:

Affected Asset	Eligible PAPs
Private Parcels	• **Owners** of lands, trees, crops, structures on affected lands • **Formal land users** (with official documentation) for trees, structures, crops on affected lands • **Informal land users who have evidence** of structure and tree ownership on affected lands (eligible under Exp. Law - Art. 19) • **Litigant owners/shareholders or formal and informal users of litigious parcels**
Public Lands	• **Formal public land users** (who have official documentation, e.g. adequate pay "*ecrimisil*", rental agreement) for trees, crops, and structure • **Informal public land users who have evidence** of structure and tree ownership on affected lands (eligible under Exp. Law - Art. 19)
Greenhouses	• Owner of the greenhouse – owner/shareholder of the private land • Owner of the greenhouse – formal tenant of the land, owner of the greenhouse • Formal tenant of the greenhouse on lands owned by others (not the owner of the greenhouse) • Owner of the greenhouse – informal user of treasury lands (with no official documentation for land use but can prove their ownership of the structure) • Owner of the greenhouse – informal user of forest and pasture lands or with no official documentation proving their ownership of the structure

E. COMPENSATION AND ENTITLEMENTS UNDER RAP TO MEET INTERNATIONAL STANDARDS

26. What additional compensation and entitlements are provided by the SPV through RAP implementation, beyond those offered by KGM under the Expropriation Law?

In addition to the compensation provided by KGM in accordance with the Expropriation Law, **the SPV implements supplementary compensation and livelihood restoration measures under the RAP** for owners as well as formal and informal users of affected lands, and greenhouses.

The SPV has established a dedicated **RAP Fund** for covering all costs arising from the implementation of additional measures beyond those required under national legislation. This Fund is allocated and managed by SPV, in coordination with KGM.

27. What are the Key Compensation and Assistance principles outlined in the RAP?

- Avoidance of Forced Eviction: The Project will not carry out forced evictions except in accordance with national legislation and the requirements of IFC PS5.
- Prioritisation of Purchase through Negotiated Settlement over Expropriation: KGM has prioritised negotiated settlements through Article 8 (purchase method). Article 27 will be used by KGM as a last resort, only after Article 8 process.
- Compensation at Full Replacement Cost: All compensation to people affected by land acquisition will be provided at full replacement cost. This includes market value plus any applicable transaction costs, as required by Lenders.
- Livelihood Restoration and Assistance in addition to cash compensation: The SPV will provide livelihood restoration and assistance measures to eligible affected people, including owners and users of affected houses and lands, as well as their formal and informal users, in accordance with the requirements of the Lenders.
- Early Consultations and Notification for Land Acquisition Process:

  Affected houses: The SPV will notify the owners and tenants of affected structures at least **three months** in advance of the commencement of expropriation, in alignment with KGM's expropriation programme. This is intended to avoid forced eviction and allow sufficient time (more than six months) for resettlement planning.

  In cases where expropriation has already been concluded, the SPV will inform property owners of the Project schedule. Each owner will be granted a six-month notice period to vacate the property following notification, unless a mutually agreed alternative timeframe is established.

  Affected lands: The SPV will notify **users of affected lands at least three months** before land entry.

  Land entry will only proceed after the completion of the expropriation process – including payment – or upon finalisation of mutual agreements.
- Vulnerable Groups: The SPV will pay specific attention to vulnerable individuals and households, and provide tailored assistance in line with the measures outlined in the RAP. In-kind support will be provided by the SPV to the vulnerable households.

  The identification of vulnerable individuals and households has already been initiated as part of the RAP process. Households to be provided with support will be further determined (depending on their vulnerability levels) by the SPV, with support from third-party implementation partners and consultants, during RAP implementation.

28. What is Cut-off Date for Eligibility?

The **cutoff date** is the date after which any new structures, trees, crops, and other immovable assets will no longer be counted or measured for compensation purposes.

The cut-off dates are determined **based on the completion date of the census and asset inventory surveys** conducted in each respective settlement. Therefore, the cutoff is specific to each affected settlement.

The SPV posts the list of affected parcels along with a notice disclosing the applicable cut-off date and its conditions. These are posted in the offices of the mukhtars, local coffee houses, and other appropriate public venues (such as mosques and community gathering spaces used by local men and women) within the respective affected settlements.

29. Who is Eligible for Compensation and Assistance under RAP?

All people affected by the Project and owning and/or using (formally or informally) the affected lands and assets **before the cut-off dates** defined in the RAP are eligible for compensation and assistance under RAP.

Accordingly, **people who encroach on the Project area after the cut-off date** are **not** eligible for compensation or assistance provided through the implementation of the RAP.

Regarding the affected lands, all persons using the lands for generating agricultural income (including both formal and informal users – regardless of their total productive agricultural area) will be eligible for entitlements and livelihood restoration and improvement measures defined in the RAP.

PAPs who believe they have not been included in the process or are eligible for the entitlements can apply to the Project CLOs with the required documents and an application letter. Their eligibility for compensation and/or assistance will be evaluated by the SPV. After the evaluation, they will be informed of the outcome, and if deemed eligible, they will be granted access to the relevant compensation and/or assistance.

The eligibility categories identified in the RAP are as follows:

Affected Lands	• Landowners (private parcels) • Formal and informal land users (private and public parcels used for agriculture and grazing) • Users of litigous properties • Owners, formal and informal users of orphan and fragmented parcels • Users of forest parcels for economic activity • Owners of affected crops and trees on affected lands • Owners of non-residential and secondary structures on affected lands (maybe formal or informal user of affected land) • Vulnerable landowners and land users • Owners, formal and informal users of parcels acquired through constitution of servitude
Affected Greenhouses	• Owner of the affected greenhouse, owner of land • Owner of the affected greenhouse, formal or informal user of the land • Tenant of the affected greenhouses • Vulnerable landowners or land users
Lands subject to Temporary Losses and Impacts during Construction	• Owners of lands and structures affected temporarily • Formal and informal users of and structures affected temporarily • Beneficiaries of infrastructures and services termpoarily affected during construction

30. What are the RAP entitlements specific for owners and users of affected private parcels?

- **Owners and Shareholders of Affected Private Parcels**

Under the Expropriation Law of Türkiye, **owners and shareholders** of affected private parcels are entitled to receive cash compensation from KGM for their affected land, structures (after depreciation is deducted), trees and crops that cannot be harvested.

The owners and shareholders of affected private parcels are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- **Assistance in searching replacement land** that is of similar quality, size, and location, subject to availability.
- Compensation to cover **transaction costs** applicable to the acquisition of replacement, if replacement land of similar quality, size, and location is identified by the PAPs who reach an agreement with KGM under Article 8.
- SPV support to cover **small costs** for official expropriation procedures (such as power of attorney costs, working capital fund for title deed transactions, inner and inter city transportation costs, etc.)
- SPV support for **relocating movable assets** to an alternative land determined by PAP.
- **Access to livelihood restoration, improvement and assistance measures** (as outlined under Question 35) provided by SPV through RAP Fund if land is used for economic activity.

> ***Important Note to PAPs**: Regarding expenditures such as transaction costs or small costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Formal and Informal (Agricultural) Users of Affected Private Parcels:**

Under the Expropriation Law of Türkiye, **formal or informal users** of affected private parcels are **not** entitled to receive cash compensation from KGM. However, they are compensated for their trees and any structures or fixed improvements/investments (after depreciation is deducted) on the rented land, provided they can demonstrate ownership of these crops and assets.

The users of affected private parcels are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- **Assistance in searching replacement land** that is of similar quality, size, and location, subject to availability.
- **One-off transitional support equivalent to the 1-year rental fee (**including any transaction costs such as new tenancy registration, fees to the authorities, cost of transport, etc.) of the lost agricultural land
- **For long-term formal tenants** (whether for greenhouses or open fields) who have paid rent in advance, guidance by the SPV regarding the legal procedures to follow to obtain a refund for the unused portion of the rental payment and if the unused portion of the rental payment cannot be obtained from the landowner, compensation of the outstanding amount by the SPV from the RAP Fund (such tenants and their tenancy agreement conditions will be determined by the SPV on a case-by-case basis during RAP implementation).
- **For long-term formal tenants** (whether for greenhouses or open fields), in cases where tenants are subject to fines under their lease agreements due to early termination, support or compensation by SPV to ensure that tenants are not disadvantaged (based on case-by-case review of the specifics of tenancy agreements).
- Notification of the user by SPV **three months in advance of land entry.**
- If land entry by the Project is required before the end of the harvesting period, **cash compensation for unharvested crops and products** (e.g., fruits) prior to land entry.
- SPV support for **relocating movable assets** to an alternative land determined by PAP.
- If there are major fixed improvements or investments (*including structures such as barns, sheds, depots, pools, etc.)* made or owned by the **informal user** on the affected land, top-up compensation in addition to the compensation paid by KGM (based on evidence of ownership) – in order to reflect market value as KGM compensates only for the **minimum material cost** under Article 19 of the Expropriation Law.
- Access to **livelihood restoration, improvement and assistance** measures (as outlined under Question 35) provided by SPV through RAP Fund.

> ***Important Note to PAPs****: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Litigant Owners and Shareholders:**

When there is a court dispute regarding the ownership of a litigious parcel, the rightful owners or shareholders eligible for compensation under the Expropriation Law are determined by the court in accordance with Article 18 of the Law.

The SPV will inform the litigant owners **about the land acquisition process**, as well as their rights and entitlements under this RAP.

Individual consultations will be held with the litigant owners/shareholders of parcels that contain houses and greenhouses to identify any specific vulnerabilities for design and delivery of tailored measures on a case-by-case basis.

The court proceedings will be monitored by SPV to mitigate any potentially exacerbated impacts arising from lengthy legal procedures.

If the case is concluded in favour of the litigant owner, they will be entitled to all RAP entitlements defined for private landowners.

- **Owners of Orphan Lands (Unacquired parts of Expropriated Parcels)**

For the unacquired portions that were not previously included in KGM's expropriation, the owner or shareholder of the affected parcel **has the right to formally apply to KGM**, in accordance with Article 12 of the Expropriation Law, to request the acquisition of the remaining part of the parcel if it is deemed economically unusable or undevelopable.

For all parcels, in line with the Expropriation Law and KGM's established practice, KGM accepts official applications from affected people – submitted within 30 days of receiving notice of expropriation by agreement – requesting the expropriation of orphan lands and evaluates each application on a case-by-case basis.

Relevant requests submitted by landowners to KGM through petitions will be periodically reviewed by the SPV as part of the Project's grievance mechanism. For cases where the acquisition request of the owners or shareholders is not positively concluded by KGM or where relevant grievances or claims are received by the Project, the SPV will engage a third-party valuation expert to review each case/claim individually and determine the actions required to be taken by SPV, if any.

- **Owners of Affected Crops**

According to Article 20 of the Expropriation Law, the evacuation of cultivated lands that are subject to expropriation must take place after the harvest period. If land entry occurs before harvesting, the crop owners are entitled to compensation.

The SPV will notify the crop owners at least **three** months in advance of land entry.

If land entry by the Project is required before the end of the harvesting period, **cash compensation for unharvested crops and products** (e.g., fruits) prior to land entry.

- **Owners of Affected Trees**

In accordance with the Expropriation Law, cash compensation is provided by KGM to the owner of the trees. Pursuant to Article 19 of the Expropriation Law, when trees are located on titled lands owned by others, on ownerless lands, or on lands not legally acquired by their possessors, compensation by KGM is paid to the possessor of the trees. This does not apply to trees on forest or pasture parcels.

The owners of affected trees are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

  - Notification of the tree owners at least **three** months in advance of land entry.
  - If land entry by the Project is required before the end of the harvesting period of the fruit trees, **cash compensation for unharvested products** (e.g., fruits) prior to land entry.
  - For fruit trees owned by informal users on **forestry or pasture lands**, which are not subject to compensation by KGM, **determination of the product value by a third-party valuation expert** commissioned by the SPV and provision of cash compensation reflecting this value to the informal users by the SPV from the RAP Fund.
  - Where needed, top-up cash compensation to compensate dense planting deduction applied by KGM, if any.
  - Commissioning of **third-party valuation expert** by the SPV for the verification of compliance of tree valuation with international standards, or and determination of the actions required to be taken by the SPV, where needed.
  - Commissioning of **third-party valuation expert** by the SPV for the review of any grievance, claim, or request raised during Article 8 negotiation meetings related to orchard valuation, and determination of the actions required to be taken by the SPV (such as provision of top-up compensation to cover any compensation gap with international standards), where needed.

- **Owners of major non-residential/secondary structures (may be the owner or formal or informal user of land)**

In accordance with the Expropriation Law, cash compensation for non-residential structures and infrastructure is provided by KGM. Depreciation is applied. As per Article 19 of the Expropriation Law, for buildings or structures located on titled lands owned by others, on ownerless lands, or on lands not legally acquired by their possessors, the minimum material cost of the structure is paid to the possessor.

The owners of *major* non-residential/secondary structures (*including structures such as barns, sheds, depots, pools, etc.)* are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

  - **Top-up cash compensation** to the structure owner (may be the land owner or formal land user with evidence) in order to cover the amount deducted for depreciation.
  - If there are major fixed improvements or investments made or owned by the **informal user** on the affected land (with proof of structure ownership), provision of **top-up compensation** by SPV in addition to the compensation paid by KGM – in order to reflect market value as KGM compensates only for the **minimum material cost** under Article 19 of the Expropriation Law.
  - **If the assets owner (informal land users) cannot prove her/his ownership claim,** commissioning of **third-party valuation expert** by the SPV for the review of the case and determination of market value for these assets for provision of cash compensation at full replacement cost by the SPV from the RAP Fund.

- **Owners of parcels to be acquired through constitution of servitude** (easement rights)

In accordance with Article 4 of the Expropriation Law, instead of acquiring full ownership of immovable assets, easement rights may be established through expropriation on a specific section, height, depth, or source of the immovable, provided that such rights are sufficient to serve the intended purpose.

Cash compensation is paid to the owners/shareholders for the alignments. As stipulated by the Law, ownership rights remain with the landowner, subject to the implementation of necessary safety measures.

They will be entitled to access livelihood restoration, improvement, and assistance measures provided by the SPV through the RAP Fund.

31. What are the RAP entitlements specific for the formal and informal users of affected public parcels?

Formal and informal users of public parcels are entitled to the same entitlements as those provided to formal and informal users of affected private parcels, as outlined under Question 30.

Additionally, if there are major fixed improvements or investments (*including structures such as barns, sheds, depots, pools, etc.)* made or owned by the informal user on the affected land – **excluding those on forest and pasture lands** – top-up compensation will be provided by the SPV from the RAP Fund to the informal user (based on evidence of structure ownership) – in order to reflect market value as KGM compensates only for the **minimum material cost** under Article 19 of the Expropriation Law.

If the trees and assets owned by informal users are located **on forestry or pasture lands**, which are not subject to compensation by KGM, their market value will be determined by a third-party valuation expert to be commissioned by the SPV. Cash compensation reflecting this value will be provided to the informal users by the SPV from the RAP Fund (based on evidence of structure ownership).

32. What are the Specific RAP Entitlements specific for the Owners and Users of Affected Greenhouses?

- **Owners of the Greenhouses – who own the Land**

In accordance with the Expropriation Law, cash compensation for greenhouses is provided by KGM to the owner of the greenhouse. Depreciation is deducted. In this Project, for parcels containing **greenhouses**, the parcel may be expropriated fully if the remaining area is **less than 400 m²** – subject to application by the PAPs and evaluation by KGM.

The owners of affected greenhouses – who own the Land – are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- Notification of the crop owners at least **three** months in advance of land entry.
- Top-up cash compensation to cover the amount deducted for **depreciation**;
- If not included in the expropriation value provided by KGM, additional cash compensation at full replacement cost to cover the cost of fixed (non-movable) investments and improvements made by the greenhouse owner, such as irrigation, heating, drainage, lighting system and components, etc. – a third-party valuation expert commissioned by the SPV will determine the associated costs on market prices.
- Compensation for costs incurred by greenhouse owners – whose greenhouses are partially expropriated – to support repair and adjustment works on the remaining portions, such as the rearrangement of irrigation or drainage systems, repair of greenhouse nylon covers, and similar interventions.
- If land entry by the Project is required before the end of the harvesting period, **cash compensation for unharvested crops and products** (e.g., fruits) prior to land entry. If the greenhouse is partially affected, crop compensation will be provided for the affected part.
- Assistance in searching a replacement site for the relocation of the greenhouse, if such relocation is planned by the greenhouse owner.
- If requested by the PAPs, support for the preparation of the land where the greenhouse will be reestablished – this may include the provision of construction machinery and labour, land levelling, provision of suitable topsoil stripped from Project areas, infrastructure connections for electricity, water, other utilities, etc.
- Assistance for rearranging the greenhouse to ensure continuity of operations (rearrangement of irrigation system, drainage system, heating system, etc.), if requested, if the greenhouse is partially affected and the owner continues operations on the remaining land.
- Arranging the full relocation or reimbursement of the moving costs (disassembly-assembly) incurred by the greenhouse owners for their movable assets and infrastructure components (such as movable irrigation system components), through direct payment to vendors or based on submitted evidence or documentation, at the time the expenses are incurred.
- **Access to livelihood restoration, improvement and assistance measures** (as outlined under Question 35) provided by SPV through RAP Fund.
- Information of the landowners and shareholders about their right to apply for the acquisition of orphan land in accordance with the Expropriation Law and coordinating consultations with KGM to facilitate the acquisition of the remaining portion – subject to evaluation and approval by KGM.

- **Owners of the Greenhouses – who are formal user (tenant) of the Land**

In accordance with the Expropriation Law, cash compensation for greenhouses is provided by KGM to the greenhouse owner, provided that the greenhouse owner holds a formal tenancy agreement or has obtained formal consent from the landowner.

The owners of affected greenhouses – who are formal users (tenants) of the Land – are entitled to all relevant entitlements outlined for the "**Owners of the Greenhouse – who own the Land**".

They are further entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- **One-off transitional support equivalent to the 1-year rental fee (**including any transaction costs such as new tenancy registration, fees to the authorities, cost of transport, etc.) of the lost agricultural land with affected greenhouse.
- **For long-term formal tenants** who have paid rent in advance, guidance by the SPV regarding the legal procedures to follow to obtain a refund for the unused portion of the rental payment and if the unused portion of the rental payment cannot be obtained from the landowner, compensation of the outstanding amount by the SPV from the RAP Fund (such tenants and their tenancy agreement conditions will be determined by the SPV on a case-by-case basis during RAP implementation).
- **For long-term formal tenants** in cases where tenants are subject to fines under their lease agreements due to early termination, support or compensation by SPV to ensure that tenants are not disadvantaged (based on case-by-case review of the specifics of tenancy agreements).

***Important Note to PAPs**: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Formal Tenant of the Greenhouses on lands owned by others – not the owner of the greenhouse**

In accordance with the law, no compensation for greenhouses is provided to the tenants of the greenhouses on land owned by others. However, the greenhouse owner and tenant may reach a separate agreement based on the terms and conditions of the tenancy contract.

They are entitled to all relevant entitlements outlined for the "Owners of the Greenhouse – who are formal user (tenant) of the Land" **but not entitled to** any "Top-up Cash Compensation to achieve Full Replacement Value of the Structures".

- **Owners of the Greenhouses – who are informal users of Treasury Lands** (with no official documentation for land use but can prove their ownership of the structure)

As per Article 19 of the Expropriation Law, for buildings/structures on lands with title deeds belonging to others, lands which do not have owners, and/or lands not acquired by their possessors, minimum material cost of the structure is paid to the possessor.

They are entitled to all relevant entitlements outlined for the "**Owners of the Greenhouse – who own the Land**"

They are further entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- Top-up cash compensation to reflect market value and achieve full replacement cost of the assets, as KGM pays for minimum material cost as per Article 19 of the Expropriation Law – a third-party valuation expert commissioned by the SPV will determine the replacement cost at market value.
- **One-off transitional support equivalent to the 1-year rental fee (**including any transaction costs such as new tenancy registration, fees to the authorities, cost of transport, etc.) of the lost agricultural land with affected greenhouse

> ***Important Note to PAPs****: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Owners of the Greenhouses – who are informal users of Forest and Pasture Lands or who cannot prove her/his ownership claim**

In accordance with the Expropriation Law, **no compensation** for land or structures is provided as informal users of forest and pasture lands are considered as illegal occupants and they are not entitled to any form of legal compensation for either the land or the assets.

They are entitled to all relevant entitlements outlined for the ""**Owners of the Greenhouse – who own the Land**" **but not entitled to** any "Top-up Cash Compensation to achieve Full Replacement Value of the Structures".

They are entitled to receive the following compensation and assistance from the SPV under the RAP:

For greenhouses owned by informal users are on forestry and pasture lands, which are not subject to compensation by KGM, or if the greenhouse owner (informal land users) cannot prove her/his ownership claim, determination of the market value of the affected greenhouse by a **third-party valuation expert** commissioned by the SPV and provision of cash compensation reflecting this value by the SPV

- **One-off transitional support equivalent to the 1-year rental fee (**including any transaction costs such as new tenancy registration, fees to the authorities, cost of transport, etc.) of the lost agricultural land with affected greenhouse

> ***Important Note to PAPs****: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

33. What specific RAP entitlements are available for people affected by construction impacts?

Construction phase impacts on people and environment will be managed through the measures specified in the Project ESIA, ESMP and subject-specific management plans (e.g. Community Health and Safety Plan) to be implemented by the SPV and construction (EPC) contractors (including subcontractors) with the objective of avoiding the impacts where possible, and where avoidance is not possible minimising and/or compensating the impacts.

PAPs may contact Project CLOs through contact information provided at the end of this GLAC to submit their construction-related grievances and feedback through Project's Grievance Mechanism.

The RAP entitlements to be provided by the SPV through implementation by the party causing the damages and losses that cannot be avoided during construction will be as below:

- **Private owners/shareholders of lands to be used temporarily during construction (including access restrictions)** will be provided with cash compensation for the use of land and any economic activity (cost of crops, trees, infrastructure etc. at market prices) based on mutual agreements /rental agreements.
- **Formal and informal users of public and private lands to be used temporarily during construction** will be compensated for crops, trees and structures, provided with 1-year rental support for the lost agricultural area and access to livelihood restoration measures defined under RAP.
- **Owners and formal/informal users of lands and assets damaged by construction** will be compensated at full replacement value for any damage on properties.

34. What Type of Assistance will be Provided to Vulnerable Groups and Individuals?

Households with vulnerable members will be provided by the SPV with special support and/or assistance on a case-by-case basis.

- **In-kind support** (e.g. agricultural input materials, tailored support packages) to vulnerable households identified during RAP preparation and implementation.
- **For vulnerable households affected by physical and/or economic displacement, priority** for all livelihood restoration, improvement, and assistance measures outlined in the RAP.
- Specific attention to vulnerable people during information, consultation, negotiation and post-resettlement monitoring processes through individually informing vulnerable PAPs about the Project, land acquisition process, RAP entitlements/support, and the grievance mechanism.
- Timely updates regarding expropriation status and court decisions, based on notifications received from KGM
- Assistance with applications to KGM for acquisition of remaining, unusable land parcels (orphan lands), including help with documentation, communication, and logistics.
- Support in completing legal and administrative procedures to enable timely access to expropriation payments.
- Facilitation of access to legal advice and public institutions, including assistance with preparing and submitting required documentation.
- In case the vulnerable PAPs own non-residential structures affected by the Project (e.g. barns, sheds, etc.), in-kind support and assistance for reconstruction of the affected structure at an available location to be indicated by the vulnerable PAP.
- Assistance in identifying and applying to existing government or third-party support programs targeting vulnerable individuals or households
- Where needed or requested, support to individuals in opening bank accounts to facilitate direct access to compensation and support payments.
- Priority for unemployed female members of physically and/or economically displaced households who are actively seeking employment.
- Training programmes to be designed and delivered by the external Agricultural Consultancy Companies.
- Women-specific training programmes.

35. What types of Livelihood Restoration, Improvement, and Assistance Packages are available to Agricultural Land Users in relation to their affected lands?

Livelihood restoration, improvement, and assistance will be provided to people who use the affected agricultural lands – including both formal and informal users of open fields and greenhouses. These measures aim to help them return to their previous income levels, or improve their livelihoods where possible.

The support packages available to agricultural land users will include the following measures:

Livelihood Restoration, Improvement and Assistance Packages for Affected Lands					
Package 1	**Package 2**	**Package 3**	**Package 4**	**Package 5**	**Package 6**
External Agricultural Consultancy Support (for 36 months)	Agricultural Training Programs	Distribution of Seedlings, Agricultural Inputs and Materials	Transitional (One-year) Rental Support for Replacement Land	Crop Payments	Priority in Project Employment

All individuals using the affected lands to generate agricultural income – including both formal and informal users, regardless of the total size of their productive agricultural area – will be eligible for the entitlements and livelihood restoration and improvement measures defined in the RAP.

As RAP implementation progresses, consultations between the SPV and affected individuals will continue on an ongoing basis.

Livelihood restoration and improvement measures will be updated as necessary.

Vulnerable households affected by physical and/or economic displacement will be prioritised for all livelihood restoration, improvement, and assistance measures outlined in the RAP. Tailored support and assistance for vulnerable households and individuals

36. How will eligible PAPs be identified, and which documents will be requested from them for eligibility evaluation and decision-making?

During RAP implementation, the SPV will proactively engage with the PAPs to identify potential eligible people and inform them about the livelihood restoration, improvement and assistance measures available to them and requested documents. The eligibility of PAPs to benefit from RAP entitlements will be evaluated by the SPV on a case-by-case basis.

Important Note to PAPs: *PAPs may also contact the Project CLOs using the contact information provided at the end of this GLAC to request further information, share suggestions, or express their interest in participating in the relevant support packages.*

The documentation requested from PAPs for the evaluation of their eligibility for RAP entitlements may include, but is not limited to, the following. It should be noted that this list is not exhaustive, and the SPV reserves the right to request additional documentation at any stage of the eligibility assessment process:

Affected Agricultural Land Users

- Official documentation of ownership for the affected assets such as lands, greenhouses, etc. (e.g., land registry records/title deeds, inheritance documents, ownership documents) (*for owners*)
- Documentation on the total productive area owned and/or used, both within and outside the expropriation corridor (*for owners, formal and informal users*)
- Tenancy agreements (*for formal users*)
- Evidence/confirmation of land use provided by settlement heads, community leaders, and other credible witnesses or third parties (*for informal users*)
- Documentation on transaction costs (*for owners, formal and informal users*)
- Evidence of expenditures made for fixed investments and improvements (*for greenhouse owners*)

F. STAKEHOLDER ENGAGEMENT AND INFORMATION DISCLOSURE

37. How will PAPs and interested parties be engaged during the Disclosure Period and RAP implementation period?

The Project has a **Stakeholder Engagement Plan (SEP)** disclosed at the Project website (www.antalyaalanyaotoyolu.com.tr).

The RAP separately includes a detailed **Stakeholder Engagement Action Plan** for RAP disclosure and implementation phases. The following RAP specific disclosure activities are conducted:

- The RAP (including the GLAC) **will be published in English and Turkish on the SPV and Lenders' websites**, in line with their disclosure policies and timelines.
- This GLAC, explaining the entitlements and next steps clearly to all affected people and stakeholders, will be delivered to the offices of mukhtars and directly to affected people and vulnerable individual in each settlement.
- The **hard copies (in Turkish)** of the final RAP and GLAC will be made available at the following locations: Project Information Office in Serik, Project's Construction Camp Sites, and Offices of the settlement heads (mukhtars)
- The **SPV CLOs will engage individually with affected households that include vulnerable members** to distribute the GLAC and communicate the key information from the RAP, as applicable.
- Specifically for the disclosure of the RAP, the RAP Implementation Team will organise separate group and/or individual meetings and information sessions prior to Article 8 negotiation meetings. **Priority will be given to settlements where land was or will be expropriated in the 2025, as listed in the table below under the "**Priority Settlements to be covered during the Disclosure Period".
- Meetings in other settlements will continue throughout the first year of RAP implementation, in alignment with the expropriation and construction schedules.
- **The Project will continue engaging with affected people throughout the 36-month RAP implementation period** in line with the RAP Stakeholder Engagement Action Plan for RAP.

G. PROJECT GRIEVANCE MECHANISM

38. How can stakeholders submit complaints and feedback about land acquisition to KGM?

KGM, as the authority responsible for expropriation, collects and manages all complaints, objections, and feedback related to land acquisition in line with its official procedures.

Stakeholders can submit land acquisition-related complaints and feedback to KGM through **KGM's institutional grievance channels**, which operate **in parallel with the Project's own grievance mechanism**.

Complaints related to expropriation, valuations, or compensation procedures carried out by KGM can be submitted **directly to KGM** through official channels, including:

- Through KGM's online grievance system: https://www.kgm.gov.tr/Sayfalar/KGM/SiteTr/Root/SikayetGeriBildirim.aspx
- Direct applications or petitions to **KGM 13th (Antalya) Regional Directorate** (Expropriation Department):
  - Mail or in-person application: Fabrikalar Mah. Gazi Bulvarı 07090, Kepez, Antalya, Türkiye
  - Phone: +90 242 320 70 00 Fax: +90 242 345 36 99
  - E-mail: bol13@kgm.gov.tr

In addition, stakeholders may submit grievances through the Presidency's Communication Centre (CIMER – https://www.cimer.gov.tr/ or 150). While CIMER is a national-level centralised communication platform, any land acquisition-related grievances submitted via CIMER are forwarded to and handled by KGM through internal coordination systems.

The grievances that fall under KGM's legal responsibility will be managed under **national administrative and legal procedures**, separate from the Project's grievance process.

The SPV does **not have a mandate to intervene** in grievances that fall under KGM's legal authority. If PAPs submit such complaints to the SPV, the SPV will guide them to the correct channels. When needed, the SPV will forward these complaints to KGM in writing.

39. Is there a Project-specific Grievance Mechanism and how can stakeholders submit their land acquisition-related complaints and feedback to SPV?

Yes, the **SPV has set up a Project-specific Grievance Mechanism** as part of the ESIA process, alongside the preparation of the RAP. This mechanism is used to collect and manage complaints and feedback related to the **SPV's areas of responsibility**, including RAP implementation and construction-related impacts.

This Mechanism is accessible to all stakeholders, including Project-Affected Persons (PAPs) and vulnerable individuals.

Grievances related to formal expropriation or compensation procedures under the legal responsibility of KGM and **must be submitted directly to KGM.**

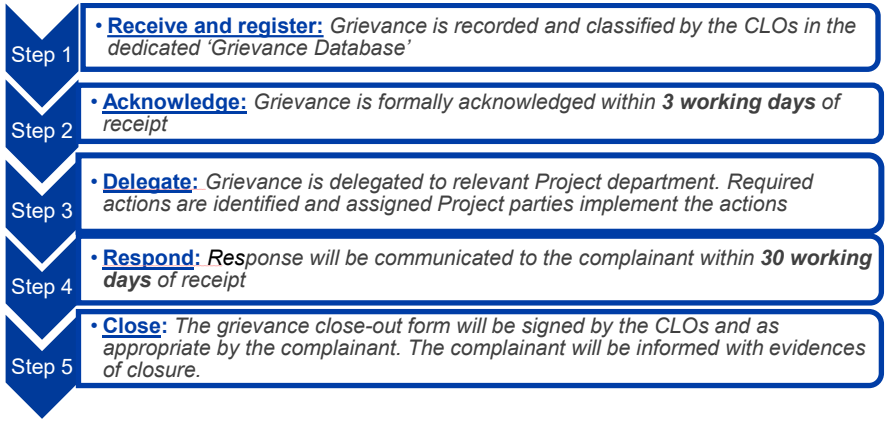
Through this mechanism, stakeholders can submit their concerns using the **channels listed below in Section H "CONTACT INFORMATION FOR STAKEHOLDERS"**

Any grievance and feedback (verbal or written) lodged or conveyed through different channels will be registered in the Project Grievance Database and managed as per the Project SEP, **by observing the requirements stipulated by the Law on the Protection of Personal Data (Law No. 6698, 2016).**

This Mechanism does not replace citizens' right to apply to other formal mechanisms including courts, CIMER) and Antalya Metropolitan Municipality's portal and call centre, among others.

40. What are the steps of the Project's Grievance Mechanism and how are complaints handled?

Key steps and timeframes of the Project Grievance Mechanism are presented below.



41. What appeal mechanisms are available if a grievance is not resolved to the satisfaction of the complainant?

If a grievance is not resolved to the satisfaction of the complainant, the Project offers an appeal mechanism. In such cases, the SPV will launch a second-tier review involving relevant authorities, third-party experts, or academics as independent parties. Based on their recommendations, the SPV will take appropriate action to resolve the grievance.

H. CONTACT INFORMATION FOR STAKEHOLDERS

Stakeholders can contact the Project and submit their questions, complaints, or feedback through the following communication channels:

Project website	**www.antalyaalanyaotoyolu.com.tr**
E-mail	**info@antalyaalanyaotoyolu.com**
Mail	**Ankara – Centre:** Kazım Özalp Mahallesi Hafta Sokak No:9, Çankaya, Ankara, Türkiye **Ankara – Office:** Söğütözü Cd. Koç Kuleleri No:2, A Blok, Kat 9, Daire 92, Çankaya, Ankara, Türkiye **Antalya Project Information Office:** Orta Belek Caddesi No:7, Kapi no: 9, Serik, Antalya, Türkiye
Phone (toll free line)	**+90 850 202 07 07**
Mobile Phone (SPV – CLOs)	**+90 530 978 78 42** **+90 539 935 16 46** **+90 536 345 39 23**
Grievance boxes and forms	Grievance and feedback boxes and forms are placed and maintained by the SPV in all affected settlements, at relevant work and mobilisation sites, and in mobile Project vehicles

APPENDIX: GENERAL DIRECTORATE OF HIGHWAYS' (KGM) BOOKLET REGARDING PROCEDURAL STEPS IN EXPROPRIATION ACTIVITIES

A. INTRODUCTION

1. What is Antalya-Alanya Motorway Project?

The **Antalya-Alanya Motorway** Project (the "**Project**") is a Public-Private Partnership (PPP), with the **Public Partner** – being the Republic of Türkiye Ministry of Transportation and Infrastructure (MoTI), represented by the **Directorate General of Highways (KGM)**, and the **Private Partner** – being the **Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş.** (the Assigned Company).

Implemented under a **Build-Operate-Transfer (BOT)** model, the Project is one of two sub-projects that constitute the broader Afyonkarahisar-Alanya Motorway Project, which was initially tendered in 2010.

The Project is located in **Antalya province,** southern Türkiye and traverses the boundaries of **three districts** – **Serik, Manavgat and Alanya** – which are key touristic and commercial hubs of the country.

2. Who is the Granting Authority under the BOT Contract?

Within the context of the BOT Implementation Contract, the **Granting Authority** is the **Republic of Türkiye Ministry of Transportation and Infrastructure** (MoTI), represented by the **Directorate General of Highways (KGM)**. KGM is responsible for implementing the land acquisition and expropriation works required for the Project in accordance with the Expropriation Law of Türkiye.

3. Who is the Assigned Company under the BOT Contract?

The Company assigned under the BOT Implementation Contract is **Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş**. – a Special Purpose Vehicle (SPV) established by **Limak İnşaat Sanayi ve Ticaret A.Ş., an affiliate of Limak Holding**.

The Assigned Company is responsible for the **design, construction, financing, operation, and maintenance** of the Motorway until its transfer to KGM at the end of the BOT concession period.

4. What are the Project's Applicable International Standards

The Project is financed by international financial institutions (IFIs) and commercial banks. A Finance Agreement was signed between the Assigned Company and the Lenders on 6 October 2025.

The following international standards are applicable to the Project:

- **International Finance Corporation (IFC)** Performance Standards (PSs) (2012),
- **Equator Principles (EP) 4** (2020), and
- **Asian Infrastructure Investment Bank (AIIB) Environmental and Social Framework** (2019).

5. Why has a Resettlement Action Plan (RAP) been prepared, and how will it be implemented?

The land acquisition required for the Project results in risks and impacts related to both physical and economic displacement. Accordingly, a **Resettlement Action Plan (RAP)** has been prepared in line with applicable international standards, with the objective of developing and implementing measures to mitigate these risks and impacts on individuals owning and/or or using the affected lands and houses, as well as on the employers and employees of impacted businesses.

The entitlements, measures, and livelihood restoration and improvement programs under RAP are in addition to the compensation provided by KGM in accordance with the Expropriation Law. The additional costs associated with RAP implementation will be covered by the SPV **through the RAP Fund, which is allocated and managed by the SPV –** separate from KGM's Expropriation Budget.

The **RAP is a living document** and will be updated as necessary.

It is disclosed in Turkish and English under the Project's ESIA Package at the Project website (www.antalyaalanyaotoyolu.com.tr).

The RAP will be implemented by the SPV in collaboration with KGM. The RAP implementation period will cover a duration of **36 months**, commencing from the singing of finance agreement, though **implementation of the key principles by the SPV has already commenced.**

6. What other Environmental and Social (E&S) studies have been undertaken for the Project?

The Project secured an **EIA Positive Decision** on 17 August 2018, in accordance with the Environmental Impact Assessment (EIA) Regulation in force at the time.

Additionally, an **Environmental and Social Impact Assessment (ESIA) package,** including a Non-technical Summary (NTS), Stakeholder Engagement Plan (SEP) and E&S Management Plans, compliant with the applicable international standards, has been prepared for the Project and disclosed in Turkish and English at the Project website (www.antalyaalanyaotoyolu.com.tr).

7. How the RAP has been reviewed independently?

Potential Lenders of the Project retained an independent **Environmental and Social Consultant (IESC)** in October 2024 to carry out an **Environmental and Social Due Diligence (ESDD)** review.

The purpose of the ESDD was to conduct an independent review of the Project's ESIA package – including the RAP – and to evaluate the compliance of land acquisition activities with the standards and requirements of the Lenders. Based on this review, the IESC also developed an **Environmental and Social Action Plan (ESAP).**

The RAP implementation will be periodically monitored by the **Lenders' IESC.** .

8. Why this Guide to Land Acquisition and Compensation (GLAC) has been prepared?

This GLAC has been prepared to provide people affected by Project-related land acquisition ("Project Affected People" or "PAPs") with a clear and concise overview of **the expropriation process carried out by KGM** in accordance with the Expropriation Law, and summarise the **key principles of the RAP,** particularly regarding additional compensation and assistance measures that go beyond the legally mandated cash compensation to ensure alignment with international standards and Lender requirements.

In addition, this GLAC outlines how affected people can apply to the SPV to access RAP entitlements and convey their grievances, inquiries, and feedback to the Project parties.

There are three versions of the GLAC: (i) for affected lands, (ii) for affected houses, and (iii) for affected businesses. This version is the GLAC concerning affected lands and houses.

B. PROJECT DESCRIPTION

9. What are the key Project Components?

The Project, designed as a **dual carriageway**, has a total length of **117.8 km**, encompassing both the main Motorway (84 km – 2x3 lanes) and connection roads (33.8 km – 2x2 lanes).

Other key Project components include **7** main interchanges, **5** tunnels, **16** viaducts, **22** bridges, **56** overpasses, **43** underpasses, and **308** culverts, with **auxiliary features** including an Operational and Maintenance (O&M) Centre, four Motorway Service Facilities, toll collection areas and temporary construction facilities.

10. Are there any associated facilities of the Project?

There are no additional associated facilities in the current design. Please refer to Question 15 for information regarding temporary facilities to be used during construction.

11. What is Motorway Expropriation Corridor?

The **expropriation corridor** defines the boundaries within which land acquisition and expropriation activities are carried out by KGM for the Motorway and associated connection roads.

All construction activities related to the main Motorway, such as excavation, embankment works, and the installation of permanent infrastructure, are executed within this designated corridor.

The width of the expropriation corridor varies along the route., width the minimum and maximum widths as follows:

- **Minimum width: ~ 55 m**
- **Maximum width: ~450 m** (at the location of service areas)

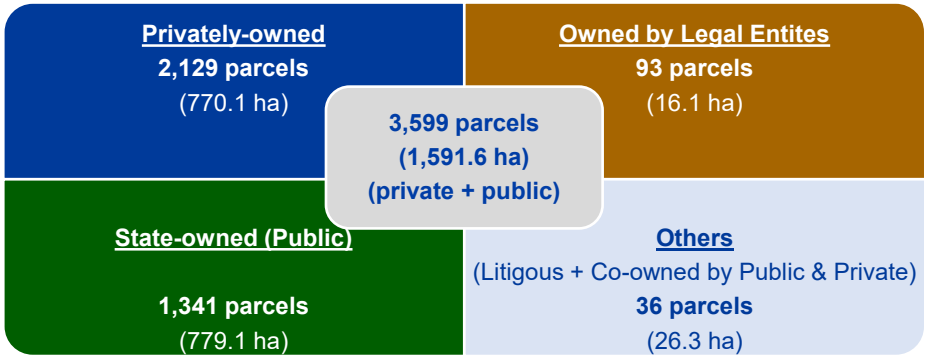
12. Which Settlements are affected within the Expropriation Corridor?

The land acquisition for the Project affects 3 districts and 57 neighbourhoods.

- **Serik (12 neighbourhoods):** Deniztepesi, Sariabali, Yukarikocayata, Asagikocayatak, Kayaburnu, Dikmen, Candir, Asagicatma, Cumali, Burmahanci, Urundu, Belpinar
- **Manavgat: (34 neighbourhoods):** Cakis, Tasagil, Gundogdu, Hocalar, Yavrudogan, Colakli, Seki, Kalemler, Evren, Ilica, Yenikoy, Siseler, Evrenleryahsi, Dolbazlar, Yukariisiklar, Dikmen, Bucakseyhler, Ulukapi, Asagisiklar, Demirciler, Karaoz, Aksaz, Haciali, Cevizler, Sulek, Haciisali, Haciobası, Kızılot, Uzunlar, Kadilar, Orensehir, Yalcidibi, Odaonu, Karakaya
- **Alanya (11 neighbourhoods):** Alara, Cakallar, Incekum, Avsallar, Akdam, Turkler, Payallar, Emisbeleni, Toslak, Telatiye, Elikesik

13. How many Parcels are Affected?

There are **3,599 private, legal entity, and public (state-owned)** parcels to be acquired **within Project's expropriation corridor.**



14. What is the land registry type of affected parcels?

The majority of the affected parcels are registered as **agricultural land**, **road**, and **forest**.

Number of Parcels per Land Registry Type (3,599 parcel)	Area of Parcels per Land Registry Type (1,591.6 ha parcel)
• **Agricultural** (2,507 parcel)	• **Agricultural** (825.6 ha)
• **Road** (258 parcel)	• **Forest** (553.5 ha)
• **Forest** (149 parcel)	• **Road** (53 ha)
• **Land with structures** (148 parcel)	• **Land with structures** (42.2 ha)
• **Constructible plot** (87 parcel)	• **Constructible plot** (9.1 ha)
• **Orchard** (101 parcel)	• **Orchard** (21.7 ha)
• **Raw soil** (83 parcel)	• **Raw soil** (15.8 ha)
• **Litigous** (13 parcel)	• **Litigous** (12.2 ha)
• **Pasture** (3 parcel)	• **Pasture** (0.2 ha)
• **Others** (250 parcel)	• **Others** (58.3 ha)

15. Which temporary facilities will be required during construction?

During the **construction phase**, the Project will utilise various temporary facilities, including **construction camp sites**, **production plants and facilities** (such as concrete batching plants, crushing/mechanical plants, and asphalt plants), as well as **quarries** and **excavated material storage sites**.

A list of planned facilities is included in the RAP.

Construction Camp Sites	• Temporary Construction Camp (KM 59+500) • Main Construction Camp Site (KM 64+500) • Manavgat Construction Camp Site (KM 87+500) • Alanya Construction Camp Site (124+300)
Plants and Facilities	• 7 concrete plants • 4 crushing/mechanical plants • 3 asphalt plants
Quarries	• 11 potential quarries
Excavated Material Storage Sites	• 20 potential excavated material storage sites

16. How is the private land for temporary facilities acquired by the Project?

Private parcels required for temporary facilities are acquired by the SPV/EPC through rental agreements, mutual protocols, or other similar arrangements made with the landowners or shareholders.

Upon completion of temporary use, the land is rehabilitated and returned to the owner in accordance with the agreed terms.

17. What are key milestones in the Project schedule?

No	Key Milestones / Tasks	Date
0	**BOT Contract Signing, Site Delivery**	14 October 2024
1	**Expropriation**	
1.1	Start of inventory of assets and valuation study commenced by appointed valuation contractor	November 2024
1.2	Start of expropriation procedures – through Article 8 negotiations – by KGM	February 2025
1.3	Completion of valuation	Q4 2025 (*target*)
1.4	Completion of Article 8 negotiations as part of expropriation procedures undertaken by KGM	
	Phase 1: KM 52 – 56; KM 74 – 104; KM ~64 (O&M Centre), KM ~80 (Concrete Plant)	February – August 2025 (***completed***)
	Phase 2: KM 56 – 74; KM 104 – 116; Connection Roads: Manavgat East, D-400, Serik	September 2025 – January 2026 (*target*)
	Phase 3: KM 116 – 141; Connections roads: Taşağıl, Manavgat, Alarahan and Konaklı	April 2026 (*target*)
2	**E&S Studies and Finance Agreement**	
2.1	Start of ESIA Package studies	March 2024
2.2	Start of RAP studies	April 2025
2.3	ESIA Package Disclosure by SPV, Lenders (60 days)	Q2 and Q3 2025
2.4	Finance Agreement Signing	6 October 2025
3	**Construction Works**	36 months after Signing
3.1	Land entry by the Project for design-related activities	November 2024
3.2	Site Mobilisation and Start of Construction	March 2025
3.3	Earthworks and Construction of Engineering Structures (incl. Connection Roads)	January 2028
	KM 52+000 – 80+000	November 2027 (*target*)
	KM 80+000 – 114+750	January 2028 (*target*)
	KM 114+750 – 141+705	November 2027 (*target*)
3.4	Tunnels, Viaducts, Superstructure, O&M Centre, Motorway Service Facilities (MSFs) and Other Secondary Works	March 2028
4.	**Motorway Commissioning**	Within 36 months from the date of signing the finance agreement

C. LAND ACQUISITION STATUS AND DISPLACEMENT IMPACTS

18. What is the status of land acquisition?

A **Public Benefit Decision** (No: 2023/371) for the Project was declared by the MoTI on **28 November 2023.**

A Presidential Decree (No. 9708) concerning the **Accelerated Expropriation** of certain immovable properties under the scope of the Project (located within the settlements covered by the Decree) by the KGM in line with **Article 27 of the Expropriation Law of Türkiye** (Law No. 2942, 1983) was published in the Official Gazette (No. 32857) on **30 March 2025.**

The **Expropriation Decisions** were taken for the Project by KGM between December 2024 and May 2025.

Pursuant to these decisions, **land acquisition activities for the Project commenced in February 2025**.

- Between February and August 2025, expropriation procedures were initiated for 22% of the **private parcels through Article 8 invitations and negotiation meetings.** and
- KGM has resorted to the **accelerated expropriation** for **3%** of the **private parcels.**
- Forestry permits have been obtained for over 75% of the forest lands located within the Motorway's expropriation corridor.

Planned Schedule of Article 8 Negotiation Meetings

Negotiation Meeting Date	Settlements
Completed between February – September 2025	Serik: Deniztepesi, Sarıabalı
	Manavgat: Şişeler, Taşağıl, Aksaz, Cevizler, Demirciler, Hacıali, Hacıisalı, Hacıobası, Karaöz, Sülek, Aşağıışıklar, Bucakşeyhler, Dikmen, Ulukapı, Yukarıışıklar, Dolbazlar, Evrenleryavşi, Kalemler, Seki, Yeniköy, Şişeler
October 2025 *(planned)*	Manavgat: Kadılar, Karakaya, Odaönü, Örenşehir, Uzunlar, Yalçıdibi
November 2025 *(planned)*	Serik: Aşağıkocayatak, Çandır, Dikmen, Kayaburnu, Yukarıkocayatak
	Manavgat: Çakış, Çolaklı, Gündoğdu, Hocalar, Taşağıl, Yavrudoğan
November 2025 *(planned)*	Manavgat: Hacıobası, Kızılot
January – February 2026 *(planned)*	Serik: Deniztepesi, Sarıabalı, Üründü, Belpınarı, Burmahancı, Cumalı, Aşağıçatma
February – April 2026 *(planned)*	Manavgat: Evren, Ilıca
	Alanya: Alara, Çakallar, Akdam, İncekum, Avsallar, Türkler, Payallar, Emişbeleni, Toslak, Telatiye, Elikesik

19. What is the status of land entry and construction?

The site was officially delivered by KGM to the SPV in October 2024, following the signing of the BOT Contract.

After site delivery, design-related activities – including drilling operations– were initiated in **November 2024**.

Site mobilisation for Project construction began in **March 2025**, financed through the Company's own equity.

Currently, **construction works are ongoing primarily on forest parcels**, for which forestry permits have been obtained.

As the expropriation of privately owned parcels is finalised, construction activities are also initiated by the SPV and EPC on those parcels following the compensation payments by KGM, in line with the national Expropriation Law, and the provision of additional support by the SPV under the RAP.

20. What are the potential displacement impacts of the Project and who would be affected?

Permanent or temporary land acquisition for the Project will lead to **physical or economic displacement** for the **owners and/or users (formal or informal)** of the affected lands and structures.

The land acquisition-related impacts are primarily classified under the following:

(i) **Affected lands** (may include non-residential and non-commercial structures)
(ii) **Affected houses** (299 building on 231 parcels with 341 households)
(iii) **Affected greenhouses** (599 greenhouse units on 347 parcels)
(iv) **Affected businesses** (29 businesses to be relocated + 8 roadside local product vendors operating on lands already expropriated by KGM)
(v) **Impacts on vulnerable people**
(vi) **Temporary losses/impacts during construction**, and
(vii) **Impacts during operation**

21. Will there be further land acquisition beyond the current expropriation Corridor?

The Project may require **further land acquisition** beyond the currently defined expropriation corridor, either during construction or, on a limited basis, after commissioning.

In case of future land acquisition requirements, the required land will be acquired by KGM in line with the Expropriation Law. Potential displacement impacts and access restrictions associated with such land acquisition or expropriation will be managed by the SPV – in collaboration with KGM – in accordance with the RAP principles.

22. What are the cumulative land acquisition and resettlement impacts of the Project?

Cumulative land acquisition impacts may arise when landowners or users are affected by multiple, overlapping land-related acquisitions linked to the Project or other developments in the region or directly to the Project.

During RAP implementation, a field-based cumulative impact assessment study will be conducted by the SPV, with support from third-party technical consultants, to make parcel-based identification of affected owners and users, assess and address these impacts under the specific budget allocated by the SPV.

D. EXPROPRIATION PROCESS IN LINE WITH EXPROPRIATION LAW

23. What is the legal basis of the expropriation process?

In the Republic of Türkiye, expropriation is carried out in accordance with **Article 46 of the Constitution** and implemented through the provisions of **Expropriation Law (No. 2942).**

The **Directorate General of Highways (KGM)** is responsible for the expropriation of privately-owned parcels in accordance with Türkiye's Expropriation Law (No. 2942), as well as coordinating the allocation of public parcels.

According to the BOT Contract, the SPV is responsible for covering a portion of the expropriation costs for the Project. The amount to be covered by the SPV is specified in the BOT Contract. Any costs exceeding this specified amount will be covered by KGM.

24. Which procedures does KGM carry out under the Expropriation Law?

Land acquisition is conducted through either negotiated settlement (Article 8) or judicial expropriation.

For detailed information on the expropriation process carried out by the KGM and its procedural steps, please refer to the booklet titled *"**Procedural Steps in Expropriation Activities Conducted by the General Directorate of Highways**"*, which has been distributed by the SPV alongside this GLAC.

25. Who is eligible for compensation under the Expropriation Law?

Under national legislation, the following categories of PAPs are eligible for compensation:

Affected Asset	Eligible PAPs
Private Parcels	• **Owners** of lands, trees, crops, structures on affected lands • **Formal land users** (with official documentation) for trees, structures, crops on affected lands • **Informal land users who have evidence** of structure and tree ownership on affected lands (eligible under Exp. Law - Art. 19) • **Litigant owners/shareholders or formal and informal users of litigious parcels**
Public Lands	• **Formal public land users** (who have official documentation, e.g. adequate pay "ecrimisil", rental agreement) for trees, crops, and structure • **Informal public land users who have evidence** of structure and tree ownership on affected lands (eligible under Exp. Law - Art. 19)
Houses	• **The owners of the houses** (in case of multiple shareholders, this refers to the actual owner of the house, subject to the consent of other shareholders who recognise the ownership of the actual owner) • **All land shareholders (in proportion to their shares) in case of multiple land ownership**, when there is no consent from other shareholders recognising the ownership of the actual structure owner
Greenhouses	• Owner of the greenhouse – owner/shareholder of the private land • Owner of the greenhouse – formal tenant of the land, owner of the greenhouse • Formal tenant of the greenhouse on lands owned by others (not the owner of the greenhouse) • Owner of the greenhouse – informal user of treasury lands (with no official documentation for land use but can prove their ownership of the structure) • Owner of the greenhouse – informal user of forest and pasture lands or with no official documentation proving their ownership of the structure

E. COMPENSATION AND ENTITLEMENTS UNDER RAP TO MEET INTERNATIONAL STANDARDS

26. What additional compensation and entitlements are provided by the SPV through RAP implementation, beyond those offered by KGM under the Expropriation Law?

In addition to the compensation provided by KGM in accordance with the Expropriation Law, **the SPV implements supplementary compensation and livelihood restoration measures under the RAP** for owners as well as formal and informal users of affected lands, houses, and greenhouses.

The SPV has established a dedicated **RAP Fund** for covering all costs arising from the implementation of additional measures beyond those required under national legislation. This Fund is allocated and managed by SPV, in coordination with KGM.

27. What are the Key Compensation and Assistance principles outlined in the RAP?

- Avoidance of Forced Eviction: The Project will not carry out forced evictions except in accordance with national legislation and the requirements of IFC PS5.
- Prioritisation of Purchase through Negotiated Settlement over Expropriation: KGM has prioritised negotiated settlements through Article 8 (purchase method). Article 27 will be used by KGM as a last resort, only after Article 8 process.
- Compensation at Full Replacement Cost: All compensation to people affected by land acquisition will be provided at full replacement cost. This includes market value plus any applicable transaction costs, as required by Lenders.
- Livelihood Restoration and Assistance in addition to cash compensation: The SPV will provide livelihood restoration and assistance measures to eligible affected people, including owners and users of affected houses and lands, as well as their formal and informal users, in accordance with the requirements of the Lenders.
- Early Consultations and Notification for Land Acquisition Process: Affected houses: The SPV will notify the owners and tenants of affected structures at least **three months** in advance of the commencement of expropriation, in alignment with KGM's expropriation programme. This is intended to avoid forced eviction and allow sufficient time (more than six months) for resettlement planning.

  In cases where expropriation has already been concluded, the SPV will inform property owners of the Project schedule. Each owner will be granted a six-month notice period to vacate the property following notification, unless a mutually agreed alternative timeframe is established.

  Affected lands: The SPV will notify **users of affected lands** at least **three months** before land entry.

  Land entry will only proceed after the completion of the expropriation process – including payment – or upon finalisation of mutual agreements.

28. What is Cut-off Date for Eligibility?

The **cutoff date** is the date after which any new structures, trees, crops, and other immovable assets will no longer be counted or measured for compensation purposes.

The cut-off dates are determined **based on the completion date of the census and asset inventory surveys** conducted in each respective settlement. Therefore, the cutoff is specific to each affected settlement.

The SPV posts the list of affected parcels along with a notice disclosing the applicable cut-off date and its conditions. These are posted in the offices of the mukhtars, local coffee houses, and other appropriate public venues (such as mosques and community gathering spaces used by local men and women) within the respective affected settlements.

29. Who is Eligible for Compensation and Assistance under RAP?

All people affected by the Project and owning and/or using (formally or informally) the affected lands and assets **before the cut-off dates** defined in the RAP are eligible for compensation and assistance under RAP.

Accordingly, **people who encroach on the Project area after the cut-off date** are **not** eligible for compensation or assistance provided through the implementation of the RAP.

Regarding the affected lands, all persons using the lands for generating agricultural income (including both formal and informal users – regardless of their total productive agricultural area) will be eligible for entitlements and livelihood restoration and improvement measures defined in the RAP.

PAPs who believe they have not been included in the process or are eligible for the entitlements can apply to the Project CLOs with the required documents and an application letter. Their eligibility for compensation and/or assistance will be evaluated by the SPV. After the evaluation, they will be informed of the outcome, and if deemed eligible, they will be granted access to the relevant compensation and/or assistance.

The eligibility categories identified in the RAP are as follows:

Affected Lands	• Landowners (private parcels) • Formal and informal land users (private and public parcels used for agriculture and grazing) • Users of litigous properties • Owners, formal and informal users of orphan and fragmented parcels • Users of forest parcels for economic activity • Owners of affected crops and trees on affected lands • Owners of non-residential and secondary structures on affected lands (maybe formal or informal user of affected land) • Vulnerable landowners and land users • Owners, formal and informal users of parcels acquired through constitution of servitude
Affected Houses	• Owners of affected houses • Formal users of affected houses (tenants) • Informal users of affected houses • Vulnerable households
Affected Greenhouses	• Owner of the affected greenhouse, owner of land • Owner of the affected greenhouse, formal or informal user of the land • Tenant of the affected greenhouses • Vulnerable landowners or land users
Lands subject to Temporary Losses and Impacts during Construction	• Owners of lands and structures affected temporarily • Formal and informal users of and structures affected temporarily • Beneficiaries of infrastructures and services termpoarily affected during construction
Lands and structures subject to impacts during Operation	• Owners or users (formal or informal) of houses that cannot be mitigated to levels compliant with Project standards through operation phase E&S management plans

30. What are the RAP entitlements specific for owners and users of affected private parcels?

- **Owners and Shareholders of Affected Private Parcels**

Under the Expropriation Law of Türkiye, **owners and shareholders** of affected private parcels are entitled to receive cash compensation from KGM for their affected land, structures (after depreciation is deducted), trees and crops that cannot be harvested.

The owners and shareholders of affected private parcels are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- **Assistance in searching replacement land** that is of similar quality, size, and location, subject to availability.
- Compensation to cover **transaction costs** applicable to the acquisition of replacement, if replacement land of similar quality, size, and location is identified by the PAPs who reach an agreement with KGM under Article 8.
- SPV support to cover **small costs** for official expropriation procedures (such as power of attorney costs, working capital fund for title deed transactions, inner and inter city transportation costs, etc.)
- SPV support for **relocating movable assets** to an alternative land determined by PAP.
- **Access to livelihood restoration, improvement and assistance measures** (as outlined under Question 36) provided by SPV through RAP Fund if land is used for economic activity.

> ***Important Note to PAPs**: Regarding expenditures such as transaction costs or small costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Formal and Informal (Agricultural) Users of Affected Private Parcels:**

Under the Expropriation Law of Türkiye, **formal or informal users** of affected private parcels are **not** entitled to receive cash compensation from KGM However, they are compensated for their trees and any structures or fixed improvements/investments (after depreciation is deducted) on the rented land, provided they can demonstrate ownership of these crops and assets.

The users of affected private parcels are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- **Assistance in searching replacement land** that is of similar quality, size, and location, subject to availability.
- **One-off transitional support equivalent to the 1-year rental fee (**including any transaction costs such as new tenancy registration, fees to the authorities, cost of transport, etc.) of the lost agricultural land
- **For long-term formal tenants** (whether for greenhouses or open fields) who have paid rent in advance, guidance by the SPV regarding the legal procedures to follow to obtain a refund for the unused portion of the rental payment and if the unused portion of the rental payment cannot be obtained from the landowner, compensation of the outstanding amount by the SPV from the RAP Fund (such tenants and their tenancy agreement conditions will be determined by the SPV on a case-by-case basis during RAP implementation).
- **For long-term formal tenants** (whether for greenhouses or open fields), in cases where tenants are subject to fines under their lease agreements due to early termination, support or compensation by SPV to ensure that tenants are not disadvantaged (based on case-by-case review of the specifics of tenancy agreements).
- Notification of the user by SPV **three months in advance of land entry.**
- If land entry by the Project is required before the end of the harvesting period, **cash compensation for unharvested crops and products** (e.g., fruits) prior to land entry.
- SPV support for **relocating movable assets** to an alternative land determined by PAP.
- If there are major fixed improvements or investments (*including structures such as barns, sheds, depots, pools, etc.)* made or owned by the **informal user** on the affected land, top-up compensation in addition to the compensation paid by KGM (based on evidence of ownership) – in order to reflect market value as KGM compensates only for the **minimum material cost** under Article 19 of the Expropriation Law.
- Access to **livelihood restoration, improvement and assistance** measures (as outlined under Question 36) provided by SPV through RAP Fund.

> ***Important Note to PAPs****: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Litigant Owners and Shareholders:**

When there is a court dispute regarding the ownership of a litigious parcel, the rightful owners or shareholders eligible for compensation under the Expropriation Law are determined by the court in accordance with Article 18 of the Law.

The SPV will inform the litigant owners **about the land acquisition process**, as well as their rights and entitlements under this RAP.

Individual consultations will be held with the litigant owners/shareholders of parcels that contain houses and greenhouses to identify any specific vulnerabilities for design and delivery of tailored measures on a case-by-case basis.

The court proceedings will be monitored by SPV to mitigate any potentially exacerbated impacts arising from lengthy legal procedures.

If the case is concluded in favour of the litigant owner, they will be entitled to all RAP entitlements defined for private landowners.

- **Owners of Orphan Lands** (Unacquired parts of Expropriated Parcels)

For the unacquired portions that were not previously included in KGM's expropriation, the owner or shareholder of the affected parcel **has the right to formally apply to KGM**, in accordance with Article 12 of the Expropriation Law, to request the acquisition of the remaining part of the parcel if it is deemed economically unusable or undevelopable.

For all parcels, in line with the Expropriation Law and KGM's established practice, KGM accepts official applications from affected people – submitted within 30 days of receiving notice of expropriation by agreement – requesting the expropriation of orphan lands and evaluates each application on a case-by-case basis.

Relevant requests submitted by landowners to KGM through petitions will be periodically reviewed by the SPV as part of the Project's grievance mechanism. For cases where the acquisition request of the owners or shareholders is not positively concluded by KGM or where relevant grievances or claims are received by the Project, the SPV will engage a third-party valuation expert to review each case/claim individually and determine the actions required to be taken by SPV, if any.

- **Owners of Affected Crops**

According to Article 20 of the Expropriation Law, the evacuation of cultivated lands that are subject to expropriation must take place after the harvest period. If land entry occurs before harvesting, the crop owners are entitled to compensation.

The SPV will notify the crop owners at least **three** months in advance of land entry. If land entry by the Project is required before the end of the harvesting period, **cash compensation for unharvested crops and products** (e.g., fruits) prior to land entry.

- **Owners of Affected Trees**

In accordance with the Expropriation Law, cash compensation is provided by KGM to the owner of the trees. Pursuant to Article 19 of the Expropriation Law, when trees are located on titled lands owned by others, on ownerless lands, or on lands not legally acquired by their possessors, compensation by KGM is paid to the possessor of the trees. This does not apply to trees on forest or pasture parcels.

The owners of affected trees are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

  - Notification of the tree owners at least **three** months in advance of land entry.
  - If land entry by the Project is required before the end of the harvesting period of the fruit trees, **cash compensation for unharvested products** (e.g., fruits) prior to land entry.
  - For fruit trees owned by informal users on **forestry or pasture lands**, which are not subject to compensation by KGM, **determination of the product value by a third-party valuation expert** commissioned by the SPV and provision of cash compensation reflecting this value to the informal users by the SPV from the RAP Fund.
  - Where needed, top-up cash compensation to compensate dense planting deduction applied by KGM, if any.
  - Commissioning of **third-party valuation expert** by the SPV for the verification of compliance of tree valuation with international standards, or and determination of the actions required to be taken by the SPV, where needed.
  - Commissioning of **third-party valuation expert** by the SPV for the review of any grievance, claim, or request raised during Article 8 negotiation meetings related to orchard valuation, and determination of the actions required to be taken by the SPV (such as provision of top-up compensation to cover any compensation gap with international standards), where needed.

- **Owners of major non-residential/secondary structures** (may be the owner or formal or informal user of land)

In accordance with the Expropriation Law, cash compensation for non-residential structures and infrastructure is provided by KGM. Depreciation is applied. As per Article 19 of the Expropriation Law, for buildings or structures located on titled lands owned by others, on ownerless lands, or on lands not legally acquired by their possessors, the minimum material cost of the structure is paid to the possessor.

The owners of *major* non-residential/secondary structures (*including structures such as barns, sheds, depots, pools, etc.)* are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

  - **Top-up cash compensation** to the structure owner (may be the land owner or formal land user with evidence) in order to cover the amount deducted for depreciation.
  - If there are major fixed improvements or investments made or owned by the **informal user** on the affected land (with proof of structure ownership), provision of **top-up compensation** by SPV in addition to the compensation paid by KGM – in order to reflect market value as KGM compensates only for the **minimum material cost** under Article 19 of the Expropriation Law.
  - **If the assets owner (informal land users) cannot prove her/his ownership claim,** commissioning of **third-party valuation expert** by the SPV for the review of the case and determination of market value for these assets for provision of cash compensation at full replacement cost by the SPV from the RAP Fund.

- **Owners of parcels to be acquired through constitution of servitude** (easement rights)

In accordance with Article 4 of the Expropriation Law, instead of acquiring full ownership of immovable assets, easement rights may be established through expropriation on a specific section, height, depth, or source of the immovable, provided that such rights are sufficient to serve the intended purpose.

Cash compensation is paid to the owners/shareholders for the alignments. As stipulated by the Law, ownership rights remain with the landowner, subject to the implementation of necessary safety measures.

They will be entitled to access livelihood restoration, improvement, and assistance measures provided by the SPV through the RAP Fund.

31. What are the RAP entitlements specific for the formal and informal users of affected public parcels?

Formal and informal users of public parcels are entitled to the same entitlements as those provided to formal and informal users of affected private parcels, as outlined under Question 30.

Additionally, if there are major fixed improvements or investments (*including structures such as barns, sheds, depots, pools, etc.)* made or owned by the informal user on the affected land – **excluding those on forest and pasture lands** – top-up compensation will be provided by the SPV from the RAP Fund to the informal user (based on evidence of structure ownership) – in order to reflect market value as KGM compensates only for the **minimum material cost** under Article 19 of the Expropriation Law.

If the trees and assets owned by informal users are located **on forestry or pasture lands**, which are not subject to compensation by KGM, their market value will be determined by a third-party valuation expert to be commissioned by the SPV. Cash compensation reflecting this value will be provided to the informal users by the SPV from the RAP Fund.

32. What are the Specific RAP Entitlements specific for the Owners and Users of Affected Houses?

- **Owners of Affected House on Private Parcels**

In accordance with the Expropriation Law, cash compensation by KGM is provided to owners. Depreciation is applied.

In cases of joint landownership, compensation is paid to the owner of the structure who is the actual resident, provided that he or she has obtained formal consent from the other co-owners confirming ownership rights. If such consent is not available, cash compensation is distributed among all landowners in proportion to their registered shares.

The owners and users of **affected houses** are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- Notification at least **three months in advance of the start of expropriation** (which is approximately six months before land entry).
- **Top-up cash compensation** to cover the amount deducted for depreciation by KGM and achieve full replacement cost.
- In case of joint landownership, help the actual resident engage – and, if possible, reach an agreement with other shareholders – with support from KGM officials, to ensure that the house owner (actual resident) receives compensation for the house at full replacement cost or provided with a replacement house; if the house owner (actual resident) cannot receive full compensation, top-up compensation by the SPV from the RAP Fund.
- **House Relocation Support Package provided prior to relocation** to cover title deed transfer costs, real estate agent service fee and allowance for other relocation related expenses such as utility subscription fees, registration, etc.
- **Assistance in searching a replacement residential house of equal or greater value or identifying suitable replacement land** for the construction of a new house at acceptable standards, including facilitation of coordination with relevant authorities, institutions and mukhtars, as needed, to help identify a suitable parcel on which the house can be built with security of tenure.
- **Allowance for moving and travel costs**
- Right granted to PAPs to **salvage recoverable building materials** from expropriated structure prior to demolition.

> ***Important Note to PAPs**: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Formal (tenants with formal tenancy agreements) and Informal Users of Affected House on Private Parcels**

In accordance with the Expropriation Law, no compensation is provided to tenants. However, the owner and tenant may reach a separate agreement based on the terms and conditions of the tenancy contract.

The formal users (tenants) of **affected houses** are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- Notification at least **three months in advance of the start of expropriation** (which is approximately six months before land entry).
- **House Relocation Support Package provided prior to relocation** to cover rental allowance (three-month rent allowance, based on the market rental rate of the replacement house to be rented), real estate agent service fee (equivalent to the market rental rate of the replacement house to be rented), allowance for other relocation related expenses such as utility subscription fees, tenancy registration, etc. and allowance for unforeseen expenses (such as fixed investments made by the renter)
- **Assistance in searching a replacement residential house**
- **Allowance for moving and travel costs** based on submitted evidence or documentation, at the time the expenses are incurred
- Right granted to PAPs to **salvage recoverable building materials** – if such materials belong to the tenant – from expropriated structure prior to demolition.

> ***Important Note to PAPs**: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Owners of Affected House (Informal Users) on Public Parcels (Treasury, Forest, Pasture or Non-registered Parcels)**

In accordance with the Expropriation Law, **no compensation** for **land** is provided to owners of informal houses. However, informal users – **excluding those occupying forest and pasture lands** – are eligible for compensation for trees and structures (e.g., fixed improvements/ investments) on the land they use informally at minimum material cost, in accordance with Article 19 of the Expropriation Law, provided they can demonstrate ownership of these assets. Informal users of **forest and pasture lands** are considered as illegal occupants, thus are not entitled to any form of legal compensation for either the land or the assets.

The owners of **affected houses** on public parcels (informal users) are entitled to receive the following compensation and assistance from the SPV under the RAP:

- **Notification** at least **three months in advance of the start of expropriation** (which is approximately six months before land entry).
- **Top-up compensation** by SPV in addition to the compensation paid by KGM – in order to reflect market value as KGM compensates only for the **minimum material cost** under Article 19 of the Expropriation Law (***for informal houses on treasury and non-registered parcels***)
- **Cash compensation at full replacement value** will be provided by the SPV from the RAP Fund to the structure owner (based on evidence of structure ownership) (***for informal houses on forest and pasture parcels***)
- **House Relocation Support Package provided prior to relocation** to cover allowance for other relocation related expenses such as utility subscription fees, registration, etc. as well as unforeseen costs such as fixed investments made by the informal house owner.
- **Assistance in searching a suitable replacement residential house** or **identifying suitable replacement land** (such as treasury, non-registered or other) for the construction of a new house at acceptable standards.
- **Assigning civil engineers and technicians from SPV and EPC teams to advise and supervise affected individuals who prefer to construct their own houses** (to provide guidance particularly on ensuring earthquake resistance, fire protection, and resilience against other natural hazards such as heavy rainfall and flooding; where necessary and appropriate, construction machinery and equipment may be temporarily provided to assist affected households during the construction of their replacement homes)**.**
- **Allowance for the moving and travel costs** based on submitted evidence or documentation, at the time the expenses are incurred
- Right granted to PAPs to **salvage recoverable building materials** from expropriated structure prior to demolition.
- **Access to livelihood restoration, improvement and assistance measures** (as outlined under Question 36) provided by SPV through RAP Fund, if the affected land – on which the impacted house is located – was used for agricultural purposes.

> ***Important Note to PAPs****: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Physically Displaced Households with Vulnerable Members**
  - **Individual information** about the Project, land acquisition, RAP entitlements, and the grievance mechanism and specific attention to vulnerable members during consultation, negotiation and post-resettlement monitoring processes.
  - **In-kind support** by SPV to be determined based on the type of vulnerability and Specific measures to be designed according to specific vulnerabilities of household members to ensure comfort during relocation.
  - **Provision of logistical and administrative support** to facilitate key processes through the Project CLOs and other appropriate in-house personnel, particularly during residency registration, school enrolment and education-related processes, access to health services through local family health centres, utility subscriptions and connections (electricity, water, gas, etc.)
  - **Facilitation of consultations with relevant governmental authorities** to identify alternative land for constructing replacement housing or to locate available housing options, with particular attention to the needs of elderly and women-headed households.
  - Priority to at least one member of households (who is looking for a job and meeting Project's employment criteria) in **Project employment during construction phase.**

33. What are the Specific RAP Entitlements specific for the Owners and Users of Affected Greenhouses?

- **Owners of the Greenhouses – who own the Land**

In accordance with the Expropriation Law, cash compensation for greenhouses is provided by KGM to the owner of the greenhouse. Depreciation is deducted. In this Project, for parcels containing **greenhouses**, the parcel may be expropriated fully if the remaining area is **less than 400 m²** – subject to application by the PAPs and evaluation by KGM.

The owners of affected greenhouses – who own the Land – are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- Notification of the crop owners at least **three** months in advance of land entry.
- Top-up cash compensation to cover the amount deducted for **depreciation**;
- If not included in the expropriation value provided by KGM, additional cash compensation at full replacement cost to cover the cost of fixed (non-movable) investments and improvements made by the greenhouse owner, such as irrigation, heating, drainage, lighting system and components, etc. – a third-party valuation expert commissioned by the SPV will determine the associated costs on market prices.

- Compensation for costs incurred by greenhouse owners – whose greenhouses are partially expropriated – to support repair and adjustment works on the remaining portions, such as the rearrangement of irrigation or drainage systems, repair of greenhouse nylon covers, and similar interventions.
- If land entry by the Project is required before the end of the harvesting period, **cash compensation for unharvested crops and products** (e.g., fruits) prior to land entry. If the greenhouse is partially affected, crop compensation will be provided for the affected part.
- Assistance in searching a replacement site for the relocation of the greenhouse, if such relocation is planned by the greenhouse owner.
- If requested by the PAPs, support for the preparation of the land where the greenhouse will be reestablished – this may include the provision of construction machinery and labour, land levelling, provision of suitable topsoil stripped from Project areas, infrastructure connections for electricity, water, other utilities, etc.
- Assistance for rearranging the greenhouse to ensure continuity of operations (rearrangement of irrigation system, drainage system, heating system, etc.), if requested, if the greenhouse is partially affected and the owner continues operations on the remaining land.
- Arranging the full relocation or reimbursement of the moving costs (disassembly-assembly) incurred by the greenhouse owners for their movable assets and infrastructure components (such as movable irrigation system components), through direct payment to vendors or based on submitted evidence or documentation, at the time the expenses are incurred.
- **Access to livelihood restoration, improvement and assistance measures** (as outlined under Question 36) provided by SPV through RAP Fund.
- Information of the landowners and shareholders about their right to apply for the acquisition of orphan land in accordance with the Expropriation Law and coordinating consultations with KGM to facilitate the acquisition of the remaining portion – subject to evaluation and approval by KGM.

- **Owners of the Greenhouses – who are formal user (tenant) of the Land**

In accordance with the Expropriation Law, cash compensation for greenhouses is provided by KGM to the greenhouse owner, provided that the greenhouse owner holds a formal tenancy agreement or has obtained formal consent from the landowner.

The owners of affected greenhouses – who are formal users (tenants) of the Land – are entitled to all relevant entitlements outlined for the "**Owners of the Greenhouse – who own the Land**".

They are further entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- **One-off transitional support equivalent to the 1-year rental fee (**including any transaction costs such as new tenancy registration, fees to the authorities, cost of transport, etc.) of the lost agricultural land with affected greenhouse.
- **For long-term formal tenants** who have paid rent in advance, guidance by the SPV regarding the legal procedures to follow to obtain a refund for the unused portion of the rental payment and if the unused portion of the rental payment cannot be obtained from the landowner, compensation of the outstanding amount by the SPV from the RAP Fund (such tenants and their tenancy agreement conditions will be determined by the SPV on a case-by-case basis during RAP implementation).
- **For long-term formal tenants** in cases where tenants are subject to fines under their lease agreements due to early termination, support or compensation by SPV to ensure that tenants are not disadvantaged (based on case-by-case review of the specifics of tenancy agreements).

> ***Important Note to PAPs**: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Formal Tenant of the Greenhouses on lands owned by others – not the owner of the greenhouse**

In accordance with the law, no compensation for greenhouses is provided to the tenants of the greenhouses on land owned by others. However, the greenhouse owner and tenant may reach a separate agreement based on the terms and conditions of the tenancy contract.

They are entitled to all relevant entitlements outlined for the "Owners of the Greenhouse – who are formal user (tenant) of the Land" **but not entitled to** any "Top-up Cash Compensation to achieve Full Replacement Value of the Structures".

- **Owners of the Greenhouses – who are informal users of Treasury Lands** (with no official documentation for land use but can prove their ownership of the structure)

As per Article 19 of the Expropriation Law, for buildings/structures on lands with title deeds belonging to others, lands which do not have owners, and/or lands not acquired by their possessors, minimum material cost of the structure is paid to the possessor.

They are entitled to all relevant entitlements outlined for the "**Owners of the Greenhouse – who own the Land**"

They are further entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- Top-up cash compensation to reflect market value and achieve full replacement cost of the assets, as KGM pays for minimum material cost as per Article 19 of the Expropriation Law – a third-party valuation expert commissioned by the SPV will determine the replacement cost at market value.
- **One-off transitional support equivalent to the 1-year rental fee (**including any transaction costs such as new tenancy registration, fees to the authorities, cost of transport, etc.) of the lost agricultural land with affected greenhouse

> ***Important Note to PAPs****: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

- **Owners of the Greenhouses – who are informal users of Forest and Pasture Lands or who cannot prove her/his ownership claim**

In accordance with the Expropriation Law, **no compensation** for land or structures is provided as informal users of forest and pasture lands are considered as illegal occupants and they are not entitled to any form of legal compensation for either the land or the assets.

They are entitled to all relevant entitlements outlined for the ""**Owners of the Greenhouse – who own the Land**" **but not entitled to** any "Top-up Cash Compensation to achieve Full Replacement Value of the Structures".

They are entitled to receive the following compensation and assistance from the SPV under the RAP:

- For greenhouses owned by informal users are on forestry and pasture lands, which are not subject to compensation by KGM, or if the greenhouse owner (informal land users) cannot prove her/his ownership claim, determination of the market value of the affected greenhouse by a **third-party valuation expert** commissioned by the SPV and provision of cash compensation reflecting this value by the SPV.
- **One-off transitional support equivalent to the 1-year rental fee (**including any transaction costs such as new tenancy registration, fees to the authorities, cost of transport, etc.) of the lost agricultural land with affected greenhouse

> ***Important Note to PAPs****: Regarding expenditures such as transaction or other costs, the Project will make direct payments to authorities or vendors where possible. If reimbursement is required, PAPs must submit evidence of expenditures to the SPV/EPC. For more information, please contact the Project CLOs using the details provided at the end of this GLAC.*

34. What specific RAP entitlements are available for people affected by construction impacts?

The SPV and construction (EPC) contractors (including subcontractors) will implement measures specified in the Project ESIA, ESMP and subject-specific management plans to avoid, and where avoidance is not possible minimise and/or compensate the impacts on people and environment.

PAPs may contact Project CLOs through contact information provided at the end of this GLAC to submit their construction-related grievances and feedback through Project's Grievance Mechanism.

The RAP entitlements to be provided by the SPV through implementation by the party causing the damages and losses that cannot be avoided during construction will be as below:

- **Private owners/shareholders of lands to be used temporarily during construction (including access restrictions)** will be provided with cash compensation for the use of land and any economic activity (cost of crops, trees, infrastructure etc. at market prices) based on mutual agreements /rental agreements.
- **Formal and informal users of public and private lands to be used temporarily during construction** will be compensated for crops, trees and structures, provided with 1-year rental support for the lost agricultural area and access to livelihood restoration measures defined under RAP.
- **Owners and formal/informal users of lands and assets damaged by construction** will be compensated at full replacement value for any damage on properties.

35. What Type of Assistance will be Provided to Vulnerable Groups and Individuals?

Households with vulnerable members will be provided by the SPV with special support and/or assistance on a case-by-case basis.

- **In-kind support** (e.g. agricultural input materials, tailored support packages) to vulnerable households identified during RAP preparation and implementation.
- **For vulnerable households affected by physical and/or economic displacement, priority** for all livelihood restoration, improvement, and assistance measures outlined in the RAP.
- Specific attention to vulnerable people during information, consultation, negotiation and post-resettlement monitoring processes through individually informing vulnerable PAPs about the Project, land acquisition process, RAP entitlements/support, and the grievance mechanism.
- Timely updates regarding expropriation status and court decisions, based on notifications received from KGM.
- Assistance with applications to KGM for acquisition of remaining, unusable land parcels (orphan lands), including help with documentation, communication, and logistics.
- Support in completing legal and administrative procedures to enable timely access to expropriation payments.
- Facilitation of access to legal advice and public institutions, including assistance with preparing and submitting required documentation.
- In case the vulnerable PAPs own non-residential structures affected by the Project (e.g. barns, sheds, etc.), in-kind support and assistance for reconstruction of the affected structure at an available location to be indicated by the vulnerable PAP
- Assistance in identifying and applying to existing government or third-party support programs targeting vulnerable individuals or households
- For physically displaced households with vulnerable members, logistical and administrative support to facilitate key processes, such as assistance with facilitating consultations with relevant governmental authorities to identify alternative land for constructing replacement housing or to locate available housing options, with particular attention to the needs of elderly and women-headed household, residency registration, school enrolment and education-related processes, access to health services through local family health centres, and utility subscriptions and connections (electricity, water, gas, etc.)
- Where needed or requested, support to individuals in opening bank accounts to facilitate direct access to compensation and support payments.
- Priority for unemployed female members of physically and/or economically displaced households who are actively seeking employment.
- Training programmes to be designed and delivered by the external Agricultural Consultancy Companies
- Women-specific training programmes

36. What types of Livelihood Restoration, Improvement, and Assistance Packages are available to Agricultural Land Users in relation to their affected lands?

Livelihood restoration, improvement, and assistance will be provided to people who use the affected agricultural lands – including both formal and informal users of open fields and greenhouses. These measures aim to help them return to their previous income levels, or improve their livelihoods where possible.

The support packages available to agricultural land users will include the following measures:

Livelihood Restoration, Improvement and Assistance Packages for Affected Lands					
Package 1	**Package 2**	**Package 3**	**Package 4**	**Package 5**	**Package 6**
External Agricultural Consultancy Support (for 36 months)	Agricultural Training Programs	Distribution of Seedlings, Agricultural Inputs and Materials	Transitional (One-year) Rental Support for Replacement Land	Crop Payments	Priority in Project Employment

All individuals using the affected lands to generate agricultural income – including both formal and informal users, regardless of the total size of their productive agricultural area – will be eligible for the entitlements and livelihood restoration and improvement measures defined in the RAP.

As RAP implementation progresses, consultations between the SPV and affected individuals will continue on an ongoing basis.

Livelihood restoration and improvement measures will be updated as necessary.

Vulnerable households affected by physical and/or economic displacement will be prioritised for all livelihood restoration, improvement, and assistance measures outlined in the RAP. Tailored support and assistance for vulnerable households and individuals

37. How will eligible PAPs be identified, and which documents will be requested from them for eligibility evaluation and decision-making?

During RAP implementation, the SPV will proactively engage with the PAPs to identify potential eligible people and inform them about the livelihood restoration, improvement and assistance measures available to them and requested documents. The eligibility of PAPs to benefit from RAP entitlements – including livelihood restoration, improvement, and assistance packages – will be evaluated by the SPV on a case-by-case basis.

Important Note to PAPs: *PAPs may also contact the Project CLOs using the contact information provided at the end of this GLAC to request further information, share suggestions, or express their interest in participating in the relevant support packages.*

The documentation requested from PAPs for the evaluation of their eligibility for RAP entitlements may include, but is not limited to, the following. It should be noted that this list is not exhaustive, and the SPV reserves the right to request additional documentation at any stage of the eligibility assessment process:

Affected Agricultural Land Users	• Official documentation of ownership for the affected assets such as lands, greenhouses, etc. (e.g., land registry records/title deeds, inheritance documents, ownership documents) (*for owners*) • Documentation on the total productive area owned and/or used, both within and outside the expropriation corridor (*for owners, formal and informal users*) • Tenancy agreements (*for formal users*) • Evidence/confirmation of land use provided by settlement heads, community leaders, and other credible witnesses or third parties (*for informal users*) • Documentation on transaction costs (*for owners, formal and informal users*) • Evidence of expenditures made for fixed investments and improvements (*for greenhouse owners*)
Affected Houses	• Title deeds for affected land and structures (*for owners*) • Documentation on expenses such as moving and transaction costs, fees paid to authorities and service providers, and price quotes from vendors and other transaction costs (*for owners, formal and informal users*) • Evidence of expenditures made for fixed investments and improvements (*for owners, formal and informal users*) • Lease agreements and relevant documentation/confirmation from the structure owner, mukhtar or other credible witnesses (*for formal users - tenants*)

F. STAKEHOLDER ENGAGEMENT AND INFORMATION DISCLOSURE

38. How will PAPs and interested parties be engaged during the Disclosure Period and RAP implementation period?

The Project has a **Stakeholder Engagement Plan (SEP)** disclosed at the Project website (www.antalyaalanyaotoyolu.com.tr)

The RAP separately includes a detailed **Stakeholder Engagement Action Plan** for RAP disclosure and implementation phases. The following RAP specific disclosure activities are conducted:

- The RAP (including the GLAC) **will be published in English and Turkish on the SPV and Lenders' websites**, in line with their disclosure policies and timelines.
- This GLAC, explaining the entitlements and next steps clearly to all affected people and stakeholders, will be delivered to the offices of mukhtars and directly to affected people and vulnerable individual in each settlement.
- The **hard copies (in Turkish)** of the final RAP and GLAC will be made available at the following locations: Project Information Office in Serik, Project's Construction Camp Sites, and Offices of the settlement heads (mukhtars)
- The **SPV CLOs will engage individually with affected households that include vulnerable members** to distribute the GLAC and communicate the key information from the RAP, as applicable.
- Specifically for the disclosure of the RAP, the RAP Implementation Team will organise separate group and/or individual meetings and information sessions prior to Article 8 negotiation meetings. **Priority will be given to settlements where land was or will be expropriated in the 2025, as listed in the table below under the "**Priority Settlements to be covered during the Disclosure Period".
- Meetings in other settlements will continue throughout the first year of RAP implementation, in alignment with the expropriation and construction schedules.
- **The Project will continue engaging with affected people throughout the 36-month RAP implementation period** in line with the RAP Stakeholder Engagement Action Plan for RAP.

G. PROJECT GRIEVANCE MECHANISM

39. How can stakeholders submit complaints and feedback about land acquisition to KGM?

KGM, as the authority responsible for expropriation, collects and manages all complaints, objections, and feedback related to land acquisition in line with its official procedures.

Stakeholders can submit land acquisition-related complaints and feedback to KGM through **KGM's institutional grievance channels**, which operate **in parallel with the Project's own grievance mechanism**.

Complaints related to expropriation, valuations, or compensation procedures carried out by KGM can be submitted **directly to KGM** through official channels, including:

- Through KGM's online grievance system: https://www.kgm.gov.tr/Sayfalar/KGM/SiteTr/Root/SikayetGeriBildirim.aspx
- Direct applications or petitions to **KGM 13th (Antalya) Regional Directorate** (Expropriation Department):
  - Mail or in-person application: Fabrikalar Mah. Gazi Bulvarı 07090, Kepez, Antalya, Türkiye
  - Phone: +90 242 320 70 00 Fax: +90 242 345 36 99
  - E-mail: bol13@kgm.gov.tr

In addition, stakeholders may submit grievances through the Presidency's Communication Centre (CIMER – https://www.cimer.gov.tr/ or 150). While CIMER is a national-level centralised communication platform, any land acquisition-related grievances submitted via CIMER are forwarded to and handled by KGM through internal coordination systems.

The grievances that fall under KGM's legal responsibility will be managed under **national administrative and legal procedures**, separate from the Project's grievance process.

The SPV does **not have a mandate to intervene** in grievances that fall under KGM's legal authority. If PAPs submit such complaints to the SPV, the SPV will guide them to the correct channels. When needed, the SPV will forward these complaints to KGM in writing.

40. Is there a Project-specific Grievance Mechanism and how can stakeholders submit their land acquisition-related complaints and feedback to SPV?

Yes, the **SPV has set up a Project-specific Grievance Mechanism** as part of the ESIA process, alongside the preparation of the RAP. This mechanism is used to collect and manage complaints and feedback related to the **SPV's areas of responsibility**, including RAP implementation and construction-related impacts.

This Mechanism is accessible to all stakeholders, including Project-Affected Persons (PAPs) and vulnerable individuals.

Grievances related to formal expropriation or compensation procedures under the legal responsibility of KGM and **must be submitted directly to KGM.**

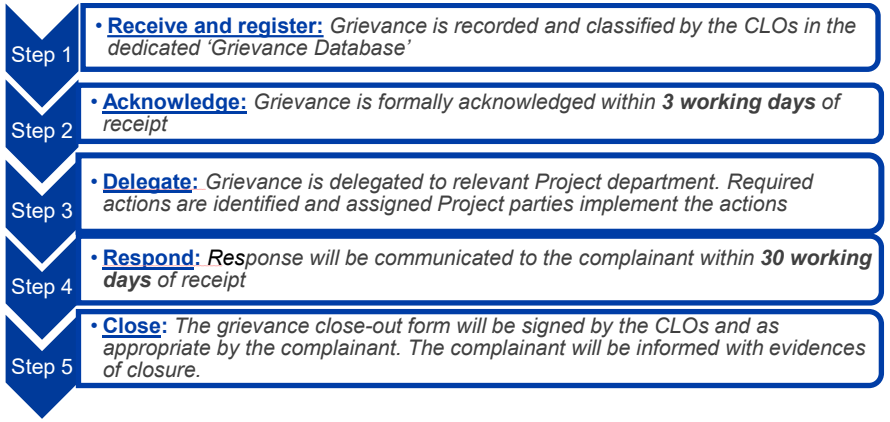
Through this mechanism, stakeholders can submit their concerns using the **channels listed below in Section H "CONTACT INFORMATION FOR STAKEHOLDERS"**

Any grievance and feedback (verbal or written) lodged or conveyed through different channels will be registered in the Project Grievance Database and managed as per the Project SEP, **by observing the requirements stipulated by the Law on the Protection of Personal Data (Law No. 6698, 2016).**

This Mechanism does not replace citizens' right to apply to other formal mechanisms including courts, CIMER) and Antalya Metropolitan Municipality's portal and call centre, among others.

41. What are the steps of the Project's Grievance Mechanism and how are complaints handled?

Key steps and timeframes of the Project Grievance Mechanism are presented below.



42. What appeal mechanisms are available if a grievance is not resolved to the satisfaction of the complainant?

If a grievance is not resolved to the satisfaction of the complainant, the Project offers an appeal mechanism. In such cases, the SPV will launch a second-tier review involving relevant authorities, third-party experts, or academics as independent parties. Based on their recommendations, the SPV will take appropriate action to resolve the grievance.

H. CONTACT INFORMATION FOR STAKEHOLDERS

Stakeholders can contact the Project and submit their questions, complaints, or feedback through the following communication channels:

Project website	**www.antalyaalanyaotoyolu.com.tr**
E-mail	**info@antalyaalanyaotoyolu.com**
Mail	**Ankara – Centre:** Kazım Özalp Mahallesi Hafta Sokak No:9, Çankaya, Ankara, Türkiye **Ankara – Office:** Söğütözü Cd. Koç Kuleleri No:2, A Blok, Kat 9, Daire 92, Çankaya, Ankara, Türkiye **Antalya Project Information Office:** Orta Belek Caddesi No:7, Kapi no: 9, Serik, Antalya, Türkiye
Phone (toll free line)	**+90 850 202 07 07**
Mobile Phone (SPV – CLOs)	**+90 530 978 78 42** **+90 539 935 16 46** **+90 536 345 39 23**
Grievance boxes and forms	Grievance and feedback boxes and forms are placed and maintained by the SPV in all affected settlements, at relevant work and mobilisation sites, and in mobile Project vehicles.

APPENDIX: GENERAL DIRECTORATE OF HIGHWAYS' (KGM) BOOKLET REGARDING PROCEDURAL STEPS IN EXPROPRIATION ACTIVITIES

A. INTRODUCTION

1. What is Antalya-Alanya Motorway Project?

The **Antalya-Alanya Motorway** Project (the "**Project**") is a Public-Private Partnership (PPP), with the **Public Partner** – being the Republic of Türkiye Ministry of Transportation and Infrastructure (MoTI), represented by the **Directorate General of Highways (KGM)**, and the **Private Partner** – being the **Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş.** (the Assigned Company).

Implemented under a **Build-Operate-Transfer (BOT)** model, the Project is one of two sub-projects that constitute the broader Afyonkarahisar-Alanya Motorway Project, which was initially tendered in 2010.

The Project is located in **Antalya province,** southern Türkiye and traverses the boundaries of **three districts** – **Serik, Manavgat and Alanya** – which are key touristic and commercial hubs of the country.

2. Who is the Granting Authority under the BOT Contract?

Within the context of the BOT Implementation Contract, the **Granting Authority** is the **Republic of Türkiye Ministry of Transportation and Infrastructure** (MoTI), represented by the **Directorate General of Highways (KGM)**. KGM is responsible for implementing the land acquisition and expropriation works required for the Project in accordance with the Expropriation Law of Türkiye.

3. Who is the Assigned Company under the BOT Contract?

The Company assigned under the BOT Implementation Contract is **Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş**. – a Special Purpose Vehicle (SPV) established by **Limak İnşaat Sanayi ve Ticaret A.Ş., an affiliate of Limak Holding**.

The Assigned Company is responsible for the **design, construction, financing, operation, and maintenance** of the Motorway until its transfer to KGM at the end of the BOT concession period.

4. How the Project is Financed and what are the Project's Applicable International Standards?

The Project is financed by international financial institutions (IFIs) and commercial banks. A Finance Agreement was signed between the Assigned Company and the Lenders on 6 October 2025.

The following international standards are applicable to the Project:

- **International Finance Corporation (IFC)** Performance Standards (PSs) (2012),
- **Equator Principles (EP) 4** (2020),
- **Asian Infrastructure Investment Bank (AIIB) Environmental and Social Framework** (2019), and

5. Why has a Resettlement Action Plan (RAP) been prepared, and how will it be implemented?

The land acquisition required for the Project results in risks and impacts related to both physical and economic displacement. Accordingly, a **Resettlement Action Plan (RAP)** has been prepared in line with applicable international standards, with the objective of developing and implementing measures to mitigate these risks and impacts on individuals owning and/or or using the affected lands and houses, as well as on the employers and employees of impacted businesses.

The entitlements, measures, and livelihood restoration and improvement programs under RAP are in addition to the compensation provided by KGM in accordance with the Expropriation Law. The additional costs associated with RAP implementation will be covered by the SPV **through the RAP Fund, which is allocated and managed by the SPV –** separate from KGM's Expropriation Budget.

The **RAP is a living document** and will be updated as necessary. It is disclosed in Turkish and English under the Project's ESIA Package at the Project website (www.antalyaalanyaotoyolu.com.tr).

The RAP will be implemented by the SPV in collaboration with KGM. The RAP implementation period will cover a duration of **36 months**, commencing from the singing of finance agreement, though **implementation of the key principles by the SPV has already commenced.**

6. What other Environmental and Social (E&S) studies have been undertaken for the Project?

The Project secured an **EIA Positive Decision** on 17 August 2018, in accordance with the Environmental Impact Assessment (EIA) Regulation in force at the time.

Additionally, an **Environmental and Social Impact Assessment (ESIA) package,** including a Non-technical Summary (NTS), Stakeholder Engagement Plan (SEP) and E&S Management Plans, compliant with the applicable international standards, has been prepared for the Project and disclosed in Turkish and English at the Project website (www.antalyaalanyaotoyolu.com.tr).

7. How the RAP has been reviewed independently?

Potential Lenders of the Project retained an independent **Environmental and Social Consultant (IESC)** in October 2024 to carry out an **Environmental and Social Due Diligence (ESDD)** review.

The purpose of the ESDD was to conduct an independent review of the Project's ESIA package – including the RAP – and to evaluate the compliance of land acquisition activities with the standards and requirements of the Lenders. Based on this review, the IESC also developed an **Environmental and Social Action Plan (ESAP).**

The RAP implementation will be periodically monitored by the **Lenders' IESC.**

8. Why this Guide to Land Acquisition and Compensation (GLAC) has been prepared?

This GLAC has been prepared to provide people affected by Project-related land acquisition ("Project Affected People" or "PAPs") with a clear and concise overview of **the expropriation process carried out by KGM** in accordance with the Expropriation Law, and summarize the **key principles of the RAP,** particularly regarding additional compensation and assistance measures that go beyond the legally mandated cash compensation to ensure alignment with international standards and Lender requirements.

In addition, this GLAC outlines how affected people can apply to the SPV to access RAP entitlements and convey their grievances, inquiries, and feedback to the Project parties.

There are three versions of the GLAC: (i) for affected lands, (ii) for affected houses, and (iii) for affected businesses. This version is the GLAC concerning affected lands.

B. PROJECT DESCRIPTION

9. What are the key Project Components?

The Project, designed as a **dual carriageway**, has a total length of **117.8 km**, encompassing both the main Motorway (84 km – 2x3 lanes) and connection roads (33.8 km – 2x2 lanes).

Other key Project components include **7** main interchanges, **5** tunnels, **16** viaducts, **22** bridges, **56** overpasses, **43** underpasses, and **308** culverts, with **auxiliary features** including an Operational and Maintenance (O&M) Centre, four Motorway Service Facilities, toll collection areas and temporary construction facilities.

10. Are there any associated facilities of the Project?

There are no additional associated facilities in the current design. Please refer to Question 15 for information regarding temporary facilities to be used during construction.

11. What is Motorway Expropriation Corridor?

The **expropriation corridor** defines the boundaries within which land acquisition, expropriation and all construction activities are carried out for the Motorway and associated connection roads.

The width of the expropriation corridor varies along the route, with the minimum and maximum widths as follows:

- **Minimum width: ~ 55 m**
- **Maximum width: ~450 m** (at the location of service areas)

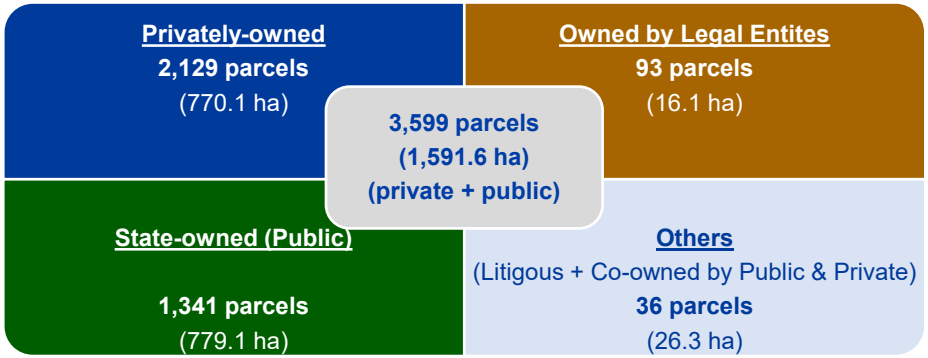
12. Which Settlements are affected within the Expropriation Corridor?

The land acquisition for the Project affects 3 districts and 57 neighbourhoods.

- **Serik (12 neighbourhoods):** Deniztepesi, Sariabali, Yukarikocayata, Asagikocayatak, Kayaburnu, Dikmen, Candir, Asagicatma, Cumali, Burmahanci, Urundu, Belpinar
- **Manavgat: (34 neighbourhoods):** Cakis, Tasagil, Gundogdu, Hocalar, Yavrudogan, Colakli, Seki, Kalemler, Evren, Ilica, Yenikoy, Siseler, Evrenleryahsi, Dolbazlar, Yukariisiklar, Dikmen, Bucakseyhler, Ulukapi, Asagisiklar, Demirciler, Karaoz, Aksaz, Haciali, Cevizler, Sulek, Haciisali, Haciobası, Kızılot, Uzunlar, Kadilar, Orensehir, Yalcidibi, Odaonu, Karakaya
- **Alanya (11 neighbourhoods):** Alara, Cakallar, Incekum, Avsallar, Akdam, Turkler, Payallar, Emisbeleni, Toslak, Telatiye, Elikesik

13. How many Parcels are Affected?

There are **3,599 private, legal entity, and public (state-owned)** parcels to be acquired **within Project's expropriation corridor.**



14. What is the land registry type of affected parcels?

The majority of the affected parcels are registered as **agricultural land**, **road**, and **forest**.

Number of Parcels per Land Registry Type (3,599 parcel)	Area of Parcels per Land Registry Type (1,591.6 ha parcel)
• **Agricultural** (2,507 parcel)	• **Agricultural** (825.6 ha)
• **Road** (258 parcel)	• **Forest** (553.5 ha)
• **Forest** (149 parcel)	• **Road** (53 ha)
• **Land with structures** (148 parcel)	• **Land with structures** (42.2 ha)
• **Constructible plot** (87 parcel)	• **Constructible plot** (9.1 ha)
• **Orchard** (101 parcel)	• **Orchard** (21.7 ha)
• **Raw soil** (83 parcel)	• **Raw soil** (15.8 ha)
• **Litigous** (13 parcel)	• **Litigous** (12.2 ha)
• **Pasture** (3 parcel)	• **Pasture** (0.2 ha)
• **Others** (250 parcel)	• **Others** (58.3 ha)

15. Which temporary facilities will be required during construction?

During the **construction phase**, the Project will utilise various temporary facilities, including **construction camp sites**, **production plants and facilities** (such as concrete batching plants, crushing/mechanical plants, and asphalt plants), as well as **quarries** and **excavated material storage sites**.

A list of planned facilities is included in the RAP.

Construction Camp Sites	• Temporary Construction Camp (KM 59+500) • Main Construction Camp Site (KM 64+500) • Manavgat Construction Camp Site (KM 87+500) • Alanya Construction Camp Site (124+300)
Plants and Facilities	• 7 concrete plants • 4 crushing/mechanical plants • 3 asphalt plants
Quarries	• 11 potential quarries
Excavated Material Storage Sites	• 20 potential excavated material storage sites

16. How is the private land for temporary facilities acquired by the Project?

Private parcels required for temporary facilities are acquired by the SPV/EPC through rental agreements, mutual protocols, or other similar arrangements made with the landowners or shareholders.

Upon completion of temporary use, the land is rehabilitated and returned to the owner in accordance with the agreed terms.

17. What are key milestones in the Project schedule?

No	Key Milestones / Tasks	Date
0	**BOT Contract Signing, Site Delivery**	14 October 2024
1	**Expropriation**	
1.1	Start of inventory of assets and valuation study commenced by appointed valuation contractor	November 2024
1.2	Start of expropriation procedures – through Article 8 negotiations – by KGM	February 2025
1.3	Completion of valuation	Q4 2025 (*target*)
1.4	Completion of Article 8 negotiations as part of expropriation procedures undertaken by KGM	
	Phase 1: KM 52 – 56; KM 74 – 104; KM ~64 (O&M Centre), KM ~80 (Concrete Plant)	February – August 2025 (***completed***)
	Phase 2: KM 56 – 74; KM 104 – 116; Connection Roads: Manavgat East, D-400, Serik	September 2025 – January 2026 (*target*)
	Phase 3: KM 116 – 141; Connections roads: Taşağıl, Manavgat, Alarahan and Konaklı	April 2026 (*target*)
2	**E&S Studies and Finance Agreement**	
2.1	Start of ESIA Package studies	March 2024
2.2	Start of RAP studies	April 2025
2.3	ESIA Package Disclosure by SPV, Lenders (60 days)	Q2 and Q3 2025
2.4	Finance Agreement Signing	6 October 2025
3	**Construction Works**	36 months after Signing
3.1	Land entry by the Project for design-related activities	November 2024
3.2	Site Mobilisation and Start of Construction	March 2025
3.3	Earthworks and Construction of Engineering Structures (incl. Connection Roads)	January 2028
	KM 52+000 – 80+000	November 2027 (*target*)
	KM 80+000 – 114+750	January 2028 (*target*)
	KM 114+750 – 141+705	November 2027 (*target*)
3.4	Tunnels, Viaducts, Superstructure, O&M Centre, Motorway Service Facilities (MSFs) and Other Secondary Works	March 2028
4.	**Motorway Commissioning**	Within 36 months from the date of signing the finance agreement

C. LAND ACQUISITION STATUS AND DISPLACEMENT IMPACTS

18. What is the status of land acquisition?

A **Public Benefit Decision** (No: 2023/371) for the Project was declared by the MoTI on **28 November 2023.**

A Presidential Decree (No. 9708) concerning the **Accelerated Expropriation** of certain immovable properties under the scope of the Project (located within the settlements covered by the Decree) by the KGM in line with **Article 27 of the Expropriation Law of Türkiye** (Law No. 2942, 1983) was published in the Official Gazette (No. 32857) on **30 March 2025.**

The **Expropriation Decisions** were taken for the Project by KGM between December 2024 and May 2025.

Pursuant to these decisions, **land acquisition activities for the Project commenced in February 2025**.

- Between February and August 2025, expropriation procedures were initiated for 22% of the **private parcels through Article 8 invitations and negotiation meetings.**
- KGM has resorted to the **accelerated expropriation** for **3%** of the **private parcels.**
- Forestry permits have been obtained for over 75% of the forest lands located within the Motorway's expropriation corridor.

Planned Schedule of Article 8 Negotiation Meetings

Negotiation Meeting Date	Settlements
Completed between February – September 2025	Serik: Deniztepesi, Sarıabalı
	Manavgat: Şişeler, Taşağıl, Aksaz, Cevizler, Demirciler, Hacıali, Hacıisalı, Hacıobası, Karaöz, Sülek, Aşağıışıklar, Bucakşeyhler, Dikmen, Ulukapı, Yukarıışıklar, Dolbazlar, Evrenleryavşi, Kalemler, Seki, Yeniköy, Şişeler
October 2025 *(planned)*	Manavgat: Kadılar, Karakaya, Odaönü, Örenşehir, Uzunlar, Yalçıdibi
November 2025 *(planned)*	Serik: Aşağıkocayatak, Çandır, Dikmen, Kayaburnu, Yukarıkocayatak
	Manavgat: Çakış, Çolaklı, Gündoğdu, Hocalar, Taşağıl, Yavrudoğan
November 2025 *(planned)*	Manavgat: Hacıobası, Kızılot
January – February 2026 *(planned)*	Serik: Deniztepesi, Sarıabalı, Üründü, Belpınarı, Burmahancı, Cumalı, Aşağıçatma
February – April 2026 *(planned)*	Manavgat: Evren, Ilıca
	Alanya: Alara, Çakallar, Akdam, İncekum, Avsallar, Türkler, Payallar, Emişbeleni, Toslak, Telatiye, Elikesik

19. What is the status of land entry and construction?

The site was officially delivered by KGM to the SPV in October 2024, following the signing of the BOT Contract.

After site delivery, design-related activities – including drilling operations– were initiated in **November 2024**.

site mobilisation for Project construction began in **March 2025**, financed through the Company's own equity.

Currently, **construction works are ongoing primarily on forest parcels**, for which forestry permits have been obtained.

As the expropriation of privately owned parcels is finalised, construction activities are also initiated by the SPV and EPC on those parcels following the compensation payments by KGM, in line with the national Expropriation Law, and the provision of additional support by the SPV under the RAP.

20. What are the potential displacement impacts of the Project and who would be affected?

Permanent or temporary land acquisition for the Project will lead to **physical or economic displacement** for the **owners and/or users (formal or informal)** of the affected lands and structures.

The land acquisition-related impacts are primarily classified under the following:

(i) **Affected lands** (may include non-residential and non-commercial structures)
(ii) **Affected houses** (299 building on 231 parcels with 341 households)
(iii) **Affected greenhouses** (599 greenhouse units on 347 parcels)
(iv) **Affected businesses** (29 businesses to be relocated + 8 roadside local product vendors operating on lands already expropriated by KGM)
(v) **Impacts on vulnerable people**
(vi) **Temporary losses/impacts during construction**, and
(vii) **Impacts during operation**

21. Will there be further land acquisition beyond the current expropriation Corridor?

The Project may require **further land acquisition** beyond the currently defined expropriation corridor, either during construction or, on a limited basis, after commissioning.

In case of future land acquisition requirements, the required land will be acquired by KGM in line with the Expropriation Law. Potential displacement impacts and access restrictions associated with such land acquisition or expropriation will be managed by the SPV – in collaboration with KGM – in accordance with the RAP principles.

22. What are the cumulative land acquisition and resettlement impacts of the Project?

Cumulative land acquisition impacts may arise when landowners or users are affected by multiple, overlapping land-related acquisitions linked to the Project or other developments in the region or directly to the Project.

During RAP implementation a field-based cumulative impact assessment study will be conducted by the SPV, with support from third-party technical consultants, to make parcel-based identification of affected owners and users, assess and address these impacts under the specific budget allocated by the SPV.

D. EXPROPRIATION PROCESS IN LINE WITH EXPROPRIATION LAW

23. What is the legal basis of the expropriation process?

In the Republic of Türkiye, expropriation is carried out in accordance with **Article 46 of the Constitution** and implemented through the provisions of **Expropriation Law (No. 2942).**

The **Directorate General of Highways (KGM)** is responsible for the expropriation of privately-owned parcels in accordance with Türkiye's Expropriation Law (No. 2942), as well as coordinating the allocation of public parcels.

According to the BOT Contract, the SPV is responsible for covering a portion of the expropriation costs for the Project. The amount to be covered by the SPV is specified in the BOT Contract. Any costs exceeding this specified amount will be covered by KGM.

24. Which procedures does KGM carry out under the Expropriation Law?

Land acquisition is conducted through either negotiated settlement (Article 8) or judicial expropriation.

For detailed information on the expropriation process carried out by the KGM and its procedural steps, please refer to the booklet titled *"**Procedural Steps in Expropriation Activities Conducted by the General Directorate of Highways**"*, which has been distributed by the SPV alongside this GLAC.

25. Who is eligible for compensation under the Expropriation Law?

Under national legislation, the following categories of PAPs are eligible for compensation:

Affected Asset	Eligible PAPs
Private Parcels	• **Owners** of lands, trees, crops, structures on affected lands • **Formal land users** (with official documentation) for trees, structures, crops on affected lands • **Informal land users who have evidence** of structure and tree ownership on affected lands (eligible under Exp. Law - Art. 19) • **Litigant owners/shareholders or formal and informal users of litigious parcels**
Public Lands	• **Formal public land users** (who have official documentation, e.g. adequate pay "ecrimisil", rental agreement) for trees, crops, and structure • **Informal public land users who have evidence** of structure and tree ownership on affected lands (eligible under Exp. Law - Art. 19)
Business Structures	• **Owners of affected business structures** • **Formal (tenants) or informal users affected business structures**

E. COMPENSATION AND ENTITLEMENTS UNDER RAP TO MEET INTERNATIONAL STANDARDS

26. What additional compensation and entitlements are provided by the SPV through RAP implementation, beyond those offered by KGM under the Expropriation Law?

In addition to the compensation provided by KGM in accordance with the Expropriation Law, **the SPV implements supplementary compensation and livelihood restoration measures under the RAP** for the affected businesses.

The SPV has established a dedicated **RAP Fund** for covering all costs arising from the implementation of additional measures beyond those required under national legislation. This Fund is allocated and managed by SPV, in coordination with KGM.

27. What are the Key Compensation and Assistance principles outlined in the RAP?

- Avoidance of Forced Eviction: The Project will not carry out forced evictions except in accordance with national legislation and the requirements of IFC PS5.
- Prioritisation of Purchase through Negotiated Settlement over Expropriation: KGM has prioritised negotiated settlements through Article 8 (purchase method) under this Project. Article 27 will be used by KGM as a last resort, only after Article 8 process.
- Compensation at Full Replacement Cost: All compensation to people affected by land acquisition will be provided at full replacement cost. This includes market value plus any applicable transaction costs, as required by Lenders.
- Livelihood Restoration and Assistance in addition to cash compensation: The SPV will provide livelihood restoration and assistance measures to eligible affected businesses, including their employers, and formal and informal employees, in accordance with the requirements of the Lenders.
- Early Consultations and Notification for Land Acquisition Process: The SPV will notify the owners and tenants of affected structures at least **three months** in advance of the commencement of expropriation, in alignment with KGM's expropriation programme. This is intended to avoid forced eviction and allow sufficient time (more than six months) for resettlement planning, including the relocation arrangements of affected businesses.

  In cases where expropriation has already been concluded, the SPV will inform property owners of the Project schedule. Each owner will be granted a six-month notice period to vacate the property following notification, unless a mutually agreed alternative timeframe is established.

28. What is Cut-off Date for Eligibility?

The **cutoff date** is the date after which any new structures, trees, crops, and other immovable assets will no longer be counted or measured for compensation purposes.

The cut-off dates are determined **based on the completion date of the census and asset inventory surveys** conducted in each respective settlement. Therefore, the cutoff is specific to each affected settlement.

The SPV posts the list of affected parcels along with a notice disclosing the applicable cut-off date and its conditions. These are posted in the offices of the mukhtars, local coffee houses, and other appropriate public venues within the respective affected settlements.

The affected businesses are also individually notified by the SPV.

29. Who is Eligible for Compensation and Assistance under RAP?

All people affected by the Project and owning and/or using (formally or informally) the affected lands and assets **before the cut-off dates** defined in the RAP are eligible for compensation and assistance under RAP.

Accordingly, **people who encroach on the Project area after the cut-off date** are **not** eligible for compensation or assistance provided through the implementation of the RAP.

Affected people who believe they have not been included in the process or are eligible for the entitlements can apply to the Project CLOs with the required documents and an application letter. Their eligibility for compensation and/or assistance will be evaluated by the SPV. After the evaluation, they will be informed of the outcome, and if deemed eligible, they will be granted access to the relevant compensation and/or assistance.

The eligibility categories for affected lands and businesses identified in the RAP are as follows:

Affected Lands	• Landowners (private parcels) • Owners and users of litigous properties • Owners of non-residential and secondary structures on affected lands (maybe formal or informal user of affected land) • Vulnerable landowners and land users
Affected Businesses	• Formal employers (owner or tenant at the affected business structure) • Informal employers (owner or tenant at the affected business structure) • Employees of the affected businesses (formal or informal) • Vulnerable employers and employees

30. What are the RAP entitlements specific for owners and users of affected private and public parcels?

For detailed information, please refer to the **GLAC for affected lands.**

31. What are the RAP Entitlements for Owners of Affected Businesses that will be permanently resettled?

- **Business owners (Employers) – who are "owners" of the relocated business structure**

In accordance with the Expropriation Law, cash compensation by KGM is provided to structure owners. Depreciation is applied. No compensation is provided by KGM for loss of income.

The owners of affected businesses are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- Notification at least **three months in advance of the start of expropriation** (which is approximately six months before land entry).
- **Top-up cash compensation** to cover the amount deducted for depreciation by KGM and achieve full replacement cost.
- **Pre-Location Financial Support Package for Business Owners** (to be provided by the SPV through a milestone-based payment approach as outlined in the RAP);
  - ❖ Cash Compensation to cover cost of fixed (non-movable) investments/improvements (for portion not covered by KGM).
  - ❖ Moving allowance to cover disassembly, transportation and assembly costs of movable assets (for portion not covered by KGM).
  - ❖ Business relocation support package to cover other business-specific relocation-related expenses such as real estate agent service fee, title deed transfer costs, potential transaction costs, subscription fees, permit renewal costs including preparation of relevant documentation, cost of approvals to be secured from related authorities, etc.
- **Post-relocation Financial Support Package for Business Owners** to compensate net income loss during the temporary business interruption period **up to 6 months** until successful reestablishment of the affected business – for eligible business owners, cash compensation support will be provided by the SPV on a monthly basis.

  ***(Important Note to PAPs:** Employers are required to provide financial and other relevant documentation upon the request of the SPV. These documents will be reviewed by the SPV to ensure a fair determination of the level and duration of support).*

- Access to **External Business Advisory Services** for 36 months.

- **Business owners (Employers) – who are "tenants" at the relocated business structure**

As per the Expropriation Law, cash compensation is provided to structure owners. If both the owner and the tenants provide their consent, tenants may be compensated by KGM for the non-movable and movable assets determined to be in their ownership. No compensation is provided by KGM for loss of income.

The owners of affected businesses employers are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- Notification at least **three months in advance of the start of expropriation** (which is approximately six months before land entry).
- **Pre-Location Financial Support Package for Tenant Business Owners** (to be provided by the SPV through a milestone-based payment approach as outlined in the RAP);
  - ❖ Cash Compensation to cover cost of fixed (non-movable) investments/improvements made by the tenants (for portion not covered by KGM).
  - ❖ Moving allowance to cover disassembly, transportation and assembly costs of movable assets (for portion not covered by KGM).
  - ❖ Business relocation support package to cover other business-specific relocation-related expenses including rental allowance (three-month rent allowance, based on the market rental rate of the replacement business structure to be rented), real estate agent service fee (equivalent to the market rental rate of the replacement business structure to be rented), and allowance for other relocation related expenses, which are specific to each business (such as environmental permits, H&S related permits and approvals, etc.).
- **Post-relocation Financial Support Package for Tenant Business Owners** to compensate net income loss during the temporary business interruption period **up to 6 months** until successful reestablishment of the affected business – for eligible business owners, cash compensation support will be provided by the SPV on a monthly basis. to affected business owners to compensate net income loss during the temporary business interruption period (**6 months**).

> ***Important Note to PAPs:*** *Employers are required to provide financial and other relevant documentation upon the request of the SPV. These documents will be reviewed by the SPV to ensure a fair determination of the level and duration of support.*

- Access to **External Business Advisory Services** for 36 months.

- **Business owners (Employers) Business owners – which would terminate operations (business shut-down) due to relocation**

As per the Expropriation Law, no compensation is provided by KGM for loss of income.

In cases where business termination is unavoidable and directly linked to relocation (this will be confirmed by the external Business Advisor(s) to be retained by the SPV), the SPV will provide **one-off** cash compensation support to the affected business owners. The external Business Advisor(s) will determine the valuation criteria and the appropriate level of support on a case-by-case basis, using official financial and accounting records (e.g. tax declarations, balance sheets from the previous year, etc.).

Affected business owners and their employees will be given priority consideration for employment opportunities generated by the Project and have access to the External Business Advisory Services to be arranged by the Project.

Employment will be contingent upon meeting relevant job requirements, and the RAP Implementation Team will assist in identifying suitable roles, supporting applications, and providing any necessary orientation or training.

32. What are the RAP Entitlements for Owners of Affected Businesses that will not relocate but face partial loss of structures at the existing premises?

As per the Expropriation Law, cash compensation is provided to structure owners. Depreciation is deducted.

The owners of affected businesses employers (owner or tenant at the affected structure) are entitled to receive the following **additional** compensation and assistance from the SPV under the RAP:

- **Top-up cash compensation** to cover the amount deducted for depreciation by KGM and achieve full replacement cost (only for structure owners)
- **Support through construction teams and vehicles** to prevent potential access restrictions to the site – such as at entry/exit gates, ramps, or for the reorganisation of the layout of movable structures, where appropriate.
- **Assistance for relocating affected movable structures and auxiliary facilities** to another location within the existing premises or nearby surroundings – in coordination and consultation with the business owner to minimise any interruption to business operations.
- Access to **External Business Advisory Services** for 36 months.
- **Monitoring requests and managing grievances** to identify any impact on the business (e.g. access restrictions caused by construction or during operation) and develop and implement corrective actions in consultation with the business owner.

33. What are the RAP Entitlements for the Formal and Informal Employees of Affected Businesses?

As per the Expropriation Law, no compensation is provided by KGM to formal or informal employees.

Employment status and conditions of employees will be identified by the SPV **three** months before start of expropriation.

They are entitled to receive following compensation and assistance from SPV under RAP:

- **Formal and Informal Employees** of relocated businesses affected by **temporary** income loss
    - **Gross salary support** (up to **three** months) to avoid temporary interruption of employee salary payments due to relocation (to be assessed and identified by the External Business Advisor(s) of SPV based on monitoring outcomes)

      If the RAP monitoring (internally by SPV and externally by IESC) proves that there is no adverse impact/interruption on the income of the employees, the SPV will **not** provide any gross salary support for the employees.
- **Formal and Informal Employees** affected by **permanent** income loss (due to business shut-down, dismissal, etc.)
    - **Review and evaluation of permanent income loss cases by External Business Advisor(s) of SPV** and provision of following support when it is verified that permanent income loss (that take place within 6 months after the relocation) is directly related/inevitable due to relocation of the business:
        - ❖ **For formal employees:** 3 months of gross salary support by SPV in addition to severance payments, unpaid annual leaves and other gained benefits to be provided by their official employers in line with the Labour Law.
        - ❖ **For informal employees:** 3 months of gross salary support by SPV plus priority for employment in the Project construction (if they meet the Project employment criteria) and other employee-specific measures to be developed by the SPV (e.g. specific skill trainings to increase opportunity for employment in similar or other sectors) and implemented by SPV on a case-by-case basis.)

34. What specific RAP entitlements are available for people affected by construction impacts?

The SPV and construction (EPC) contractors (including subcontractors) will implement measures specified in the Project ESIA, ESMP and subject-specific management plans to avoid, and where avoidance is not possible minimise and/or compensate the impacts on people and environment.

PAPs may contact Project CLOs through contact information provided at the end of this GLAC to submit their construction-related grievances and feedback through Project's Grievance Mechanism.

35. What Livelihood Restoration, Improvement, and Assistance Packages are available to the Owners of Affected Businesses (Employers) in related to their affected business operations?

Livelihood restoration, improvement, and assistance will be provided to both employers and employees – whether formal or informal – of businesses affected by the Project. These measures aim to support the successful re-establishment of relocated businesses at their new locations, reduce business interruptions during the transition and prevent potential shutdowns, and help restore (or where possible, improve) their income levels.

The support packages available to affected businesses will include the following measures:

Livelihood Restoration Improvement and Assistance Packages for Affected Businesses				
Package 1 External Business Consultancy Support for Relocation (for 36 months)	**Package 2** Pre-relocation Financial Support Package to Business Owners	**Package 3** Post-relocation Financial Support Package to Business Owners	**Package 5** Financial Support Package to Employees	**Package 6** Priority in Project Employment

The SPV will retain an external Business Consultancy Company (Business Consultant), comprising a team of experts specialised in business development and management for micro, small, and medium-sized enterprises (MSMEs). The consultancy services will be provided over a period of 36 months, aligning with the duration of RAP implementation.

36. How will eligible PAPs be identified, and which documents will be requested from them for eligibility evaluation and decision-making?

During RAP implementation, the SPV will proactively engage with the affected people, including businesses, to identify potential eligible people and inform them about the livelihood restoration, improvement and assistance measures available to them and requested documents.

The eligibility of affected business employers and employees to benefit from RAP entitlements will be evaluated by the SPV on a case-by-case basis.

Important Note to PAPs: *PAPs may also contact the Project CLOs using the contact information provided at the end of this GLAC to request further information, share suggestions, or express their interest in participating in the relevant support packages.*

The documentation requested from PAPs for the evaluation of their eligibility for RAP entitlements may include, but is not limited to, the following.

It should be noted that this list is not exhaustive, and the SPV reserves the right to request additional documentation at any stage of the eligibility assessment process:

Affected Businesses

- Title deeds for affected business structures (*for structure owners*)
- Lease agreements (*for formal users - tenants of land or business structure*)
- Legal company documentation for affected businesses (*for formal business owners*)
- Financial records, accounting documents, social security registration, permitting documentation, etc. (*for formal business owners*)
- Information and documentation on informal employees in relation to their informal employment terms and duration, salaries, residency or work related documentation of foreign workers, etc. (*for formal and informal business owners*)
- Documentation of moving and transaction costs, including fees paid to authorities and service providers, and price offers/quotes as requested by the SPV and other transaction costs (*for formal and informal business owners*)
- Evidence of expenditures made for fixed investments and improvements (*for formal and informal business owners*)

F. STAKEHOLDER ENGAGEMENT AND INFORMATION DISCLOSURE

37. How will PAPs and interested parties be engaged during the Disclosure Period and RAP implementation period?

The Project has a **Stakeholder Engagement Plan (SEP)** disclosed at the Project website (www.antalyaalanyaotoyolu.com.tr)

The RAP separately includes a detailed **Stakeholder Engagement Action Plan** for RAP disclosure and implementation phases. The following RAP specific disclosure activities are conducted:

- The RAP (including the GLAC) **will be published in English and Turkish on the SPV and Lenders' websites**, in line with their disclosure policies and timelines.
- This GLAC, explaining the entitlements and next steps clearly to all affected people and stakeholders, will be delivered to the offices of mukhtars and directly to affected people and vulnerable individual in each settlement.
- The **hard copies (in Turkish)** of the final RAP and GLAC will be made available at the following locations: Project Information Office in Serik, Project's Construction Camp Sites, and Offices of the settlement heads (mukhtars)
- The **SPV CLOs will engage individually with affected businesses that include vulnerable employers and employees** to distribute the GLAC and communicate the key information from the RAP, as applicable.
- Specifically for the disclosure of the RAP, the RAP Implementation Team will organise separate group and/or individual meetings and information sessions prior to Article 8 negotiation meetings.
- Meetings in other settlements will continue throughout the first year of RAP implementation, in alignment with the expropriation and construction schedules.
- **The Project will continue engaging with affected people throughout the 36-month RAP implementation period** in line with the RAP Stakeholder Engagement Action Plan for RAP.

G. PROJECT GRIEVANCE MECHANISM

38. How can stakeholders submit complaints and feedback about land acquisition to KGM?

KGM, as the authority responsible for expropriation, collects and manages all complaints, objections, and feedback related to land acquisition in line with its official procedures.

Stakeholders can submit land acquisition-related complaints and feedback to KGM through **KGM's institutional grievance channels**, which operate **in parallel with the Project's own grievance mechanism**.

Complaints related to expropriation, valuations, or compensation procedures carried out by KGM can be submitted **directly to KGM** through official channels, including:

- Through KGM's online grievance system: https://www.kgm.gov.tr/Sayfalar/KGM/SiteTr/Root/SikayetGeriBildirim.aspx
- Direct applications or petitions to **KGM 13th (Antalya) Regional Directorate** (Expropriation Department):
  - Mail or in-person application: Fabrikalar Mah. Gazi Bulvarı 07090, Kepez, Antalya, Türkiye
  - Phone: +90 242 320 70 00 Fax: +90 242 345 36 99
  - E-mail: bol13@kgm.gov.tr

In addition, stakeholders may submit grievances through the Presidency's Communication Centre (CIMER – https://www.cimer.gov.tr/ or 150). While CIMER is a national-level centralised communication platform, any land acquisition-related grievances submitted via CIMER are forwarded to and handled by KGM through internal coordination systems.

The grievances that fall under KGM's legal responsibility will be managed under **national administrative and legal procedures**, separate from the Project's grievance process.

The SPV does **not have a mandate to intervene** in grievances that fall under KGM's legal authority. If PAPs submit such complaints to the SPV, the SPV will guide them to the correct channels. When needed, the SPV will forward these complaints to KGM in writing.

39. Is there a Project-specific Grievance Mechanism and how can stakeholders submit their land acquisition-related complaints and feedback to SPV?

Yes, the **SPV has set up a Project-specific Grievance Mechanism** as part of the ESIA process, alongside the preparation of the RAP. This mechanism is used to collect and manage complaints and feedback related to the **SPV's areas of responsibility**, including RAP implementation and construction-related impacts.

This Mechanism is accessible to all stakeholders, including Project-Affected Persons (PAPs) and vulnerable individuals.

Grievances related to formal expropriation or compensation procedures under the legal responsibility of KGM and **must be submitted directly to KGM.**

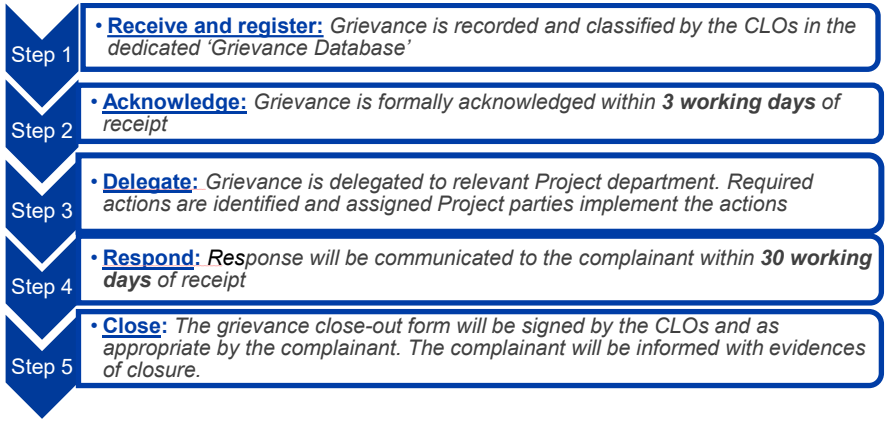
Through this mechanism, stakeholders can submit their concerns using the **channels listed below in Section H "CONTACT INFORMATION FOR STAKEHOLDERS"**

Any grievance and feedback (verbal or written) lodged or conveyed through different channels will be registered in the Project Grievance Database and managed as per the Project SEP, **by observing the requirements stipulated by the Law on the Protection of Personal Data (Law No. 6698, 2016).**

This Mechanism does not replace citizens' right to apply to other formal mechanisms including courts, CIMER) and Antalya Metropolitan Municipality's portal and call centre, among others.

40. What are the steps of the Project's Grievance Mechanism and how are complaints handled?

Key steps and timeframes of the Project Grievance Mechanism are presented below.



41. What appeal mechanisms are available if a grievance is not resolved to the satisfaction of the complainant?

If a grievance is not resolved to the satisfaction of the complainant, the Project offers an appeal mechanism. In such cases, the SPV will launch a second-tier review involving relevant authorities, third-party experts, or academics as independent parties. Based on their recommendations, the SPV will take appropriate action to resolve the grievance.

H. CONTACT INFORMATION FOR STAKEHOLDERS

Stakeholders can contact the Project and submit their questions, complaints, or feedback through the following communication channels:

Project website	**www.antalyaalanyaotoyolu.com.tr**
E-mail	**info@antalyaalanyaotoyolu.com**
Mail	**Ankara – Centre:** Kazım Özalp Mahallesi Hafta Sokak No:9, Çankaya, Ankara, Türkiye **Ankara – Office:** Maidan İş Yaşam Merkezi, Mustafa Kemal Mah. 2118. Cad. B Blok, Kat 10, Daire 105, Çankaya, Ankara, Türkiye **Antalya Project Information Office:** Orta Belek Caddesi No:7, Kapi no: 9, Serik, Antalya, Türkiye
Phone (toll free line)	**+90 850 202 07 07**
Mobile Phone (SPV – CLOs)	**+90 530 978 78 42** **+90 539 935 16 46** **+90 536 345 39 23**
Grievance boxes and forms	Grievance and feedback boxes and forms are placed and maintained by the SPV in all affected settlements, at relevant work and mobilisation sites, and in mobile Project vehicles

Table.3 Vascular Plant Elements Identified from the Area Within the Scope of the Project (L: Literature, O: Observation; Relative Abundance; 1: Rare, 2: Middle, 3: Abundant, 4: Very abundant)

Scientific Name	Local Name	Endemism	IUCN	CITES	BERN	Habitat Directive	Phytogeographic Region	Relative Abundance				Type of Detection
								1	2	3	4	
Amaranthaceae												
Chenopodium album subsp. *album* var. *album*	-	-	-	-	-	-	-			X		O+L
Noaea mucronata	Hölmezotu	-	-	-	-	-	-		X			L
Amaryllidaceae												
Narcissus tazetta	Nergis	-	-	-	-	-	-		X			O+L
Anacardiaceae												
Cotinus coggygria	Boyacısumağı	-	LC	-	-	-	-		X			O+L
Pistacia terebinthus subsp. *palaestiana*	Çöğre	-	-	-	-	-	-			X		O+L
Rhus coriaria	Sumak	-	-	-	-	-	-		X			O+L
Apiaceae												
Artedia squamata	Karabenek	-	-	-	-	-	-			X		O+L
Daucus carota	Yabani Havuç	-	LC	-	-	-	-		X			O+L
Daucus guttatus	Benekli Havuç	-	LC	-	-	-	-		X			O+L
Echinophora tournefortii	Dikenli Çördük	-	-	-	-	-	Irano-Turanien			X		L
Eryngium campestre	Kırsenet	-	-	-	-	-	-		X			O+L
Eryngium glomeratum	Top Boğadikeni	-	-	-	-	-	-		X			O+L
Eryngium kotschyi	Deveelması	Endemic	LC	-	-	-	-			X		L
Scandix stellata	Dağ Kişkişi	-	-	-	-	-	-			X		L
Torilis arvensis	Dercikotu	-	-	-	-	-	-			X		O+L
Apocynaceae												
Nerium oleander	Zakkum	-	-	-	-	-	-			X		O+L
Vincetoxicum canescens	Zilasur	-	-	-	-	-	-			X		O+L
Araceae												
Arisarum vulgare	Yılancıkotu	-	-	-	-	-	Mediterranean		X			O+L
Arum dioscoridis	Tirşikpancarı	-	-	-	-	-	-	X				O+L
Dracunculus vulgaris	Yılanbıçağı	-	LC	-	-	-	Mediterranean	X				O+L
Araliaceae												
Hedera helix	Duvarsarmaşığı	-	-	-	-	-	-			X		O+L
Asparagaceae												
Drimia maritima	Kumörümcekotu	-	-	-	-	-	-			X		O+L
Muscari neglectum	Arapüzümü	-	-	-	-	-	-		X			L

Prospero autumnale	Güzsümbülü	-	-	-	-	-	-			X		O+L
Ruscus aculeatus	Tavşanmemesi	-	LC	-	-	-	Europe-Siberia		X			O+L
Asteraceae												
Achillea millefolium subsp. *millefolium*	Civanperçemi	-	-	-	-	-	-		X			L
Antemisia campestris	Yavşan Otu	-	-	-	-	-	-		X			O+L
Anthemis cotula	Hozan Çiçeği	-	-	-	-	-	-		X			O+L
Arctium minus	Löşlek	-	-	-	-	-	Europe-Siberia		X			L
Bellis perennis	Koyungözü	-	-	-	-	-	Europe-Siberia		X			O+L
Centaurea solstitialis subsp. *solstitialis*	Çakırdikeni	-	-	-	-	-	-		X			O+L
Centaurea virgata	Acı Süpürge	-	-	-	-	-	Irano-Turanien		X			O+L
Chondrilla juncea	Karakavuk	-	LC	-	-	-	-		X			O+L
Cichorium intybus	Hindiba	-	LC	-	-	-	-		X			O+L
Cirsium arvense subsp. *vestitum*	Köygöçüren	-	-	-	-	-	-		X			L
Cirsium vulgare	Yaygın Kangal	-	-	-	-	-	-		X			O+L
Conyza canadensis	Selvi otu	-	-	-	-	-	-		X			O+L
Crepis sancta subsp. *obovata*	Yumurta Kıskısı	-	-	-	-	-	-		X			L
Crupina crupinastrum	Gelindöndüren	-	-	-	-	-	-		X			O+L
Cyanus depressus	Gökbaş	-	-	-	-	-	-			X		O+L
Echinops pungens var. *pungens*	-	-	-	-	-	-	Irano-Turanien			X		O+L
Echinops ritro	Topuz	-	-	-	-	-	-			X		L
Filago arvensis	Keçeotu	-	-	-	-	-	-			X		L
Inula viscosa	Sümenit	-	-	-	-	-	-			X		O+L
Lactuca serriola	Eşekhelvası	-	-	-	-	-	-			X		O+L
Logfia arvensis	Keçeotu	-	-	-	-	-	-			X		O+L
Picnomon acarna	Kılçıkdiken	-	-	-	-	-	Mediterranean			X		O+L
Senecio vernalis	Kanaryaotu	-	-	-	-	-	-		X			O+L
Silybum marianum	Devedikeni	-	LC	-	-	-	Europe-Siberia		X			O+L
Sonchus asper	Eşekgevreği	-	-	-	-	-	-		X			O+L
Tragopogon porrifolius	Yemlik	-	-	-	-	-	-		X			O+L
Xanthium spinosum	Pıtrak	-	-	-	-	-	-			X		L
Xeranthemum annuum	Kâğıtçiçeği	-	-	-	-	-	-			X		O+L
Boraginaceae												
Alkanna orientalis var. *orientalis*	-	-	-	-	-	-	Irano-Turanien		X			O+L
Anchusa azurea var. *azurea*	Sığırdili	-	-	-	-	-	-			X		L
Buglossoides arvensis	Tarla Taşkeseni	-	-	-	-	-	-		X			O+L
Cerinthe minor subsp. *auriculata*	Livarotu	-	-	-	-	-	-			X		L
Echium italicum	Kurtkuyruğu	-	-	-	-	-	Mediterranean		X			O+L
Heliotropium europaeum	Akrep Otu	-	-	-	-	-	Irano-Turanien		X			L
Heliotropium hirsutissimum	Aygünçiçeği	-	-	-	-	-	-			X		L
Lithodora hispidula	Ebruliçalısı	-	-	-	-	-	-			X		L
Myosotis ramosissima	Kuşgözü	-	-	-	-	-	-			X		L

Brassicaceae												
Alyssum desertorum	Dumanotu	-	-	-	-	-	-		X			O+L
Alyssum simplex	Sade Kuduzotu	-	-	-	-	-	-		X			L
Capsella bursa-pastoris	Çobançantası	-	LC	-	-	-	-			X		O+L
Crambe orientalis subsp. *orientalis*	Akyumak	-	-	-	-	-	-		X			O+L
Descurainia sophia	Sadırotu	-	-	-	-	-	-			X		O+L
Draba verna	Çırçırotu	-	-	-	-	-	-			X		L
Fibigia clypeata	Sikkeotu	-	-	-	-	-	-			X		L
Isatis glauca subsp. *glauca*	Soğutot	-	-	-	-	-	Irano-Turanien		X			L
Microthlaspi perfoliatum	Giyle	-	-	-	-	-	-		X			L
Neslia apiculata	Göçmen Hardalı	-	-	-	-	-	-		X			O+L
Raphanus raphanistrum	Eşek Turpu	-	-	-	-	-	-			X		G+L
Sinapis arvensis	Hardal	-	LC	-	-	-	-			X		O+L
Sisymbrium loeselii	Bülbülotu	-	-	-	-	-	-		X			O+L
Cactaceae												
Opuntuia ficus-barbarica	Firenkinciri	-	-	-	-	-	Mediterranean		X			O+L
Caprifoliaceae												
Scabiosa argentea	Yazı Süpürgesi	-	-	-	-	-	-		X			O+L
Capparaceae												
Capparis sicula	Delikarpuzu	-	-	-	-	-	-		X			O+L
Caryophyllaceae												
Herniaria Micrantha	Sık Atyaran	-	-	-	-	-	Mediterranean		X			L
Holosteum Umbellatum Var. *Umbellatum*	-	-	-	-	-	-	-		X			O+L
Silene Conoidea	Şıvananotu	-	-	-	-	-	-		X			O+L
Stellaria media	Kuşotu	-	LC	-	-	-	-		X			L
Velezia Rigida	Tığotu	-	-	-	-	-	-		X			L
Convolvulaceae												
Convolvulus arvensis	Tarla Sarmaşığı	-	-	-	-	-	-		X			O+L
Cistaceae												
Cistus creticus	Laden	-	-	-	-	-	-		X			O+L
Cistus salviifolius	Kartli	-	-	-	-	-	-		X			O+L
Crassulaceae												
Sedum hispanicum	Damkoruğu	-	-	-	-	-	-		X			L
Sedum sediforme	Yalıkoruğu	-	-	-	-	-	-		X			L
Cupressaceae												
Cupressus sempervirens	Servi	-	-	-	-	-	Mediterranean		X			O+L
Juniperus excelsa	Bozardıç	-	-	-	-	-	-		X			O+L
Juniperus oxycedrus	Katranardıcı	-	-	-	-	-	-		X			O+L
Juniperus phoenicea	Finike ardıcı	-	-	-	-	-	Mediterranean		X			O+L
Eleagnaceae												
Elaeagnus angustifolia	İğde	-	LC	-	-	-	-		X			O+L

Ephedraceae												
Ephedra major	Hum	-	LC	-	-	-	-		X			O+L
Ericaceae												
Erica arborea	Funda	-	LC	-	-	-	-		X			O+L
Erica manipuliflora	Püren	-	-	-	-	-	Mediterranean		X			O+L
Arbutus andrachne	Sandalağacı	-	-	-	-	-	-		X			L
Euphorbiaceae												
Euphorbia characias	Azman sütleğen	-	-	-	-	-	-		X			O+L
Euphorbia macroclada	Neblul	-	-	-	-	-	Irano-Turanien		X			O+L
Euphorbia falcata subsp. *falcata* var. *falcata*	Eğri Sütleğen	-	-	-	-	-	-		X			O+L
Mercurialis annua	Parşen	-	-	-	-	-	-			X		O+L
Fabaceae												
Alhagi maurorum	Ağulikeni	-	-	-	-	-	-			X		O+L
Astragalus schizopterus	Kediçomağı	-	-	-	-	-	Mediterranean			X		O+L
Bituminaria bituminosa	Asfaltotu	-	-	-	-	-	-			X		O+L
Calicotome villosa	Keçiboğan	-	-	-	-	-	Mediterranean		X			O+L
Ceratonia siliqua	Keçiboynuzu	-	-	-	-	-	Mediterranean		X			O+L
Cercis siliquastrum	Erguvan	-	-	-	-	-	-			X		O+L
Colutea cilicica	Patlangaç	-	-	-	-	-	-			X		O+L
Lotus corniculatus	Gazalboynuzu	-	LC	-	-	-	-		X			O+L
Medicago sativa	Karayonca	-	LC	-	-	-	-			X		L
Medicago x varia	Yaban Yoncası	-	-	-	-	-	-		X			L
Melilotus officinalis	Kokulu Yonca	-	LC	-	-	-	-			X		O+L
Onobrychis cornuta	Kuşkaçıran	-	-	-	-	-	Irano-Turanien		X			L
Ononis viscosa	Siyekdikeni	-	-	-	-	-	-		X			L
Robinia pseudoacacia	Yalancı Akasya	-	LC	-	-	-	-			X		O+L
Spartium junceum	Katırtırnağı	-	LC	-	-	-	-			X		O+L
Trifolium campestre	Üçgül	-	-	-	-	-	-			X		L
Trifolium repens var. *repens*	-	-	-	-	-	-	-			X		O+L
Vicia cracca subsp. *cracca*	Kuş Fiği	-	-	-	-	-	Europe-Siberia			X		O+L
Fagaceae												
Quercus coccifera	Kermes meşesi	-	-	-	-	-	-			X		O+L
Quercus infectoria	Mazı meşesi	-	-	-	-	-	-			X		O+L
Geraniaceae												
Erodium cicutarium	İğnelik	-	-	-	-	-	-		X			L
Geranium rotundifolium	Helilok	-	-	-	-	-	-		X			O+L
Geranium tuberosum	Çakmuz	-	-	-	-	-	Irano-Turanien		X			O+L
Hypericaceae												
Hypericum scabrum	Karahasançayı	-	-	-	-	-	Irano-Turanien		X			O+L
Hypericum triquetrifolium	Pırpırotu	-	-	-	-	-	-		X			O+L
Iridaceae												

Romulea tempskyana	Sarıboğaz	-	-	-	-	-	Mediterranean		X			O+L
Lamiaceae												
Ajuga chamaepitys	Acıgıcı	-	-	-	-	-	-		X			O+L
Lamium amplexicaule	Baltutan	-	-	-	-	-	-		X			O+L
Lamium purpureum	Ballıbaba	-	-	-	-	-	-		X			O+L
Marrubium parviflorum	Bozotu	-	-	-	-	-	-		X			O+L
Melissa oficinalis	Oğulotu	-	-	-	-	-	-		X			O+L
Micromeria myrtifolia	Boğumluçay	-	-	-	-	-	-		X			O+L
Phlomis leucophracta	Çalba	Endemic	-	-	-	-	Mediterranean		X			O+L
Phlomis lycia	Tüylü çalba	Endemic	LC	-	-	-	Mediterranean		X			O+L
Phlomis monocephala	Topuz çalba	Endemic	LC	-	-	-	Mediterranean		X			L
Phlomis nissolii	Öbek çalba	Endemic	-	-	-	-	Irano-Turanien		X			O+L
Salvia tomentosa	Şalba	-	LC	-	-	-	-		X			O+L
Salvia viridis	Zarif Şalba	-	-	-	-	-	-		X			O+L
Sideritis congesta	Başakçayı	Endemic	LC	-	-	-	Mediterranean		X			O+L
Sideritis montana subsp. *montana*	Karaçay	-	-	-	-	-	Mediterranean		X			O+L
Teucrium polium	Acıyavşan	-	-	-	-	-	-		X			O+L
Thymus sipyleus subsp. *sipyleus* var. *sipyleus*	Sipil Kekiği	-	-	-	-	-	-			X		O+L
Vitex agnus-castus	Hayıt	-	-	-	-	-	-			X		O+L
Ziziphora capitata	Anuk	-	-	-	-	-	-		X			O+L
Liliaceae												
Gagea fibrosa	Tellisarı	-	LC	-	-	-	-		X			O+L
Lythraceae												
Lythrum salicaria	Hevhulma	-	-	-	-	-	-		X			O+L
Punica granatum	Nar	-	-	-	-	-	-		X			O+L
Malvaceae									X			
Alcea pallida	Hatmi	-	-	-	-	-	-		X			O+L
Malva neglecta	Çobançöreği	-	LC	-	-	-	-			X		O+L
Moraceae												
Ficus carica	İncir	-	-	-	-	-	-			X		O+L
Morus alba	Akdut	-	-	-	-	-	-			X		O+L
Morus nigra	Karadut	-	-	-	-	-	-			X		O+L
Myrtaceae												
Eucalyptus camaldulensis	Sıtmaağacı	-	-	-	-	-	Mediterranean		X			O+L
Myrtus communis	Mersin	-	-	-	-	-	Mediterranean		X			O+L
Oleaceae												
Fontanesia phillyreoides	Cıbırtı	-	-	-	-	-	-		X			G+L
Olea europaea	Zeytin	-	-	-	-	-	-		X			G+L
Phillyrea latifolia	Akçakesme	-	-	-	-	-	-		X			G+L
Orchidaceae												
Barlia robertiana	Patpatanak	-	-	Ek-II	-	-	Mediterranean		X			G+L

Oxalidaceae												
Oxalis pes-caprae	Koca ekşiyonca	-	-	-	-	-	-		X			G+L
Papaveraceae												
Glaucium corniculatum var. *corniculatum*	Çömlekçatlatan	-	-	-	-	-	-		X			O+L
Papaver rhoeas	-	-	-	-	-	-	-			X		O+L
Pinaceae												
Pinus brutia	Kızılçam	-	LC	-	-	-	-			X		O+L
Plantaginaceae												
Plantago lanceolata	Damarlıca	-	LC	-	-	-	-		X			L
Plantago major subsp. *major*	Sinirotu	-	-	-	-	-	-		X			O+L
Veronica cymbalaria	Venüs çiçeği	-	-	-	-	-	Mediterranean		X			O+L
Platanacee												
Platanus orientalis	Çınar	-	-	-	-	-	-		X			O+L
Plumbaginaceae												
Acantholimon acerosum var. *acerosum*	Pişikkeveni	-	-	-	-	-	-		X			O+L
Poaceae												
Aegilops cylindrica	Kirpikli Ot	-	LC	-	-	-	Irano-Turanien		X			O+L
Aegilops triuncialis	Üçkılçık	-	LC	-	-	-	Irano-Turanien		X			L
Avena sativa	Yulaf	-	-	-	-	-	-		X			O+L
Bromus intermedius	Damiyeotu	-	-	-	-	-	-		X			L
Bromus japonicus subsp. *japonicus*	İyeotu	-	-	-	-	-	-		X			O+L
Bromus tectorum	Kır Bromu	-	-	-	-	-	-		X			O+L
Chrysopogon gryllus	Buzağıotu	-	-	-	-	-	-		X			O+L
Cynodon dactylon var. *dactylon*	Köpekdişi	-	-	-	-	-	-		X			L
Dactylis glomerata subsp. *glomerata*	Domuzayrığı	-	-	-	-	-	Europe-Siberia		X			O+L
Elymus repens	Sabankıran	-	-	-	-	-	-		X			O+L
Hordeum bulbosum	Boncuk Arpa	-	LC	-	-	-	-		X			O+L
Lolium persicum	Eres Çimi	-	-	-	-	-	Irano-Turanien			X		L
Phragmites austrialis	Kamış	-	-	-	-	-	-			X		O+L
Poa bulbosa	Yumrulu Salkım	-	-	-	-	-	-			X		O+L
Poa pratensis	Çayır Salkımotu	-	LC	-	-	-	-			X		O+L
Setaria verticillata var. *verticillata*	-	-	-	-	-	-	-		X			O+L
Sorghum halepense	Ekinsüpürgesi	-	-	-	-	-	-		X			O+L
Taeniatherum caput-medusae	Kılçık Arpası	-	-	-	-	-	-			X		O+L
Polygonaceae												
Rumex sanguineus	Kuzuuğlağı	-	-	-	-	-	-		X			O+L
Portulaceae												
Portulaca oleracea subsp. *oleracea*	Semizotu	-	LC	-	-	-	-		X			O+L
Primulaceae												
Anagallis arvensis	Farekulağı	-	LC	-	-	-	-		X			L
Ranunculaceae												

Anemone coronaria	Manisalalesi	-	-	-	-	-	Mediterranean		X			O+L
Ceratocephala falcata	Yelotu	-	-	-	-	-	-	X				L
Clematis cirrhosa	Baharsarmaşığı	-	-	-	-	-	Mediterranean		X			O+L
Consolida orientalis	Morçiçek	-	-	-	-	-	-		X			L
Ranunculus arvensis	Mustafaçiçeği	-	-	-	-	-	-		X			O+L
Resedaceae												
Resede lutea var. *lutea*	-	-	-	-	-	-	-		X			O+L
Rhamnaceae												
Paliurus spina-christi	Karaçalı	-	-	-	-	-	Mediterranean			X		O+L
Rosaceae												
Crataegus monogyna	Yemişen	-	LC	-	-	-	-			X		O+L
Persica vulgaris	Şeftali	-	-	-	-	-	-			X		O+L
Pyrus serikensis	Serik Armudu	Endemic	EN	-	-	-	Mediterranean			X		O+L
Rubus sanctus	Böğürtlen	-	-	-	-	-	-			X		O+L
Sanguisorba minor	Çayırdüğmesi	-	-	-	-	-	-			X		O+L
Sarcopoterium spinosum	Abdestbozan	-	-	-	-	-	-			X		O+L
Rubiaceae												
Galium verum	Boyalık	-	-	-	-	-	-		X			O+L
Rutaceae												
Citrus limon	Limon	-	-	-	-	-	Mediterranean		X			O+L
Citrus reticulata	Mandalina	-	-	-	-	-	Mediterranean		X			O+L
Citrus sinensis	Portakal	-	-	-	-	-	Mediterranean		X			O+L
Salicaceae												
Salix alba	Aksöğüt	-	-	-	-	-	-		X			O+L
Scrophulariaceae												
Verbascum cheiranthifolium var. *asperulum*	-	-	-	-	-	-	-		X			O+L
Verbascum mucronatum	Şapala	-	-	-	-	-	Mediterranean		X			L
Verbascum sinuatum	Bodanotu	-	-	-	-	-	-		X			O+L
Smilaceae												
Smilax excelsa	Dikenucu	-	-	-	-	-	-		X			O+L
Solanaecae												
Hyoscyamus reticulatus	Kumacıkotu	-	-	-	-	-	Irano-Turanien		X			L
Solanum americanum	İtüzümü	-	-	-	-	-	Mediterranean		X			L
Styracaceae												
Styrax officinalix	Ayıfındığı	-	-	-	-	-	Mediterranean		X			L
Tamaricaceae												
Tamarix smyrnensis	Ilgın	-	-	-	-	-	-		X			O+L
Thymelaeaceae												
Daphne sericea	Tavukbüzüğü	-	-	-	-	-	-		X			O+L
Xanthorrhoeaceae												
Asphodelus aestivus	Kirkiçökü	-	LC	-	-	-	-		X			O+L

Table.4. Fish Species Found and Likely to be Found in the Project Area and Its Immediate Surroundings and their Conservation Status (*: exotic species; UP: Under Protection; L: Literature, O: Observation)

Scientific Name	Common Name	Endemism	IUCN	CITES	BERN	Habitat Directive	CHCD	Wild Animal Species Protected by TOB	Distribution Range	Type of Detection
Anguillidae										
Anguilla anguilla (Linnaeus, 1758)	European Eel	-	CR	Annex-II	-	-	-	UP	Common	O+L
Cobitidae										
Cobitis battalgilae Bacescu, 1962	Battalgil Spined Loach	Endemic	LC	-	-	-	-	UP	Local	O+L
Nemacheilidae										
Oxynoemacheilus eregliensis (Banarescu & Nalbant, 1978)	Central Anatolian Loach	Endemic	VU	-	-	-	-	UP	Common	O+L
Cyprinidae										
Carassius gibelio (Bloch, 1782)*	Gibel Carp	-	-	-	-	-	-	UP	Common	O+L
Cyprinus carpio Linnaeus, 1758	Carp	-	VU	-	-	-	-	UP	Common	L
Capoeta antalyensis (Battalgil, 1943)	Antalya Barb	Endemic	VU	-	-	-	-	UP	Local	O+L
Capoeta caelestis Schöter, Özulug & Freyhof, 2009	Taurus Scraper	Endemic	LC	-	-	-	-	UP	Local	O+L
Gobionidae										
Pseudorasbora parva (Temminck & Schlegel, 1846)*	Stone Moroko	-	LC	-	-	-	-	UP	Common	O+L
Leuciscidae										
Alburnus baliki Bogutskaya, Küçük & Ünlü, 2000	Antalya Bleak	Endemic	EN	-	-	-	-	UP	Common	O+L
Alburnus escherichii Steindachner, 1897	Sakarya Bleak	Endemic	LC	-	-	-	-	UP	Common	L
Pseudophoxinus battalgilae Bogutskaya, 1997	Beysehir Minnow	Endemic	LC	-	-	-	-	UP	Local	O+L
Pseudophoxinus fahrettini Freyhof & Özulug, 2010	Pisidian Spring Minnow	Endemic	EN	-	-	-	-	UP	Common	O+L
Squalius anatolicus (Bogutskaya, 1997)	Beysehir Dace	Endemic	LC	-	-	-	-	UP	Local	L
Squalius fellowesii (Günther, 1868)	Aegean Chub	Endemic	LC	-	-	-	-	UP	Common	L
Vimba vimba (Linnaeus, 1758)	Baltic Vimba	-	LC	-	-	-	-	UP	Local	L
Clariidae										
Clarias gariepinus (Burchell, 1822)	North African Catfish	-	LC	-	-	-	-	UP	Common	L
Salmonidae										
Oncorhynchus mykiss (Walbaum, 1792)*	Rainbow Trout	-	-	-	-	-	-	UP	Common	L
Salmo ekmekciae Küçük, Kalaycı, Güçlü, Oral, & Turan, 2024	Trout	Endemic	-	-	-	-	-	UP	Local	L

Cichlidae										
Oreochromis aureus (Steindachner, 1864)*	Blue Tilapia	-	-	-	-	-	-	UP	Local	O
Atherinidae										
Atherina boyeri Risso, 1810	Big-Scale Sand Smelt	-	LC	-	-	-	-	UP	Local	O
Poeciliidae										
Gambusia holbrooki Girard, 1859*	Holbrook's Mosquitofish	-	LC	-	-	-	-	UP	Common	O+L
Cyprinodontidae										
Aphanius mento (Heckel, 1843)	Pearl-Spotted Killifish	-	LC	-	-	-	-	UP	Common	O+L
Mugilidae										
Chelon auratus (Risso, 1810)	Golden Grey Mullet	-	LC	-	-	-	-	UP	Common	O+L
Chelon labrosus (Risso, 1827)	Thicklip Grey Mullet	-	LC	-	-	-	-	UP	Common	O+L
Chelon ramada (Risso, 1827)	Thinlip Mullet	-	LC	-	-	-	-	UP	Common	O+L
Chelon auratus (Risso, 1810)	Flathead Mullet	-	LC	-	-	-	-	UP	Common	O+L
Blenniidae										
Salaria fluviatilis (Asso, 1801)	Freshwater Blenny	-	LC	-	-	-	-	UP	Common	O+L
Gasterosteidae										
Gasterosteus aculeatus Linnaeus, 1758	Three-Spined Stickleback	-	LC	-	-	-	-	UP	Common	O
Moronidae										
Dicentrarchus labrax (Linnaeus, 1758)	European Seabass	-	LC	-	-	-	-	UP	Common	L

Table.5 Location of sampling stations for fish

Station No	Sampling Point	Latitude	Longitude	Altitude (m)
1	Stream-8	31° 02' 43.68" N	36° 55' 14.16" E	7
2	Noprucay Stream	31° 10' 58.24" N	36° 58' 11.94" E	22
3	Stream -7	31° 16' 27.27" N	36° 54' 19.42" E	47
4	Stream -6	31° 18' 45.04" N	36° 53' 25.71" E	71
5	Stream -5	31° 23' 59.65" N	36° 51' 08.49" E	27
6	Stream -4	31° 25' 37.66" N	36° 50' 40.65" E	19
7	Stream -3	31° 27' 31.54" N	36° 50' 52.39" E	16
8	Stream -2	31° 28' 31.86" N	36° 50' 28.18" E	18
9	Manavgat River	31° 28' 57.45" N	36° 50' 09.80" E	17
10	Stream -1	31° 33' 39.41" N	36° 46' 12.82" E	35
11	Narpuz Stream	31° 35' 57.77" N	36° 43' 52.26" E	10
12	Çenger Stream	31° 36' 27.27" N	36° 43' 39.05" E	13
13	Alara (Ulugüney) Stream	31° 43' 07.14" N	36° 41' 26.00" E	28
14	Kargı Stream	31° 49' 12.11" N	36° 38' 23.65" E	33

Table.6. Distribution of Observed Fish Species According to Stations (L: Literature, O: Observation)

Scientific Name	Type of Detection	1	2	3	4	5	6	7	8	9	10	11	12	13	14

Table.7. Amphibian Species Found and Likely to be Found in the Project Area and its Immediate Surroundings and their Conservation Status (*: exotic species; UP: Under Protection; L: Literature, O: Observation)

Table.8. Reptile Species Found and Likely to be Found in the Project Area and its Immediate Surroundings and their Conservation status (*: exotic species; UP:

Scientific Name	Common Name	Endemism	IUCN	CITES	BERN	Habitat Directive	CHCD	Wild Animal Species Protected by TOB	Distribution Range	Type of Detection
Salamandraidae										
Lyciasalamandra atifi (Başoğlu, 1967)	Atif's Lycian salamander	Endemic	EN	-	-	-	-	UP	Local	L
Ranidae										
Pelophylax bedriagae (Camerano, 1882)	Levantine frog, Levantine marsh frog	-	LC	-	Annex-III	-	-	UP	Common	O+L
Bufonidae										
Bufo verrucosissimus Pallas, 1814	Caucasian toad	-	LC	-	Annex-III	-	-	UP	Common	O+L
Bufotes viridis (Laurenti, 1768)	Green toad	-	NT	-	Annex-III	Annex-IV	-	UP	Common	O+L
Hylidae										
Hyla orientalis Bedriaga, 1890	Oriental tree frog, Green frog	-	LC	-	Annex-III	-	-	UP	Common	O+L

Under Protection; L: Literature, O: Observation)

Scientific Name	Common Name	Endemism	IUCN	CITES	BERN	Habitat Directive	CHCD	Wild Animal Species Protected by TOB	Distribution Range	Type of Detection
Testudinidae										
Testudo graeca Linnaeus, 1758	Mediterranean Spur-Thighed Tortoise	-	VU	Annex-II	Annex-II	Annex-IV	-	UP	Common	O+L

Geoemydidae										
Mauremys rivulata (Valenciennes, 1833)	Western Caspian Turtle	-	-	-	Annex-III	-	-	UP	Common	L
Gekkonidae										
Hemidactylus turcicus (Linnaeus, 1758)	Mediterranean House Gecko	-	LC	-	Annex-III	-	-	UP	Common	L
Mediodactylus danilewskii (Satrauch, 1887)	Bulgarian Bent-toed Gecko	-	-	-	Annex-III	-	-	UP	Common	L
Agamidae										
Laudakia stellio (Linnaeus, 1758)	Roughtail Rock Agama	-	LC	-	Annex-II	Annex-IV	-	UP	Common	O+L
Chamaeleonidae										
Chamaeleo chamaeleon (Linnaeus, 1758)	Common Chameleon	-	LC	Annex-II	Annex-II	Annex-IV	-	UP	Common	O+L
Anguidae										
Pseudopus apodus (Pallas, 1775)	European Glass Lizard	-	LC	-	Annex-II	Annex-IV	-	UP	Common	O+L
Lacertidae										
Anatololacerta ibrahimi (Eiselt & Schmidtler 1987)	Baran's Lizard	Endemic	-	-	Annex-III	-	-	UP	Common	L
Lacerta pamphylica Schmidtler, 1975	Pamphylian Green Lizard	Endemic	LC	-	Annex-III	Annex-IV	-	UP	Common	O+L
Ophisops elegans Ménétriés, 1832	Snake-Eyed Lizard	-	LC	-	Annex-II	Annex-IV	-	UP	Common	O+L
Phoenicolacerta laevis (Gray, 1838)	Syrian Lizard	-	LC	-	Annex-III	-	-	UP	Common	O+L
Scincidae										
Ablepharus anatolicus Schmidtler, 1997	Anatolian Snake-Eyed Skink	Endemic	-	-	Annex-II	-	-	UP	Common	O+L
Heremites auratus (Linnaeus, 1758)	Golden Grass Mabuya	-	LC	-	Annex-III	-	-	UP	Common	L
Heremites vittatus (Olivier, 1804)	Twin-Striped Skink	-	LC	-	Annex-III	-	-	UP	Common	L
Blanidae										
Blanus aporus Werner, 1898	Cilician Worm Lizard	Endemic	LC	-	Annex-III	-	-	UP	Common	L
Typhlopidae										
Xerotyphlops vermicularis (Merrem, 1820)	Worm Snake, Blind Snake	-	LC	-	Annex-III	-	-	UP	Common	L
Colubridae										
Dolichophis jugularis (Linnaeus, 1758)	Large Whip Snake	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Eirenis modestus Martin, 1838	Asia Minor Dwarf Racer	-	LC	-	Annex-III	Annex-IV	-	UP	Common	O+L
Hemorrhois nummifer (Reuss, 1834)	Coin-Marked Snake	-	LC	-	Annex-III	Annex-IV	-	UP	Common	L
Platyceps najadum (Eichwald, 1831)	Dahl's Whip Snake	-	LC	-	Annex-III	Annex-IV	-	UP	Common	O+L
Telescopus fallax (Fleischmann, 1831)	Cat-Eyed Snake	-	LC	-	Annex-III	-	-	UP	Common	L
Natricidae										
Natrix natrix (Linnaeus, 1758)	Grass Snake	-	LC	-	Annex-III	Annex-IV	-	UP	Common	O+L
Natrix tessellata (Laurenti, 1768)	Dice Snake, Tessellated Water Snake	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L

Psammophiidae										
Malpolon insignitus (Geoffroy De St-Hilaire, 1809)	Eastern Montpellier Snake	-	LC	-	Annex-II	-	-	UP	Common	O+L
Viperidae										
Montivipera xanthina (Gray, 1849)	Ottoman Viper	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L

Table.9. Bird Species Found and Likely to be Found in the Project Area and its Immediate Surroundings and their Conservation Status (*: exotic species; UP: Under Protection; WV: Winter Visitor; SV: Summer Visitor; N: Native; T: Transit Migrant; V: Vagrant; L: Literature, O: Observation)

Scientific Name	Common Name	Endemism	IUCN	CITES	BERN	Bird Directive	Wi- Animal Species Protected by TOB	CHCD	Migration	RDB	Type of Detection

Laniidae											
Lanius collurio Linnaeus, 1758	Red-Backed Shrike	-	LC	-	Annex-II	Annex-I	UP	Annex-I	SV	A.1.2	O+L
Lanius minor Gmelin, 1788	Lesser Grey Shrike	-	LC	-	Annex-II	Annex-I	UP	-	T	A.3	L
Lanius nubicus Lichtenstein, 1823	Masked Shrike	-	LC	-	Annex-II	Annex-I	UP	-	SV	A.2	O+L
Lanius senator Linnaeus, 1758	Woodchat Shrike	-	LC	-	Annex-II	-	UP	-	SV	A.2	O+L
Locustellidae											
Locustella fluviatilis (Wolf, 1810)	River Warbler	-	LC	-	Annex-II	-	UP	-	T	A.1.2	L
Locustella luscinioides (Savi, 1824)	Savi's Warbler	-	LC	-	Annex-II	-	UP	-	T	A.2	L
Locustella naevia (Boddaert, 1783)	Common Grasshopper-Warbler	-	LC	-	Annex-II	-	UP	-	T	A.1.2	L
Motacillidae											
Motacilla alba Linnaeus, 1758	White Wagtail	-	LC	-	Annex-II	-	UP	-	Y	A.3.1	O+L
Motacilla cinerea Tunstall, 1771	Grey Wagtail	-	LC	-	Annex-II	-	UP	-	WV	A.2	L

Motacilla citreola Pallas, 1776	Citrine Wagtail	-	LC	-	Annex-II	-	UP	-	T	A.2	L
Motacilla flava Linnaeus, 1758	Western Yellow Wagtail	-	LC	-	Annex-II	-	UP	-	SV	A.3.1	O+L
Anthus campestris Linnaeus, 1758	Tawny Pipit	-	LC	-	Annex-II	-	UP	-	T	A.2	L
Anthus cervinus Pallas, 1811	Red-Throated Pipit	-	LC	-	Annex-II	-	UP	-	WV	A.2	L
Anthus godlewskii Taczanowski, 1876	Blyth`S Pipit	-	LC	-	Annex-II	-	UP	-	T	A.7	L
Anthus pratensis Linnaeus, 1758	Meadow Pipit	-	LC	-	Annex-II	-	UP	-	WV	A.3	L
Anthus richardi Vieillot, 1818	Richard's Pipit	-	LC	-	Annex-II	-	UP	-	T	A.2	L
Anthus spinoletta Linnaeus, 1758	Water Pipit	-	LC	-	Annex-II	-	UP	-	WV	A.3	L
Anthus trivialis Linnaeus, 1758	Tree Pipit	-	LC	-	Annex-II	-	UP	-	T	A.3	L
Muscicapidae											
Luscinia luscinia (Linnaeus, 1758)	Thrush Nightingale	-	LC	-	Annex-II	-	UP	-	T	A.2	L
Luscinia megarhynchos (Brehm, 1831)	Common Nightingale	-	LC	-	Annex-II	-	UP	-	SV	A.2	O+L
Luscinia svecica (Linnaeus, 1758)	Bluethroat	-	LC	-	Annex-II	Annex-I	UP	-	WV	A.2	L
Monticola saxatilis (Linnaeus, 1776)	Rufous-Tailed Rock-Thrush	-	LC	-	Annex-II	-	UP	-	WV	A.1.2	L
Monticola solitarius (Linnaeus, 1758)	Blue Rock-Thrush	-	LC	-	Annex-II	-	UP	-	N	A.1.2	L
Oenanthe deserti (Temminck, 1825)	Desert Wheatear	-	LC	-	Annex-II	-	UP	Annex-II	T	A.1.2	L
Oenanthe finschii (Heuglin, 1869)	Finsch's Wheatear	-	LC	-	Annex-II	-	UP	-	T	A.1.2	L
Oenanthe hispanica (Linnaeus, 1758)	Black-Eared Wheatear	-	LC	-	Annex-II	-	UP	-	SV	A.2	O+L
Oenanthe isabellina (Temminck, 1829)	Isabelline Wheatear	-	LC	-	Annex-II	-	UP	-	SV	A.3	O+L
Oenanthe oenanthe (Linnaeus, 1758)	Northern Wheatear	-	LC	-	Annex-II	-	UP	-	T	A.3	O+L
Phoenicurus ochruros (Gmelin, 1774)	Black Redstart	-	LC	-	Annex-II	-	UP	-	WV	A.2	O+L
Phoenicurus phoenicurus (Linnaeus, 1758)	Common Redstart	-	LC	-	Annex-II	-	UP	-	SV	A.3	L
Saxicola rubetra (Linnaeus, 1758)	Whinchat	-	LC	-	Annex-II	-	UP	-	T	A.3	L
Saxicola torquatus (Linnaeus, 1766)	Common Stonechat	-	LC	-	Annex-II	-	UP	-	WV	A.3	O+L
Paridae											
Cyanistes caeruleus (Linnaeus, 1758)	Eurasian Blue Tit	-	LC	-	Annex-II	-	UP	-	N	A.2	L
Parus major Linnaeus, 1758	Great Tit	-	LC	-	Annex-II	-	UP	-	N	A.3.1	O+L
Periparus ater (Linnaeus, 1758)	Coal Tit	-	LC	-	Annex-II	-	UP	-	N	A.3	O+L
Passeridae											
Passer domesticus (Linnaeus, 1758)	House Sparrow	-	LC	-	-	-	UP	Annex-I	N	A.3.1	O+L
Passer hispaniolensis (Temminck, 1820)	Spanish Sparrow	-	LC	-	Annex-III	-	UP	Annex-II	T	A.3	L
Passer montanus (Linnaeus, 1758)	Eurasian Tree Sparrow	-	LC	-	Annex-III	-	UP	Annex-II	WV	A.3	L
Phylloscopidae											
Phylloscopus collybita (Vieillot, 1817)	Common Chiffchaff	-	LC	-	Annex-III	-	UP	-	N	A.3	O+L
Phylloscopus orientalis (Brehm, 1855)	Eastern Bonelli's Warbler	-	LC	-	Annex-III	-	UP	-	T	A.2	L
Phylloscopus sibilatrix (Bechstein, 1793)	Wood Warbler	-	LC	-	Annex-III	-	UP	-	T	A.2	L

Phylloscopus trochilus (Linnaeus, 1758)	Willow Warbler	-	LC	-	Annex-III	-	UP	-	T	A.3.1	O+L
Pycnonotidae											
Pycnonotus xanthopygos (Ehrenberg, 1833)	White-Spectacled Bulbul	-	LC	-	Annex-III	-	UP	-	N	A.2	O+L
Sittidae											
Sitta neumayer Michahelles, 1830	Western Rock Nuthatch	-	LC	-	Annex-II	-	UP	-	N	A.2	O+L
Scotocercidae											
Cettia cetti (Temminck, 1820)	Cetti's Warbler	-	LC	-	Annex-III	-	UP	-	S	A.2	O+L
Sturnidae											
Sturnus vulgaris Linnaeus, 1758	Common Starling	-	LC	-	-	Annex-II/B	UP	Annex-II	WV	A.3.1	O+L
Sylviidae											
Curruca cantillans (Pallas, 1764)	Subalpine Warbler	-	LC	-	Annex-II	-	UP	-	T	A.2	L
Curruca communis Latham, 1787	Common Whitethroat	-	LC	-	Annex-II	-	UP	-	T	A.3	O+L
Curruca crassirostris (Gmelin, 1789)	Eastern Orphean warbler	-	LC	-	Annex-II	-	UP	-	T	A.2	L
Curruca curruca (Linnaeus, 1758)	Lesser Whitethroat	-	LC	-	Annex-II	-	UP	-	T	A.2	O+L
Curruca melanocephala (Gmelin, 1789)	Sardinian Warbler	-	LC	-	Annex-II	-	UP	-	T	A.3	O+L
Curruca nisoria (Bechstein, 1795)	Barred Warbler	-	LC	-	Annex-II	-	UP	-	T	A.2	O+L
Sylvia atricapilla (Linnaeus, 1758)	Eurasian Blackcap	-	LC	-	Annex-II	-	UP	-	WV	A.2	O+L
Sylvia borin (Boddaert, 1783)	Garden Warbler	-	LC	-	Annex-II	-	UP	-	T	B.3	L
Turdidae											
Turdus merula Linnaeus, 1758	Eurasian Blackbird	-	LC	-	Annex-III	Annex-II/B	UP	-	N	A.3	O+L
Turdus philomelos Brehm, 1831	Song Thrush	-	LC	-	Annex-III	Annex-II/B	UP	-	WV	A.2	L
Strigidae											
Athene noctua (Scopoli, 1769)	Little Owl	-	LC	Annex-II	Annex-II	-	UP	-	N	A.6	O+L
Asio otus (Linnaeus, 1758)	Northern Long-Eared Owl	-	LC	Annex-II	Annex-II	-	UP	-	S	A.2	L
Otus scops (Linnaeus, 1758)	Eurasian Scops-Owl	-	LC	Annex-II	Annex-II	-	UP	-	SV	A.2	L
Strix aluco Linnaeus, 1758	Tawny Owl	-	LC	Annex-II	Annex-II	-	UP	-	S	A.2	L
Tyto alba (Scopoli, 1769)	Common Barn-Owl	-	LC	Annex-II	Annex-II	-	UP	-	S	A.1.2	L

Table.10. Mammal Species Found and Likely to be Found in the Project Area and its Immediate Surroundings and their Conservation Status (*: exotic species; UP: Under Protection; L: Literature, O: Observation)

Scientific Name	Common Name	Endemism	IUCN	CITES	BERN	Habitat Directive	CHCD	Wild Animal Species Protected by TOB	Distribution Range	Type of Detection
Canidae										
Canis aureus Linnaeus, 1758	Golden Jackal	-	LC	Annex-III	-	Annex-V	Annex-I	UP	Local	O+L
Canis lupus Linnaeus, 1758	Grey Wolf	-	LC	Annex-I/II	Annex-II	Annex-II/V	-	UP	Local	L
Vulpes vulpes (Linnaeus, 1758)	Red Fox	-	LC	-	-	-	Annex-I	UP	Common	O+L
Felidae										
Caracal caracal (Schreber, 1776)	Caracal	-	LC	Annex-I/II	Annex-II	-	-	UP	Local	O+L
Felis silvestris Schreber, 1777	Wild Cat	-	LC	Annex-II	Annex-II	Annex-IV	-	UP	Local	O+L
Lynx lynx (Linnaeus, 1758)	Eurasian Lynx	-	LC	Annex-II	Annex-II	Annex-IV	-	UP	Local	O+L
Mustelidae										
Lutra lutra (Linnaeus, 1758)	Eurasian Otter	-	NT	Annex-I	Annex-II	Annex-IV	-	UP	Local	L
Martes foina (Erxleben, 1777)	Beech Marten	-	LC	Annex-III	Annex-III	-	Annex-II	UP	Common	O+L
Martes martes (Linnaeus, 1758)	Pine Marten	-	LC	-	Annex-III	-	-	UP	Common	L
Meles meles (Linnaeus, 1758)	Eurasian Badger	-	LC	-	Annex-III	-	Annex-II	UP	Common	L
Mustela nivalis Linnaeus, 1758	Least Weasel	-	LC	-	Annex-III	-	Annex-II	UP	Common	L
Bovidae										
Capra aegagrus Erxleben, 1777	Wild Goat	-	NT	-	Annex-II	Annex-IV	-	UP	Rare	O+L
Suidae										
Sus scrofa Linnaeus, 1758	Wild Boar	-	LC	-	-	-	Annex-I	UP	Common	O+L
Molossidae										
Tadarida teniotis (Rafinesque, 1814)	European Free-Tailed Bat	-	LC	-	Annex-II	-	-	UP	Common	O+L
Pteropodidae										
Rousettus aegyptiacus (E. Geoffroy, 1810)	Egyptian Fruit Bat	-	LC	-	-	Annex-II/IV	-	UP	Common	O+L
Rhinolophidae										
Rhinolophus blasii Peters, 1867	Blasius's Horseshoe Bat	-	LC	-	Annex-II	Annex-II/IV	-	UP	Common	L
Rhinolophus euryale Blasius, 1853	Mediterranean Horseshoe Bat	-	NT	-	Annex-II	Annex-II/IV	-	UP	Common	L
Rhinolophus ferrumequinum (Schreber, 1774)	Greater Horseshoe Bat	-	LC	-	Annex-II	Annex-II/IV	-	UP	Common	L
Rhinolophus hipposideros (Bechstein, 1800)	Lesser Horseshoe Bat	-	LC	-	Annex-II	Annex-II/IV	-	UP	Common	L

Rhinolophus mehelyi Matschie, 1901	Mehely's Horseshoe Bat	-	VU	-	Annex-II	Annex-II/IV	-	UP	Common	L
Vespertilionidae										
Eptesicus anatolicus Felten, 1971	Anatolian Serotine	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Eptesicus serotinus Schreber, 1774	Serotine	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Myotis blythii (Tomes, 1857)	Lesser Mouse-Eared Myotis	-	LC	-	Annex-II	Annex-II/IV	-	UP	Common	L
Myotis capaccinii (Bonaparte, 1837)	Long-Fingered Bat	-	VU	-	Annex-II	Annex-II/IV	-	UP	Common	L
Myotis davidi (Peters, 1869)	David's Myotis	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Myotis emarginatus (É. Geoffroy, 1806)	Geoffroy's Bat	-	LC	-	Annex-II	Annex-II/IV	-	UP	Common	L
Myotis hoveli Harrison, 1964	Hovel's Myotis	-	-	-	Annex-II	Annex-IV	-	UP	Common	L
Myotis myotis (Borkhausen, 1759)	Greater Mouse-Eared Bat	-	LC	-	Annex-II	Annex-II/IV	-	UP	Common	L
Myotis nattereri (Kuhl, 1817)	Noctule	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Pipistrellus kuhlii (Kuhl, 1817)	Kuhl's Pipistrelle	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Pipistrellus nathusii (Keyserling & Blasius, 1839)	Nathusius' Pipistrelle	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Pipistrellus pipistrellus (Schreber, 1774)	Common Pipistrelle	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Plecotus kolombatovici Dulic, 1980	Kolombatovic's Long-Eared Bat	-	LC	-	Annex-II	Annex-IV	-	UP	Common	L
Erinaceidae										
Erinaceus concolor Martin, 1837	Southern White-Breasted Hedgehog	-	LC	-	-	-	-	UP	Common	O+L
Soricidae										
Neomys milleri Mottaz, 1907	Mediterranean Water Shrew	-	LC	-	Annex-III	-	-	UP	Common	O+L
Leporidae										
Lepus europaeus Pallas, 1778	European Hare	-	LC	-	Annex-III	-	Annex-I	UP	Common	O+L
Cricetidae										
Microtus anatolicus Krystufek & Kefioglu, 2002	Anatolian Vole	-	DD	-	-	-	-	UP	Common	L
Microtus guentheri (Danford & Alston, 1880)	Günther's Vole	-	LC	-	-	-	-	UP	Common	L
Hystricidae										
Hystrix indica Kerr, 1792	Indian Crested Porcupine	-	LC	-	-	-	-	UP	Local	O+L
Muridae										
Apodemus mystacinus (Danford & Alston, 1877)	Broad-Toothed Field Mouse	-	LC	-	-	-	-	UP	Common	L
Apodemus witherbyi (Thomas, 1902)	Steppe Field Mouse	-	LC	-	-	-	-	UP	Common	L
Mus macedonicus Petrov & Ruzic, 1983	Macedonian Mouse	-	LC	-	-	-	-	UP	Common	L
Mus musculus Linnaeus, 1758	House Mouse	-	LC	-	-	-	-	UP	Common	L
Rattus norvegicus (Berkenhout, 1769)	Brown Rat	-	LC	-	-	-	-	UP	Common	L

Rattus rattus (Linnaeus, 1758)	House Rat	-	LC	-	-	-	-	UP	Common	L
Sciuridae (Sincapgiller)										
Sciurus anomalus Gmelin, 1778	Caucasian Squirrel	-	NT	-	Annex-II	Annex-IV	-	UP	Common	O+L
Spalacidae (Kör faregiller)										
Nannospalax xanthodon (Nordman, 1840)	Nehring's Blind Mole Rat	-	DD	-	-	-	-	UP	Common	O+L

Table.11 Terrestrial Invertebrate Species Likely to be Found in the Project Area

Order	Family	*Species*	IUCN	Endemism	BERN	CITES
Diptera	Psychodidae	*Clogmia albipunctatus*	NE			
Diptera	Syrphidae	*Eristalinus taeniops*	NE			
Diptera	Syrphidae	*Eristalis tenax*	NE			
Lepidoptera	Pieridae	*Colias croceus*	NE			
Lepidoptera	Saturniidae	*Saturnia pyri*	NE			
Lepidoptera	Lycaenidae	*Celastrina argiolus*	NE			
Lepidoptera	Erebidae	*Utetheisa pulchella*	NE			
Lepidoptera	Lycaenidae	*Tarucus balkanica*	NE			
Lepidoptera	Lycaenidae	*Lampides boeticus*	LC			
Lepidoptera	Crambidae	*Herpetogramma licarsisalis*	NE			
Lepidoptera	Hesperiidae	*Gegenes pumilio*	LC

Lepidoptera	Sphingidae	*Theretra alecto*	NE			
Lepidoptera	Nymphalidae	*Coenonympha pamphilus*	LC			
Lepidoptera	Nymphalidae	*Charaxes jasius*	LC			
Lepidoptera	Nymphalidae	*Vanessa atalanta*	LC			

Lepidoptera	Nymphalidae	*Pseudochazara mniszechii*	LC			
Lepidoptera	Nymphalidae	*Melitaea trivia*	LC			
Lepidoptera	Nymphalidae	*Pseudochazara anthelea*	LC			
Lepidoptera	Nymphalidae	*Ypthima asterope*	LC			
Lepidoptera	Geometridae	*Rhodometra sacraria*	NE			
Lepidoptera	Hesperiidae	*Gegenes nostrodamus*	LC			
Lepidoptera	Hesperiidae	*Pyrgus serratulae*	LC			
Lepidoptera	Lycaenidae	*Satyrium abdominalis*	LC			
Lepidoptera	Pieridae	*Pieris napi*	LC			
Lepidoptera	Noctuidae	*Egira conspicillaris*	NE			
Lepidoptera	Notodontidae	*Peridea anceps*	NE			
Lepidoptera	Nymphalidae	*Maniola megala*	LC	Near Endemics (NrE)		
Lepidoptera	Noctuidae	*Autographa gamma*	NE			
Lepidoptera	Nymphalidae	*Coenonympha leander*	LC			
Lepidoptera	Nymphalidae	*Maniola telmessia*	LC			
Lepidoptera	Lycaenidae	*Polyommatus icarus*	LC			
Lepidoptera	Lycaenidae	*Cyaniris semiargus*	LC			
Lepidoptera	Pieridae	*Pontia edusa*	LC			
Lepidoptera	Lycaenidae	*Glaucopsyche alexis*	LC			
Lepidoptera	Pieridae	*Gonepteryx rhamni*	LC			
Lepidoptera	Nymphalidae	*Kirinia roxelana*	LC			
Lepidoptera	Hesperiidae	*Thymelicus hyrax*	LC			
Lepidoptera	Pieridae	*Pontia daplidice*	LC			
Lepidoptera	Sphingidae	*Daphnis nerii*	NE			
Lepidoptera	Sesiidae	*Pyropteron minianiformis*	NE			

Lepidoptera	Nymphalidae	*Hipparchia syriaca*	LC			
Lepidoptera	Pieridae	*Colias alfacariensis*	LC			
Lepidoptera	Papilionidae	*Papilio machaon*	LC			
Lepidoptera	Pieridae	*Pieris pseudorapae*	LC			
Lepidoptera	Papilionidae	*Zerynthia cerisy*	LC			
Lepidoptera	Nymphalidae	*Hipparchia fatua*	LC			
Lepidoptera	Hesperiidae	*Thymelicus acteon*	LC			
Lepidoptera	Noctuidae	*Spodoptera littoralis*	NE			
Lepidoptera	Hesperiidae	*Pelopidas thrax*	LC			
Lepidoptera	Nymphalidae	*Vanessa cardui*	LC			
Lepidoptera	Papilionidae	*Archon apollinus*	NT			
Lepidoptera	Crambidae	*Nomophila noctuella*	NE			
Lepidoptera	Nymphalidae	*Nymphalis polychloros*	LC			
Lepidoptera	Hesperiidae	*Erynnis tages*	LC			
Lepidoptera	Nymphalidae	*Polygonia egea*	LC			
Lepidoptera	Crambidae	*Spoladea recurvalis*	NE			
Lepidoptera	Lycaenidae	*Lycaena alciphron*	LC			
Lepidoptera	Nymphalidae	*Melanargia larissa*	LC			
Lepidoptera	Nymphalidae	*Satyrus ferula*	LC			
Lepidoptera	Noctuidae	*Heliothis peltigera*	NE			
Lepidoptera	Pieridae	*Aporia crataegi*	LC			
Lepidoptera	Papilionidae	*Parnassius mnemosyne*	LC			
Lepidoptera	Pieridae	*Gonepteryx farinosa*	LC			
Lepidoptera	Nymphalidae	*Hyponephele lycaon*	LC			
Lepidoptera	Nymphalidae	*Melitaea cinxia*	LC			
Lepidoptera	Lycaenidae	*Plebejidea loewi*	NE			

Lepidoptera	Lycaenidae	*Pseudophilotes bavius*	LC			
Lepidoptera	Hesperiidae	*Carcharodus alceae*	LC			
Lepidoptera	Lycaenidae	*Zizeeria karsandra*	LC			
Lepidoptera	Nymphalidae	*Danaus chrysippus*	LC			
Lepidoptera	Pieridae	*Pieris brassicae*	LC			
Lepidoptera	Lycaenidae	*Polyommatus cornelia*	LC	E		
Lepidoptera	Lycaenidae	*Leptotes pirithous*	LC			
Lepidoptera	Pieridae	*Anthocharis cardamines*	LC			
Lepidoptera	Pieridae	*Leptidea sinapis*	LC			
Lepidoptera	Papilionidae	*Papilio alexanor*	LC			
Lepidoptera	Noctuidae	*Mythimna vitellina*	NE			
Lepidoptera	Hesperiidae	*Pyrgus armoricanus*	LC			
Lepidoptera	Hesperiidae	*Pyrgus melotis*	LC			
Lepidoptera	Geometridae	*Scopula luridata*	NE			
Odonata	Libellulidae	*Sympetrum meridionale*	LC			
Odonata	Libellulidae	*Selysiothemis nigra*	LC			
Odonata	Aeshnidae	*Aeshna mixta*	LC			
Odonata	Libellulidae	*Libellula fulva*	LC			
Odonata	Libellulidae	*Libellula depressa*	LC			
Odonata	Lestidae	*Chalcolestes parvidens*	LC			
Odonata	Libellulidae	*Orthetrum cancellatum*	LC			
Odonata	Libellulidae	*Orthetrum sabina*	LC			
Odonata	Libellulidae	*Trithemis arteriosa*	LC			
Odonata	Libellulidae	*Orthetrum brunneum*	LC			
Odonata	Gomphidae	*Gomphus schneiderii*	LC			
Odonata	Calopterygidae	*Calopteryx splendens*	LC			

Odonata	Libellulidae	*Sympetrum fonscolombii*	LC			
Odonata	Libellulidae	*Crocothemis erythraea*	LC			
Odonata	Aeshnidae	*Anax imperator*	LC			
Odonata	Gomphidae	*Onychogomphus assimilis*	VU			
Odonata	Libellulidae	*Sympetrum striolatum*	LC			
Odonata	Calopterygidae	*Calopteryx virgo*	LC			
Odonata	Libellulidae	*Trithemis annulata*	LC			
Odonata	Coenagrionidae	*Ischnura elegans*	LC			
Odonata	Libellulidae	*Orthetrum chrysostigma*	LC			
Odonata	Aeshnidae	*Anax parthenope*	LC			
Odonata	Euphaeidae	*Epallage fatime*	LC			
Odonata	Libellulidae	*Trithemis festiva*	LC			
Odonata	Cordulegastridae	*Cordulegaster insignis*	LC			
Odonata	Libellulidae	*Orthetrum taeniolatum*	LC			
Odonata	Aeshnidae	*Caliaeschna microstigma*	LC			
Odonata	Aeshnidae	*Anax ephippiger*	LC			
Odonata	Libellulidae	*Diplacodes lefebvrii*	LC			
Odonata	Libellulidae	*Brachythemis fuscopalliata*	VU		Annex-II	
Odonata	Platycnemididae	*Platycnemis pennipes*	LC			
Odonata	Coenagrionidae	*Erythromma viridulum*	LC			
Odonata	Coenagrionidae	*Erythromma lindenii*	LC

I. PURPOSE AND SCOPE

This Biodiversity Management Plan ("the Plan") has been prepared by ENCON Environmental Consultancy Co. ("ENCON" or "ESIA Consultant") as part of the Environmental and Social Impact Assessment (ESIA) studies for the Antalya-Alanya Motorway Project ("the Project").

The purpose of this Plan is to identify impacts on biodiversity and outline mitigation, control, and monitoring measures to minimize adverse environmental and social impacts during the construction phase.

The Plan has been developed in alignment with applicable national legislation and relevant international standards, including the requirements of international financial institutions. It outlines actions that should be done to manage biodiversity effectively across construction-related activities and facilities. This plan will provide mitigation alternatives and an impact monitoring schedule in accordance with Turkish and international regulations and standards.

This Plan will be applied by all parties involved in the construction phase, including the Project Sponsor, Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ), the Main Contractor, and all subcontractors. Responsibilities for implementation, monitoring, and reporting biodiversity related issues will be clearly assigned. Necessary updates to the Plan will be considered in case of changes in project design, construction methodology, or regulatory requirements. This Management Plan is part of the overall suite of Management Plans developed for the Project and as described in the ESMS Framework Document.

Summary of BMP Aims:

1. Avoidance: Minimise footprint, restrict access, schedule work outside sensitive periods.
2. Mitigation: Dust/noise control, wildlife corridors, nest/roost protection, speed limits, invasive species management.
3. Translocation procedure will be prepared as a separate document by the third-party consultant prior to any translocation activity.
4. Restoration: Replanting with native species, topsoil reuse, habitat restoration post-construction.
5. Monitoring & KPI: Surveys, inspections, mapping, water/soil/noise monitoring; compliance thresholds set.
6. Corrective Actions: Immediate halt of harmful activities, relocation/translocation, restoration, retraining, and ESMS documentation.

II. LEGISLATIVE FRAMEWORK AND REFERENCE STANDARDS

This Management Plan has been structured to align with both national and international requirements, including legislation, guidelines, and sectoral standards that define biodiversity standarts. Accordingly, the following sources of reference will be used to guide the implementation and compliance procedures:

II.1. National Requirements

The following Turkish laws and regulations will be used as the legal basis for managing biodiversity during construction:

- Regulation on Wildlife Protection and Wildlife Enhancement Areas (Official Gazette: 08.11.2004 – No. 25637)
- Forestry Law (Official Gazette: 31.08.1956 – No. 6831)
- Law on Fisheries (Official Gazette: 04.04.1971 – No. 1380)
- Law on National Parks (Official Gazette: 09.08.1983 – No. 2873)
- Law for the Protection of Cultural and Natural Assets (Official Gazette: 23.07.1983 – No. 2863)
- Decree-Law Establishing the Special Environmental Protection Agency (Official Gazette: 19.10.1989 – No. 383)
- Regulation on Fisheries (Official Gazette: 10.03.1995; – No. 22223)
- Regulation for Implementing the Convention on International Trade in Endangered Species of Wild Fauna and Flora (Official Gazette: 27.12.2001 – No. 24623)
- Terrestrial Hunting Law (Official Gazette: 01.07.2003 – No. 4915)
- Regulation for the Protection of Wetlands (Official Gazette: 04.04.2014 – No. 28962)
- Law for the Protection of Animals (Official Gazette: 24.06.2004 – No. 5199)
- Regulation on Wildlife Protection and Wildlife Enhancement Areas (Official Gazette: 08.11.2004 – No. 25637)
- Law on Protection of Soil and Land Use (No: 5403) (Official Gazette: 19.07.2005 – No. 25880)
- Regulation on the Implementation of the Law on Protection of Soil and Land Use (Official Gazette: 15.12.2005 – No. 26024)
- Regulation on the Collection, Production and Exportation of Natural Flower Bulbs (Official Gazette: 19.07.2012 – No. 28358)

II.2. International Standards and Conventions

In addition to national requirements, the following international guidelines and agreements will be considered to ensure alignment with best practices and financial institution requirements:

- IFC Performance Standards (2012), specifically:
  - Performance Standard 6: Biodiversity Conservation and Sustainable Management of Living Natural Resources
- IFC Guidance Notes (2012)
- Equator Principles IV (2020)

The Project is committed to implementing the IFC Performance Standards (PS) in order to manage social and environmental risks and impacts. IFC PS6 covers areas of biodiversity conservation, ecosystem services and sustainable management of living resources, which are all fundamental to achieve sustainable development. The objectives of PS6 are outlined as follows:

- To protect and conserve biodiversity.
- To maintain the benefits from ecosystem services; and
- To promote the sustainable management of living natural resources through the adoption of practices that integrates conservation needs and development priorities.

These references will be used to guide the implementation, monitoring, and performance evaluation of biodiversity and mitigation measures on-site throughout the construction phase.

II.3. Project Standarts

Critical Habitat Assessment Process

Critical habitats are areas with high biological diversity value. Their identification is based on the following key criteria:

- i) Habitats supporting Critically Endangered and/or Endangered species.
- ii) Habitats of significance for endemic and/or range-restricted species.
- iii) Habitats that support globally important populations of migratory species and/or are crucial for migratory corridors.
- iv) Highly threatened and/or unique ecosystems.
- v) Areas associated with key evolutionary processes.

These criteria are essential for determining critical habitats and ensuring their protection and conservation within the scope of ecosystem assessments and environmental management planning.

The criteria for critical habitats are defined according to IFC PS6, 2012, as follows:

- Criterion 1: Critically Endangered (CR) and/or Endangered (EN) species
- Criterion 2: Endemic and/or restricted-range species
- Criterion 3: Migratory and/or congregation species
- Criterion 4: Highly threatened and/or unique ecosystems
- Criterion 5: Key evolutionary processes

Projects located in areas with high biological diversity value, recognized at the national and/or international level, may require a critical habitat assessment. These areas include IUCN Protected Areas, Key Biodiversity Areas (KBA) and Important Bird and Biodiversity Areas (IBA).

A critical habitat assessment is essential for ensuring that project activities do not negatively impact these ecologically significant areas, and that conservation measures are integrated into project planning and implementation.

Mitigation Hierarchy

According to IFC PS6, the project is required to fully implement the mitigation hierarchy (Figure II.1). To apply this hierarchy in line with Performance Standard 6, an evaluation of the project's Area of Influence within the existing landscape -along with any related facilities- can help guide the identification, screening, and design of alternatives as part of the avoidance process. Mitigation measures will be developed or reviewed by qualified biodiversity and engineering experts to ensure their optimization in accordance with the hierarchy.

Avoidance	Actions taken to prevent the irreversible loss of biodiversity or essential ecosystem services. This may involve alternatives such as site selection, design modifications, and scheduling changes.
Minimization	Efforts to reduce or limit the duration, intensity, and/or extent of impacts that cannot be avoided. Alternatives include physical controls, operational adjustments, and abatement measures.
Restoration	When biodiversity or ecosystem services have been impacted, remediation involves efforts such as rehabilitation and restoration. Alternatives may include re-establishing habitats, restoring biodiversity values, and revitalizing ecosystem services.
Offset	Measures taken to compensate for any residual impacts that cannot be avoided, minimized, or remedied on-site. This can include restoration offsets and averted loss offsets.

Figure II.1 Mitigation Hierarchy

No Net Loss and Loss-Gain Assesment

Biodiversity Net Gain (BNG) is a metric used to assess the impact of a development project on biodiversity. The goal is to ensure that, as a result of the development process, biodiversity achieves a net positive outcome compared to its initial state. If biodiversity is lost, it is considered a net loss.

The principle of biodiversity balance is based on achieving no net loss of biodiversity. This means that the biodiversity gains from conservation efforts must offset the biodiversity losses caused by a specific project. In this approach:

- No Net Loss occurs when the biodiversity gains from conservation activities are equal to the biodiversity losses caused by the project, ensuring no overall decline in species, population sizes, or habitat conditions.
- Net Loss refers to a situation where biodiversity and its components are in a worse state than before the project.
- Net Gain occurs when the biodiversity benefits surpass the biodiversity losses, leading to an overall improvement in biodiversity.

This BNG framework is crucial for sustainable development and ecological compensation strategies, ensuring that biodiversity conservation are integrated into project planning and implementation.

III. LINKAGE WITH OTHER PROJECT PLANS AND PROCEDURES

This Plan is supported by other management plans and procedures developed under the Environmental and Social Management System (ESMS) of the Project. The following plans and procedures are particularly relevant and will be implemented in coordination with the Biodiversity Management Plan:

- Air Pollution and Emissions Management Plan
- Solid Waste Management Plan

- Environmental Accident and Spill Response Management Plan
- Traffic Management Plan
- Community Health and Safety Management Plan
- Training Management Plan
- Environmental and Social Management and Monitoring Plan (ESMMP)
- Biodiversity Action Plan (BAP)

The effective integration of these plans should be ensured to maintain compliance with national regulations and international standards and to minimize the cumulative environmental and social impacts of construction activities.

IV. ROLES AND RESPONSIBILITIES

This section outlines the capacity for implementing the Biodiversity Management Plan (BMP) and the corresponding measures to be undertaken. To ensure the effective execution of the action plans, the Project Owner will designate qualified personnel who will be responsible for addressing and managing biodiversity-related matters.

Biodiversity management roles and responsibilities for the AAMP include but are not limited to:

- Development of procurement conditions regarding biodiversity management
- Professional training of its representative on site
- Surveillance and control
- Management cooperation in case of environmental accident
- Management of pollution from its own operations
- Update and implementation of the BMP during the operations phase

The roles and responsibilities specifically related to the implementation, monitoring, and reporting requirements of this Plan is outlined in Table IV.1. The table clarifies the functional duties of each party involved in ensuring the effective execution of the measures described herein and reinforces accountability across all relevant units.

Table IV.1. Allocation of Roles and Responsibilities for Plan Implementation

Roles	Responsibilities
General Manager	• Ensure the provision of necessary resources for the preparation, revision, and implementation of this Plan in line with company policies. • Ensure the provision of sufficient budget and resources for the implementation of environmental and social management plans. • Oversee compliance with this Plan during project implementation observations.
Project Manager	• Ensure the preparation, revision, and implementation of this Plan in accordance with company policies. • Ensure that all employees comply with the conditions and obligations specified in this Plan during project activities. • Monitor whether the Project is being implemented in accordance with this Plan during project implementation observations. • In case of non-compliance, ensure that corrective and preventive actions are taken in coordination with the, Environmental and Social Interaction Manager, Cultural Heritage Chief, Environmental Chief/Engineer, and Public Relations Chief/Specialist. • Communicate this Plan to all Contractors/Subcontractors and supervise their compliance with the Plan. • Make decisions regarding the provision of project resources, budget determination, and effective use of resources. • Coordinate internal management intervention in the event of an emergency. • Ensure that all project personnel receive the necessary training and approve site inspections.

Roles	Responsibilities
Biodiversity Specialists	• Conduct baseline biodiversity assessments to understand and document existing habitats, species, and ecosystem conditions in and around the project footprint. • Monitor biodiversity risks during construction activities, ensuring sensitive habitats, critical species, and ecological corridors are not adversely affected. • Ensure compliance with national environmental legislation and international biodiversity standards. • Implement Biodiversity Action Plan (BAP) and Biodiversity Management Plan (BMP) and associated mitigation measures in coordination with the Environmental Engineer and E&S Manager. • Implement ecological mitigation measures (e.g., habitat restoration, species relocation, buffer zones) by contractors and subcontractors. • Train construction and environmental teams on biodiversity protection requirements and promote awareness of key species and habitats on-site. • Monitor biodiversity indicators and report findings in line with project performance monitoring systems and environmental management plans. • Ensure corrective actions are taken promptly when biodiversity-related non-compliances are observed. • Liaise with local environmental authorities, consultants, and NGOs on biodiversity matters as required. • Support environmental inspections and audits related to biodiversity performance. • Maintain biodiversity records and contribute to periodic reports and updates to the E&S Manager and Project Director. • Assist with community awareness activities related to biodiversity conservation in collaboration with the Community Liaison Officer when relevant. • Ensure integration of biodiversity considerations into site planning, construction methods, and landscape rehabilitation. • Review contractor/subcontractor method statements and work plans to confirm inclusion of biodiversity mitigation measures. is accurately collected, analyzed, and applied to improve mitigation strategies.
Field Personnel / Contractor Field Personnel	• Follow this Plan and all related Plans and Procedures, and carry out all activities in accordance with the requirements of this Plan. • In case of any non-compliance related to the implementation of this Plan, report it first to the Environmental & Public Relations Team and the Biodiversity Specialists, Contractor Environmental & Public Relations Team, or Environmental & Public Relations Specialist. • Participate in relevant trainings. • Ensure self-sufficiency in the implementation of this Plan.
All Personnel (including Contractor/Subcontractor Personnel)	• Participate in relevant trainings. • Fulfill and ensure the implementation of the requirements of this Plan.

V. BIODIVERSITY MANAGEMENT AND IMPLEMENTATION APPROACH

The Biodiversity Management Plan (BMP) is intended to be a live and adaptive document, subject to ongoing refinement and enhancement throughout the lifecycle of the Project. As the Project progresses, unforeseen biodiversity impacts that were not identified in the Environmental and Social Impact Assessment (ESIA) may arise. In such cases, appropriate mitigation measures will be developed and incorporated into the BMP accordingly.

V.1. Monitoring and Reporting

A comprehensive Biodiversity Monitoring and Evaluation Programme (BMEP) was developed to evaluate the effectiveness of the mitigation and enhancement measures implemented throughout the Project. The BMEP focused on monitoring the condition and ecological health of affected habitats, assessing the success of restoration activities, and tracking the impacts on species populations.

The results of biodiversity monitoring activities and the progress of mitigation measures will be communicated to stakeholders on a regular basis, ensuring transparency and enabling ongoing feedback and adaptive management

V.2. Mitigation Measures

All mitigation measures must be designed and implemented in accordance with the mitigation hierarchy, prioritising:

- Avoidance of impacts wherever possible,
- Minimisation or reduction of unavoidable impacts,
- Restoration or rehabilitation of affected environments,
- Offsetting as a last resort for residual impacts that cannot be otherwise addressed.

A core assumption underpinning the BMP is that during the construction phase, the Project will ensure the presence of suitably qualified and trained personnel on site. These individuals, operating under the direction and oversight of the Biodiversity Supervisor, will be responsible for actively monitoring, verifying, and supporting the correct implementation of all biodiversity mitigation measures.

Avoidance includes activities that change or stop actions before they take place to prevent their expected negative impacts on biodiversity and decrease the overall potential impact of an operation. For example, adjusting the location, scope or timing of development could avoid negative impacts on a vulnerable species or sensitive ecosystem. Mitigation measures determined in this scope are explained in detail in this BMP.

Minimisation measures are taken to reduce the duration, intensity, extent and/or likelihood of impacts that cannot be completely avoided. Mitigation measures determined in this scope are explained in detail in this BMP.

Restoration involves altering an area in such a way as to re-establish an ecosystem's composition, structure, and function, usually bringing it back to its original (pre-disturbance) state or a healthy state close to the original. This holistic process aims to return an ecosystem to its former natural condition and restore ecological function.

All disturbed temporary areas will be rehabilitated. Mitigation measures determined in this scope are explained in detail in this BMP.

Biodiversity offsets are measurable conservation outcomes resulting from actions designed to compensate for significant residual adverse biodiversity impacts arising from project development and persisting after appropriate avoidance, minimisation and restoration measures have been taken.

VI. FINDINGS OF BIODIVERSITY BASELINE

VI.1. Protected Areas

Internationally recognized areas are situated in the vicinity of the Project Area, which spans the provinces of Antalya and Mersin. These include Key Biodiversity Areas (KBAs) and Important Bird Areas (IBAs), both of which are identified as critical for supporting biodiversity. A total of 16

internationally recognized areas have been identified; however, no RAMSAR sites are located within or near the Project Area. Studies have shown that parts of the Antalya Plains (designated as both a KBA and IBA), Belek SEPA (nationally protected area), and Köprüçay Basin Natural Protected Area falls within the boundaries of the Project Area.

VI.2. Habitats

As part of the ESIA, the extent of both natural and modified habitats was evaluated. The Critical Habitat Assessment utilized the relevant Ecologically Appropriate Area for Analysis (EAAA) for the various habitats and species considered.

- C2 - Surface running waters
- J1 - Buildings of cities, towns and villages
- G1.1 - Riparian and gallery woodland, with dominant Alnus, Betula, Populus or Salix
- T3 - Coniferous forest
- T1.4 - Mediterranean and Macaronesian riparian forest
- S7.211 - Aegean Sarcopoterium phrygana
- S6 - Garrigue
- S5 - Maquis, arborescent matorral and thermo-Mediterranean scrub
- V1 - Arable land and market gardens

The results indicated that habitats within the expropriation corridor and its surrounding area (400 m buffer zone) were primarily classified as modified habitats.

VI.3. Flora and Fauna Species

A total of 221 plant species from 60 families were identified, including seven endemic species to Türkiye. Only one species, *Pyrus serikensis* (Endangered – EN), is classified as threatened under IUCN criteria. No other plant species recorded are considered threatened.

Five amphibian species were documented. *Lyciasalamandra atifi* (EN) is listed as threatened due to its strict habitat requirements; however, it was not detected during spring surveys, the optimal period for observation.

The study recorded 25 reptile species, including the threatened species *Testudo graeca* (Vulnerable – VU), which has a broad national distribution and does not trigger critical habitat designation. Four lizard species are endemic, with *Lacerta pamphylica* showing a more restricted range and occurring within the Project area.

A total of 124 bird species were identified. Two species are IUCN-listed as threatened: *Neophron percnopterus* (EN) and *Streptopelia turtur* (VU).

46 mammal species are potentially present, including a high diversity of bats. Two bat species, *Rhinolophus mehelyi* and *Myotis capaccinii* (both VU), are listed as threatened, though not detected in field surveys.

29 fish species were recorded. Five species are IUCN-listed as threatened:

- *Anguilla anguilla* (Critically Endangered – CR)
- *Alburnus baliki* and *Pseudophoxinus fahrettini* (Endangered – EN)

- *Cyprinus carpio* and *Capoeta antalyensis* (Vulnerable – VU)

The presence of *Anguilla anguilla* is linked to the catadromous nature of local rivers that drain into the sea.

VII. NOTABLE BIODIVERSITY AND CRITICAL HABITAT FEATURES

VII.1. Selection Criteria for Notable Habitats and Species

Based on the evaluations conducted during the Ecological Assessment and monitoring studies carried out within the scope of the Project, habitats and species of high priority and conservation significance were identified in this section. Earlier sections of this report outlined various national and international criteria used to assess the conservation status and threat levels of habitats and species. Accordingly, all biodiversity assessments were carried out in alignment with one or more of these criteria, as applicable to their respective contexts.

VII.2. Critical Habitat Features

Based on the findings of the Critical Habitat Assessment carried out for the Project, the following features provided in Table VII.1 have been identified as meeting the criteria to be classified as Critical Habitat.

Table VII.1. Critical Habitat Assessment Results

Criteria	Species / habitat triggered
Criterion 1: Critically endangered and/or endangered species	Maquis, arboreal matorral, and thermo-mediterranean scrub (EUNIS code S5) • *Pyrus serikensis*

VII.3. Habitats and Species of Conservation Importance

As a result of the comprehensive assessments conducted during the biodiversity studies, the selection criteria for habitats and species to be addressed in the biodiversity conservation action plans - developed as part of this document- were defined as follows.

Species of conservation concern, for the purposes of this assessment, are defined according to the following criteria:

- Species classified as Critically Endangered (CR), Endangered (EN), or Vulnerable (VU) on the IUCN Red List;
- Species that are globally, nationally, or regionally threatened;
- Endemic species to the area;
- Species listed under Resolution No. 6 of the Bern Convention;
- Range-restricted species;
- Migratory species for which the local population represents more than 1% of the global population.

It is important to note that, as Turkey is not a member state of the European Union, Priority Biodiversity Features and Critical Habitat (CH) associated with the EU Habitats and Birds Directives are not applicable in this context.

The subsections below present the species of conservation concern identified as potentially occurring within the Study Area, based on the outcomes of the Environmental and Social Impact Assessment (ESIA) and according to the criteria outlined above.

Habitat types and species identified as having high priority and conservation importance listed in Table VII.2. The conservation of these species required specific actions to be implemented within the scope of the Project.

Table VII.2. Priority habitats and species of conservation importance

Biodiversity Component		**Status**
Habitats	Critical Habitats S5 - Maquis, arborescent matorral and thermo-Mediterranean scrub	Natural habitats that qualify as Critical Habitat.
	Natural Habitats G1.1 - Riparian and gallery woodland, with dominant *Alnus*, *Betula*, *Populus* or *Salix* T3 - Coniferous forest T14 - Mediterranean and Macaronesian riparian forest S7.211 - Aegean *Sarcopoterium phrygana* S6 - Garrigue C2 - Surface running waters	Natural habitats that do not qualify as Critical Habitat.
Species	*Pyrus serikensis*	Regional endemic and EN category in the IUCN Red List
	Lyciasalamandra atifi	EN category in the IUCN Red List
	Lacerta pamphylica	Local endemic
	Testudo graeca	VU category in the IUCN Red List
	Neophron percnopterus	EN category in the IUCN Red List
	Streptopelia turtur	VU category in the IUCN Red List
	Myotis capaccinii	VU category in the IUCN Red List
	Rhinolophus mehelyi	VU category in the IUCN Red List
	Alburnus baliki	Endemic and EN category in the IUCN Red List
	Capoeta antalyensis	Regional Endemic and VU category in the IUCN Red List
	Oxynoemacheilus eregliensis	VU category in the IUCN Red List
	Pseudophoxinus fahrettini	Regional Endemic and EN category in the IUCN Red List

VIII. IMPACT ASSESSMENT ON ECOLOGY

The construction and operation of the Motorway Project will involve a wide range of activities that have the potential to affect the ecology. Impacts of project activities can be further divided into the target group of terrestrial and aquatic biological elements. Important impacts of motorway construction and operation activities on the biological environment are mainly habitat fragmentation. Habitat fragmentation can be described as splitting natural habitats and ecosystems into smaller, more isolated patches. The process of fragmentation is connected to many different factors, of which the direct loss and isolation of natural habitat are the most important.

VIII.1. Potential Impacts on Critical Habitats

The Project area comprises mainly maquis vegetation and agricultural lands, with scattered degraded forest patches. While impacts in agricultural zones are expected to be minimal, some alteration of maquis vegetation and use of forest areas for soil deposition may occur. These impacts will be addressed through targeted post-construction habitat restoration to prevent permanent vegetation loss.

- Habitat fragmentation is a key concern, but the project design—featuring viaducts, bridges, and at-grade crossings—leverages the natural topography and hydrology to maintain ecological connectivity. Although no significant migratory routes are present, additional wildlife passages (e.g. culverts) will be installed to further reduce fragmentation risks.
- Water pollution risks stem from excavation, blasting, and channel modifications, particularly in coastal river sections. These activities may degrade aquatic habitats and water-dependent species. Mitigation measures must be implemented to prevent turbidity, habitat loss, and the decline of aquatic ecosystems.
- Noise and dust pollution during construction may disturb local fauna, particularly mammals, though these effects are expected to be temporary, with species likely to reoccupy the area post-construction.

While the Project is expected to have localized impacts on critical habitats—particularly through vegetation disturbance, habitat fragmentation, and potential water pollution—these impacts can be effectively managed through the application of targeted mitigation measures and good construction practices. The integration of ecological structures, post-construction habitat rehabilitation, and strict controls on water quality and site activities will be essential to minimizing biodiversity loss.

Given the limited presence of continuous habitats, the absence of major migratory corridors, and the incorporation of natural features such as viaducts and at-grade crossings, the overall risk to habitat connectivity and species movement is considered manageable. With proper implementation, monitoring, and adaptive management, the Project is not anticipated to result in significant or irreversible impacts on critical habitats.

IX. MEASURES, MONITORING REQUIREMENTS, AND KEY PERFORMANCE INDICATORS

This BMP was designed to be adaptive and open-ended, allowing for updates and improvements based on ongoing research and the evolving nature of the Project. The mitigation hierarchy was strictly followed, ensuring that all necessary avoidance, minimization, and mitigation measures were implemented. Where required, additional offsets beyond those defined in this document were also considered throughout the life cycle of the Project.

The scope of the ESMS Management Plans has been determined to be construction phase, however BMP includes mitigation and monitoring actions to be taken for both construction and operation phases and mentions the long-term commitments but since the BAP includes operational measures the BAP will discuss both the construction and operation phases and will have greater detail on long-term mitigation measures for the project.

Pre-construction measures will be identified and implemented for each component of the project individually, to ensure site-specific biodiversity considerations and potential impacts are adequately addressed in accordance with IFC PS6. This is emphasizes site-specific impact management and proactive planning.

In accordance with the IFC PS6 mitigation hierarchy and the thresholds described under each Critical Habitat criterion in GN6, the incorporation of tunnels, culverts, and viaducts is recommended where technically and environmentally feasible. When strategically located, these structures can function as avoidance measures by maintaining habitat connectivity and preventing direct impacts on ecologically sensitive features such as Critical Habitats, wildlife corridors, and aquatic ecosystems. Due to the linear configuration and engineering constraints of the Project, however, complete avoidance of impacts is not always possible. In such cases, measures are applied primarily as minimization tools to reduce the extent, intensity, and fragmentation of unavoidable impacts.

For aquatic ecosystems in particular, viaducts and overpasses are regarded as avoidance measures where they fully maintain hydrological continuity and prevent disruption of aquatic habitats, while in situations where some disturbance remains they serve as minimization measures by reducing the severity of impacts compared to conventional embankments or culverts. The outcomes of these design considerations, together with predicted levels of habitat loss, are reviewed against PS6 requirements to confirm compliance and ensure that residual impacts are addressed through restoration and offset measures to achieve No Net Loss or Net Gain.

Table IX.1 Summary of Ecology and Biodiversity Assessments

Impacted Ecosystem Component		Definition of Potential Impact	Type of Impact	Impact Magnitude						Sensitivity/ Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts	Reason for Decrease in Significance
				Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude					
Land Preparation and Construction														
Terrestrial Habitats	S5 - Maquis, arborescent matorral and thermo-Mediterranean scrub	Habitat loss and habitat fragmentation Vegetation and topsoil removal Noise and dust pollution	Adverse	Widespread	Long	Medium	Irreversible	One-off	Moderate (B)	High	High (B3)	• The intrusion of any invasive flora species into the Project Area and its surroundings will be prevented. For this purpose, vehicles used for vegetation clearance and/or plant transfer will be checked beforehand. • Project workers will not be allowed to bring any live animals or plants into the construction site to avoid the risk of pest/invasive species establishing in the Project Area. • Measures to reduce noise, dust, and air quality will be taken. • Project construction sites and access roads will be separated from other areas with appropriate KGM approved signboards, signs, and fences. Therefore, staff and vehicle access to the area will be limited to the construction site. • Construction waste generated due to project activities will be stored at designated storage areas, and then disposed of solid waste will not be allowed to be left in natural habitats. • Vegetation clearance will take place gradually, so fauna elements will be allowed to leave construction sites. • Topsoil storage and reuse for vegetation reinstatement. • Conduct post-construction rehabilitation to restore the natural structure of affected maquis and forest habitats. • Ecological restoration of disturbed areas post construction • Collect seeds from endemic species and deliver to a seed bank for ex-situ conservation. • Minimize human-induced disturbances and adhere to conservation guidelines throughout the Project Area.	Medium (B2)	Mitigation measures (invasive species control, phased clearance, fencing, waste management, topsoil reuse, and replanting) reduce disturbance and ensure restoration, making impacts temporary and localized.
	G1.1 - Riparian and gallery woodland, with dominant Alnus, Betula, Populus or Salix T3 - Coniferous forest T14 - Mediterranean and Macaronesian riparian forest S7.211 - Aegean *Sarcopoterium phrygana* S6 - Garrigue	Habitat loss and habitat fragmentation Vegetation and topsoil removal Noise and dust pollution	Adverse	Widespread	Long	Medium	Irreversible	One-off	Moderate (B)	Medium	Medium (B2)		Low (B1)	Mitigation measures (invasive species control, phased clearance, fencing, waste management, topsoil reuse, and replanting) reduce disturbance and ensure restoration, making impacts temporary and localized. Therefore, significance is reduced from Medium to Low..
	J1 - Buildings of cities, towns and villages V1 - Arable land and market gardens	Habitat loss and habitat fragmentation Vegetation and topsoil removal Noise and dust pollution	Adverse	Widespread	Long	Medium	Irreversible	One-off	Moderate (B)	Low	Low (B1)		Low	Impacts are already minor by nature. Mitigation keeps them controlled and ensures they do not escalate, so the rating stays Low.
Aquatic Habitats	C2 - Surface running waters	Habitat loss and habitat fragmentation Water pollution	Adverse	Widespread	Long	Medium	Irreversible	One-off	Moderate (B)	Medium	Medium (B2)	• During construction, mixing any chemical substances that is used in the construction area, in aquatic ecosystems will be prevented • Excavation materials will not be dumped onto riverbeds	Low (B1)	Risk of water contamination and habitat alteration reduced throuh strict waste/chemical controls and no dumping policy. Impacts become limited and reversible.
(Flora)	*Pyrus serikensis*	Vegetation and topsoil removal Habitat loss and habitat fragmentation Noise and dust pollution	Adverse	Widespread	Long	Medium	Irreversible	One-off	Moderate (B)	High	High (B3)	• Seeds of the species will be collected and delivered to the Seed Gene Bank. • Monthly monitoring between April and August will be conducted in the flowering period for these species	Medium (B2)	Mitigation reduces the risk of permanent loss. Lowering significance from High to Medium.
	Eryngium kotschyi *Phlomis leucophracta* *Phlomis lycia* *Phlomis monocephala* *Phlomis nissolii* *Sideritis congesta* *Barlia robertiana*	Vegetation and topsoil removal Habitat loss and habitat fragmentation Noise and dust pollution	Adverse	Widespread	Long	Medium	Irreversible	One-off	Moderate (B)	Low	Low (B1)		Low	Impacts are already minor, mitigation ensures they remain controlled, so the rating stays low.

Impacted Ecosystem Component		Definition of Potential Impact	Type of Impact	Impact Magnitude						Sensitivity/ Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts	Reason for Decrease in Significance
				Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude					
(Amphibians)	*Lyciasalamandra atifi*	Habitat loss and habitat fragmentation	Adverse	Widespread	Long	Low	Irreversible	One-off	Moderate (B)	High	High (B3)	• Due to habitat loss, noise, dust formation, and vehicle-human traffic, construction activities will be carried out gradually to provide birds and mobile fauna species with time and energy to leave the area. • At-grade crossings will be established to facilitate movement between the fragmented habitats. • The construction sites will be fenced to prevent the entry of fauna species. In addition, traffic will be restricted in the Project Area, except for pre-designed roads, to avoid animal destruction. • Construction activities involving ground disturbance will ideally be scheduled outside the hibernation period or conducted with caution in areas where hibernating reptiles may be present. • Warning signs will be used along the Motorway with the approval of KMG. • To prevent collisions of insects the use of sodium lights will be used. • Bird nests, and moist habitats will be monitored during the construction and operation phases, and additional measures will be determined if necessary. • Monitoring will be done during the construction and operation. • Project personnel will be informed and trained in the aquatic environment. • Confirming species presence for *Lacerta pamphylica*, relocating individuals pre-construction.	Medium (B2)	Gradual works, safe crossings, fencing, restricted traffic and monitoring reduce mortality and habitat fragmentation, lowering significance from High to Medium.
(Reptiles)	*Testudo graeca*	Vegetation and topsoil removal Habitat loss and habitat fragmentation	Adverse	Widespread	Long	Low	Irreversible	One-off	Moderate (B)	Medium	Medium (B2)		Low (B1)	Mitigation limits disturbance and ensures impacts remain localized and reversible, reducing significance from Medium to Low.
	Lacerta pamphylica									High	High (B3)		Low (B2)	Scheduling, fencing, and species-specific measures reduce long-term risks. Considering species population being stable and IUCN category being “LC”, these measures are bringing significance down from High to Low.
	Anatololacerta ibrahimi *Ablepharus anatolicus* *Blanus aporus*									Low	Low (B1)		Low	Already minor; mitigation ensures no escalation, so significance remains Low.
(Birds)	*Neophron percnopterus*	Vegetation and topsoil removal Habitat loss and habitat fragmentation	Adverse	Widespread	Long	Low	Irreversible	One-off	Moderate (B)	High	High (B3)		Low (B2)	Targeted measures (crossings, fencing, monitoring) effectively reduce major risks, lowering significance from High to Low.
	Streptopelia turtur		Adverse	Widespread	Long	Low	Irreversible	One-off	Minor (C)	Medium	Low (C2)		Low (C1)	Impacts are already small; controls and monitoring reduce them further, shifting significance from Low (C2) to Low (C1).
	Accipiter nisus *Aquila chrysaetos* *Buteo buteo* *Buteo rufinus* *Circaetus gallicus* *Circus aeruginosus* *Circus cyaneus* *Circus macrourus* *Ciconia ciconia* *Ciconia nigra* *Falco columbarius* *Falco peregrinus* *Falco subbuteo* *Falco tinnunculus*								Minor (C)	Low	Low (C1)		Low	Impact is negligible; mitigation maintains low level with no change.
(Mammals)	*Myotis capaccinii* *Rhinolophus mehelyi*	Vegetation and Topsoil Removal Habitat Loss and Habitat Fragmentation	Adverse	Widespread	Long	Low	Irreversible	One-off	Moderate (B)	Medium	Medium (B2)		Low (B1)	Mitigation minimizes extent and duration of impacts, reducing significance from Medium to Low.

Impacted Ecosystem Component		Definition of Potential Impact	Type of Impact	Impact Magnitude						Sensitivity/ Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts	Reason for Decrease in Significance
				Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude					
(Freshwater species)	*Anguilla anguilla* *Alburnus baliki* *Capoeta antalyensis* *Pseudophoxinus fahrettini* *Pseudophoxinus battalgilae*	Habitat Loss and Habitat Fragmentation Water Pollution	Adverse	Widespread	Long	Medium	Irreversible	One-off	Minor (C)	High	Medium (C3)	• Excavation materials will not be dumped onto a riverbed. • Mixing any chemical substances used in the construction area, waterbed, and/or aquatic ecosystems will be prevented. • The natural structure of the riparian vegetation will be preserved, which forms the spawning and sheltering area for many aquatic organisms. • Especially during the breeding season of fish species (April and May), any intervention on riverbeds will be prevented. Viaduct or bridge construction activities will be conducted in months other than April-May, as turbidity can have lethal effects on fish eggs. If the activity has to be carried out, it will be done after determining whether there are breeding fish species in the area. • Sediment traps will be used to prevent the negative impact of the sediment that construction activities will generate. • Strengthening works will be done with certain rock blocks to ensure the stability of the coast. • Project activities will be limited to designated areas to avoid direct impacts. • Monitoring will be done during the construction and operation. • Project personnel will be informed and trained in the aquatic environment.	Low (C2)	Strict controls on waste, chemicals, and sediment, plus seasonal restrictions and riparian protection, significantly reduce risks to aquatic habitats, lowering significance from High to Low.
	Cyprinus carpio *Capoeta caelestis* *Cobitis battalgilae* *Oxynoemacheilus eregliensis* *Alburnus escherichii* *Squalius anatolicus* *Squalius fellowesii* *Salmo ekmekciae*									Medium	Low (C2)		Low (C1)	Mitigation limits pollution and disturbance, protecting aquatic species and spawning areas, reducing significance from Medium to Low.
Operation														
Terrestrial Habitats	S5 - Maquis, arborescent matorral and thermo-Mediterranean scrub	Noise and pollution Alteration of soil chemistry	Adverse	Widespread	Long	Low	Irreversible	Continuous	Moderate (B)	High	High (B3)	• Maintaining vegetation buffers to reduce noise/light disturbance • Monitor and control of any invasive species • Ecological restoration of disturbed areas post construction • Topsoil storage and reuse for vegetation reinstatement	Medium (B2)	Vegetation buffers and invasive species control reduce disturbance, lowering significance from High to Medium.
	G1.1 - Riparian and gallery woodland, with dominant Alnus, Betula, Populus or Salix T3 - Coniferous forest T14 - Mediterranean and Macaronesian riparian forest S7.211 - Aegean *Sarcopoterium phrygana* S6 - Garrigue	Noise and pollution Alteration of soil chemistry	Adverse	Widespread	Long	Low	Irreversible	Continuous	Moderate (B)	Medium	Medium (B2)		Low (B1)	Noise/light impacts are localized and controlled by vegetation buffers, reducing significance to Low.
	J1 - Buildings of cities, towns and villages V1 - Arable land and market gardens	Noise and pollution Alteration of soil chemistry	Adverse	Widespread	Long	Low	Irreversible	Continuous	Moderate (B)	Low	Low (B1)		Low (B1)	Already minor; mitigation maintains impacts at Low.
Aquatic Habitats	C2 - Surface running waters	Water pollution	Adverse	Widespread	Long	Low	Irreversible	Continuous	Minor (C)	Medium	Medium (B2)	• Prevent chemical runoff	Low (B2)	Runoff prevention minimizes water pollution risk, keeping impacts Low.
(Amphibians)	*Lyciasalamandra atifi*	Mortality due to vehicle collision Light and noise disturbance	Adverse	Widespread	Long	Low	Irreversible	Continuous	Minor (C)	High	High (B3)	• Installing culverts, underpasses, overpasses, viaducts, and bridges for safe crossing and fences to prevent fauna to enter the motorway • Warning signs will be used along the Motorway with the approval of KMG. • To prevent collisions of insects the use of sodium lights will be used. • Bird nests, and moist habitats will be monitored	Low (B2)	Culverts, fencing, and monitoring reduce collision risk and habitat fragmentation, lowering significance from High to Low.
(Reptiles)	*Testudo graeca*	Mortality due to vehicle collision	Adverse	Widespread	Long	Low	Irreversible	Continuous	Moderate (B)	Medium	Medium (B1)		Low (B2)	Culverts, fencing, and monitoring reduce collision risk and habitat fragmentation, lowering significance from Medium to Low.

Impacted Ecosystem Component		Definition of Potential Impact	Type of Impact	Impact Magnitude						Sensitivity/ Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts	Reason for Decrease in Significance
				Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude					
	Lacerta pamphylica		Adverse	Widespread	Long	Low	Irreversible	Continuous	Moderate (B)	High	High (B3)	during the construction and operation phases, and additional measures will be determined if necessary. • Monitoring will be done during the construction and operation.	Low (B2)	Safe crossing structures and fencing minimize severe risks, reducing significance from High to Low.
	Anatololacerta ibrahimi *Ablepharus anatolicus* *Blanus aporus*		Adverse	Widespread	Long	Low	Irreversible	Continuous	Moderate (B)	Medium	Medium (B2)		Low (B1)	Crossing measures reduce residual mortality and fragmentation, lowering significance to Low.
(Birds)	*Neophron percnopterus*	Mortality due to vehicle collision Disturbance from light/noise	Adverse	Widespread	Long	Low	Irreversible	Continuous	Minor (C)	High	High (B3)		Low (B1)	Use of sodium lights prevents insect attraction and by this, preventing birds attraction and reduces disturbance, lowering significance to Low.
	Streptopelia turtur		Adverse	Widespread	Long	Low	Irreversible	Continuous	Minor (C)	Low	Low (B1)		Low (B1)	Use of sodium lights prevents insect attraction and by this, preventing birds attraction and reduces disturbance, keeping the significance Low.
	Accipiter nisus *Aquila chrysaetos* *Buteo buteo* *Buteo rufinus* *Circaetus gallicus* *Circus aeruginosus* *Circus cyaneus* *Circus macrourus* *Ciconia ciconia* *Ciconia nigra* *Falco columbarius* *Falco peregrinus* *Falco subbuteo* *Falco tinnunculus*								Minor (C)	Low	Low (C1)		Low	Already minor; culverts and fencing maintain low-level impacts.
(Mammals)	*Myotis capaccinii* *Rhinolophus mehelyi*	Mortality due to vehicle collision Light pollution Noise pollution	Adverse	Widespread	Long	Medium	Irreversible	Continuous	Minor (C)	Medium	Medium (C2)	• Installing culverts and/or underpasses for safe crossing • Monitoring of bat species populations • Usage of sodium lights • Reporting of fauna casualties	Low (C1)	Crossing structures, monitoring, and lighting reduce collision and disturbance risks, lowering significance from Low (C2) to Low (C1).
(Freshwater species)	*Anguilla anguilla* *Alburnus baliki* *Capoeta antalyensis* *Pseudophoxinus fahrettini* *Pseudophoxinus battalgilae*	Water Pollution	Adverse	Widespread	Long	Low	Irreversible	Continuous	Minor (C)	Low	Low (C1)	• Prevent chemical runoff	Low (C1)	Runoff prevention avoids water pollution, maintaining already minor impacts at Low.
	Cyprinus carpio *Capoeta caelestis* *Cobitis battalgilae* *Oxynoemacheilus eregliensis* *Alburnus escherichii* *Squalius anatolicus* *Squalius fellowesii* *Salmo ekmekciae*		Adverse	Widespread	Long	Low	Irreversible	Continuous	Minor (C)	Medium	Low (C2)	• Prevent chemical runoff	Low (C1)	Preventing chemical runoff further reduces pollution risks, shifting significance from Low (C2) to Low (C1).

IX.1. Biodiversity Risks, Monitoring Requirements, and Mitigation Framework

Construction-related impacts may occur either directly, such as habitat clearance resulting in loss or fragmentation, wildlife disturbance from noise, vibration and lighting, and accidental mortalities during site preparation and earthworks, or indirectly through habitat degradation that can alter species distribution, abundance and ecological functions.

During the operational phase, impacts are primarily associated with vehicle traffic, including wildlife collisions leading to increased mortalities, particularly for medium and large mammals, reptiles, amphibians, and ground-nesting birds.

Additional impacts result from chronic noise and light disturbance along the motorway, the barrier effect restricting wildlife movement and dispersal, and the potential spread of invasive or feral species facilitated by road corridors. Over the long term, these impacts may contribute to reduced habitat quality and landscape connectivity within the wider project area.

To address and mitigate potential impacts, Table IX.2 presents identified biodiversity risks associated with the Project, along with corresponding mitigation measures, assigned responsibilities, monitoring requirements, performance indicators, verification methods, and corrective actions.

The figures showing the current design of viaducts, tunnels, bridges, culverts, underpasses, and overpasses combined with the habitat map that causes the least amount of fragmentation is provided in the ESIA Annex 11C figures. Biodiversity specialist will review these figures during the construction period Figures including sensitive biodiversity location maps are presented in ESIA Findings for Ecology and Biodiversity section.

Locations for pre-construction surveys for bats is given in Figure IX.1.

Table IX.2 Biodiversity Management Plan for Construction and Operation Phase

Type of Habitat/Type of Species	Impact	Sensitive Habitat Location	Mitigation and Monitoring Measure	Responsibility for Mitigation Measure	Monitoring Parameter	Timing of Monitoring and Frequency	Monitoring Location	KPI (variable, Threshhold Aim)	Means of Verification	Corrective action
Natural Critical	• Habitat fragmentation and edge effects • Creation of barriers to movement	• Project footprint • Sensitive habitats (Culverts to be Constructed for the Motorway are detailed within Table IX.3)	**Minimisation** • Off-road driving is strictly prohibited; all vehicles must remain on designated access routes at all times. • Vehicle movement near sensitive habitats shall be restricted using physical barriers. • If operational or biodiversity monitoring identifies a previously unknown migration corridor, the EPC Contractor / Biodiversity Specialist shall conduct a rapid assessment and prepare a supplementary mitigation plan within 14 days, subject to approval by the Project's Environmental Manager. **Monitoring** • Monthly inspection of access roads by site supervisors. • Monthly walkover surveys by the Biodiversity Specialist to confirm compliance. • Wildlife–vehicle collision records maintained and reviewed quarterly.	• EPC Contractor • Biodiversity Specialist	• Number and length of access roads vs. approved design • Number of off-road driving incidents • Number of wildlife vehicle collisions	• Weekly during construction phase • Quarterly during operation	• All temporary access road alignments • Construction sites, staging areas, • Sensitive habitat boundaries	• Habitat connections created by culverts. • No unauthorized roads • Wildlife-vehicle collision incidents < 5 incidents per km per month	• Site walkover inspection records • Records of new access roads	• Update GIS records for any unauthorized access roads. • Report closures and rehabilitation actions to the Biodiversity Specialist. • Immediately stop work in the affected area in case of off-road driving/parking incidents. • Rehabilitate disturbed habitat within 7 days. • Conduct mandatory refresher training for drivers within 48 hours. • Remove repeat offenders from driving duties. • During construction implement speed restrictions (≤20 km/h) and install warning signage within 7 days if wildlife–vehicle collision rate exceeds 5incidents/km/month. • Identify collision hotspots and install permanent mitigations (culverts, crossings) within 3 months. • Ensure that if migration corridors are obstructed, the Biodiversity Specialist proposes remedial measures within 14 days. • Implement remedial measures by the EPC Contractor within 3 months. • Record all wildlife collision incidents, where necessary, additional measures such as additional signage or fencing adjustments will be made. • Document all incidents, actions taken, and outcomes in the Environmental and Social Management System (ESMS). • Verify effectiveness of corrective actions through follow-up monitoring.

Natural Critical	• Loss or degradation of Habitats and Flora • Reduction of area of fauna and flora habitat available	• Natural habitats within the project area	**Avoidance** • Micro-site project facilities to avoid sensitive receptors; project footprint minimised. **Minimisation** • Ground disturbance limited to approved construction footprint. • Pre-clearance surveys for flora and fauna conducted by a qualified biodiversity specialist, not earlier than 7 days prior to clearing. Surveys include breeding sites, underground burrows, tree nests, and micro-habitats under rocks, logs, and bark. • Cutting of grasslands avoided during flowering/fruiting of sensitive plant species. • Topsoil stripped and stored separately from subsoil. Topsoil storage includes measures to maintain fertility and prevent invasive species colonisation if storage > 3 months. **Restoration** • Topsoil returned to its original habitat location immediately after excavation or at latest within the same construction season. • Revegetation implemented during the next spring season using only native, non-invasive species. • Tree cutting recorded; 5 replacement trees planted per felled tree under a signed Ministry of Forestry protocol. More details are presented in BAP	• EPC Contractor • Biodiversity Specialist • SPV	• Pre-clearance survey records • Number of trees felled and planted • Area of habitat restored (ha) • Topsoil storage records	• Pre-clearence before consturction works; • Continuous during construction; • Restoration monitoring annually for 5 years	• All construction footprints • Borrow areas • Storage areas	• No disturbance to biodiversity outside the approved operational footprint • Record of the restoration vegetation planting. • All temporarily disturbed habitats will be restored to their pre-construction state within five years following the completion of the restoration works • No IAS invasion on soil stockpiles	• Site walkover inspection records • Construction site layout plan • Post-reinstatement inspection records • Pre-clearance check-lists • Topsoil storage records	• Stop work and reinstate unauthorized disturbance using stored topsoil; verify by Biodiversity Specialist. • Conduct immediate pre-clearance survey if missed before clearing. • Replace or remediate mismanaged topsoil; apply protection to prevent fertility loss/invasive species. • Accelerate habitat restoration using native species; monitor until KPI met. • Information regardingthe plantation is within the BAP • Remove invasive species promptly; implement prevention and monthly monitoring. • Suspend vehicle access and retrain drivers; install signage/barriers if off-road driving occurs.
Natural Critical Modified Fauna species	• Noise and Vibration Disturbance	• Project construction footprint	**Minimisation** • Where possible, high-impact noise (e.g., blasting) will be limited to daylight hours. • Pre-construction biodiversity monitoring will be conducted, • Unnecessary revving of engines will be avoided and switched off equipment when not in use. • During the night work activities high impact noise and vibration activities will be avoided.	• EPC Contractor • Biodiversity Specialist	• Noise monitoring results • Training coverage (%)	• Monthly during construction and prior to blasting	• Construction areas near sensitive fauna habitats	• Records of monitoring schedule and result of environmental noise • Training attendance sheets and transcript of the presentation	• Site walkover inspection records; complaint records	• If noise exceeds thresholds, investigate within 48 hours and implement additional mitigation measures (e.g., noise barriers, equipment adjustments) within 7 days. Verify through follow-up monitoring. • If training attendance coverage falls below 90%, conduct make-up sessions within 2 weeks and track attendance until target is met. • All incidents and corrective actions must be recorded in the Environmental and Social Management System and verified through follow-up inspections.

Natural Critical Modified Fauna Species	• Light disturbance	• Construction sites and camp areas (Table IX.6)	**Minimisation** • Lighting for construction and security purposes will be inward and downward facing to minimise light pollution in remote areas, and to minimize the disturbance to nocturnal wildlife, birds and invertebrates. • Artificial light will be limited to areas where it is essential. • Fewer lights will be preferable to more lights and lighting design will be prevented from affecting the sky as much as possible. • LEDs will be preferred than HPS to lighting • During the night work activities high impact noise and vibration activities will be avoided.	• EPC Contractor • Biodiversity Specialist	• Number of wildlife incidents linked to light • Compliance with lighting design	• Monthly during, construction and operation	• Worksites, security lighting zones	• Records of incidents with wildlife due to light pollution	• Incident reports; lighting design records	• If wildlife incidents occur due to lighting, immediately adjust lighting (direction, intensity, shielding) and document actions. • If lighting does not comply with design specifications, correct installation within 7 days and verify compliance through inspection. • Review lighting layout if repeated incidents occur and implement additional measures (e.g., motion sensors, timers) within 14 days. • All incidents and corrective actions must be recorded in the Environmental and Social Management System and verified during follow-up inspections.
Natural Critical Modified Flora Species	• Increase in dust	• Access roads • Construction areas	**Avoidance** • Induction training will be used to raise awareness of staff operating motor vehicles that includes instruction on the need to comply with speed limits to respect all forms of wildlife. Speed limits will be reduced. Note that speed limit is 20 km/s. • On-site personnels will be informed about important habitat and species. **Minimisation** • Dust emission will be minimised by performing irrigation on access roads.	• EPC Contractor • Biodiversity Specialist	• Number of complaints • Visual dust levels • Irrigation frequency	• Weekly during construction	• Access roads, sensitive habitats • Adjacent settlements	• Site walkover inspection records • Records of complaint of stakeholders	• Pre-clearance checklists; walkover inspection records	• If dust complaints are received, immediately increase frequency of road irrigation and implement temporary dust suppression measures (e.g., water spraying, covering stockpiles) within 24–48 hours. • If visual dust levels exceed acceptable thresholds, adjust speed limits and enforce vehicle driving rules immediately; document corrective action. • If staff fail to comply with dust minimisation procedures, provide refresher induction/training within 7 days. • All incidents, actions, and follow-up verification must be recorded in the Environmental and Social Management System and confirmed during site inspections.
Natural Critical Modified	• Invasive-alien distribution risk:	• All project sites	**Avoidance** • Construction machines and equipment will be washed by pressure wash before the entrance of the construction sites. • Wheels of the construction machines will be checked regularly. • Parking areas and camp sites will be kept clean against spreading of invasive species. **Minimisation** • There will be regular inventories of invasive species within the AoI, if any are identified, eradication measures will be developed and implemented.	• EPC Contractor • Biodiversity Specialist	• Number of IAS identified • implementation of cleaning records	• Pre-entry and quarterly inspections	• Site entry points • Storage areas • Camp sites	• No IAS infestation recorded	• Pre-clearance check-lists • Site walkover inspection records • Construction site layout plan • Post-reinstatement inspection records	• If IAS are detected on site, implement immediate containment and eradication measures within 7 days and report to Biodiversity Specialist. • If machinery or equipment is found not to have been cleaned, halt its operation until proper cleaning is completed; document the incident. • If IAS are spreading despite preventive measures, review and update cleaning and site hygiene procedures within 14 days. • All IAS-related incidents, mitigation measures, and follow-up verification must be recorded in the Environmental and Social Management System (ESMS) and confirmed during follow-up inspections.

Natural Critical Modified Fauna species Flora species	• Accidental loss of fauna • Disturbance to fauna • Killing/injuring fauna • Displacement of fauna • Accidental loss of flora	• Construction footprint	**Avoidance** • Herbicide and fire will not be permitted as a means to clear vegetation to ensure a minimal impact footprint during habitat clearance and to reduce the risk of mortality and injury to wildlife. • Construction sites will be surveyed before and during construction period. • Pre-blasting biodiversity monitoring for burrowing and nesting species will be conducted, and the nests will be marked with fences and signboards (if found any) • If there are any active nests on construction site, a biodiversity specialist in consultation with an ornitologist will decide if it is safe to proceed with the works as planned, OR if the works close to the nest area will be postponed until the offspring fledges, OR if the nest will be relocated • Tree cutting activities will not be carried out as much as possible during the bird breeding season, otherwise it will be carried out under the supervision of an ornithologist. • Regular trainings will be held in order to raise awareness associated with the natural assets & importance of the site and protection of the natural structure including legislative framework, related conventions and their requirements as in line with the Environmental & Social Management System. **Minimisation** • Removal of topsoil and vegetation will be implemented to ensure no individuals are killed or no galleries are destructed, and populations of the species continue to survive in the area. • Environmental incidents will be recorded to monitor the need for additional preventative measures to be implemented alongside the current animal exclusion methods. • A ban on hunting and fishing by construction and operation staff • Induction training will be used to raise awareness of staff operating motor vehicles that includes instruction on the need to comply with speed limits to respect all forms of wildlife. • Speed limits will be reduced. Note that speed limit for vehicles during construction is 20 km/h	• EPC Contractor • Biodiversity Specialist	• Translocation records • Number of nests affected • Number of fauna incidents	• Pre-clearance before works; • Continuous during construction	• Entire project footprint; • Access roads	• No nest/offspring lost; no fauna killed during clearance; • Vehicle speed compliance	• Walkover survey reports • Training records • Incident logs	• If fauna is injured, killed, or nests/offspring affected, halt works immediately and notify Biodiversity Specialist; implement rescue, relocation, or mitigation measures within 24–48 hours and document the action. • If staff fail to comply with speed limits or wildlife protection procedures, issue retraining and enforce compliance immediately; repeat offenders removed from operation duties. • If tree cutting occurs during breeding season without supervision, halt works and consult ornithologist; remedial measures implemented within 7 days. • Record all incidents, corrective actions, and follow-up verification in the Environmental and Social Management System; verify effectiveness through continuous monitoring and walkovers.

Natural Critical Modified	• Environmental pollution risk	• Construction and camp sites • Waste storage • Aquatic habitats	**Avoidance** • Organic waste will be managed in a way to prevent wildlife access to it. • **Minimisation** • Waste storage outside of the landfill will be situated in bins with lids secured. • Waste oils and/or hazardous substances and domestic waste outside landfill/waste-storage facility will be kept in temporary hazardous waste areas. Preventing wildlife access to it. • Proper waste disposal will be provided avoiding natural habitats. • Prevent will be ensured wastewater discharge into aquatic habitats, especially in breeding seasons. • Accidental release of pollutants and potentially contaminated sediments will be controlled.	• EPC Contractor • Biodiversity Specialist	• Waste storage condition • Number of pollution incidents • Wastewater discharge records	• Daily during, pre-construction, construction and operation	• Waste storage areas • Work camps • Aquatic habitats	• Number of non-compliance related to waste and pollution incidents <5	• Walkover inspection records; waste storage logs; incident reports	• If waste is found unsecured, immediately secure bins and review staff procedures within 24 hours; document action. • If a pollution incident occurs (e.g., wastewater discharge, chemical spill), stop the source immediately, contain and remediate within 48 hours, and notify the Biodiversity Specialist. • If improper waste disposal is observed, retrain responsible personnel within 7 days and monitor compliance until resolved. • All incidents, remedial actions, and follow-up verification must be recorded in the Environmental and Social Management System (ESMS) and confirmed through inspections.
Natural Critical (Special importance for S5 - Maquis, Arboreal Matorral, and Thermo-mediterranean Scrub due to determined as Critical Habitat)	• Habitat loss/degradation resulting from clearing and permanent removal of the vegetation in the process of construction of the motorway as well as clearing vegetation to secure access to locations. • Motorway construction will affect the edge of the maquis near Serik district which are determined as Critical Habitats. Therefore possible impacts on these particular habitats will be mitigated and no net loss will apply.	• Edges of maquis near Serik district • Critical Habitat areas identified in the EAAA	• Map critical maquis areas before construction. • Restrict construction during flowering, breeding, and hibernation periods. • In sensitive areas, minimise noise during excavation and construction works (demolition, earth moving, vehicle disturbance) from October to June. • Limit unnecessary land use. • Prefer existing access roads and facilities during design and construction. • Reuse stored topsoil and rocks for restoration. • Reintroduce native vegetation.	• EPC Contractor • Biodiversity Specialist • Local Communities	• Area of Critical Habitat mapped • Compliance with construction timing restrictions • Noise levels near sensitive habitats • Use of existing access roads vs. new roads • Area of topsoil/rocks reused for restoration • Area re-vegetated with native species	• Pre-construction • Routine site inspections during construction • After restoration, (annually for 5 years) • Flowering period for S5 Habitat (March - June) • Breeding period for S5 Habitat (April - June)	• Construction footprint • Critical maquis edges • Restoration sites	• No unplanned clearing in Critical Habitat • Noise within acceptable limits • 100% reuse of stored topsoil and rocks • Restoration success ≥90% native vegetation cover	• Site walkover reports • Construction logs • Noise monitoring records • Restoration monitoring reports	• If unplanned clearing occurs, halt works immediately and rehabilitate within 14 days; notify Biodiversity Specialist. • If construction occurs during flowering/breeding/hibernation periods, suspend works in that area and implement mitigation within 7 days. • If noise exceeds thresholds, implement additional measures (e.g., barriers, machinery adjustments) within 48 hours. • If existing access roads are not used, document deviation and correct immediately. • If restoration is incomplete or vegetation survival <90%, implement supplementary planting and monitor until target achieved. • All incidents, corrective measures, and monitoring results must be recorded in ESMS and verified through follow-up inspections.

Pyrus serikensis Determined as Critical Habitat trigger species (IUCN Status - EN)	• Habitat loss • Soil disturbance • Plant destruction during construction	• Identified Critical Habitats	• Conduct pre-construction surveys to identify critical habitats. • Investigate areas to be affected prior to works (April–July) to locate Pyrus serikensis individuals. • Translocate detected trees to suitable habitat.* • Contracting a third party expert in regards to translocation • Remove and store topsoil with seeds for reuse. • Rehabilitate disturbed areas using local plant species.	• EPC Contractor • Biodiversity Specialist • SPV	• Number of trees surveyed and mapped • Number of trees translocated • Area of topsoil and seeds preserved • Area of successful rehabilitation	• Pre-construction surveys • During construction (annually) • Post-rehabilitation (annually for 5 years)	• Identified critical habitats • Construction sites impacting *Pyrus serikensis*	• 100% of trees identified and protected • All trees requiring translocation successfully moved • All stored topsoil and seeds reused • ≥90% survival of rehabilitated plants	• Pre-construction survey reports • Translocation records • Site walkover and restoration monitoring reports	• Before corrective actions, as per the results of the pre-construction surveys, if any *Pyrus serikensis* trees are found in addition to the baseline studies, the biodiversity specialist will initiate the translocation procedures. • If any other *Pyrus serikensis* trees are found during construction besides the ones from baseline or pre-construction surveys, halt works in the area immediately, contact the Biodiversity Specialist and initiate the translocation procedures. (*Translocation procedure will be prepared as a separate document by the third-party consultant)* • If topsoil or seeds are lost or not stored properly, implement corrective collection and storage within 48 hours. • If rehabilitation survival rate falls below 90%, conduct supplementary planting and monitor until target achieved. • All surveys, translocations, and rehabilitation actions must be recorded in ESMS and verified through follow-up inspections.
Endemic Plants Local endemic plant species in the AoI *Eryngium kotschyi* *Phlomis leucophracta* *Phlomis lycia* *Phlomis monocephala* *Phlomis nissolii* *Sideritis congesta*	• Habitat loss • Soil disturbance • Plant destruction during construction	• At the flora sampling point 11 (X: 344079,Y: 4087799) for *Sideritis congesta*, • sampling point 11 (X: 344079,Y: 4087799) and 25 (X: 394464,Y: 4055587) for *Phlomis leucophracta*, • sampling point 25 (X: 394464,Y: 4055587for *Phlomis lycia*, • sampling point 28 (X: 335259,Y: 4093731) for *Phlomis nissolii*	• Conduct pre-construction surveys to identify species presence habitats • Investigate areas to be affected prior to construction (April–July) to locate endemic plants • Remove and store topsoil with seeds for reuse • Restore topsoil post-construction. • Rehabilitate disturbed areas using local plant species • Monitor restoration success for a minimum of 3 years	• EPC Contractor • Biodiversity Specialist • SPV	• Area of topsoil and seeds stored • Area of restoration • Restoration success rate (%)	• Pre-construction surveys • During construction • Post-construction monitoring for 3 years	• Identified species habitats • Construction sites impacting endemic plants • Restoration areas	• 100% of plants identified and protected • All stored topsoil and seeds reused • ≥90% survival of rehabilitated plants over 3 years	• Pre-construction survey reports • Site walkover records • Restoration monitoring reports • ESMS logs	• Before corrective action, as per the results of the pre-construction surveys, if any endemic plants are found in addition to the baseline studies, the biodiversity specialist will initiate translocation procedures and/or mitigation measures. • If any other endemic plants are found during construction besides the ones from baseline or pre-construction surveys, halt works in the area immediately, contact the Biodiversity Specialist and initiate the translocation or protection procedures. • If topsoil or seeds are lost or not stored properly, implement corrective collection and storage within 48 hours. • If restoration survival is <90%, implement supplementary planting and monitor until target is achieved. • All surveys, restoration, and corrective actions must be recorded in ESMS and verified through follow-up inspections.

Lyciasalamandra atifi	• Habitat loss • Noise • Dust	• Suitable habitats in T3 Coniferous forests above 200 m elevation • Road sides near T3 Coniferous forests	• Conduct pre-construction habitat surveys to locate active populations • Identification and mapping of areas occupied by species prior to the commencement of clearance • The sectors overlapping the suitable habitats (T3 Coniferous forests) of above 200 m elevation will be searched by Biodiversity Specialists immediately prior to start of works. • The translocation of specimens identified in work zone into favourable habitat areas identified adjacent to the works. Checks to be conducted by Biodiversity Specialists ahead of the excavation. • Implement dust and noise controls • Create wildlife corridors in fragmented areas (T3 Coniferous Forests)	• EPC Contractor • Biodiversity Specialist	• Number of active populations mapped • Number of specimens translocated (if found near AoI) • Dust and noise levels near habitats • Presence/continuity of wildlife corridors	• Pre-construction surveys • During construction • Post-construction monitoring	• T3 Coniferous forests above 200 m • Work zones • Wildlife corridor areas	• Survival of all translocated individuals • Number of non-conformaties related to dust and noise < 5 • Wildlife corridors maintained by culverts	• Survey and mapping reports • Translocation records • Dust and noise monitoring reports • Site inspection reports	• Before corrective action, as per the results of the pre-construction surveys, if any *Lyciasalamandra atifi* individuals are found in in the project footprint, the biodiversity specialist will initiate translocation procedures. • If populations are detected during works, halt activity in affected area immediately; conduct translocation within 7 days and document. • If dust or noise exceed thresholds, implement additional mitigation (e.g., water spraying, noise barriers) within 48 hours. • If wildlife corridors are blocked or fragmented, restore connectivity within 14 days. • All incidents, mitigation measures, and follow-up verification must be recorded in ESMS and verified through inspections.
Reptiles Especially considering the Turtle (*Testudo graeca*)	• Habitat loss • Noise • Dust • Disturbance during hibernation	• Project footprint	• Conduct pre-construction habitat surveys to locate active populations (including old run-down places/ buildings, crevices) • The working areas will be carefully searched by the Biodiversity Specialists prior to the commencement of the work; any individuals found will be carefully transported outside risk areas in habitats matching their ecological requirements; • Any individuals found on site will be relocated to favourable habitats • Implement dust and noise controls • Create wildlife corridors in fragmented areas	• EPC Contractor • Biodiversity Specialist	• Number of individuals located and translocated • Dust and noise levels • Continuity of wildlife corridors	• Pre-construction surveys • During construction (annually) • Post-construction monitoring (annually for 5 years)	• Construction areas • Wildlife corridor areas	• 100% of individuals identified and safely relocated • Number of non-conformities related to dust and noise < 5 • Wildlife corridors maintained by culverts	• Survey and relocation records • Dust and noise monitoring reports • Site inspection reports	• Before corrective action, as per the results of the pre-construction surveys, if any *Testudo graeca* individuals are found in in the project footprint, the biodiversity specialist will initiate translocation procedures • If *Testudo graeca* individuals are detected during works, halt activity in affected area immediately and relocate individuals within 24–48 hours; document all actions. • If construction occurs during hibernation, construction works in the affected area will be minimized until period ends. • If dust or noise exceed thresholds, implement immediate mitigation (e.g., barriers, water spraying) and verify effectiveness. • If wildlife corridors are blocked or fragmented, restore connectivity within 14 days. • All incidents, mitigation actions, and follow-up verification must be recorded in ESMS and confirmed during inspections.

Bats	• Habitat loss • Light and noise pollution • Roosting site disturbance	• Rocky areas, caves and flight corridors within the AoI, especially at the location of quarries (Km 56+500, Km 58+500, Km 104+750, Km 105+000, Km 106+000, Km 114+200, Km 117+000, Km 119+500, Km 134+000)	• Conduct pre-construction surveys to identify roosting and hibernation sites (including old run-down places/ buildings, crevices) • Any tree above 100mm in diameter to be checked by the Biodiversity Specialist for the potential of roosting bats prior to removal (i.e the presence of potential roosting features). If bats are found, the roost will be left undisturbed until vacated by bats. • All felled trees with evidence of roosting bats (i.e. with suitable cavities showing signs of occupation (droppings, feeding remains, grease markings), including those which could not be inspected by the Biodiversity Specialist will be left in situ (on the ground) for 24 hours to allow any bats to move • Use low-intensity, non-UV lighting • Restore disturbed habitats post-construction • Protect roosting structures	• EPC Contractor • Biodiversity Specialist	• Number of roosting/hibernation sites identified • Number of trees checked prior to felling • Number of roosting structures protected • Compliance with lighting and noise limits	• Pre-construction surveys • During construction (annually) • Post-construction monitoring (annually for 5 years)	• Roosting and hibernation sites • Trees with potential roosts • Disturbed habitat areas • Rocky areas, caves and flight corridors within the AoI, especially at the location of quarries	• 100% of roosting sites identified and protected • No disturbance to occupied roosts • Lighting and noise within thresholds • Disturbed habitats successfully restored • No mortality in individuals	• Survey and inspection reports • Tree check and roost monitoring records • Post-construction habitat restoration reports	• Before corrective action, as per the results of the pre-construction surveys, if any bat individuals are found, the biodiversity specialist will initiate translocation procedures. • If bats are discovered during tree removal or works,cut trees will be left undisturbed for 24 hours until individuals leave roost site • If felled trees with bats are moved prematurely, re-establish on site and monitor for 24 hours. • If construction occurs near roosts during hibernation, construction works will be minimized until period ends. • If lighting or noise exceed thresholds, implement immediate mitigation (e.g., barriers, reduced intensity) within 48 hours. • Record all incidents, mitigation actions, and follow-up verification in ESMS and verify during inspections.
Freshwater Fishes	• Habitat loss; • Water pollution	• River streams and aquatic habitats	• Conduct habitat surveys pre-construction to locate active populations • Avoid disruption of the riverbed • Implement dust and noise controls • Implement measures for surface water pollution	• EPC Contractor • Biodiversity Specialist	• Compliance with timing restrictions • Water quality parameters (turbidity, pollutants) • Number of riverbed disturbances	• Pre-construction surveys • During construction (annually) • Post-construction monitoring (annually for 3 years)	• Rivers and streams within AoI • Bridge/viaduct construction sites	• Water quality within acceptable limits • No riverbed disruption	• Survey reports • Construction logs • Water quality monitoring records • Site inspection reports	• If water quality is compromised, implement immediate mitigation (e.g., silt curtains, pollution containment) and monitor until restored. • If riverbed disturbance occurs, restore substrate and habitat within 7 days. • Record all incidents, mitigation actions, and verification in ESMS and confirm through follow-up inspections.

** EPC will contract with a third-party contractor for the translocation (translocation procedure will be prepared as a separate document by the third-party consultant). The translocation will be carried out after expert opinion is obtained, portability is assessed, and suitable areas is determined, again with the help of third-party expert opinion.*

The project component locations relevant to the Biodiversity Management Plan are detailed in accompanying tables. The figures showing the current design of viaducts, tunnels, bridges, culverts, underpasses, and overpasses combined with the habitat map that causes the least amount of fragmentation is provided in the ESIA Annex-11C. Maps for the location of the sensitive biodiversity is presented in ESIA Chapter IX – Ecology and Biodiversity section IX.5.5 Locations of Sensitive Biodiversity Flora-Fauna, Figures IX.27 to IX.31.

Table IX.3. Culverts to be Constructed for the Motorway

Culverts	Dimensions (m x m)	Location on the Route (Motorway Km)
Culvert	2.00 x 2.00	Km 52+731, Km 52+940, Km 53+180, Km 53+324, Km 53+458, Km 54+180, Km 56+361, Km 56+614, Km 58+201, Km 59+602, Km 59+713, Km 60+306, Km 60+456, Km 60+750, Km 60+899, Km 63+433, Km 65+010, Km 66+697, Km 2+225, Km 2+408, Km 2+717, Km 67+550, Km 67+901, Km 69+076, Km 69+389, Km 69+775, Km 69+869, Km 70+859, Km 71+605, Km 71+912, Km 72+711, Km 73+426, Km 73+920, Km 74+170, Km 75+098, Km 75+608, Km 75+832, Km 76+012, Km 76+167, Km 76+862, Km 77+086, Km 77+357, Km 77+630, Km 78+675, Km 79+826, Km 79+946, Km 82+095, Km 83+125, Km 83+527, Km 2+808, Km 3+659, Km 4+046, Km 4+265, Km 4+384, Km 6+274, Km 6+572, Km 6+650, Km 6+695, Km 6+755, Km 6+780, Km 6+870, Km 83+790, Km 84+751, Km 85+060, Km 86+893, Km 87+032, Km: 89+718, Km 89+899, Km 90+156, Km 90+950, Km 91+829, Km 92+863, Km 93+379, Km 94+005, Km 95+016, Km 95+258, Km 97+186, Km 99+222, Km 99+709, Km 100+396, Km: 100+632, Km 100+987, Km 1+854, Km 2+077, Km 2+279, Km 2+478, Km 2+821, Km 101+918, Km 102+139, Km 102+222, Km 103+600, Km 103+953, Km 105+792, Km 106+003, Km 107+317, Km 107+456, Km 108+915, Km 109+059, Km 109+948, Km 110+162, Km 110+405, Km 110+654, Km 111+327, Km 111+570, Km 111+856, Km 112+662, Km 114+550, Km 114+808, Km 115+690, Km 2+503, Km 2+393, Km 2+150, Km 1+884, Km 1+224, Km 0+937, Km 0+880, Km 116+950, Km 117+296, Km 0+068, Km 117+848, Km 118+447, Km: 118+774, Km 119+007, Km 119+091, Km 120+013, Km 121+239, Km 122+613, Km 123+683, Km 124+119, Km 124+247, Km 124+445, Km 125+452, Km 125+675, Km 126+700, Km 127+238, Km 128+375, Km 129+353, Km 129+593, Km 129+770, Km 129+944, Km 130+369, Km 130+508, Km 130+760, Km 131+046, Km 131+291, Km 131+450, Km 131+530, Km 131+877, Km 132+071, Km 132+174, Km 132+423, Km 132+534, Km 133+243, Km 133+395, Km 133+607, Km 134+419, Km 135+207, Km 135+438, Km 135+709, Km 135+906, Km 136+099, Km 136+490, Km 137+034, Km 138+586, Km 138+790, Km 139+348, Km 139+728, Km 140+250, Km 140+971, Manavgat K-2, Lane-1, Km 67+000 (Taşağıl K-1, Lane-2), (Taşağıl K-1, Lane-3), (Taşağıl K-1, Lane-4), Taşağıl State Highway, (Manavgat Access Road)*2, Manavgat K-3, Kol-2, Manavgat K-2, Lane-3, Manavgat K-2, Lane-2, Manavgat K-5, Lane-1, (Manavgat K-5, Lane-2)x2, Manavgat K-5, Lane-3, Manavgat K-5, Lane-7, (K1, Manavgat East K-1)

The table below lists the locations of borrow pits, quarries, and plants that are required for pre-construction surveys and related activities.

Table IX.6. Locations of the Borrow Pits/Quarries and Plants

Location	Province	District	Nearest Neighborhood	Description of the Site / Plant	Area (m²)	Capacity Information / Operation Period
Km 53+800	Antalya	Serik	Sarıabalı	Sarıabalı (AO-1) Borrow Pit	249,000	375 m³/hour
						36 months
Km 55+450	Antalya	Serik	Sarıabalı	Concrete Plant-1	13,946	140 m³/hour
						36 months
Km 56+500	Antalya	Manavgat	Çakış	Çakış (TOY4a) Quarry	250,000	375 m³/hour
						36 months
Km 58+500	Antalya	Manavgat	Taşağıl	Kuruçay (TOY4b) Quarry	243,000	375 m³/hour
						36 months
Km 59+400	Antalya	Manavgat	Taşağıl	Concrete Plant-2	66,450	140 m³/hour
						36 months
				Mechanical Plant-1		550 tonnes/hour
						16 months
				Asphalt Plant-1		240 tonnes/hour
						16 months
Km 64+400	Antalya	Manavgat	Taşağıl	Construction Camp Site-1 (Main)	-	
Km 80+400	Antalya	Manavgat	Yeniköy	Concrete Plant-3	15,000	140 m³/hour
						36 months
Km 83+000	Antalya	Manavgat	Sarılar	Dikmen Borrow Pit	245,000	375 m³/hour
						36 months
Km 87+500	Antalya	Manavgat	Bucakşeyhler	Construction Camp Site-2	-	
Km 87+700	Antalya	Manavgat	Bucakşeyhler	Concrete Plant-4	42,371	140 m³/hour
						36 months
				Mechanical Plant-2		550 tonnes/hour
						16 months
				Asphalt Plant-2		240 tonnes/hour
						16 months
Km 89+700	Antalya	Manavgat	Ulukapı	Concrete Plant-4a	11,665	140 m³/hour
						36 months
Km 99+200	Antalya	Manavgat	Sülek	Concrete Plant-5	11,977	140 m³/hour

X. SUMMARY OF KEY PERFORMANCE INDICATORS

The following Key Performance Indicators (KPIs) will be monitored, verified, and evaluated.

Table X.1 Summary of Key Performance Indicators

Monitoring Parameter / Performance Indicator	Target	Monitoring Measure	Responsible Party
Number and length of access roads vs. approved design;	No unauthorized roads	Routine site inspections ; Walkover surveys;	EPC Contractor Biodiversity Specialist
Wildlife-vehicle collisions	<5 collisions/km/month	Collision record review	EPC Contractor Biodiversity Specialist
Pre-clearance survey records	100% pre-clearance	Pre-clearance checks; Continuous monitoring during works;	EPC Contractor, Biodiversity Specialist
Number of trees felled/planted	5:1 tree replacement	Annual restoration monitoring	SPV
Area of habitat restored	All disturbed habitats restored within 5 years	Annual restoration monitoring	SPV
Topsoil storage	No IAS in stockpiles	Continuous monitoring during works;	EPC Contractor, Biodiversity Specialist
Noise monitoring results	Number of non-conformaties related to noise < 5	Regular noise monitoring;	EPC Contractor, Biodiversity Specialist
Training coverage	≥90% staff trained	Training attendance tracking	EPC Contractor, Biodiversity Specialist
Wildlife incidents linked to lighting	Wildlife mortality from lighting < 5 monthly	Incident report reviews monthly	EPC Contractor, Biodiversity Specialist
Compliance with lighting design	100% compliance with design	Monthly inspections of light installations	EPC Contractor, Biodiversity Specialist
Dust levels;	Number of non-conformaties related to dust < 5;	Regular dust inspections;	EPC Contractor , Biodiversity Specialist
Complaints; Irrigation frequency	Zero unresolved complaints	Complaint log review	EPC Contractor , Biodiversity Specialist
IAS presence	No IAS infestations	Quarterly IAS inventories	EPC Contractor , Biodiversity Specialist
Cleaning of machinery	100% machinery cleaned	Pre-entry inspections	EPC Contractor , Biodiversity Specialist
Fauna incidents;	Zero fauna mortality during clearance	Pre-clearance fauna surveys; Continuous construction monitoring	EPC Contractor, Biodiversity Specialist
Nests affected;	No nest/offspring loss	Walkover survey reports	EPC Contractor, Biodiversity Specialist
Waste storage condition	Number of non-compliance related to waste < 5	Daily waste inspections	EPC Contractor, Biodiversity Specialist
Pollution incidents	Number of non-compliance related to pollution incidents < 5	Incident report checks	EPC Contractor, Biodiversity

			Specialist
Area of Critical Habitat mapped;	100% mapped	Pre-construction surveys;	EPC Contractor, Biodiversity Specialist
Restoration cover	≥90% restoration success	Annual restoration surveys	SPV
Pyrus serikensis surveys,	100% individuals identified	Pre-construction survey;	EPC Contractor , Biodiversity Specialist
Translocation, restoration	≥90% survival of restored plants	Annual restoration monitoring (5 years)	EPC Contractor , Biodiversity Specialist
Endemic plant records;	100% identified/protected;	Pre-construction surveys;	EPC Contractor , Biodiversity Specialist
Restoration success	≥90% restoration success	Annual restoration monitoring (3 years)	SPV
Lyciasalamandra translocations records	100% individual translocated (if identified)	Pre-construction surveys; Continuous construction monitoring	EPC Contractor, Biodiversity Specialist
Tortoise (*Testudo graeca*) translocation records	100% individuals relocated (if identified)	Pre-construction surveys; Continuous construction monitoring	EPC Contractor , Biodiversity Specialist
Bat roosts and hibernation sites; Lighting/noise compliance	100% roosts identified and protected; No disturbance to occupied roosts	Pre-construction surveys; Continuous construction monitoring (3 years)	EPC Contractor , Biodiversity Specialist
Water quality;; Timing of works	Number of non-compliance related to water quality; No spawning disruption;	Pre-construction habitat surveys; continuous construction monitoring (3 years)	EPC Contractor, Biodiversity Specialist
Riverbed disturbance	No bed disturbance	Continuous construction monitoring (3 years)	EPC Contractor , Biodiversity Specialist

XI. SUMMARY OF MONITORING

Table XI.1 Summary of Monitoring

Monitoring Parameter / Performance Indicator	Timing of Monitoring and Frequency	Monitoring Measure	Monitoring Location	Corrective Actions
• Number of off-road driving incidents • Number of wildlife vehicle collisions	• Weekly during construction phase • Quarterly during operation	Monthly road inspections; Walkover surveys; Collision record review	All temporary access road alignments Construction sites, staging areas, Sensitive habitat boundaries	• During construction implement speed restrictions (≤20 km/h) and install warning signage within 7 days if wildlife–vehicle collision rate exceeds 5 incidents/km/month. • Record all wildlife collision incidents, where necessary, additional measures such as additional signage or fencing adjustments will be made.
• Pre-clearance survey records • Topsoil storage records	• Pre-clearance before construction works; • Continuous during construction;	Pre-clearance checks; Continuous monitoring during works	All construction footprints Borrow areas Storage areas	• Conduct immediate pre-clearance survey if missed before clearing. • Replace or remediate mismanaged topsoil; apply protection to prevent fertility loss/invasive species.

• Noise monitoring results • Training coverage (%)	Monthly during construction and prior to blasting	Monthly noise monitoring; Training attendance tracking	Construction areas near sensitive fauna habitats	• If noise exceeds thresholds, investigate within 48 hours and implement additional mitigation measures (e.g., noise barriers, equipment adjustments) within 7 days. Verify through follow-up monitoring. • If training attendance coverage falls below 90%, conduct make-up sessions within 2 weeks and track attendance until target is met.
• Number of wildlife incidents linked to light • Compliance with lighting design	Monthly during, construction and operation	Monthly inspections of light installations; Incident report reviews	Worksites, security lighting zones	• If wildlife incidents occur due to lighting, immediately adjust lighting (direction, intensity, shielding) and document actions. • If lighting does not comply with design specifications, correct installation within 7 days and verify compliance through inspection.

• Number of complaints • Visual dust levels • Irrigation frequency	Weekly during construction	Weekly dust inspections; Complaint log review	Access roads, sensitive habitats Adjacent settlements	• If dust complaints are received, immediately increase frequency of road irrigation and implement temporary dust suppression measures (e.g., water spraying, covering stockpiles) within 24–48 hours. • If visual dust levels exceed acceptable thresholds, adjust speed limits and enforce vehicle driving rules immediately; document corrective action.
• Number of IAS identified • implementation of cleaning records	Pre-entry and quarterly inspections	Pre-entry inspections; Quarterly IAS inventories	Site entry points Sorage areas Camp sites	• If IAS are detected on site, implement immediate containment and eradication measures within 7 days and report to Biodiversity Specialist. • If machinery or equipment is found not to have been cleaned, halt its operation until proper cleaning is completed; document the incident.

• Translocation records • Number of nests affected • Number of fauna incidents	• Pre-clearance before works; Continuous during construction	Pre-clearance fauna surveys; Continuous construction monitoring	Entire project footprint; Access roads	• If fauna is injured, killed, or nests/offspring affected, halt works immediately and notify Biodiversity Specialist; implement rescue, relocation, or mitigation measures within 24–48 hours and document the action.
• Waste storage condition • Number of pollution incidents • Wastewater discharge records	Daily during, pre-construction, construction and operation	Daily waste inspections; Incident report checks	Waste storage areas Work camps Aquatic habitats	• If waste is found unsecured, immediately secure bins and review staff procedures within 24 hours; document action. • If a pollution incident occurs (e.g., wastewater discharge, chemical spill), stop the source immediately, contain and remediate within 48 hours, and notify the Biodiversity Specialist. • If improper waste disposal is observed, retrain responsible personnel within 7 days and monitor compliance until resolved.

• Area of Critical Habitat mapped • Noise levels near sensitive habitats • Use of existing access roads vs. new roads • Area of topsoil/rocks reused for restoration • Area re-vegetated with native species	• Pre-construction • Weekly during construction • After restoration, (annually for 5 years) • Flowering period for S5 Habitat (March - June) Breeding period for S5 Habitat (April - June)	Pre-construction surveys; Weekly site checks; Annual restoration surveys	Construction footprint Critical maquis edges Restoration sites	• If noise exceeds thresholds, implement additional measures (e.g., barriers, machinery adjustments) within 48 hours. • If existing access roads are not used, document deviation and correct immediately. • If restoration is incomplete or vegetation survival <90%, implement supplementary planting and monitor until target achieved.
• Number of trees surveyed and mapped • Number of trees translocated • Area of topsoil and seeds preserved • Area of successful rehabilitation	• Pre-construction surveys • During construction (annually) Post-rehabilitation (annually for 5 years)	Pre-construction survey; Annual restoration monitoring (5 years)	Identified critical habitats Construction sites impacting *Pyrus serikensis*	• If Pyrus serikensis trees are found during construction, halt works in the area immediately and translocate or protect trees within 7 days. • All surveys, translocations, and rehabilitation actions must be recorded in ESMS and verified through follow-up inspections.

• Number of plants surveyed and mapped • Area of topsoil and seeds stored • Area of restoration • Restoration success rate (%)	• Pre-construction surveys • During construction Post-construction monitoring for 3 years	Pre-construction surveys; Annual restoration monitoring (3 years)	Identified species habitats Construction sites impacting endemic plants Restoration areas	• If endemic plants are found during construction, halt works immediately and protect or translocate within 7 days. • If topsoil or seeds are lost or not stored properly, implement corrective collection and storage within 48 hours.
• Number of active populations mapped for *Lyciasalamandra atifi* • Number of specimens translocated (if found near AoI) • Dust and noise levels near habitats • Presence/continuity of wildlife corridors	• Pre-construction surveys • During construction Post-construction monitoring	Pre-construction surveys; Continuous construction monitoring	T3 Coniferous forests above 200 m Work zones Wildlife corridor areas	• If populations are detected during works, halt activity in affected area immediately; conduct translocation within 7 days and document. • If dust or noise exceed thresholds, implement additional mitigation (e.g., water spraying, noise barriers) within 48 hours.
• Number of individuals located and translocated for *Testudo graeca* • Dust and noise levels • Continuity of wildlife corridors	• Pre-construction surveys • During construction (annually) Post-construction monitoring (annually for 5 years)	Pre-construction surveys; Annual monitoring (5 years)	Construction areas Wildlife corridor areas	• If turtles are detected during works, halt activity in affected area immediately and relocate individuals within 24–48 hours; document all actions. • If dust or noise exceed thresholds, implement immediate mitigation (e.g., barriers, water spraying) and verify effectiveness.

• Number of roosting/hibernation sites identified • Number of trees checked prior to felling • Number of roosting structures protected • Compliance with lighting and noise limits	• Pre-construction surveys • During construction (annually) Post-construction monitoring (annually for 5 years)	Pre-construction surveys; Annual monitoring (5 years)	Roosting and hibernation sites Trees with potential roosts Disturbed habitat areas Rocky areas, caves and flight corridors within the AoI, especially at the location of quarries	• If bats are discovered during tree removal or works,cut trees will be left undisturbed for 24 hours untill individuals leave roost site • If construction occurs near roosts during hibernation, consturction works will be minimized until period ends.
• Compliance with timing restrictions • Water quality parameters (turbidity, pollutants) • Number of riverbed disturbances	• Pre-construction surveys • During construction (annually) Post-construction monitoring (annually for 3 years)	Pre-construction habitat surveys; Annual water monitoring (3 years)	Rivers and streams within AoI Bridge/viaduct construction sites	• If water quality is compromised, implement immediate mitigation (e.g., silt curtains, pollution containment) and monitor until restored.

XII. BAP OFFSETS

The 3 offsets are detailed in BAP under section I.24.

Offset 1 has been designed as a roadside plantation. The plantation will be established along 117.5 km of the motorway corridor, with a designated planting strip of approximately 1.5 meters on each side..

Offset 2 has been specifically developed to achieve a Net Gain for Critical Habitat (CH) by safeguarding populations of the endangered endemic species, *Pyrus serikensis*.

Offset 3 delivers afforestation in a 5:1 ratio. The Project Sponsor will pay the cost and the afforestation itself and management will be carried out by the Ministry of Forestry, as part of their protocol.

XIII. AUDIT AND REVIEW

The implementation of this Plan will be regularly monitored and reviewed in accordance with the ESMMP. All labor-related incidents and non-conformities willbe documented and reported as outlined in the Plan. Contractors and subcontractors will be subject to audits conducted by the Project Sponsor within the scope and schedule defined in the Contractor and Subcontractor Management Plan. These audits and the associated records will be managed in compliance with the Project's established human resources and labor-related procedures. Observations and deficiencies identified during audits will be recorded in formal audit reports, and all findings requiring improvement will be registered under Corrective Actions. Project management will review audit outcomes and corrective action records, follow up on progress, and ensure that additional measures are implemented where necessary to ensure full compliance with labor legislation and international standards.

XIV. REPORTING

Regular reporting will be conducted to ensure the effective implementation and continuous monitoring of biodiversity management activities throughout the construction phase of the Project. Reporting will be structured to address both internal monitoring and auditing outcomes, as well as external compliance obligations and stakeholder engagement requirements.

Based on monitoring results, necessary corrective and preventive actions will be identified and the required updates will be incorporated into this Plan. The training program will also be revised accordingly to address any observed gaps. Regular audits and visual inspections will be conducted to verify that all activities are being undertaken in accordance with the provisions of this Plan.
Reports will be prepared using data gathered through biodiversity monitoring activities defined under this Plan. The results and supporting evidence of these monitoring activities will be documented in detail within appropriate reporting formats.

All data, together with the results of inspections and audits, will be summarized in the dedicated Ecology and Biodiversity chapter of the Environmental and Social Monitoring Report prepared on a quarterly basis. This report will include any non-compliances identified, corrective actions taken, and any recommended time-bound corrective measures. These will be supported with documentary evidence such as photographs and field logs.

XV. TRAINING

The Project Company is responsible for ensuring that all Project personnel and sub-contractors are knowledgeable about the biodiversity values and conservation priorities. As part of this effort, the Project staff members are required to undergo training that covers various aspects of BMP implementation, site-specific measures, compliance with environmental plans, the Project standarts, and protocols based on their specific roles.

A general framework for a training on biodiversity will include the following elements:

- **Introduction to Biodiversity:** Construction workers need to have a basic understanding of biodiversity and its importance in construction projects. An overview of what biodiversity is and its importance for ecosystems and human well-being are provided in training materials.
- **Policies:** Training will cover legal requirements and policies related to biodiversity conservation specific to the location and project type.
- **Biodiversity Values and Conservation Priorities:** Presenting the distinct biodiversity attributes and conservation priorities within the Project area involves critical species, habitats, and ecological processes. Additionally, it will be considered general insights into habitats and species of significant conservation interest, along with relevant visual representations (Protected areas, forests, flora species, nests, raptors, migratory species etc).
- **Roles and Responsibilities:** Clarifying the roles and responsibilities and strong emphasis on adhering to this BMP and other environmental strategies.
- **Site-specific Measures:** Detailing the specific measures that need to be taken at the Project site to minimize impacts on biodiversity, such as habitat restoration, protected species management, and invasive species control. Methods to be followed in responding incidents related to biodiversity features (collision, electrocution, invasive management etc).
- **Environmental Plans, Standards, and Protocols:** Introducing participants to the environmental plans, project standards, and protocols related to biodiversity conservation, emphasizing their significance and the necessity of adherence
- **Case Studies and Best Practices:** Sharing case studies and best practices from similar Projects or industries to illustrate successful approaches to biodiversity conservation and to inspire participants.
- **Monitoring and Reporting:** Providing guidance on the monitoring and reporting requirements related to biodiversity, including data collection methods, record-keeping, and reporting protocols.
- **Q&A and Discussion:** Allowing participants to ask questions, seek clarifications, and engage in discussions to enhance their understanding of the training content.
- **Evaluation and Assessment:** Conducting evaluations or assessments to gauge participants' comprehension of the training material and identify areas for improvement.
- **Refresher Training:** Highlighting the importance of regular refresher training sessions to ensure ongoing awareness and compliance with biodiversity conservation measures. It's important to note that the specific content and structure of the training may vary depending on the Project's context, local regulations, and specific biodiversity considerations.

EXECUTIVE SUMMARY

This Critical Habitat Assessment (CHA) has been prepared in accordance with the requirements of the IFC Performance Standard 6 (IFC PS6): Biodiversity Conservation and Sustainable Management of Living Natural Resources. The purpose of this assessment is to evaluate the potential presence of critical habitats within the area of influence of the proposed motorway project, and to determine the associated risks and mitigation obligations in line with international best practices. The assessment identifies and characterizes biodiversity features of concern—such as threatened species, endemic species, and ecologically significant habitats—and evaluates whether the project area meets the criteria for critical habitat designation under PS6. The findings aim to inform project planning and decision-making to ensure that the development proceeds in a manner that avoids or minimizes adverse impacts on biodiversity and ecosystem services, while enabling compliance with international environmental safeguards.

The project area encompasses a variety of ecologically sensitive habitats, including rocky cliffs, Mediterranean scrublands (maquis), wetlands, and agricultural lands, which support a high diversity of flora and fauna, including several endemic, migratory, and threatened species. Of particular significance is the maquis habitat, which has been assessed as critical habitat under IFC PS6 criteria due to its ecological importance and the presence of regionally endemic species such as *Pyrus serikensis* and *Lyciasalamandra atifi*. The CHA aims to inform project planning and mitigation strategies by identifying biodiversity features of conservation concern and evaluating the project's potential impacts on these critical ecosystems.

I. INTRODUCTION

I.1. Purpose of the CHA

The Antalya-Alanya Motorway Project (hereinafter “the Project”) is planned to be financed through a Project Finance structure involving multiple international lenders. In recognition of this, the Project aims to comply with relevant international environmental and social standards, including the International Finance Corporation (IFC) Performance Standard 6 (PS6): Biodiversity Conservation and Sustainable Management of Living Natural Resources.

The purpose of this Critical Habitat Assessment Report is to evaluate the presence and extent of Critical Habitat and other High Conservation Value Biodiversity Features that may be impacted by the Project. These areas and features represent key biodiversity values of global or national significance.

Under IFC PS6, the Project is required to avoid adverse impacts on Critical Habitat and, where avoidance is not feasible, to apply the mitigation hierarchy to minimize, restore, and offset impacts. The standard emphasizes the achievement of no net loss or, preferably, a net gain of biodiversity values associated with Critical Habitat, ensuring the long-term conservation of these ecologically important areas.

This report provides the basis for identifying biodiversity risks, guiding mitigation measures, and supporting compliance with IFC PS6 throughout project planning and implementation.

I.2. Project Description

Antalya-Alanya Motorway Project (the Project) is one of the two sub-projects that constitute the Afyonkarahisar-Alanya Motorway Project and is designed to connect Serik and Alanya districts through Manavgat district of Antalya province (Figure I.1). The Project will enhance the existing transportation network services with surrounding provinces (Burdur, Muğla, Konya, Isparta, Karaman and Mersin). Various environmental, social, and technical studies have been conducted along the initial route of the Project tendered by the KGM.

According to the current design (as of July, 2024), total length of the Motorway, which will be a dual carriageway of mostly 3 and partially 2 lanes (3x2 and 2x2) in each direction, is 117.8 kilometers including the main carriageway and the access roads.

Table I.1 provides the approximate distances of the Motorway according to the current design.

Table I.1. Information of the Motorway

Start Location	End Location	Main Road (Motorway)	Access Roads	Total
Km 52+000	Km 136+000	84+000	33+800	117+800

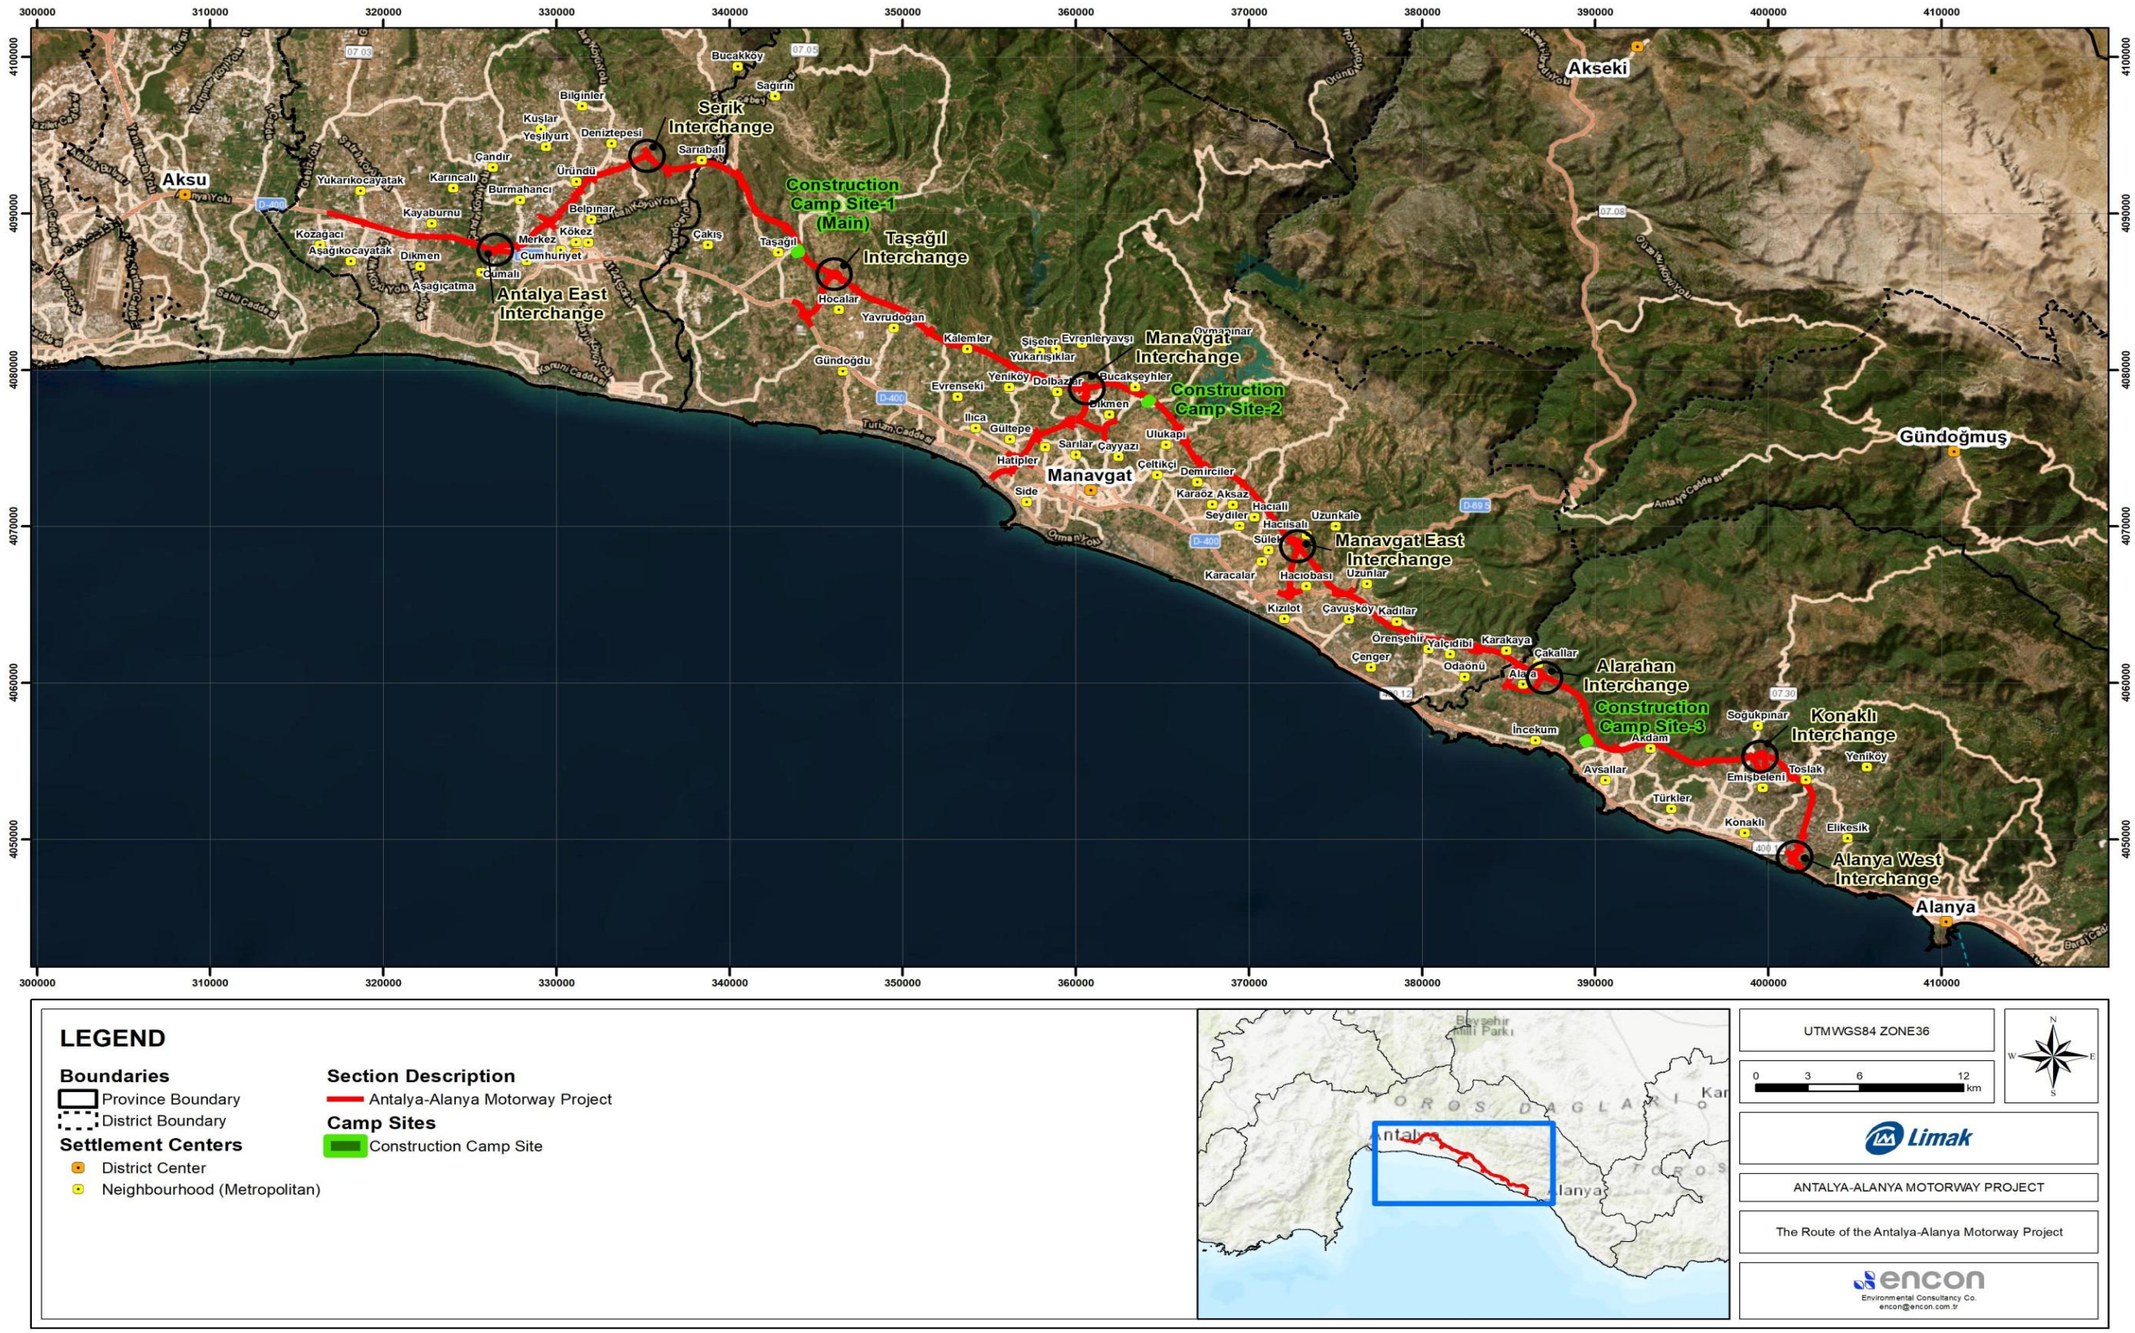

Figure I.1. The Route of the Antalya-Alanya Motorway Project

II. METHODOLOGY

The Critical Habitat Assessment (CHA) was conducted in accordance with the International Finance Corporation (IFC) Performance Standard 6 (PS6) and Guidance Note 6 (2019), focusing on biodiversity conservation and the sustainable management of living natural resources.

An Ecologically Appropriate Area of Analysis (EAAA) was defined to evaluate biodiversity features within a spatial context relevant to the ecological needs of species and ecosystems potentially affected by the project. This included consideration of the project's area of influence and broader landscape processes.

The methodology included the following steps:

- ***Screening and Scoping***

  Identification of biodiversity features of concern was conducted based on a review of international, national, and regional data sources.

- ***Data Collection***

  Both secondary data from international and national databases and targeted field surveys were used, supported by expert consultation, to confirm species presence, ecosystem types, and habitat conditions. No IBAT report was generated for this Project, as the data collection and assessments methodology already incorporates World Database on Protected Areas, IUCN Red List of Threatened Species, World Database of Key Biodiversity Areas along with other international and national databases (e.g. public biodiversity databases such as eBird, Trakus, Bizimbitkiler, iNaturalist etc.).

- ***Application of PS6 Criteria***

  Biodiversity features against the five PS6 critical habitat criteria were evaluated, using quantitative thresholds from IFC GN6 and the IUCN KBA Standard as guidance.

- ***Determination of Critical Habitat***

  Species populations, habitat quality, and ecological viability within the EAAA to confirm critical habitat presence were assessed.

II.1. Selection Criteria for Notable Habitats and Species

Based on the findings from the ecological assessment and baseline monitoring studies conducted as part of the Project, as well as the targeted analyses carried out under this Critical Habitat Assessment, key habitats and species of high conservation value have been identified within the defined Ecologically Appropriate Area of Analysis (EAAA).

The primary objective of this assessment is to identify species and ecosystems that meet one or more of the IFC Performance Standard 6 (PS6) critical habitat criteria, and to determine whether these features trigger critical habitat designation. In ESIA report detail the national and international frameworks used to evaluate the conservation status and vulnerability of biodiversity features, including the IUCN Red List, Key Biodiversity Areas (KBA), and relevant national conservation lists.

All biodiversity assessments were conducted in accordance with these recognized criteria, ensuring a robust and standardized approach to identifying biodiversity values that may be at risk from project activities. Special attention was given to those species and habitats that require targeted

management, due to their restricted distribution, threatened status, or functional importance in maintaining ecological processes.

II.2. Critical Habitat Assessment Process

Critical habitats are areas with high biological diversity value. Their identification is based on the following key criteria:

i. Habitats supporting Critically Endangered and/or Endangered species.
ii. Habitats of significance for endemic and/or range-restricted species.
iii. Habitats that support globally important populations of migratory species and/or are crucial for migratory corridors.
iv. Highly threatened and/or unique ecosystems.
v. Areas associated with key evolutionary processes.

These criteria are essential for determining critical habitats and ensuring their protection and conservation within the scope of ecosystem assessments and environmental management planning.

Projects located in areas with high biological diversity value, recognized at the national and/or international level, may require a critical habitat assessment. These areas include:

- IUCN Protected Area Categories: Ia (Strict Nature Reserves), Ib (Wilderness Areas), and II (National Parks).
- Key Biodiversity Areas (KBA) and Important Bird and Biodiversity Areas (IBA).

A critical habitat assessment is essential for ensuring that project activities do not negatively impact these ecologically significant areas, and that conservation measures are integrated into project planning and implementation.

To facilitate decision-making, numerical thresholds have been defined for the first four critical habitat criteria:

- Critically Endangered (CR) / Endangered (EN) species, endemic or range-restricted species.
- Migratory species or species forming large aggregations.
- Threatened ecosystems.
- Unique ecosystems.

These quantitative thresholds help assess whether an area qualifies as a critical habitat and guide the appropriate conservation measures needed to mitigate potential impacts from project activities.

The threshold values are derived from the globally standardized numerical thresholds published in the IUCN Global Standard for Key Biodiversity Area Identification. These thresholds serve as indicators and are intended only as guidance for decision-making. There is no universally accepted or automatic formula for critical habitat identification.

The involvement of external experts and project-specific assessments are crucial, especially in cases where data availability is limited, which is often the case in biodiversity evaluations.

The thresholds defined for each criterion are outlined below, based on IFC, 2019 GN6. The critical habitat assessment for species identified within the Project Area has been conducted in accordance with these criteria.

Table II.1. Quantitave thresholds for triggering Critical Habitat for Criteria 1-4

Criteria	Quantitative Thresholds
1. CR / EN Species	(a) Areas that support globally important concentrations of an IUCN Red-Listed EN or CR species (≥ 0.5% of the global population and ≥ 5 reproductive units of a CR or EN species. (b) Areas that support globally important concentrations of an IUCN Red-Listed VU species, the loss of which would result in the change of the IUCN Red List status to EN or CR and meet the thresholds in GN72(a). (c) As appropriate, areas containing important concentrations of a nationally or regionally listed EN or CR species.
2. Endemic / Restricted Range Species	(a) Areas that regularly hold ≥10% of the global population size and ≥10 reproductive units of a species
3. Migratory / Congregatory Species	(a) Areas known to sustain, on a cyclical or otherwise regular basis, ≥ 1 percent of the global population of a migratory or congregatory species at any point of the species' lifecycle. (b) Areas that predictably support ≥10 percent of the global population of a species during periods of environmental stress
4. Highly Threatened / Unique Ecosystems	(a) Areas representing ≥5% of the global extent of an ecosystem type meeting the criteria for IUCN status of CR or EN. (b) Other areas not yet assessed by IUCN but determined to be of high priority for conservation by regional or national systematic conservation planning.

Criterion 1: Critically Endangered and Endangered Species

a) Areas that support globally important concentrations of an IUCN Red-listed EN or CR species (≥ 0.5% of the global population and ≥ 5% of reproductive units of a CR or EN species).
b) Areas that support globally important concentrations of an IUCN Red-listed Vulnerable (VU) species, the loss of which would result in the change of the IUCN Red List status to EN or CR and meet the thresholds.
c) As appropriate, areas containing important concentrations of a nationally or regionally listed EN or CR species.

Criterion 2: Endemic and Restricted-range Species

a) Areas that regularly hold ≥10% of the global population size and ≥10% of reproductive units of a species.

Criterion 3: Migratory and Congregator Species

a) Areas known to sustain, on a cyclical or otherwise regular basis, ≥ 1% of the global population of a migratory or congregator species at any point of the species' lifecycle.
b) Areas that predictably support ≥10% of the global population of a species during periods of environmental stress.

Criterion 4: Highly Threatened or Unique Ecosystems

a) Areas representing ≥5% of the global extent of an ecosystem type meeting the criteria for IUCN status of CR or EN.
b) Other areas not yet assessed by IUCN but determined to be highly prioritized for conservation by regional or national systematic conservation planning.

Criterion 5: Key Evolutionary Processes

For Criterion 5, there are no numerical thresholds. Best available scientific information and expert opinion will be used to guide decision-making with respect to the relative "criticality" of a habitat in these cases. For illustrative purposes, some potential examples of spatial features associated with evolutionary processes are as follows:

- Landscapes with high spatial heterogeneity are a driving force in speciation, as species are naturally selected based on their ability to adapt and diversify.
- Environmental gradients, also known as ecotones, produce transitional habitat, which has been associated with the process of speciation and high species and genetic diversity.
- Edaphic interfaces are specific juxtapositions of soil types (for example, serpentine outcrops, limestone, and gypsum deposits), which have led to the formation of unique plant communities characterized by both rarity and endemism.
- Connectivity between habitats (for example, biological corridors) ensures species migration and gene flow, which is especially important in fragmented habitats and for the conservation of metapopulations. This also includes biological corridors across altitudinal and climatic gradients and from "crest to coast."

II.2.1.1. Ecologically Appropriate Area of Analysis

To comply with IFC Performance Standard 6 (PS6) requirements and to conduct a critical habitat assessment, an ecologically reasonable analysis unit has been defined for each biodiversity component using Ecologically Appropriate Area of Analysis (EAAA).

Ecologically Appropriate Area of Analysis (EAAA) defines geographical boundaries based on the natural distribution and interaction areas of species, habitats and ecosystems to assess the potential impacts of a project.

This area is not limited to the physical boundaries of the project site, but encompasses a meaningful area at the ecological level where direct, indirect and cumulative impacts may occur. The reasons for preparing an EAAA in accordance with IFC PS6 can be written as follows;

- Taking into account the ecological context of the species in order to properly understand project impacts.
- Focusing only on the project area is inadequate, especially for mobile species (e.g. birds, mammals) or systems with extensive habitat connectivity.
- When conducting a Critical Habitat Assessment (CHA), the EAAA provides a framework consistent with the species' life cycle and habitat continuity.

In this context, data collection carried out with surveys within the study area and along the motorway route. Thus, in addition to the assessments made, EAAA for each species have been defined taking into account the following criteria:

a) Ecological Range of Target Species
- Breeding, feeding, sheltering and migration areas of species are taken into account.
- For example, for a bat species, not only the cave area but also the feeding sites are included.

b) Natural Distribution of Habitats
- Environmental continuity of the habitat type and its distribution in the region are taken into account.
- Similar habitat mosaics that may be affected by the Project are included in the EAAA.

c) Cumulative Impact Assessment Area
- Other projects and human activities (roads, power lines, agriculture) that may have an impact on the same species or habitat are considered.

d) Protected Areas and Biodiversity Priority Areas
- National or international protected areas such as Ramsar sites, Natura 2000, Key Biodiversity Areas (KBA), Important Bird Areas (IBA) may be included in the EAAA.

e) Ecological Integrity at Landscape Level
- Landscape-scale structures such as species mobility, habitat connectivity and ecological corridors are taken into account.

Within the scope of this project, the impact of the construction and operation of the motorway on the species and habitats considered in the biodiversity assessment was examined not only in the project area where the impacts will be direct, but also in a wider ecological impact area where they may be indirect and cumulative.

Using Geographic Information Systems (GIS)-supported analysis, the EAAA of each species was defined. These areas provide an ecologically meaningful scale at which project impacts can be assessed in terms of species life cycle and habitat continuity.

III. CRITICAL HABITAT FEATURES

III.1. Internationally Recognized Areas

Internationally recognized conservation areas are located in the vicinity of the Project Area, which spans the provinces of Antalya and Mersin. These areas include Key Biodiversity Areas (KBAs), Important Bird Areas (IBAs), and Important Plant Areas (IPAs). KBAs are designated as critical sites based on their significant biological value. A total of 33 internationally recognized areas have been identified near the project, with no RAMSAR sites present within or adjacent to the Project Area.

Studies indicate that a portion of the Antalya Plains KBA and IBA falls within the Project Area boundaries. Table III.1 provides the total extent of this KBA/IBA and the portion encompassed within the Project's Study Area.

Table III.1. Internationally Recognized Areas and Nationally Protected Areas within the Region of the Project Area

Internationally Recognized Areas	Total Area (ha)	with in the Study Area (400 m corridor)	
		ha	%
Antalya Plains KBA, IBA	27.039	277	1.02
Nationally Protected Areas	**Total Area (ha)**	**Within the Study Area (400 m corridor)**	
		ha	**%**
Belek SEPA	11.173	140.06	1.25
Köprüçay Basin Natural Protected Area	4,019	47.44	1.18

The portion of the Antalya Plains KBA/IBA intersecting the Project Area comprises exclusively modified habitats, which have been significantly altered by human activities and generally support lower biodiversity value compared to natural habitats. According to IFC Performance Standard 6, areas of modified habitat present low biodiversity sensitivity, and thus, the risk of significant adverse impacts on biodiversity values is reduced.

Given that the habitats within the project footprint do not include natural ecosystems or habitats critical for threatened or endemic species, the project's potential impacts on the biodiversity values of this protected area are expected to be minimal.

Based on a review of available data and field assessments, this portion does not trigger Critical Natural Habitat or Critical Modified Habitat under PS6, as it does not support concentrations of endangered, endemic, or migratory species, nor does it represent a significant ecological feature of the broader KBA. The habitat portion within the project footprint are not considered natural or critical for sustaining biodiversity features of concern. This assessment is further supported by expert opinion, confirming low biodiversity value in the intersecting area of the project and Antalya Plains.

Therefore the project is considered to be compliant with PS6, which guide projects located in or near protected and internationally recognized areas. The approach taken ensures alignment with the mitigation hierarchy, avoids degradation of biodiversity values, and supports long-term conservation objectives of the wider KBA/IBA.

The Project also intersects with a portion of Belek SEPA. However this portion only consists of modified habitats such as agricultural lands and access roads, which makes about 44.5% of Belek SEPA's area. Belek SEPA is considered a nationally protected area due to it's natural beaches that *Caretta caretta* and *Chelonia mydas* species uses for nesting. It is not expected that the Project will have any impact on these areas. *Pyrus serikensis* which is also an important species for Belek SEPA is already considered and evaluated for this project, there are no individuals in the area that the

Project and Belek SEPA intersects, however this species is present in other areas of the Projects area of impact.

Based on a review of available data and field assessments, this portion does not trigger Critical Natural Habitat or Critical Modified Habitat conditions under PS6.

An evaluation has been carried out for Köprüçay Basin, as a viaduct is planned to be built above this nationally protected area. It's been determined that the extinction from the drilling works that will be carried out for the viaduct piers is 5 meters. Considering the nearest pier is 15 meters to the basin riverside. This distance provides a sufficient buffer to avoid direct disturbance of the aquatic environment. Based on these design parameters, the potential impacts of drilling on the Köprüçay Basin are expected to be minimal, with no significant alteraiton anticipated to the river flow, water quality, or ecological integrity of the protected area. Based on a review of available data and field assessments, this portion does not trigger Critical Habitat conditions under PS6.

While the risk of significant adverse impacts is low, the project acknowledges its proximity to a recognized area and has incorporated precautionary mitigation measures to avoid indirect effects (e.g., dust, noise, runoff). These include implementing good construction practices, maintaining buffer zones where feasible, and ongoing biodiversity monitoring during project implementation to confirm that no residual impacts emerge.

III.2. Critical Habitat Assessment

For each potential trigger species, an Ecologically Appropriate Area of Analysis (EAAA) was delineated to provide the spetial framework for evaluating the presence of Critical Habitat. The EAAA was defined based on the known distribution of the species bot within and, where relevant, beyond the Project's Area of Influence (AoI), as well as the ecological processes, features, and functions necessary to support the species' persistence. Species-spesific boundaries were determined in line with ecological considerations, which in some cases encompassed catchments, tiver systems, or other relevant landscape features. This ensured that the EAAA captured the functional scale required for robust assessment against Critical Habitat criteria and thresholds.

The evaluation was undertaken againsts the IFC PS6 Critical Habitat criterias (Criterion 1-5), with the results presented below. Each section includes the species assessed, their IUCN Red List status, endemism status, Extent of Occurrence, and EAAA. Potential trigger species were identified using a combination of literature review, field survey data, international and national up-to-date databases. Where quantitative information on local populations was unavailable, a precautionary approach was applied. For criteria 1-3, Extent of Occurrence (EOO), derived from the IUCN Red List database, was used as a proxy for local population data. Local distribution information was obtained from bizimbitkiler.org and TÜBİVES (Turkish Plants Data Service). In some instances, species presence within the AoI was inferred on the basis of habitat suitability; where species presence was confirmed, the AoI was considered part of the species' overall range. This conservative approach ensured that potential Critical Habitat is not underestimated. For threatened ecosystems, the assessment was constrained by limited data on extent and condition at both local and regional scales; in these cases, conservative assumptions were applied.

In total, 6 species for Criterion 1, 23 species for Criterion 2, and 16 species for Criterion 3 were screened against the relevant criteria thresholds to determine if they trigger Critical Habitat requirements to be applied.

.

III.2.1.1. Criterion 1: Critically endangered and/or endangered species

For Criterion 1, CR, EN and VU species were examined whether the Project area supports more than 0.5% globally important concentrations of these species or whether the Project could lead to a decrease in population of species categorized as VU. In cases where a global IUCN assessment was not available (e.g., Not Evaluated, NE or Data Deficient, DD), national threat assessments (e.g. Red Data Book for Turkish Plants) were taken into account. These categories were re-evaluated by an expert based on the most recent and available information on species distribution. The global population, the EOO and the Project area were considered to estimate the global range of species in AoI to assign Critical Habitat trigger status of species based on Criterion 1.

Among the 221 plant taxa identified in the region, only one species, *Pyrus Serikensis*, currently have a global assessment as “VU” according to IUCN Red List Database. However, according to the Red Data Book of Turkish Plants (Ekim et al., 2000), *Pyrus serikensis* is listed as **Endangered (EN)** at the national level due to its highly restricted distribution and population decline.

This national threat status was reviewed and confirmed by a botanical expert during field assessments. Given the assessment date of “01 January 1998” and annotations as “Needs updating” at the IUCN Red List of Threatened Species database, the national “EN” listing has been considered for the purposes of the Critical Habitat Assessment, in line with IFC PS6, which allows the use of national assessments where global data is lacking.

No other plant species in the area are considered threatened. *Pyrus serikensis* is distributed within the maquis ecosystem in and around the Project Area, with reported populations located near the Serik district. Therefore, it meets Criterion-1, which states that "areas hosting ≥5% of the global reproductive unit of an EN category species" are considered critical habitats. Consequently, maquis habitats along the project route where *Pyrus serikensis* is present have been designated as Critical Habitat. The EAAA of *Pyrus serikensis is* given in Figure III.1.

Five amphibian species are distributed within the Project Area, one of which, *Lyciasalamandra atifi*, is classified as Endangered (EN). *Lyciasalamandra atifi* has not been observed within the Project Area. Monitoring studies conducted during the spring season, which provides the most favorable climatic conditions for observing the species. Although suitable habitats for the species exist at elevations above 190 meters and more than 1 km from the Project Area, these areas have not been designated as critical habitats. This is because no species have been observed within the Study Area, and there is no overlap between the EAAA and the Project Area. Monitoring studies should be continued for this species, and if the presence of the species is confirmed within the Project Area, the habitats where the species inhabits should be designated as critical habitats. The EAAA of *Lyciasalamandra atifi is* given in Figure III.2.

Birds represent the most diverse vertebrate group in the Project Area, with 124 identified species. Among them, one species, *Neophron percnopterus*, is classified as EN. However, this species does not meet Criterion-1 based on EAAA, and population density in the vicinity of the area.

A total of 29 fish species belonging to 10 orders and 16 families identified. Among these, there are three species in the threatened categories (CR, EN); one species of CR (*Anguilla anguilla*) and two species of EN (*Alburnus baliki* and *Pseudophoxinus fahrettini*).

All vulnerable (VU) species identified as potentially present within the study area possess very wide distribution ranges, therefore it is considered unlikely that any of these species would meet the thresholds established under Criterion 1.

A summary of the evaluation of species falling under Criterion-1 is provided in

Table III.2. Species that could trigger critical habitat, but are considered only potentially present based on literature sources and/or for which insufficient data are available, are classified as triggering 'Potential Critical Habitat' (PCH). In contrast, where the presence of critical habitat has been confirmed on at least one occasion, it is designated as 'Critical Habitat'. Species that do not trigger Criterion-1 are classified as “Not Critical Habitat”.

Table III.2 Critical Habitat Assessment According to Criterion-1

Species	IUCN	End.	EOO (km^2)	EAAA (km^2)	0.5% EOO	EAAA > 0.5% EOO	Evaluation	Critical Habitat Assessment
Pyrus serikensis	EN	Endemic	986.77	83.55	4.93	yes	This species was observed during field surveys, and the population in the project area represents a significant portion of its global distribution. Consequently, the species meets Criterion 1a and Criterion 1c and therefore designated as Critical Habitat.	CH
Lyciasalamandra atifi	EN	Endemic	3169.00	30.02	15.85	yes*	This species qualifies under Criterion-1c, however, it was not observed during field studies, and the Project Area lacks suitable habitat conditions for it however the distribution and population abundance and possibility of species presence. Therefore, it is considered Potential Critical Habitat trigger species	PCH
Neophron percnopterus	EN	-	266846.82	270.40	1334.23	no	This species is not considered a critical habitat trigger as it was not observed during field studies. Altough EAAA contains suitable habitat, it does not meet the thresholds of Criterion-1a or Criterion 1c and is therefore treated as Not CH.	Not Critical Habitat
Anguilla anguilla	CR	-	742787.86	0.01	3713.94	no	This species was observed within the study area but the proportion for the EAAA is not sufficient to trigger Critical Habitat. Species population in the area does not meet the threshold of criterion 1a or criterion 1c and is therefore treated as Not CH.	Not Critical Habitat
Alburnus baliki	EN	Endemic	6482.67	0.01	32.41	no	This species was observed within the study area but the proportion for the EAAA is not sufficient to	Not Critical Habitat

							trigger Critical Habitat. Species population in the area does not meet the threshold of criterion 1a or criterion 1c and is therefore treated as Not CH.	
Pseudophoxinus fahrettini	EN	Endemic	2638.52	0.01	13.19	no	This species was observed within the study area but the proportion for the EAAA is not sufficient to trigger Critical Habitat. Species population in the area does not meet the threshold of criterion 1a or criterion 1c and is therefore treated as Not CH.	Not Critical Habitat

* EAAA of *Lyciasalamandra atifi* does not overlap with the Project Area

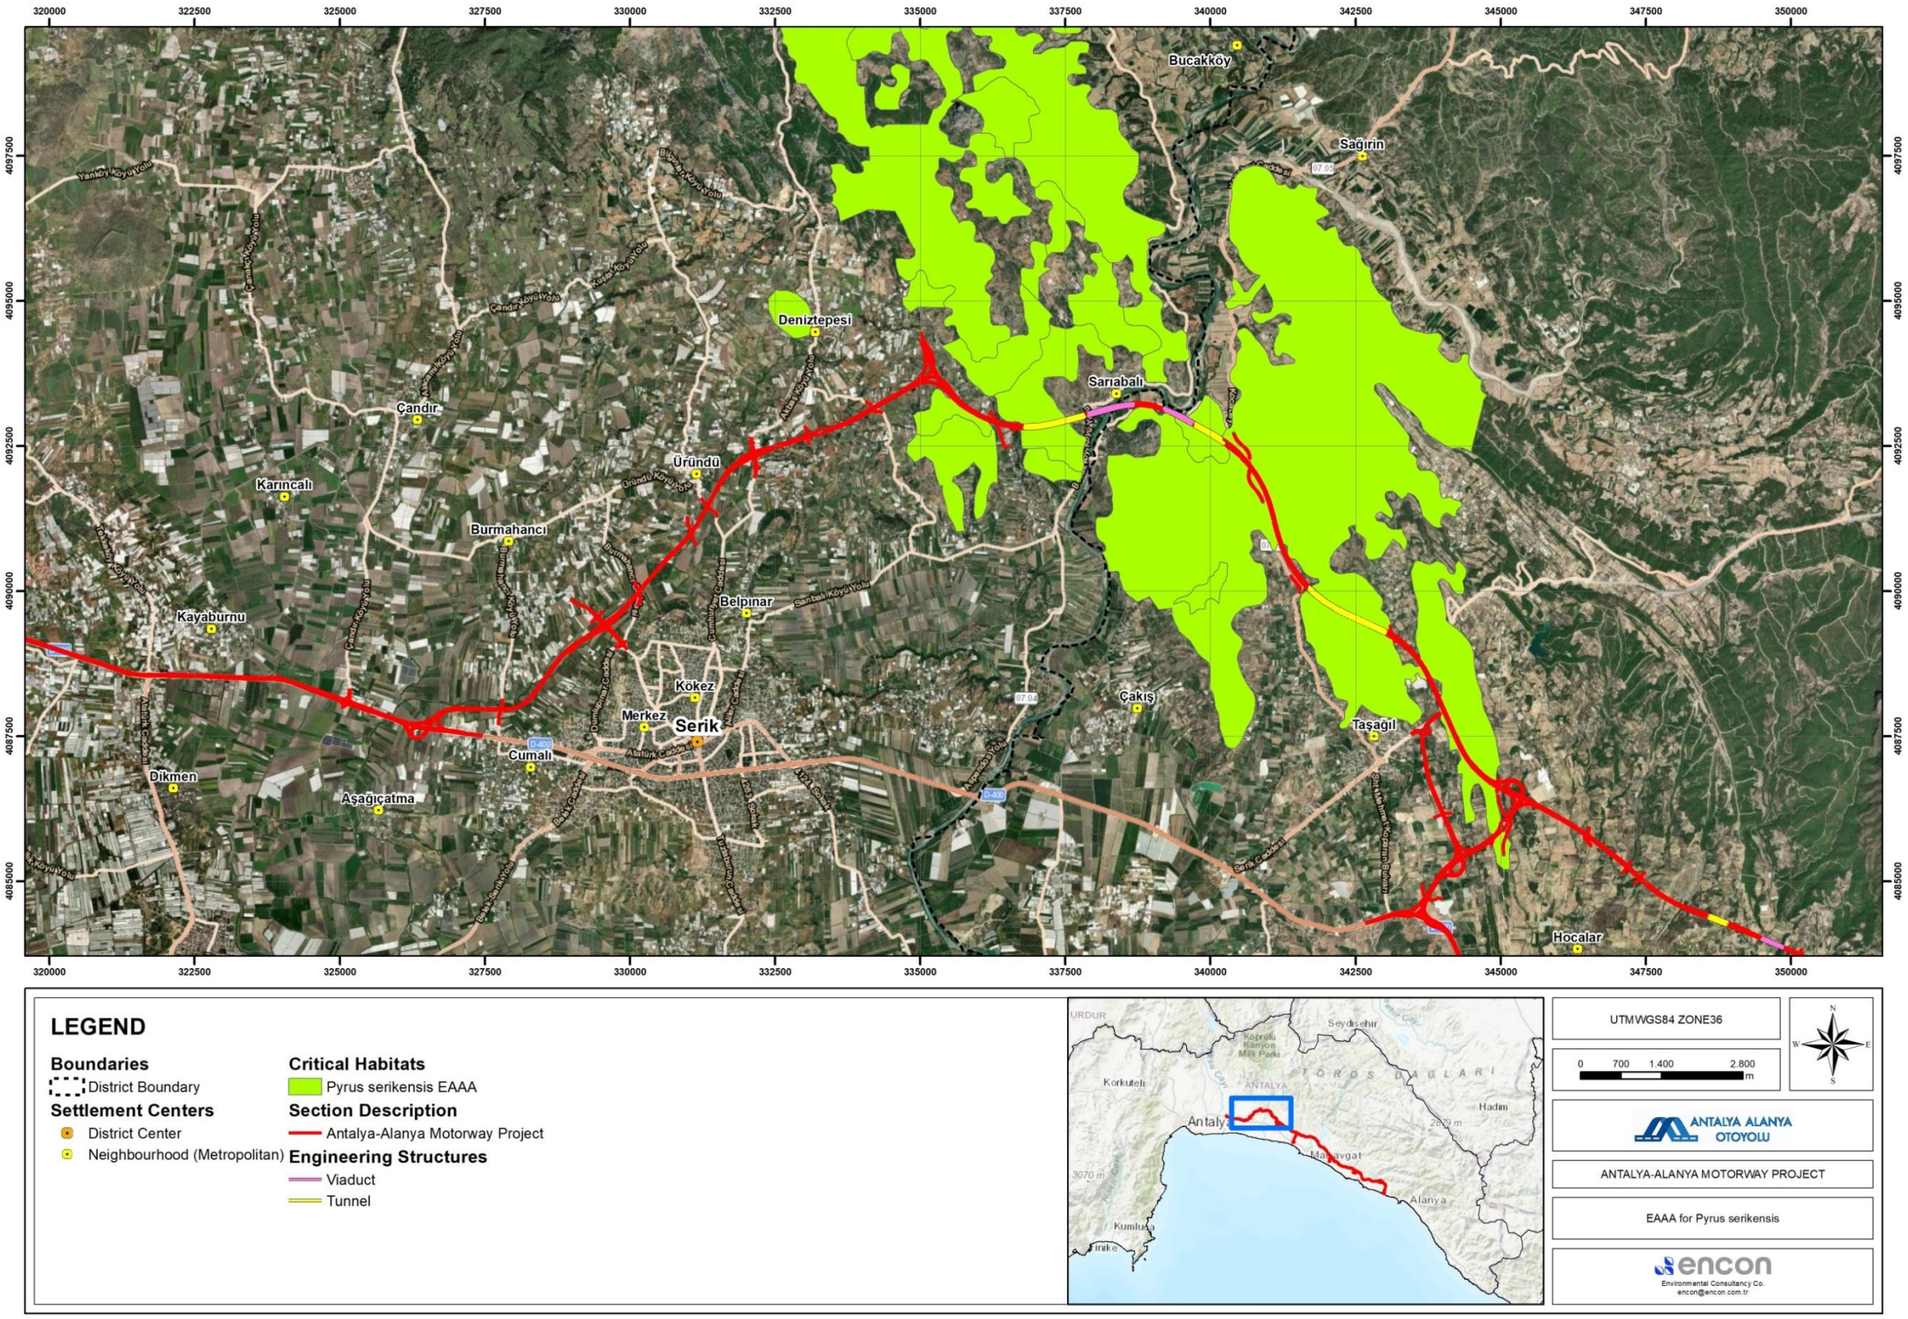

Figure III.1. EAAA of *Pyrus serikensis*

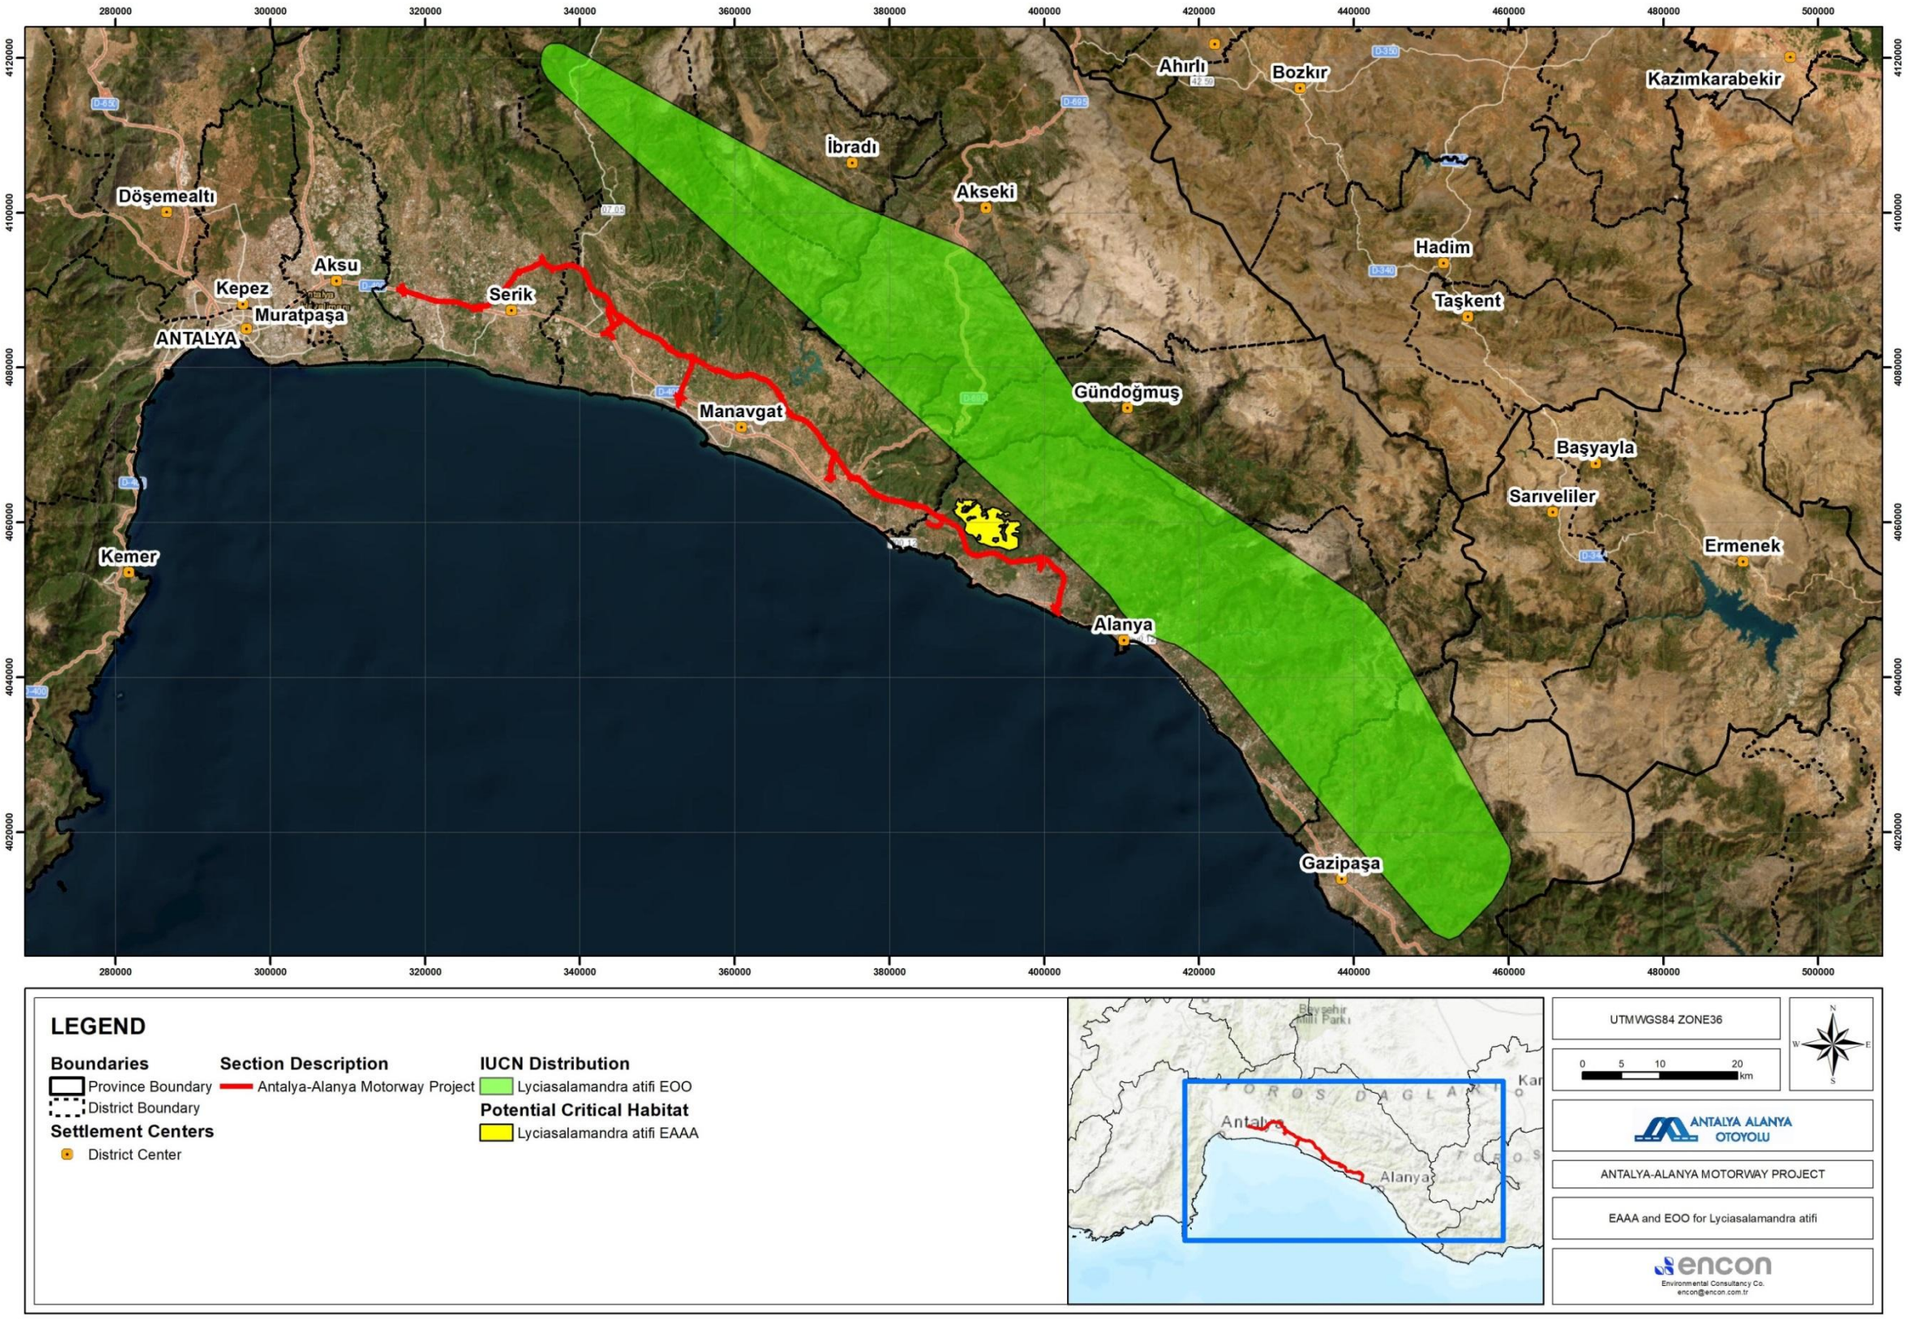

Figure III.2. EAAA and EOO of *Lyciasalamandra atifi*

III.2.1.2. Criterion 2: Endemic and/or restricted-range species

For criterion 2, the assessment considered the presence of endemic or restricted-range species—defined as those with an extent of occurrence (EOO) of less than 50,000 km² for terrestrial vertebrates and plants, or a global range of 500 km or less in linear geographic span for coastal, riverine, and other aquatic species that do not exceed 200 km in width at any point.

A total of 221 plant taxa belonging to 60 families have been identified within the Project Area. Among these, seven species (*Eryngium kotschyi*, *Phlomis leucophracta*, *Phlomis lycia*, *Phlomis monocephala*, *Phlomis nissolii*, *Pyrus serikensis*, and *Sideritis congesta*) are endemic to Türkiye. Except for *Pyrus serikensis*, the identified endemic species are relatively widespread. *Pyrus serikensis* meets Criterion-2, which states that "areas containing ≥10% of the global population or ≥10% of the reproductive population of any species" qualify as critical habitats. Therefore, maquis areas along the project route, where this species is distributed, have not been triggered by criterion 2.

Five amphibian species have been recorded in the Project Area, with *Lyciasalamandra atifi* being the only endemic species. This species is distributed between Antalya and Alanya, with a known lower elevation limit of 190 meters. The highest elevation in the Project Area is around 160 meters. Despite surveys conducted in February-March under optimal climatic conditions in spring, the species was not observed within the Project Area. The closest recorded individuals were found in suitable forested habitats approximately 1 km north of the project site. However, since *Lyciasalamandra atifi* remains inactive under unfavorable climatic conditions and was characterized by dry and mild weather, the possibility of its absence due to these factors should not be disregarded. Continuation of monitoring studies is recommended. If the species is observed in the Project Area, the critical habitat analysis will be reassessed and may trigger criterion 2.

Species of the *Lyciasalamandra* genus are typically found in rainy seasons or areas with groundwater sources. The primary reason for *Lyciasalamandra atifi* being classified as EN by the IUCN is its specific habitat, climatic, and hydrological requirements. Changes in hydrological conditions due to human activities and global climate change pose a significant threat to this species.

Since *Lyciasalamandra* species are active only in ecologically favorable periods and regions, it is believed that their absence in surveys conducted during summer, autumn, and winter along the project route is due to unsuitable conditions. Therefore, the most appropriate period for field studies is during the rainy season in spring, when conditions for salamander activity are optimal.

Among the reptiles, there are four endemic lizard species (*Ablepharus anatolicus*, *Anatololacerta ibrahimi*, *Lacerta pamphylica*, and *Blanus aporus*). Among these endemic species, *Lacerta pamphylica* has a relatively narrower and more localized distribution. The Project Area lies within the distribution range of *Lacerta pamphylica*. However, considering the overall distribution ranges of all endemic species, there is no critical habitat within the Project Area as defined by Criterion-2.

Among the 29 fish species identified in the Project Area, 11 are endemic (*Cobitis battalgilae*, *Oxynoemacheilus eregliensis*, *Capoeta antalyensis*, *Capoeta caelestis*, *Alburnus baliki*, *Alburnus escherichii*, *Pseudophoxinus battalgilae*, *Pseudophoxinus fahrettini*, *Squalius anatolicus*, *Squalius fellowesii*, and *Salmo ekmekciae*). *Capoeta antalyensis*, *Pseudophoxinus battalgilae*, and *Pseudophoxinus fahrettini* are regionally distributed endemic species, while the remaining nine are more widely distributed. However, regardless of their distribution range, none of these species meet Criterion-2 based on population density along the project route. As a result, no critical habitat has been designated for fish species.

A summary of the evaluation of species falling under Criterion-1 is provided in Table III.3.

Table III.3 Critical Habitat Assessment According to Criterion-2

Species	IUCN	End.	EOO (km^2)	EAAA (km^2)	10% EOO	EAAA > 10% EOO	Evaluation	Critical Habitat Assessment
Eryngium kotschyi	LC	Endemic	42422.31	14.66	4242.23	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Phlomis leucophracta	-	Endemic	99470.89	14.66	9947.09	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Phlomis lycia	LC	Endemic	26034.84	14.66	2603.48	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Phlomis monocephala	LC	Endemic	99470.89	14.66	9947.09	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Phlomis nissolii	LC	Endemic	152307.52	133.06	15230.75	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Pyrus serikensis	EN	Endemic	986.77	83.55	98.67	no	The species was observed during field studies. While suitable habitat is present within the EAAA, its range and local occurrence do not meet the thresholds required under Criterion 2. Although it qualifies under Criterion 1 and triggers Critical Habitat, the available information is insufficient to trigger Critical Habitat under Criterion-2; therefore, the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Sideritis congesta	LC	Endemic	27386.85	133.94	2738.69	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Lyciasalamandra atifi	EN	Endemic	3169.00	30.02	31.69	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Anatololacerta ibrahimi	-	Endemic	775.55	14.17	77.55	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Ablepharus anatolicus	-	Endemic	775.55	14.17	77.55	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this	Not Critical Habitat

Species	IUCN	End.	EOO (km^2)	EAAA (km^2)	10% EOO	EAAA > 10% EOO	Evaluation	Critical Habitat Assessment
							species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	
Blanus aporus	LC	Endemic	3490.55	26.18	349.06	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Lacerta pamphylica	LC	Endemic	3599.72	120.10	359.97	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Cobitis battalgilae	LC	Endemic	3111.27	0.04	311.13	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Oxynoemacheilus eregliensis	NT	Endemic	3111.27	0.04	311.13	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Capoeta antalyensis	VU	Endemic	13296.87	0.04	1329.69	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Capoeta caelestis	LC	Endemic	13296.87	0.04	1329.69	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Alburnus baliki	EN	Endemic	6482.67	0.04	648.27	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Alburnus escherichii	LC	Endemic	6482.67	0.04	648.27	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Pseudophoxinus battalgilae	LC	Endemic	2638.52	0.04	263.85	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Pseudophoxinus fahrettini	EN	Endemic	2638.52	0.04	263.85	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not	Not Critical Habitat

							triggering Critical Habitat.	
Squalius anatolicus	LC	Endemic	97407.67	0.04	9740.77	no	The species is not considered as critical habitat trigger species as it was not observed during field studies. Given that the EAAA contains suitable habitat conditions for this species to support, but range and local occurrence do not meet the thresholds required under Criterion-2, this species is assessed as not triggering critical habitat.	Not Critical Habitat
Squalius fellowesii	LC	Endemic	97407.67	0.04	9740.77	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Salmo ekmekciae	-	Endemic	97407.67	0.04	9740.77	no	The species was observed during field studies.Although suitable habitat is present within the EAAA, the available information indicates that the species' range and local occurrence do not meet the thresholds required under Criterion-2; therefore the species is assessed as not triggering Critical Habitat.	Not Critical Habitat

III.2.1.3. Criterion 3: Habitats supporting globally significant migratory or congregatory species

The assessment considered whether there are any Key Biodiversity Areas (KBAs), Important Bird and Biodiversity Areas (IBAs) for congregatory species, or Ramsar Wetlands of International Importance listed under criteria 5 or 6.

The Antalya Plains (KBA/IBA) is the only internationally important area located within the project's study area. However, *Halcyon smyrnensis* and *Prinia gracilis*—species that contribute to the qualification of this KBA/IBA—were not recorded during surveys conducted within the project study area and its surrounding environment.

Among the amphibian, reptile, and mammal species in the Project Area, no migratory or herd-forming species have been identified. Therefore, no critical habitat has been designated under Criterion-3 for these groups.

The Project Area is not located on a primary or secondary migration route used by soaring migratory birds in the Mediterranean region. However, based on both field surveys and BirdLife International records, 20 different species of soaring, broad-winged birds have been recorded in the Project Area and its surroundings.

Considering the population densities of migratory bird species present in the area, it has been determined that their populations are not at a level that meets Criterion-3. Consequently, no critical habitat has been designated for birds within the Project Area.

Fish species that spend their growth and development stages in freshwater before migrating back to the marine environment to spawn are classified as catadromous migrators. Since the rivers in the Project Area discharge into the sea, the catadromous species *Anguilla anguilla* (European eel) inhabits these waters and falls under Criterion-3. However, since this species does not meet the two specific sub-criteria defined under Criterion-3, no critical habitat has been designated.

A summary of the evaluation of species falling under Criterion-3 is provided in Table III.4.

Table III.4 Critical Habitat Assessment According to Criterion-3

Species	IUCN	EOO (km^2)	EAAA (km^2)	Global Population	Local Population	1% EOO	EAAA > 1% EOO	1% of Global Population	Local pop. > 1% Global pop.	Evaluation	Critical Habitat Assessment
Accipiter nisus	LC	266903.35	270.40	2000000-3200000	3	2669.03	no	20000-32000	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus the EAAA should support 20000 individuals considering its global population. Estimated individuals throughtout the year is 200, considering 3 individuals were observed in the field studies, it is likely the EAAA could not support 20000 individuals on a year-round basis. Hence, the species could not be considered as CH-qualifying species.	Not Critical Habitat
Aquila chrysaetos	LC	205934.05	270.40	85000-160000	-	2059.34	no	850-1600	no	The species was not observed in the field studies, and the proportion of global range in EAAA is not sufficient to trigger Critical Habitat in terms of Criterion 3. Due to species data only being available as presence/absence in the studies and uncertainty regarding field observation vs literature, and given the species' unknown national conservation status, long life cycle, availability of nesting habitat, and demonstrated heightened vulnerability to being effected by the Motorway, species was designated as Does Not Trigger Critical Habitat..	Not Critical Habitat
Buteo buteo	LC	266488.95	270.40	2000000-3500000	8	2664.89	no	20000-35000	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus the EAAA should support 20000 individuals considering its global population. Estimated individuals throughtout the year is 300, considering 8 individuals were observed in the field studies, it is likely the EAAA could not support 20000 individuals on a year-round basis. Hence, the species could not be considered as CH-qualifying species	Not Critical Habitat
Buteo rufinus	LC	266488.95	270.40	100000-499999	5	2664.89	no	1000-4999	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus the EAAA should support 1000 individuals considering its global population. Estimated individuals throughtout the year is 300, considering 5 individuals were observed in the field studies, it is likely the EAAA could not support 1000 individuals on a year-round basis. Hence, the species could not be considered as CH-qualifying species	Not Critical Habitat
Circaetus gallicus	LC	767347.13	270.40	50000-99999	-	7673.47	no	500-999	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus the EAAA should support 500 individuals considering its global population. Estimated individuals throughtout the year is 4, It is likely the EAAA could not support 500 individuals on a year-round basis. Hence, the species could not be considered as CH-qualifying species	Not Critical Habitat
Circus aeruginosus	LC	43449.19	270.40	600000-1100000	-	434.49	no	6000-11000	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus the EAAA should support 6000 individuals considering its global population. Estimated individuals throughtout the year is 6, It is likely the EAAA could not support 6000 individuals on a year-round basis. Hence, the species could not be considered as CH-qualifying species	Not Critical Habitat
Circus cyaneus	LC	778040.52	270.40	330000-512000	-	7780.41	no	3300-5120	no	The species was not observed in the field studies, and the proportion of global range in EAAA is not sufficient to trigger Critical Habitat in terms of Criterion 3. Due to species data only being available as presence/absence in the studies and uncertainty regarding field observation vs literature, and given the species' unknown national conservation status, long life cycle, availability of nesting habitat, and demonstrated heightened vulnerability to being effected by the Motorway, species was designated as Does Not Trigger Critical Habitat	Not Critical Habitat
Circus macrourus	LC	778034.24	270.40	18000-30000	-	7780.34	no	180-300	no	The species was not observed in the field studies, and the proportion of global range in EAAA is not sufficient to trigger Critical Habitat in terms of Criterion 3. Due to species data only being available as presence/absence in the studies and	Not Critical Habitat

										uncertainty regarding field observation vs literature, and given the species' unknown national conservation status, long life cycle, availability of nesting habitat, and demonstrated heightened vulnerability to being effected by the Motorway, species was designated as Does Not Trigger Critical Habitat	
Neophron percnopterus	EN	266846.82	270.40	12400-36000	-	2668.47	no	120-360	no	The species was not observed during field surveys, and the proportion of its global range within the EAAA is insufficient to trigger Criterion-3. Thus the EAAA should support 120 individuals considering its global population. Estimated individuals throughout the year is 2. It is likely the EAAA could not support 120 individuals in a yearly basis. Although suitable nesting habitat may exist in the wider landscape, no active nests were identified in the Project Area, or wider components. Given limited data, long life cycle, and sensitivity to disturbance, the species is assessed as not triggering Critical Habitat.	Not Critical Habitat
Ciconia ciconia	LC	778028.66	270.40	700000-704000	9	7780.29	no	7000-7040	no	Although the species was observed in the field studies, the EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus, the EAAA should support 7000 individuals, considering its global population. Estimated individual throughout the year is 200, considering that 9 individuals were observed in the field studies, thus, it is not likely that the EAAA supports 7000 individuals on a year-round basis. Hence the species could not be considered as CH-qualifying species	Not Critical Habitat
Ciconia nigra	LC	778034.24	270.40	24000-44000	-	7780.34	no	240-440	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus, the EAAA should support 240 individuals, considering its global population. Estimated individual throughout the year is 4, considering the species was not observed during field studies, it is not likely that the EAAA supports 240 individuals on a year-round basis. Hence the species could not be considered as CH-qualifying species	Not Critical Habitat
Falco columbarius	LC	616863.12	270.40	250000-3200000	-	6168.63	no	2500-32000	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus, the EAAA should support 2500 individuals, considering its global population. Estimated individual throughout the year is 4, considering the species was not observed during field studies, it is not likely that the EAAA supports 2500 individuals on a year-round basis. Hence the species could not be considered as CH-qualifying species	Not Critical Habitat
Falco peregrinus	LC	266909.42	270.40	100000-499999	-	2669.09	no	1000-4999	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus, the EAAA should support 1000 individuals, considering its global population. Estimated individual throughout the year is 162, considering that the species was not observed during the field studies, it is unlikely that the EAAA supports 1000 individuals on a year-round basis. Hence the species could not be considered as CH-qualifying species	Not Critical Habitat
Falco subbuteo	LC	266909.42	270.40	900000-1500000	-	2669.09	no	9000-15000	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus, the EAAA should support 9000 individuals, considering its global population. Estimated individual throughout the year is 162, considering that no individuals were observed during the field studies, it is unlikely that the EAAA supports 9000 individuals on a year-round basis. Hence the species could not be considered as CH-qualifying species	Not Critical Habitat
Falco tinnunculus	LC	266909.42	270.40	4300000-6700000	2	2669.09	no	43000-67000	no	The EAAA should support at least 1% of global population of species to have critical habitat trigger species based on Criterion-3. Thus, the EAAA should support 43000 individuals, considering its global population. Estimated individual throughout the year is 100, considering that 2 individuals were observed during the field studies, it is unlikely that the EAAA supports 9000 individuals on a year-round basis. Hence the species could not be considered as CH-qualifying species.	Not Critical Habitat

Anguilla anguilla	CR	742787.86	0.01	-	20	7427.88	no	-	no	The species was observed during field surveys, however no global population data are available to assess its proportional representation within the EAAA. Based on current knowledge and the limited scale of occurrence in the Project Area, the species is assessed as not triggering Critical Habitat.	Not Critical Habitat

III.2.1.4. Criterion 4: Highly-threatened and unique ecosystems

The application of Criterion 4, recommends the use of the IUCN Red List of Ecosystems (RLE) where formal assessments have been conducted. However, no such evaluations have been carried out in Türkiye, as confirmed by the IUCN RLE Database. Therefore, the RLE framework cannot be applied in this context. Instead, the 'European Red List of Habitats' (European Union, 2016) was utilized to identify threatened ecosystems.

The habitats identified in the Project Area are not among the priority habitats under Annex I of the Habitats Directive. Also None of these habitats are protected according to the "European Red Habitat List" prepared by the European Union.

None of the EUNIS habitats identified within the Local Study Area (LSA) through desktop photointerpretation, mapping, and field ground-truthing are considered unique ecosystems or classified as Critically Endangered (CR) or Endangered (EN) according to the European Red List of Habitats. Furthermore, no unique or threatened ecosystems were reported by experts.

The rivers along the Motorway corridor will be crossed by bridges. In the areas where the bridges will be constructed, it is estimated that there will be an impact only during construction works. However, as a result of the measures to be taken, the Project is not expected to impact river habitats.

The Project Area lies along the Western Mediterranean Coast of Türkiye. The corridor where the Motorway will be constructed does not have habitat features with unique characteristics to meet the biological needs of endemic, rare or threatened species such as breeding, wintering and feeding. It is concluded that the Project Area cannot be evaluated within this scope according to the items specified under Criterion-4.

III.2.1.5. Criterion 5: Key evolutionary processes

This criterion considers the presence of areas with landscape features that may be associated with evolutionary processes or with species populations that are particularly distinct. Such populations may warrant special conservation attention due to their unique evolutionary history.

Considering the habitats in the Project Area, landscapes with high spatial heterogeneity, edaphic interfaces and areas of proven importance in terms of adaptation to climate change were not identified. Moreover, the area is not considered to be of demonstrated importance for climate change adaptation or as a biological corridor. Therefore, it is concluded that the habitats within the Study Area do not exhibit the characteristics defined under Criterion 5.

III.3. Confirmed Species Triggering Critical Habitat

- ***Pyrus serikensis*** (Critical Habitat Trigger Species)
  Serik Pear Tree (Endemic tree species) was identified within the “S5 - Maquis, Woody Matorral, and Thermo-Mediterranean Scrub” habitats. This species occurs both within and adjacent to the project footprint and is of critical ecological importance due to its restricted distribution.

These findings verify the existence of Critical Habitat (CH) as defined under IFC Performance Standard 6 (PS6), thereby necessitating the implementation of targeted conservation and mitigation measures. Mitigation and implementation measures for designated Critical Habitats are outlined in detail in the Biodiversity Action Plan (BAP). Critical habitats, natural and modified habitats are shown in Figure III.3.

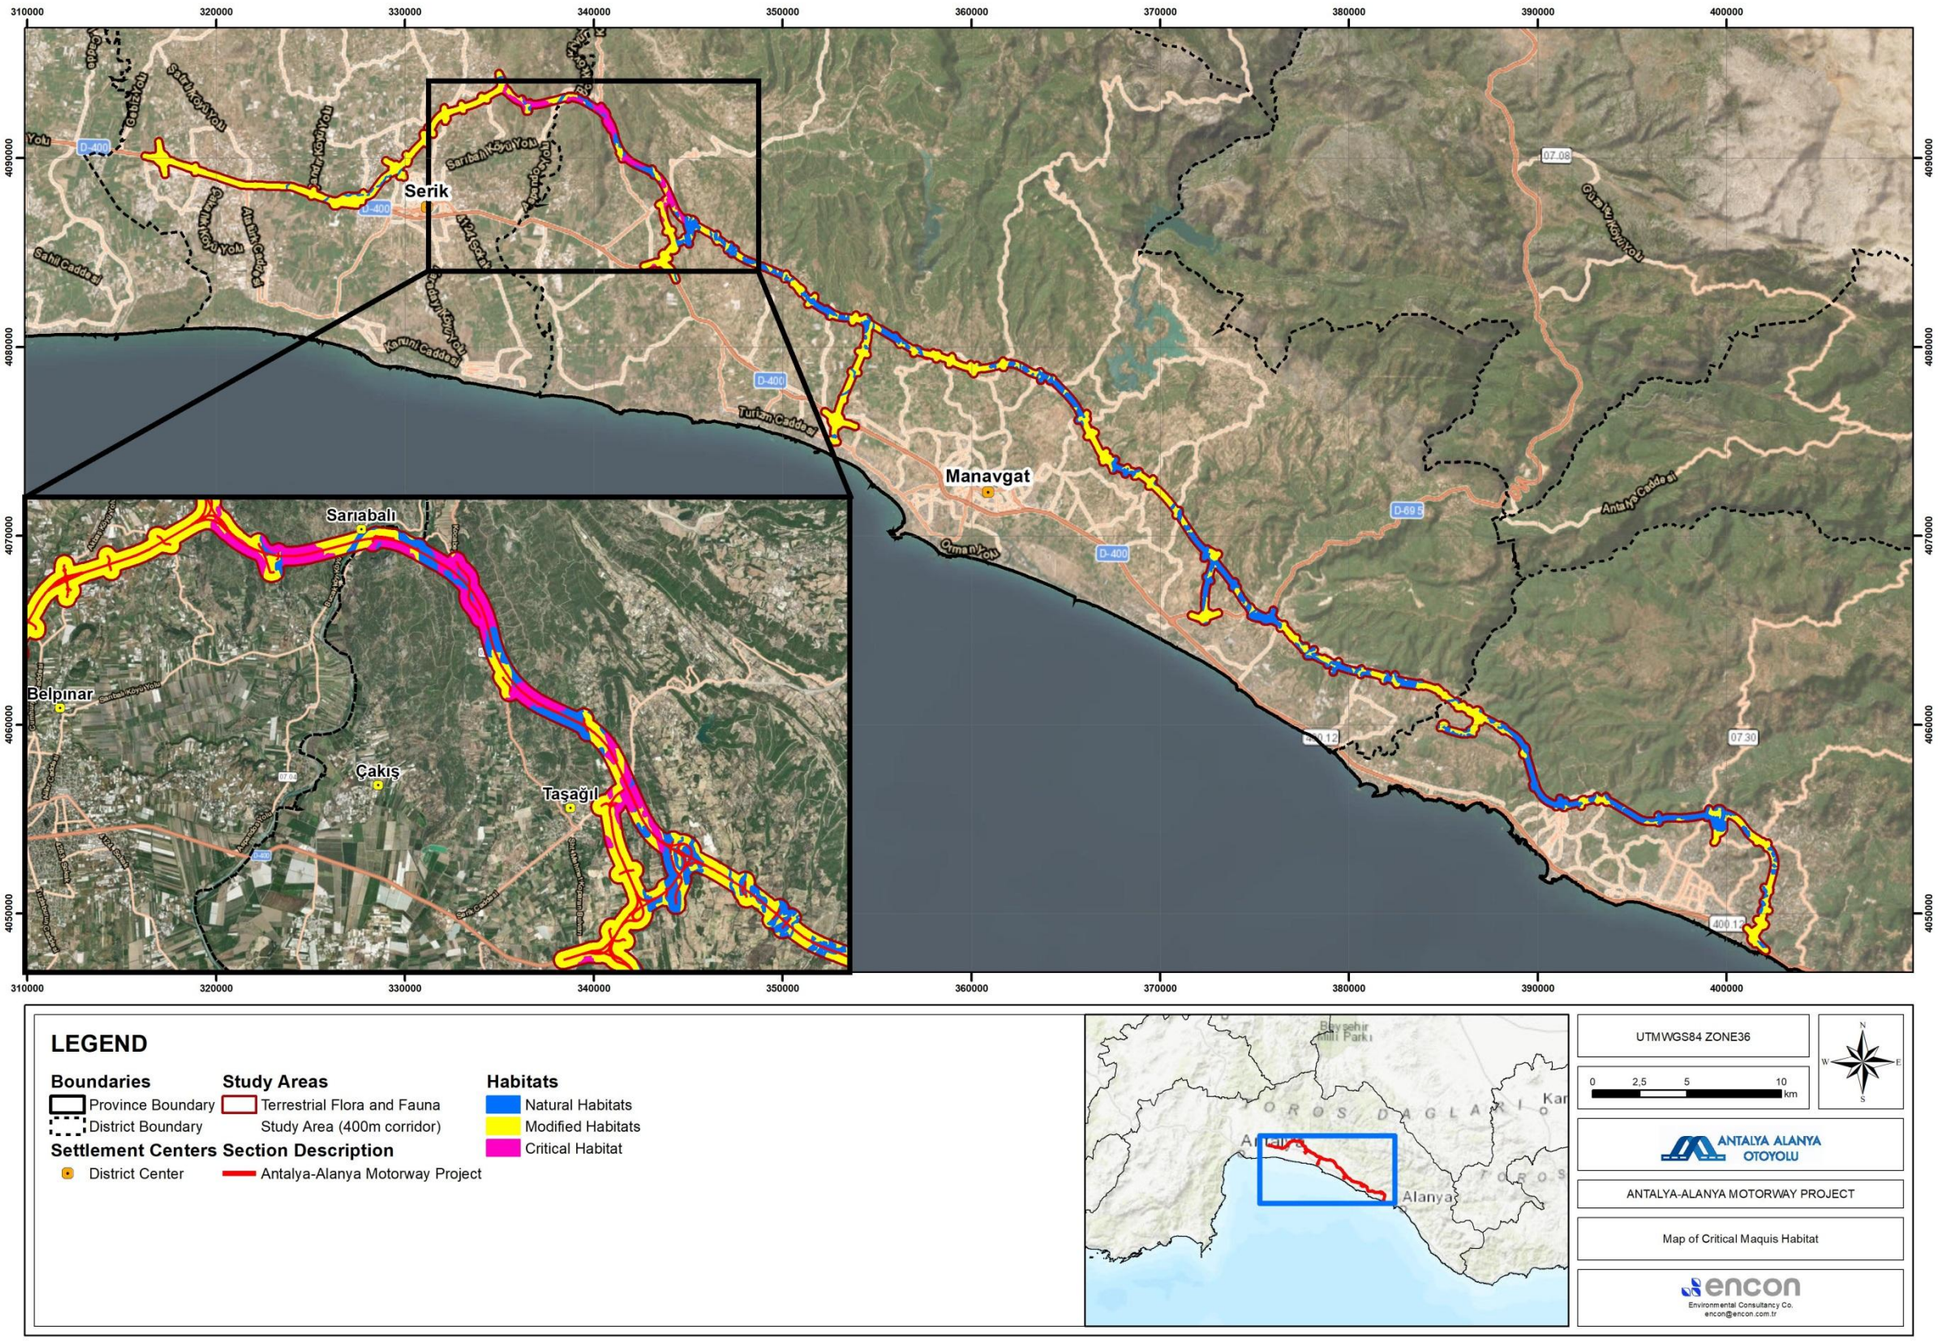

Figure III.3. Critical, Natural and Modified Habitats in the Study Area

IV. CONCLUSION

The Critical Habitat Assessment (CHA) for the Antalya-Alanya Motorway Project was conducted in line with the IFC Performance Standard 6 (PS6) to ensure biodiversity conservation and sustainable natural resource management. The assessment aimed to identify critical habitats and high-conservation-value species within the project's ecological area of influence, considering both direct and cumulative impacts. It applied PS6's five criteria to evaluate species and ecosystems, utilizing field surveys, expert input, and GIS-based spatial analysis. The findings confirmed that the maquis habitat type, home to the endemic and endangered *Pyrus serikensis*, qualifies as a critical habitat under PS6 Criteria 1. Although other potentially significant species were noted—such as *Lyciasalamandra atifi* and various endemic reptiles and fish—most did not meet the strict thresholds required for critical habitat designation.

The assessment concludes that while only one species (*Pyrus serikensis*) triggers critical habitat status and amphibian species *Lyciasalamandra atifi* requires ongoing monitoring due to their ecological sensitivity and limited distribution. The project area includes diverse ecosystems such as scrublands, wetlands, and rivers, but none meet the definitions of highly threatened or unique ecosystems (Criterion 4) or areas essential for key evolutionary processes (Criterion 5). Moreover, migratory species observed in the area do not reach the population thresholds necessary to designate the region as critical under Criterion 3. The report emphasizes the need for mitigation strategies, continuous monitoring, and targeted conservation measures to ensure that biodiversity impacts are minimized and aligned with international environmental standards.

The critical habitats and triggered species identified in the CHA report will form a baseline for net loss calculations and measure actions under the Biodiversity Action Plan (BAP).

1.0 *Executive Summary*

This traffic due diligence report assesses projected traffic demand on the Antalya-Alanya Motorway Project (hereafter, "the Project"), a planned 122-kilometer motorway along Türkiye's Mediterranean. The Project aims to establish a high-speed, high-capacity (2x3 lanes) connection between the cities of Antalya and Alanya procured through a Build-Operate-Transfer (BOT) model as defined in Law No. 3996.

Representing one of two sub-projects comprising the larger Afyonkarahisar-Alanya Motorway, the Antalya-Alanya segment specifically connects the Serik and Alanya districts within the Antalya province. The estimated total investment for this project is approximately €2.3 billion.

The traffic forecasts presented in this report cover a 12-year period. The analysis assumes the motorway will become operational in 2028. Traffic projections are based on 2028 as the base year and consider four key future years: 2028, 2032, 2036, and 2040.

The project includes a traffic guarantee ("MRG"), specifying a minimum number of vehicles (expressed in automobile equivalents, or passenger car units) that are expected to use the motorway in both directions. (Article 29 of IC) For the Antalya-Alanya Motorway Project (122 Km of motorway length subject to guarantee), the total guaranteed AADT in Automobile Equivalents in both directions is 100,000 Automobile Equivalents/Day. Traffic Guarantee is indexed to IC Effective Date and expected to hoover around c.EUR730K/day in IC Effective Date real terms.

According to the 2053 Logistic Master Plan, Turkey's motorway density is at the level of 4.5 km/1,000 km². This figure is considerably below the level of developed countries (24.25 km per 1,000 km² in Japan; 48.83 km in South Korea; 37.54 km in Germany; 34.56 km in Spain; 22.62 km in France). Increasing Turkey's motorway density is considered a realistic solution for providing a fast and safe transportation infrastructure. By implementing motorway projects planned for the 2021-2023 and 2023-2035 periods, it is projected that the motorway density can be increased to 10 km/1,000 km². While traffic congestion is generally less pronounced in Türkiye compared to more densely populated European countries, certain sections of the state road network experience significant traffic volumes, particularly around major urban centers and seasonally around tourism destinations, Antalya-Alanya alignment hits both these marks.

The Antalya-Alanya Motorway project strategically addresses pressing transportation needs in a region experiencing rapid growth in both tourism and local traffic. Tourism and agriculture represent the two main economic activity in the project catchment zone, which comprise some of the most populated cities in Turkiye and representative of a substantial proportion of GDP generated. Specifically, Antalya is experiencing a significant surge in tourism, with foreign tourist arrivals reaching over 20.6 million in 2023. This growth aligns with a broader trend of increased tourism revenue in the region (EY Tourism Update 2023). Overnight stays in Antalya's accommodations also reached a record high of 94 million in 2023, indicating both increased visitor numbers and potentially longer stays.

The current D400 highway, characterized by its passage through numerous settlements, exhibits traffic patterns akin to urban environments, leading to congestion and reduced travel speeds. (Environmental Impact Assessment, 2018) This situation is further exacerbated by the heavy traffic flow between Antalya International Airport and popular tourist destinations along the coast. It is therefore evaluated that the new motorway will not only provide a faster and more direct connection between key points but also significantly alleviate congestion on the D400, improving travel times and road safety for both residents and tourists.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

In this study, we have primarily utilized publicly available KGM traffic data and counts. We supported the data collection with TomTom data acquired through private channels and utilized our algorithms to estimate Origin-Destination ("OD") matrices. We have used satnav and other digital sources to estimate duration, distance and congestion levels especially in review of the existing state road service levels.

We have made use of reputable national and international databases to collate socioeconomic data, including population, GDP, and tourism statistics. We have included salient points informing our forecasts within the body of this report, specifically under Section 3 and 4. We note that the region's positive economic outlook, rising car ownership rates, and continuous growth in both domestic and international tourism contribute to a favorable demand environment for the motorway.

We have calibrated our traffic model using historical data and considering key socioeconomic drivers. We utilized the Tamin and Willumsen (1989) method in modeling capture rates based on generalized time considerations.

1.1 Key Findings

In review, we forecast that the total Average Annual Daily Traffic (AADT) on the Motorway will be c.25K passenger car equivalent units (pcu) in 2028, rising to c.60K pcu by 2040.

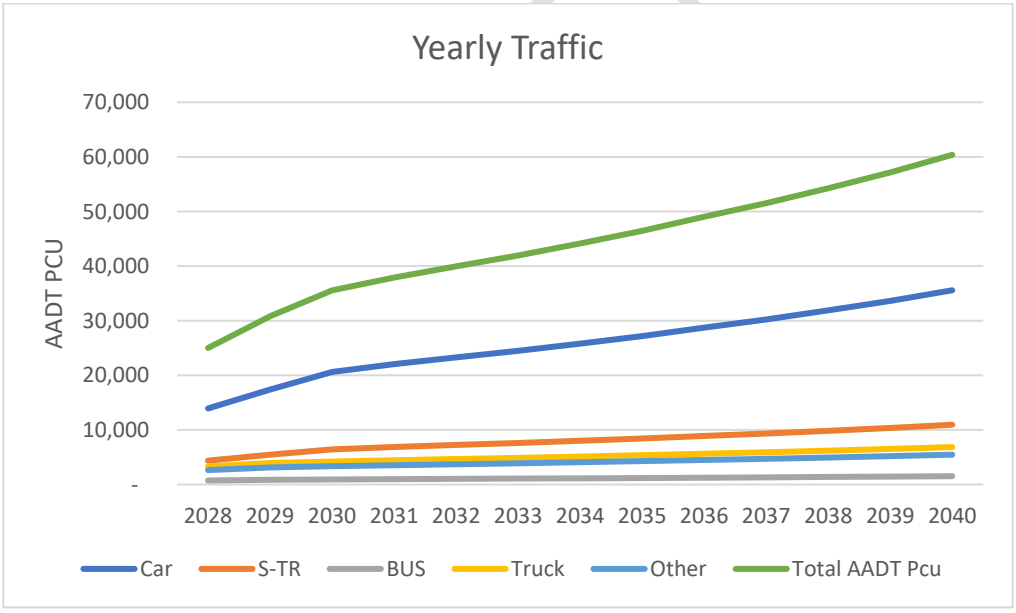

Figure 1. Yearly Traffic of the Motorway

As can be observed in Figure 1, light vehicle growth is projected to outpace truck growth, leading to a further decline in heavy-vehicle representation which is forecasted at 27% in 2028, and this is projected to fall to 22% in 2040.

Average capture rate at the beginning of the operation is forecasted to be 44%. On the other hand, the total traffic of state road in 2040 will be c.23K AADT PCU while it will be c.60K AADT PCU in the motorway resulting in an average diversion rate of c.72% at the end of the concession term.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

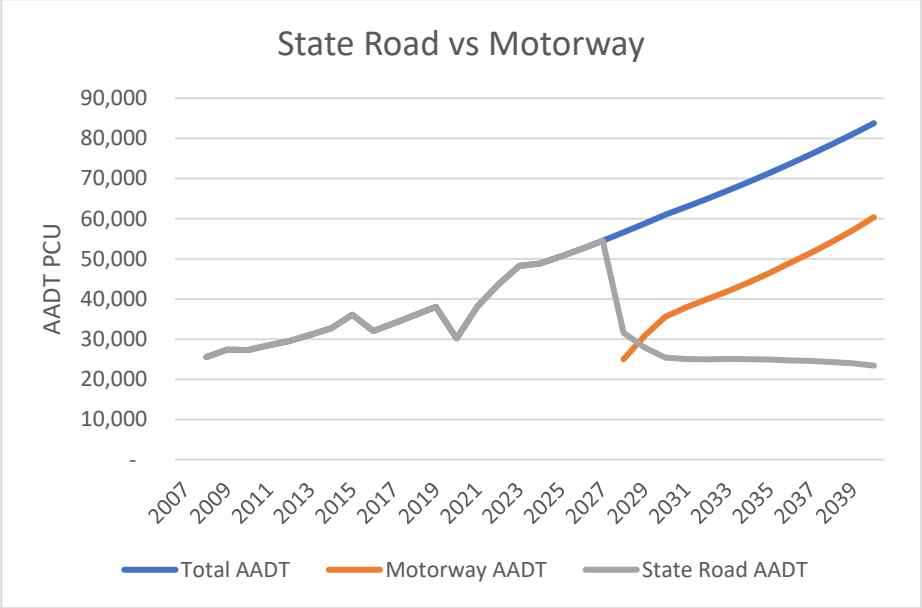

Figure 2. State Road vs Motorway Capture

Further details of our findings can be found under Section 5 of this report. Sensitivity tests have not been carried out at this stage but will be included in Section 6 of this report.

1.2 Opportunities And Risks

Within the traffic demand forecasting exercise, we carried out a market review and evaluated opportunities and risks surrounding the traffic demand and need for the Project. The market review also informs the traffic forecast parameters, therefore has been a critical element of the forecasting process. The main opportunities and risks associated with the Project can be summarized as follows.

Strong Government Support: The Antalya-Alanya Motorway has received strong endorsement from the Turkish government, recognizing its significance in supporting economic growth, particularly in the tourism sector. (12th Turkiye Development Plan, 2023)

Strategic Location: The project's location along Türkiye's Mediterranean coast, a prime tourist destination, positions it to capitalize on the region's existing tourism infrastructure and anticipated future growth. (EY Tourism Update, 2023)

Traffic Guarantee: The inclusion of a traffic guarantee in the concession contract provides a level of revenue certainty for the project, mitigating the risk of lower-than-expected traffic volumes. (Implementation Contract, Article 29)

Environmental Impacts: The construction of a new motorway through a sensitive coastal environment will inevitably raise environmental concerns. The project's Environmental Impact Assessment (2018) must thoroughly address potential impacts on biodiversity, water resources, and air quality, and propose robust mitigation measures to minimize adverse effects.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Competition from Existing Road: The existing D400, despite its limitations, offers a toll-free alternative to the motorway. The traffic model must accurately estimate the proportion of drivers willing to pay for the time savings and convenience offered by the new motorway.

Economic Uncertainty: Global economic volatility, particularly in relation to tourism, could impact traffic volumes and revenue projections. The sensitivity analysis must incorporate scenarios that account for potential economic downturns.

We have carried out a SWOT analysis based on the market review completed in the catchment area of the Project.

The salient points evaluated to contribute to the Project SWOT can be summarized as follows:

Table 1. SWOT Analysis

Strength	Weakness
➢ Strategic Location in a Thriving Tourism Corridor: The motorway's location along the Mediterranean coast, connecting two major tourist destinations, positions it to capture significant tourism-related traffic. ➢ Strong Government Support and Public-Private Partnership Model: The project benefits from government commitment and a well-established PPP framework, providing financial stability and expertise. Guaranteed income will be monthly basis. ➢ Potential for Induced Demand and Regional Development: The motorway's improved accessibility can stimulate new economic activity and generate additional traffic beyond initial projections.	➢ Dependence on the Tourism Sector: The project's reliance on tourism revenue makes it vulnerable to fluctuations in global tourism trends and potential economic downturns. ➢ Competition from Existing and Planned Alternative Routes: The existing D400 state road and planned improvements present competition, potentially diverting some traffic away from the motorway. ➢ Exposure to Currency Fluctuations and Inflation: The depreciation of the Turkish Lira against the Euro, coupled with potential inflation risks, can impact construction costs, financing arrangements, and toll affordability.
Opportunities	**Threats**
➢ Integration with Other Transportation Modes: Developing seamless connections to airports, ports, and railway stations can enhance the motorway's attractiveness and generate multi-modal traffic. ➢ Leveraging Technology for Enhanced Efficiency and Safety: Implementing intelligent transportation systems (ITS) and exploring innovative toll collection methods can improve traffic flow, enhance safety, and reduce operational costs. ➢ Promoting Sustainable Transportation Practices: Integrating environmental considerations into project design and operation, such as measures for climate resilience and promoting electric vehicle charging infrastructure, can enhance the project's sustainability profile.	➢ Global Economic Slowdown or Geopolitical Instability: Unforeseen global events could negatively impact tourism and overall economic activity in the region, affecting traffic volumes. ➢ Delays in Construction or Cost Overruns: Project delays or unexpected cost increases can strain financing arrangements and impact the project's financial viability. ➢ Changes in Government Policy or Regulations: Shifts in government policy or regulations related to toll rates, environmental standards, or transportation could impact the project's profitability and long-term outlook.

DRAFT

2.0 *Introduction*

2.1 Project Description

This traffic due diligence report assesses the Antalya-Alanya Motorway Project (hereafter, "the Project"), a planned 122-kilometer motorway along Türkiye's Mediterranean. The Project aims to establish a high-speed, high-capacity (2x3 lanes) connection between the cities of Antalya and Alanya procured through a Build-Operate-Transfer (BOT) model as defined in Law No. 3996. This report analyzes the project's traffic potential, assessing key assumptions and risks, and provides insights to support lender decision-making.

Representing one of two sub-projects comprising the larger Afyonkarahisar-Alanya Motorway, the Antalya-Alanya segment specifically connects the Serik and Alanya districts within the Antalya province. The estimated total investment for this project is approximately €2.3 billion.

Figure 3. Current Motorway Network of Turkey (KGM 2023) and Antalya – Alanya Motorway

The contract has been awarded to Limak on December 15th, 2023, outlines a build-operate-transfer model with a total duration of 15 years. This period includes a 3-year construction phase followed by a 12-year operational phase. Project routing is shown in Figure 4.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

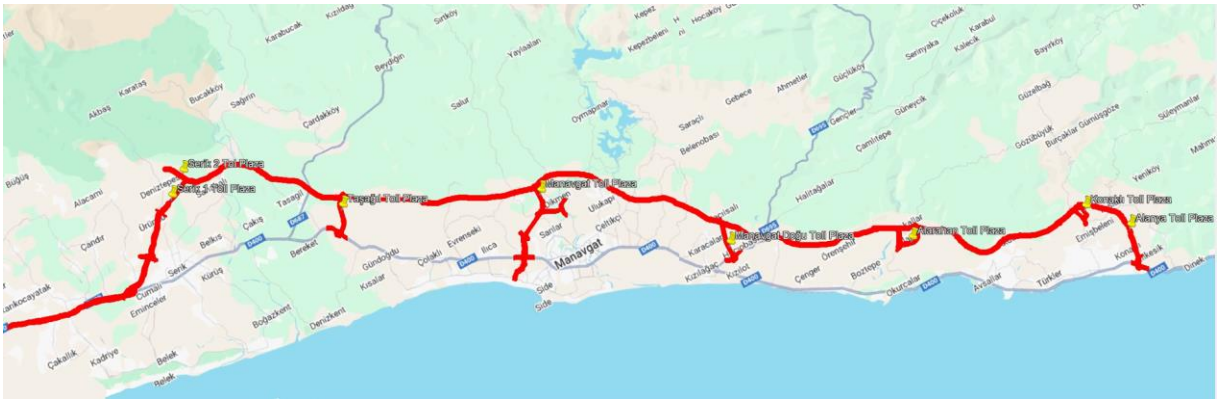

Figure 4: The Project Route

In traffic review and analysis motorway entry and exit points constitute model nodes. Therefore, corresponding distances and associated time and cost are critical factors in review. We understand the conceptual design segmental distances are as follows. Any substantial changes following detailed design may need to be reflected in the modeling exercise thus could impact forecast results. The current nodes and associated distances are presented in Table 2 and current locations of planned tolling stations are depicted in Figure 4.

Table 2. Antalya Alanya Motorway Distance Km between Toll Stations

		Exit Toll							
	Station	Serik 1	Serik 2	Taşağıl	Manavgat	Manavgat Doğu	Alarahan	Konaklı	Alanya
Entry Toll	Serik 1	x	x	17.9	34.2	52.7	68.9	83.8	88.4
	Serik 2	x	x	16.2	32.5	51.0	67.2	82.1	86.7
	Taşağıl	17.9	16.2	x	18.7	37.2	53.4	68.3	72.9
	Manavgat	34.2	32.5	18.7	x	20.1	36.3	51.2	55.8
	Manavgat Doğu	52.7	51.0	37.2	20.1	x	20.6	35.5	40.1
	Alarahan	68.9	67.2	53.4	36.3	20.6	x	18.1	22.7
	Konaklı	83.8	82.1	68.3	51.2	35.5	18.1	x	5.8
	Alanya	88.4	86.7	72.9	55.8	40.1	22.7	5.8	x

- These distances include connection roads between the main line and the connection roads.
- These distances may change according to the upcoming design changes. This table is created according to the data received on August 14, 2024.

2.2 Key Project Inputs

The analysis presented in this report is based on several key project inputs derived from the Implementation Contract (IC) and associated documents:

- **Contract Period:** The total contract period, encompassing both construction and operation phases, is 15 years, with a 3-year Construction Period and a 12-year Operation Period. (Article 5 of IC)

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

- **Total Investment Amount:** The investment amount, excluding VAT and the Construction Period Financing Cost but including the cost of financing, is specified in the Priced Quantity Schedule (Form No-2) attached to the Letter of Offer. (Article 38 of IC)

- **Equity:** The Designated Company will contribute a minimum of 30% of the total investment amount as equity. (Article 8 of IC)

- **Financing:** The project will be financed through a combination of equity and loans, with the Designated Company responsible for securing all financing. (Article 8 of IC)

- **Toll Rates:** The initial toll rates, excluding VAT, are determined through a competitive bidding process based on a discount over the Ceiling Fee set by the Administration (Winning bid is 0.0598 Euro/km). (Articles 9 of IC)

- **Traffic Guarantee:** The project includes a traffic guarantee ("MRG"), specifying a minimum number of vehicles (expressed in automobile equivalents, or passenger car units) that are expected to use the motorway in both directions. (Article 29 of IC) For the Antalya-Alanya Motorway Project (122 Km of motorway length subject to guarantee), the total guaranteed AADT in Automobile Equivalents in both directions is 100,000 Automobile Equivalents/Day. Traffic Guarantee is indexed to IC Effective Date and shall be calculated using the following formula;

$$Gn_1 = FTL\,n_1 \times Ln \times Sn_1$$

Where;

Sn1= Total number of guaranteed vehicle passes (car equivalent) on a monthly basis in the First Operating Semester (100,000 Automobile Equivalents/Day in both directions)

$FTLn_1$ = Toll in TL for the First Operational Half of the Operational Year ;

Ln = Guaranteed length of motorway (km) (122 km).

Gn_1 = Guaranteed revenue (TL) on monthly basis for the First Operational Half

Further details on the principles of the monthly top up mechanism as it applies to the MRG can be found in Article 9 of the IC. Based on the formulation provided, the daily MRG amount as at the date of IC Effective Date shall be c.EUR730K/day.

$$Gn_1 * = 0.0598\ EUR/km \times 122\ km \times 100{,}000 = 729{,}560\ EUR/day$$

Expropriation: The Assigned Company is responsible for paying 500,000,000 TL towards the expropriation costs of the project site, with the remaining costs covered by the Administration. (Article 13 of IC)

- **Procurement:** Limak was awarded the tender contract to build-operate-transfer the Antalya-Alanya Motorway on December 15, 2023.

- **Early Completion:** If the construction period is completed ahead of schedule, the operational period will start with construction completion; however, the total concession period of 15 years will remain unchanged. This effectively increases the operation term by the same amount construction term may be expedited.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

2.3 Methodology

2.3.1 DATA SOURCES AND LIMITATIONS

Key data sources include historical traffic volume reports from the General Directorate of Highways (KGM) dating back to 2007, as well as relevant socioeconomic and demographic data.

It is important to acknowledge limitations inherent in relying on data exclusively from 2007 onwards. While this timeframe offers valuable insights, it may not fully capture long-term traffic patterns spanning several decades.

Seasonality: While the initial scope of work outlined the need for site visits and traffic surveys, these tasks will not be undertaken within the current project timeline. This decision stems from the understanding that comprehensive traffic data collection, particularly vehicle counts, necessitates observations across all four seasons to account for potential variations in traffic patterns. Given the time constraints of the current engagement, conducting such an extensive study would not be feasible. The analysis and subsequent findings presented in this report will therefore primarily utilize existing traffic data and relevant historical trends.

Locality: It is important to acknowledge the limitations of directly applying historical traffic data from the existing state road to the projected traffic volume on the planned toll motorway. While the existing road serves as a primary point of reference, its traffic patterns encompass a significant portion of local traffic traveling between the numerous small towns along its route. This localized traffic is not expected to fully transition to the toll motorway, as users traveling between these towns are likely to opt for the shorter and more direct route offered by the existing road. Consequently, relying solely on historical data from the existing road could lead to an overestimation of potential traffic on the new motorway. The traffic model and projections presented in this report will strive to address this limitation by factoring in the distinct traffic behaviors of local and through-traffic and relies on Origin-Destination ("OD") matrices developed using digital and public sources.

2.3.2 FORECAST HORIZON

The traffic forecasts presented in this report cover a 12-year period. The analysis assumes the motorway will become operational in 2028. Traffic projections are based on 2028 as the base year and consider four key future years: 2028, 2032, 2036, and 2040.

2.3.3 DATA COLLECTION

We have primarily utilized publicly available KGM traffic data and counts. We supported the data collection with TomTom data acquired through private channels and utilized our algorithms to estimate OD matrices. We have used satnav and other digital sources to estimate duration, distance and congestion levels especially in review of the existing state road service levels.

We have made use of reputable national and international databases to collate socioeconomic data, including population, GDP, and tourism statistics. Below list has been developed to present data availability and usage in our traffic forecast;

- General Directorate of Highways 2023 or 2022 Roadside Surveys (separated by seasons or months) - Requested directly from KGM but was not made available.
- 2019-2023 Monthly Traffic Data has been requested from KGM and received. Seasonality has been prorated based on this data and we consider this to be accurate. The data correlates with other comparative motorway deals we worked on in the domestic market.
- OD matrices have been generated according to TomTom Database October 2022 data and modified according to the KGM traffic data further to our mathematical modeling.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

- Ministry of Transport and Infrastructure Transport and Logistics Master Plan, 2053 full report and annexes.
- Gasoline Liter Price Forecast – Historical gasoline prices has been obtained from Petrol Ofisi A.Ş. Future prices in EUR has been forecasted by using Heat Roadmap Europe Analysis.
- Exchange rate (€/TRY) forecast – Sponsor's forecast has been used.
- GDP Real Growth Rate – for base case, IMF forecast has been used. For the sensitivity analysis, OECD and Oxford Economic Forecasts has been used.
- Population forecast (Both Turkey and Antalya) – TUIK historical and TUIK forecasts have been used.
- GDP/per capita USD forecast – It is a combination of IMF and TUIK forecasts.
- Inflation forecast in TL and EUR – Sponsor's forecast has been used.
- Country and province vehicle number forecast (car, truck, bus, other) - TUIK and other publicly available sources used.
- KGM regional directorate's planned underpass projects on state roads in the next 15 years – Turkiye 2053 Logistics Plan has been referred to.
- Hotel capacities, hotel bed capacity, accommodation statistics in the region - publicly available sources used
- Airport Passengers in the region - publicly available sources used.

All the background matrices have been merged with data collected for the above work, which is the basis of the model.

We directly communicated with KGM to request the monthly distribution of State Road traffic data, roadside survey data, and existing traffic analyses conducted in the region. However, we were informed that only the monthly distribution of traffic data related to State Roads could be provided, as the other data sets are not shared outside the organization.

2.3.4MARKET SEGMENTATION

The traffic analysis employs a market segmentation approach considering primary vehicle categories: cars, small trucks, buses, trucks and other vehicles. This segmentation allows for a nuanced understanding of traffic composition and its implications for toll revenue projections.

The traffic model forecasts traffic demand for different market segments separately. This is critical for the model to consider route-choice preferences between differing group conditions, costs, travel times, and determinants of market growth.

Toll vehicle classification in the project are depicted in Table 3, which comprise the pcu conversion factors we used in our reporting outcomes.

Table 3: Vehicle Class Type and Conversion Factors (IC)

Class Type	Description	Coefficient	Review Class
1	Standard Automobile	1.00	LV - Cars
2	Two axle automobile, if distance between axles greater or equal to 3.2 meter	1.60	LV – Small Trucks

DRAFT

Class Type	Description	Coefficient	Review Class
3	Vehicle having 3 axles	1.90	HV - Buses
4	Vehicle having 4 or 5 axles	2.52	HV - Trucks
5	Vehicle having 6 axles	3.18	HV – Other Vehicle
6	Motorcycle	0.25	Not projected

In Turkey Class 1 and 2 present similar growth patterns and much like Class 1, light vehicle traffic, thus are projected based on passenger matrices or GDP/capita. It has been modelled as a function of car ownership, which is a function of GDP growth and population growth.

Classes 3, 4 and 5 traffic demand follow a heavy vehicle demand pattern based on GDP growth (real), on the other hand, heavy vehicles in the Project have a low representation on the overall traffic AADT and most of the traffic on the Project is driven by light vehicle traffic.

2.3.5TRAFFIC FORECASTING APPROACH

1. Traffic Generation: This stage estimates the total vehicle trips *generated* within the study area. The model analyzes historical data (2007-2023) to establish relationships between traffic volume and key socioeconomic drivers. These drivers include:
    - *Provincial Factors:* Antalya's population growth, hotel bed capacity, and tourist arrivals.
    - *District-Level Factors:* Population and tourism indicators for districts surrounding the corridor.
    - *Economic Indicators:* GDP per capita for both Antalya province and Turkey as a whole.
    - *Car Ownership:* This is part related to GDP, on the other hand car ownership also has an elasticity to GDP in Turkey. Trends in the total number of vehicles in Turkey inform this variable.
2. Trip Distribution & Assignment: This stage determines how generated traffic will be *distributed* across the existing state road and the proposed motorway. Key aspects of this stage include:
    - Target Origin Matrix: A matrix representing travel patterns between origin and destination zones is developed according to TomTom Database and KGM historical traffic data.
    - Probabilistic Route Choice Model: A probabilistic/econometric model is employed to simulate driver route choice between the state road and the motorway. The model is based on the following formula:

$$Pm = e^{(-Cm)} / (e^{(-Cm)} + e^{(-Ch)})$$

Where:

- Pm: Probability of choosing the motorway
- Cm: Generalized cost of using the motorway
- Ch: Generalized cost of using the highway

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

- Generalized Cost Components: The generalized cost for each route considers factors beyond just travel time, aiming to reflect the overall driver experience. These components include:

$C = k1*Cf + k2*Cl + k3*Ct$

Where

- Cf: Fuel cost - calculated based on distance, fuel efficiency, and projected fuel prices.
- Cl: Toll fee - using the proposed toll rates for the motorway.
- Ct: Time cost - determined by multiplying travel time by the value of time (VoT). VoT varies by vehicle type, reflecting the higher opportunity cost of time for commercial vehicles.
- k1, k2, k3 = Coefficients representing the relative weights of each cost component (calibrated based on observed driver behavior)

Calibration Process: The model undergoes a rigorous calibration process to ensure its accuracy in replicating observed traffic patterns. This iterative process involves adjusting model parameters and comparing estimated traffic volumes to actual data from KGM reports. The calibrated model is then tested for its ability to explain current traffic demand and the statistical significance of the included variables.

2.4 Findings

Our findings in summary form are presented in this section.

2.4.1 BASE CASE FINDINGS

In review, we forecast that the total Average Annual Daily Traffic (AADT) on the Motorway will be c.25K passenger car equivalent units (pcu) in 2028, rising to c.60K pcu by 2040.

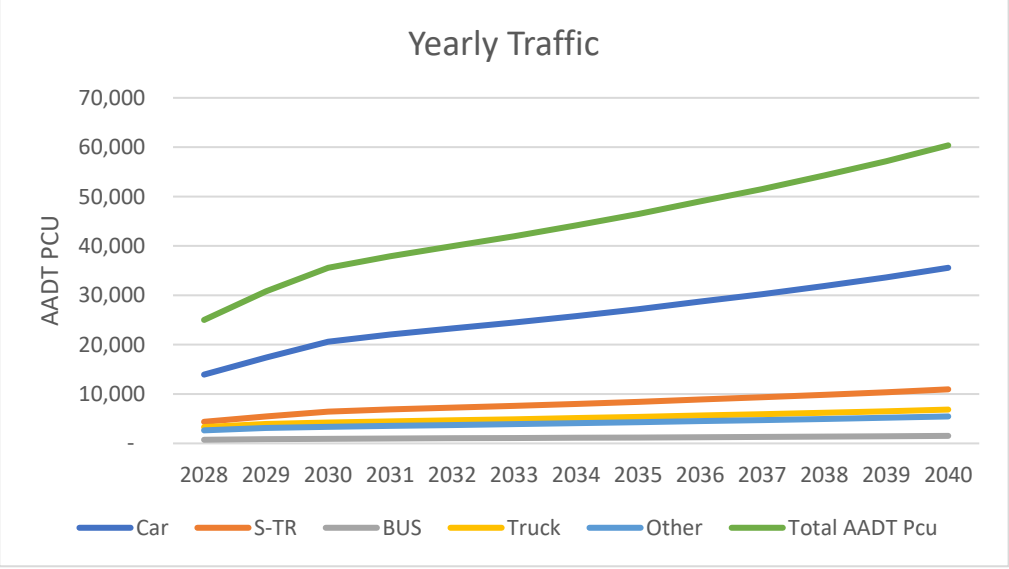

Figure 5. Yearly Traffic of the Motorway

DRAFT

As can be observed in Figure 5, light vehicle growth is projected to outpace truck growth, leading to a further decline in heavy-vehicle representation which is forecasted at 27% in 2028, and this is projected to fall to 22% in 2040.

Average capture rate at the beginning of the operation is forecasted to be 44%. On the other hand, the total traffic of state road in 2040 will be c.23K AADT PCU while it will be c.60K AADT PCU in the motorway resulting in an average diversion rate of c.72% at the end of the concession term.

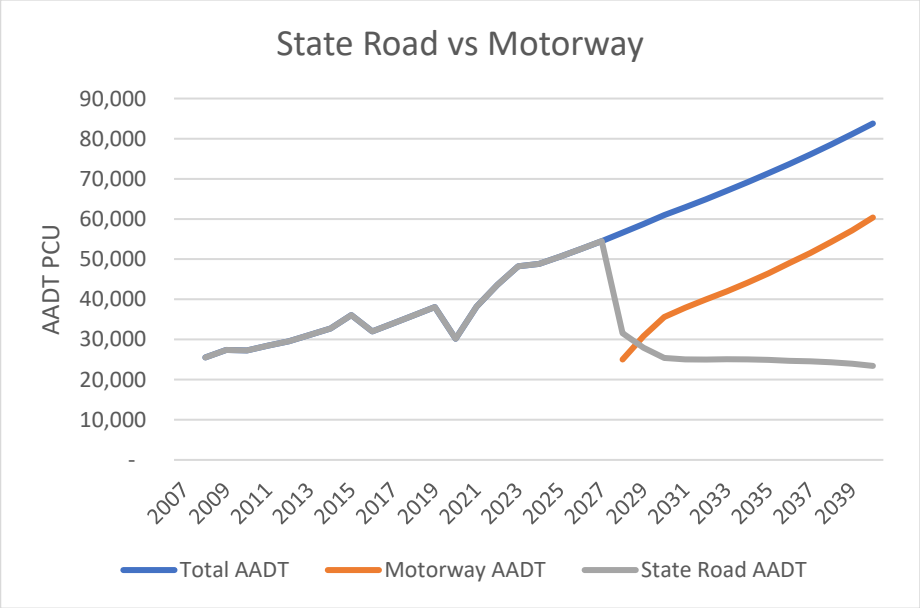

Figure 6. State Road vs Motorway Capture

Further details of our findings can be found under Section 5.5 of this report.

2.4.2 SENSITIVITY FINDINGS

[NTD: We will run sensitivity testing following initial engagement with the Lenders and present our findings in summary form under this heading.]

DRAFT

3.0 *Macroeconomic and Socioeconomic Context*

Turkey acts as the crossroads between Europe and Asia and has a central position on the transportation networks connecting Middle Eastern, Caucasian and Central Asian countries with Europe. With 27 border crossings with the 8 neighboring countries, Turkey is situated to be a natural transport hub connecting the East, West and South. This view is also supported through the Belt and Road Initiative where countries to the East of Turkey continues to expand and converge with Western markets at a brisk pace requiring a short, safe and fast way to transport cargo, passengers and services. As the accessibility to efficient highways systems increases, Turkey will be able to generate more foreign investment from transportation.

Surrounded by three seas, Turkey has a large variety of climates and landscapes. The tourism industry is one of the faster growing sectors of the economy along with infrastructure and agriculture. Further developing the transportation networks within Turkey will have positive knock-on effects to other industries within the economy.

The population of Turkey has continuously been rising, from around 13.5 million in 1927 to over 85.4 million in 2023. Urban population has been increasing steadily since 1950, mostly due to rural migration. Approximately 71% of the country's population was living in urban areas by year 2016. The need for urban and inter-urban transport infrastructure has dramatically increased following fast urban development and urban spiral.

Antalya, a major city and transportation hub, anchors the western end of the Project corridor. Recognized as a global tourism destination, Antalya boasts a vast network of accommodation facilities, ranging from luxury resorts to budget-friendly hotels, and welcomes millions of international tourists annually. (EY Tourism Update 2023). The city's proximity to Antalya International Airport , a major international gateway, further amplifies its significance in the tourism sector, generating substantial passenger traffic.

Alanya, situated at the eastern end of the corridor, is another prominent tourist destination, known for its stunning beaches, historic castle, and vibrant nightlife. Similar to Antalya, Alanya's economy is heavily reliant on tourism, with numerous hotels, resorts, and tourist attractions catering to both domestic and international visitors. (EY Tourism Update 2023).

Beyond tourism, the Project corridor encompasses several agricultural hubs specializing in the production of key agricultural commodities. Serik, located approximately midway along the route, is renowned for its extensive greenhouse cultivation, producing a variety of vegetables and fruits year-round. Manavgat, situated closer to Alanya, is another important agricultural center, known for its production of citrus fruits, primarily oranges and lemons. These agricultural centers contribute significantly to regional freight traffic, with trucks transporting produce to both domestic and international markets. (Ministry of Transport Master Plan, 2022).

The Antalya-Alanya Motorway is ideally positioned to capitalize on this robust mix of tourism and agriculture, providing the following strategic advantages:

- Enhanced Tourism Connectivity: The motorway will significantly improve connectivity between Antalya International Airport and key tourist destinations along the coast, reducing travel times and enhancing the overall tourist experience. This enhanced accessibility is particularly crucial for attracting high-spending tourists who place a premium on time and convenience. (EY Tourism Update 2023).
- Efficient Freight Transportation: The motorway will facilitate the efficient movement of agricultural goods from production centers like Serik and Manavgat to both local and national markets. Reduced transportation costs and improved logistics infrastructure are expected to boost the competitiveness of the region's agricultural sector. (Ministry of Transport Master Plan, 2022).

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

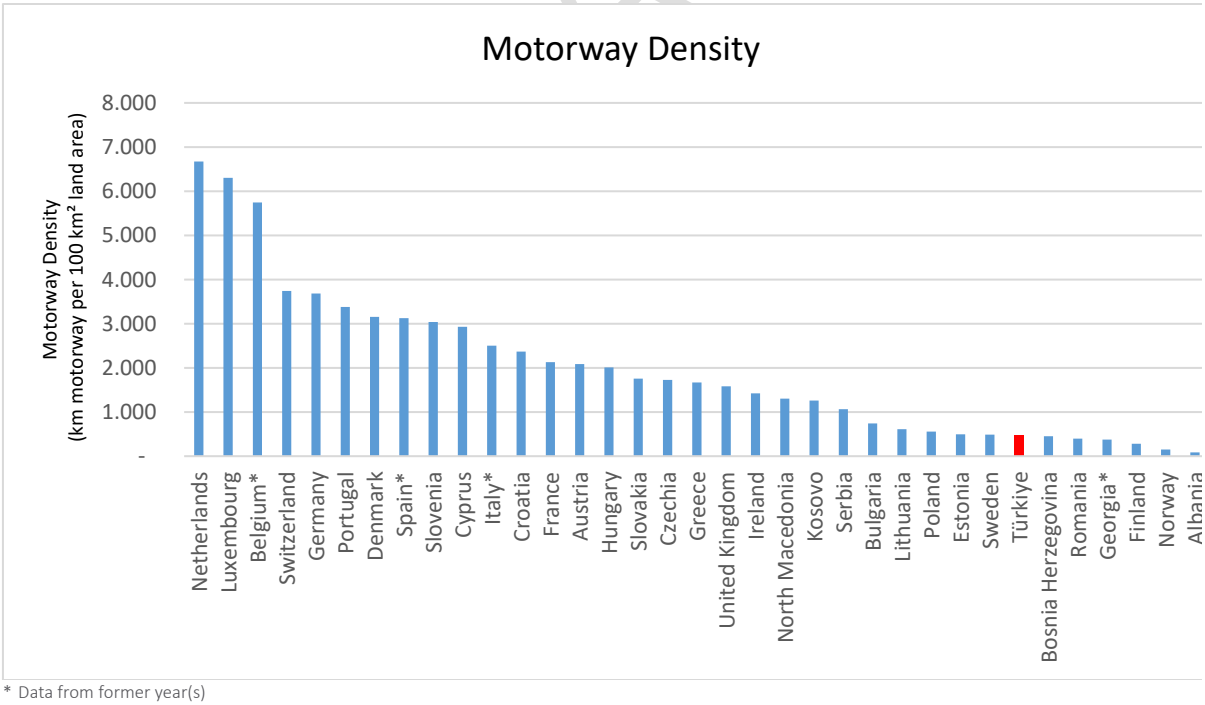
- **Stimulating Regional Development:** The motorway, by enhancing connectivity and reducing travel times, is expected to unlock the economic potential of towns and villages along the route, encouraging new investments and job creation.
- **Reduced Congestion on Existing Road:** By diverting through-traffic from the congested D400, the motorway will improve traffic flow and safety on the existing highway, benefiting local communities and businesses. (Environmental Impact Assessment, 2018).

The Antalya-Alanya Motorway project is a crucial infrastructure investment that will significantly enhance connectivity, boost economic activity, and improve the quality of life for residents and visitors alike. Its strategic location, catering to both tourism and agricultural needs, makes it a pivotal component of Türkiye's long-term development strategy for the Akdeniz Region.

3.1 Roads and Highways in Turkey and Where the Project Fits in

Comprised of 3,726 km of motorways (5.4%), 30,864 km of state highways (45%) and 34,064 km of provincial roads (49.6%), the extent of the Turkish main highway network has reached a total length of 68,654 km as of January 2024 according to KGM.

According to the latest set of data published by EuroStat for 2022, Turkey is the 6th country in Europe, in terms of total length of Motorways, following Spain, Germany, France, Italy and UK. However, in terms of motorway density (i.e. km of motorways per 100 km^2 of land area), Turkey is still lagging far behind many EU countries. The same evaluation can also be made for state highways of Turkey. However, the definition of road types varies from country to country and therefore, the data are not comparable (European Union Road Federation, 2017).



* Data from former year(s)

Figure 7. Total Length of Motorways in 2022 for European Countries (EuroStat)

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Since 2001, Turkey has maintained a strong commitment to infrastructure development, significantly expanding its motorway network to enhance connectivity and support economic growth. According to the 2053 Logistic Master Plan, Turkey's motorway density is at the level of 4.5 km/1,000 km². This figure is below the level of developed countries (24.25 km per 1,000 km² in Japan; 48.83 km in South Korea; 37.54 km in Germany; 34.56 km in Spain; 22.62 km in France). Increasing Turkey's motorway density is considered a realistic solution for providing a fast and safe transportation infrastructure. By implementing motorway projects planned for the 2021-2023 and 2023-2035 periods, it is projected that the motorway density can be increased to 10 km/1,000 km².

According to the 2053 Logistic Master Plan, the construction of 5,839 km of new motorways is projected in Turkey by 2053. In addition to motorways, a total of 13,951 km of road widening and 795 km of new divided road projects are also planned.

While traffic congestion is generally less pronounced in Türkiye compared to more densely populated European countries, certain sections of the state road network experience significant traffic volumes, particularly around major urban centers and seasonally around tourism destinations, Antalya-Alanya alignment hits both these marks.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Figure 8: Current Motorway Network of Turkey (KGM 2023)

As of 2023, Türkiye's motorway network, while still under development, has expanded significantly, providing key connections between major cities and economic centers. The concentration of operational motorways in the western and southern regions, particularly around Istanbul and along the Mediterranean coast, reflects the country's economic and population distribution, with those areas generating the highest traffic volumes and demanding greater transport infrastructure investment.

This report has been prepared by BTY Group at the request of Otoyol Yatırım ve İşletme A.Ş. and is the exclusive property of Otoyol Yatırım ve İşletme A.Ş. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of Otoyol Yatırım ve İşletme A.Ş.

Figure 9. Transport and Logistics Mater Plan 2053 - Ports

The 2053 Green (Sustainable) Scenario envisions a significant expansion of port and logistics infrastructure across Türkiye, supporting increased trade and economic activity. The Antalya-Alanya Motorway can play a crucial role in connecting the numerous ports planned along the southern coast to inland regions, facilitating efficient movement of goods and strengthening the motorway's strategic importance as a key freight corridor. Furthermore, the development of inland logistics centers, particularly in the vicinity of Denizli, Karaman and Konya, will further enhance the motorway's role in facilitating seamless integration of road and rail transport for the efficient distribution of goods.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Figure 10. Transport and Logistics Mater Plan 2053 - Airports

Türkiye's 2053 Green (Sustainable) Scenario envisions a substantial increase in the number of airports across the country, enhancing regional connectivity and supporting economic growth, particularly in the tourism sector. The Antalya-Alanya Motorway's proximity to existing airports, including Antalya International Airport and Gazipaşa Airport, will facilitate convenient access for tourists and improve the region's overall attractiveness as a destination. This increased accessibility, driven by the seamless integration of air and road transport, will be crucial in capturing a greater share of the anticipated growth in domestic and international tourism and air travel.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Figure 11. Transport and Logistics Mater Plan 2053 - Roads

The Turkish government's ambitious 2053 Green (Sustainable) Scenario prioritizes a substantial expansion of the national road network, particularly the development of new motorways, aiming to enhance connectivity and facilitate economic growth. The completion of the Afyonkarahisar-Alanya Motorway, which incorporates the Antalya-Alanya section, will create a crucial high-speed corridor linking central Anatolia to the Mediterranean coast, significantly reducing travel times and unlocking economic potential in the region. This enhanced connectivity will facilitate both tourism and freight transport, making the Antalya-Alanya Motorway a vital component of this strategic transportation network.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

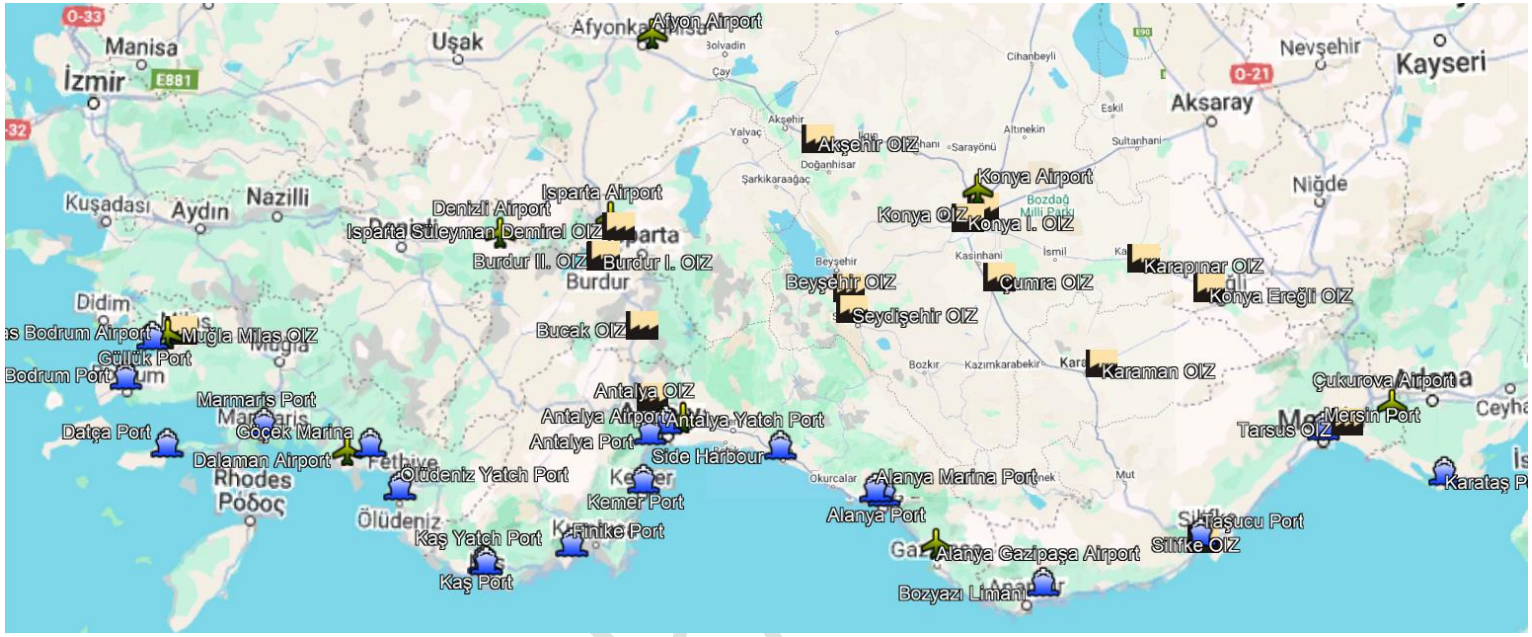


Figure 12. Existing Airports, Ports and Industrial Zones In Catchment Area

The map highlights the existing airports, sea ports and industrial infrastructure within the Antalya-Alanya Motorway's catchment area, emphasizing the region's reliance on tourism and the presence of key industrial clusters. The concentration of ports and marinas along the coastline, stretching from Antalya to Alanya, underscores the region's strong maritime orientation, primarily driven by tourism and the transportation of agricultural goods. The Antalya-Alanya Motorway will not only enhance access to these coastal hubs but also facilitate the movement of goods and people between these points and inland regions, bolstering regional economic activity.

Furthermore, the presence of several Organized Industrial Zones (OIZs), particularly in Antalya, Isparta, Burdur, and Denizli, highlights the potential for the motorway to generate substantial freight traffic. These OIZs are home to a diverse range of industries, including manufacturing, agriculture, and textiles. The motorway, by providing a fast and reliable connection between these industrial hubs, can reduce transportation costs and enhance the region's overall industrial competitiveness. The development of the Antalya-Alanya Motorway, therefore, represents a strategic investment that aligns with the region's existing economic strengths and its future growth potential in both the tourism and industrial sectors.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

3.2 Catchment Area Definition

The project's catchment area encompasses a vital segment of Türkiye's Mediterranean coast, known for its thriving tourism industry and significant agricultural activity. The Antalya-Alanya Motorway is strategically positioned to capitalize on and further stimulate growth in both sectors.

Below figure shows the inner and outer catchment area of the project.

Figure 13. Catchment Area

It's important to recognize that the Antalya-Alanya Motorway is not a standalone project but a critical section of the larger planned Afyonkarahisar-Alanya Motorway. This broader context significantly expands the project's potential catchment area, extending its reach deep into central Anatolia in the long term, further amplifying the motorway's importance in connecting diverse regions and stimulating economic activity across a wider geographic area.

Representing one of two sub-projects comprising the larger Afyonkarahisar-Alanya Motorway, the Antalya-Alanya segment specifically connects the Serik and Alanya districts within the Antalya province.

Overall, the Antalya-Alanya Motorway benefits from a strategically advantageous location within a region poised for significant economic growth. The inner catchment zone, encompassing Antalya province, is already a prominent tourism hub. The outer catchment zone, which includes the provinces of Muğla, Burdur, Isparta, Konya, Karaman, Mersin, Denizli, and Afyonkarahisar, represents a mix of developing regions with considerable potential for expansion in sectors such as agriculture, industry, and logistics.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

The inner catchment zone is defined as the province the Motorway directly crosses which is Antalya. The outer catchment, on the other hand, covers the bordering provinces which are Muğla, Burdur, Isparta, Konya, Karaman and Mersin. Also Denizli and Afyonkarahisar are also included in the outer catchment area.

3.3 Project Market Overview

3.3.1SOCIO-ECONOMIC INDICATORS (POPULATION GROWTH, CAR OWNERSHIP RATES)

The Antalya region, with its strong focus on tourism, benefits from a dynamic demographic profile characterized by a relatively young population and an increasing middle class. This demographic trend, coupled with rising income levels, has fueled a growing demand for travel and leisure activities, contributing to the region's vibrant tourism industry. (EY Tourism Update, 2023) Furthermore, car ownership rates in the region are on the rise, further indicating increased disposable income and a potential shift towards private transportation, making the Antalya-Alanya Motorway an even more attractive alternative to the existing state road. (Environmental Impact Assessment, 2018)

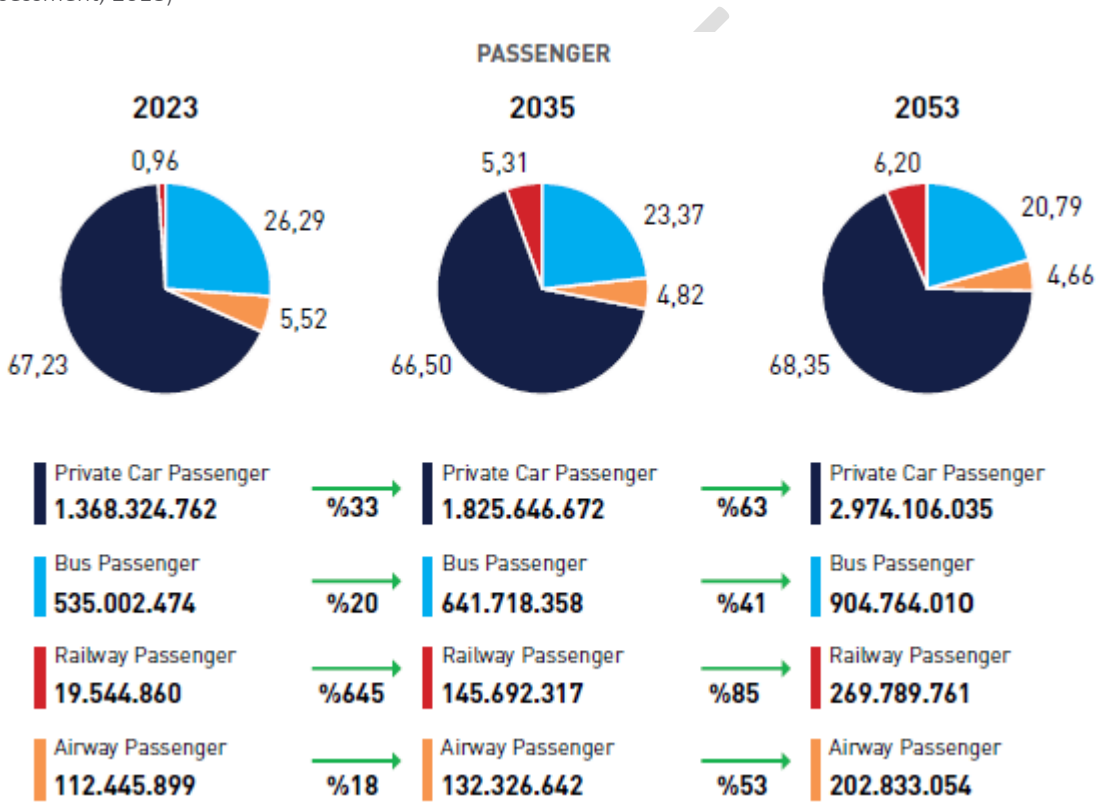

Figure 14. Passenger Projection in Turkey (2053 Transportation and Logistics Master Plan)

Above figure illustrates the projected shift in passenger transportation modes within Turkey through 2053. While car travel currently dominates, representing 67.23% of passenger trips in 2023, the model predict that it will be 68.35% in 2053. Although number of passenger will increase in air travel, the percentage in overall will decrease from 5.52% in 2023 to 4.66% in 2053. The projected rise in railway passengers from a negligible 0.96% in 2023 to

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

a more substantial 6.2% in 2053 signals the potential impact of planned railway improvements. While competition from rail may impact car traffic projections, the motorway, by offering a faster and more convenient alternative to the existing state road, can still capture a significant share of car passengers seeking to bypass congested areas and reduce travel times.

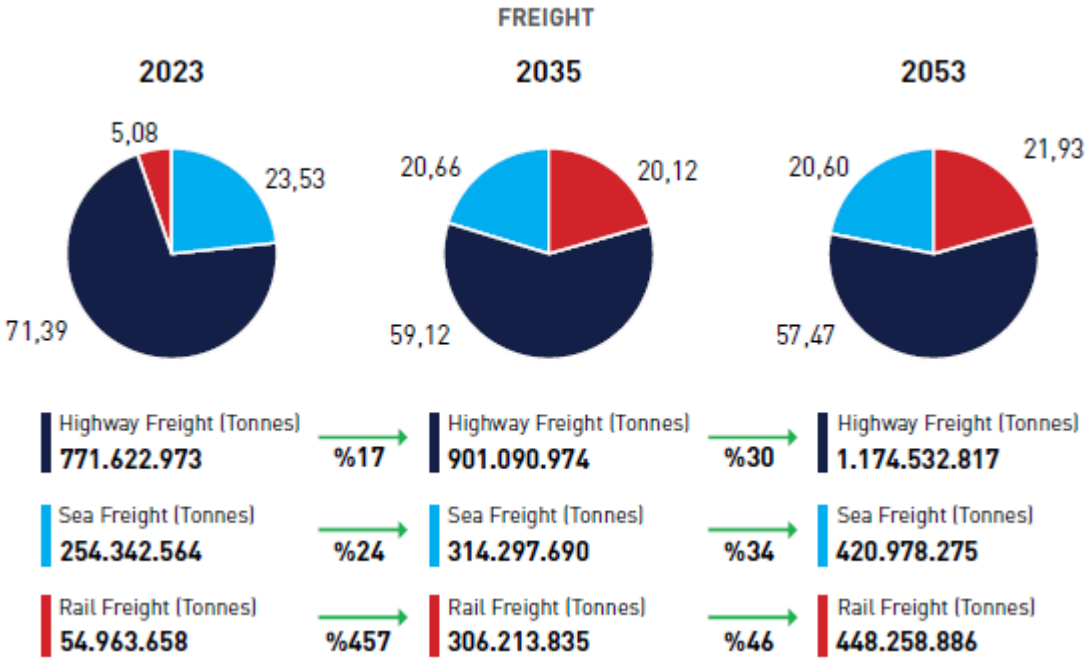

Figure 15. Freight Projection in Turkey (2053 Transportation and Logistics Master Plan)

Similar to the passenger projections, above figure illustrates the projected shift in freight transportation modes within Turkey through 2053. While highway freight currently dominates, representing 71.39% of all freight transportation in 2023, the model predict that it will be 57.47% in 2053. However, the transported freight amount will increase from 771M Tonnes to 1,174M Tonnes. The projected rise in rail freight from a negligible 5.08% in 2023 to a more substantial 21.93% in 2053 signals the potential impact of planned railway improvements. While competition from rail may impact freight transportation on highways, increase in the amount of freight can still capture a significant share of heavy vehicles.

Vehicle Ownership in Turkey

Vehicle type and ownership are drivers of traffic density. The status quo for car type and ownership has shifted over years. As seen in Figure 16, the total number of vehicles that are registered in Turkey has increased from over 19 million to 29 million in the past 10 years (from 2014 to 2024). In 2024, cars represented 52% of the total vehicles, followed by small trucks at 15%, motorcycles at 19%, tractors at 7%, trucks at 3%, minibuses at 2%, busses at 1% and special purpose vehicles (e.g. ambulances, fire trucks, funeral vehicles, etc.) at less than 1%. As in Figure 18, Turkey is still lagging far behind many EU countries in terms of passenger car per capita.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

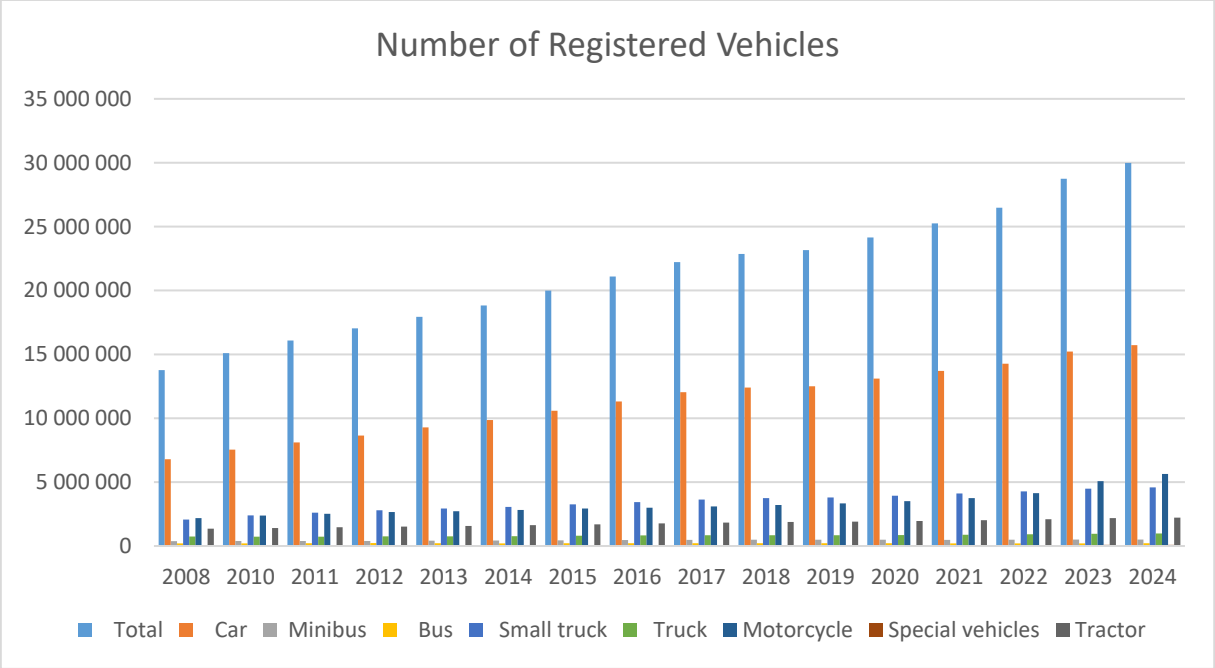

Figure 16. Number of Registered Vehicles in Turkey by Vehicle Type (TUIK 2024 June)

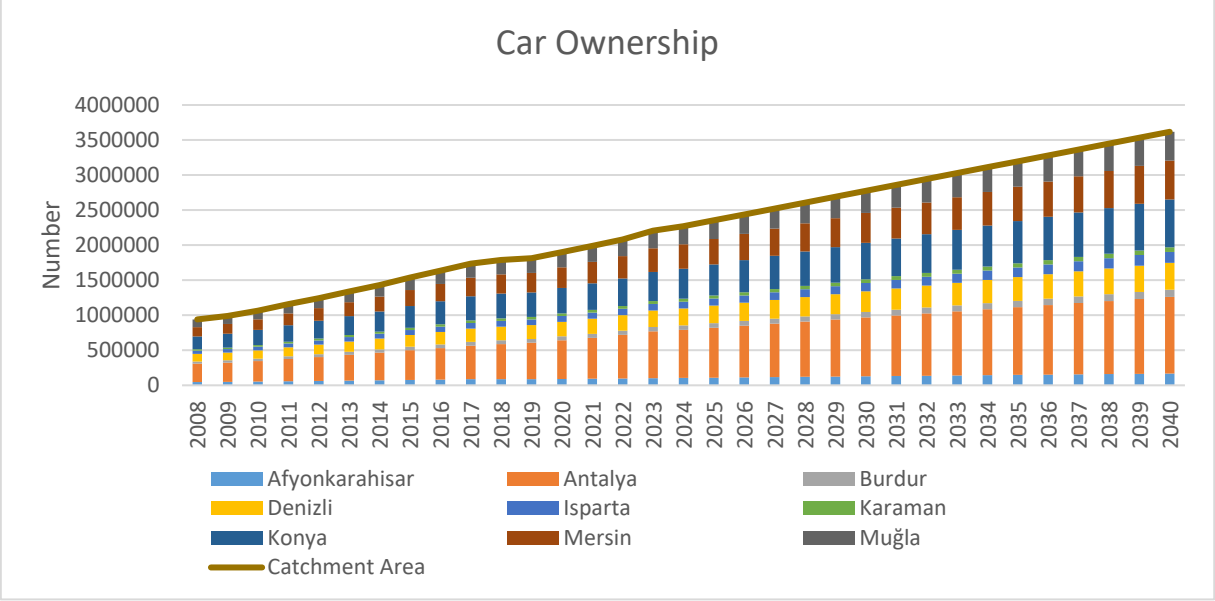

Figure 17. Car Ownership in Catchment Area by Province

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

As can be seen in the above figure, the increase in number of registered vehicles in motorway provinces and in Turkey are comparable. The annual growth in vehicle ownership has increased at an average of 4.8% in Turkey and also comparably at 4.8% in motorway provinces over ten years period. According to the trendline, Antalya car ownership could increase from 686K in 2024 to 1.1M in 2040 and catchment are car ownership could increase from 2.3M in 2024 to 3.6M in 2040.

We note that the average car ownership growth rate has been greater than the growth rate of GDP, GDP per capita and population. This would infer that there has been a cultural shift in the importance and acceptance of vehicles into the Turkish lifestyle and we can expect more car owners to inflate traffic volumes in future years.

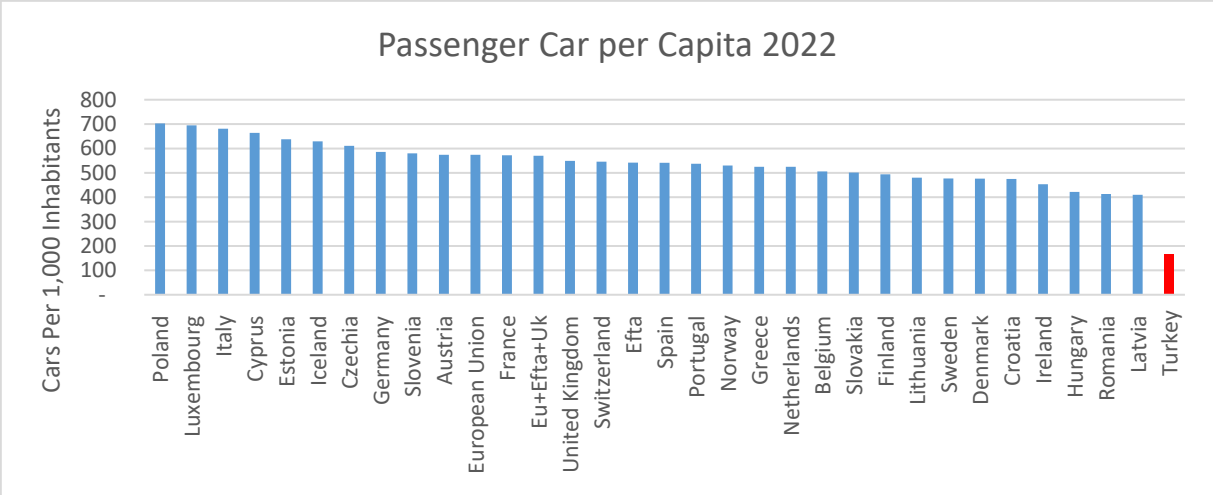

Figure 18. Passenger Car Per 1,000 Inhabitants in 2022 for European Countries (ACEA Report, 2023)

Finally, Turkey lags behind its European counterparts in passenger car ownership therefore we are able to explain ever increasing vehicle ownership levels even through financial downturn in recent years while GDP/capita has been steady or reducing.

Population Overview

Below, Figure 19 represents each catchment provinces' population. The Project's inner catchment zone constitute some of the most densely populated regions in Turkey.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

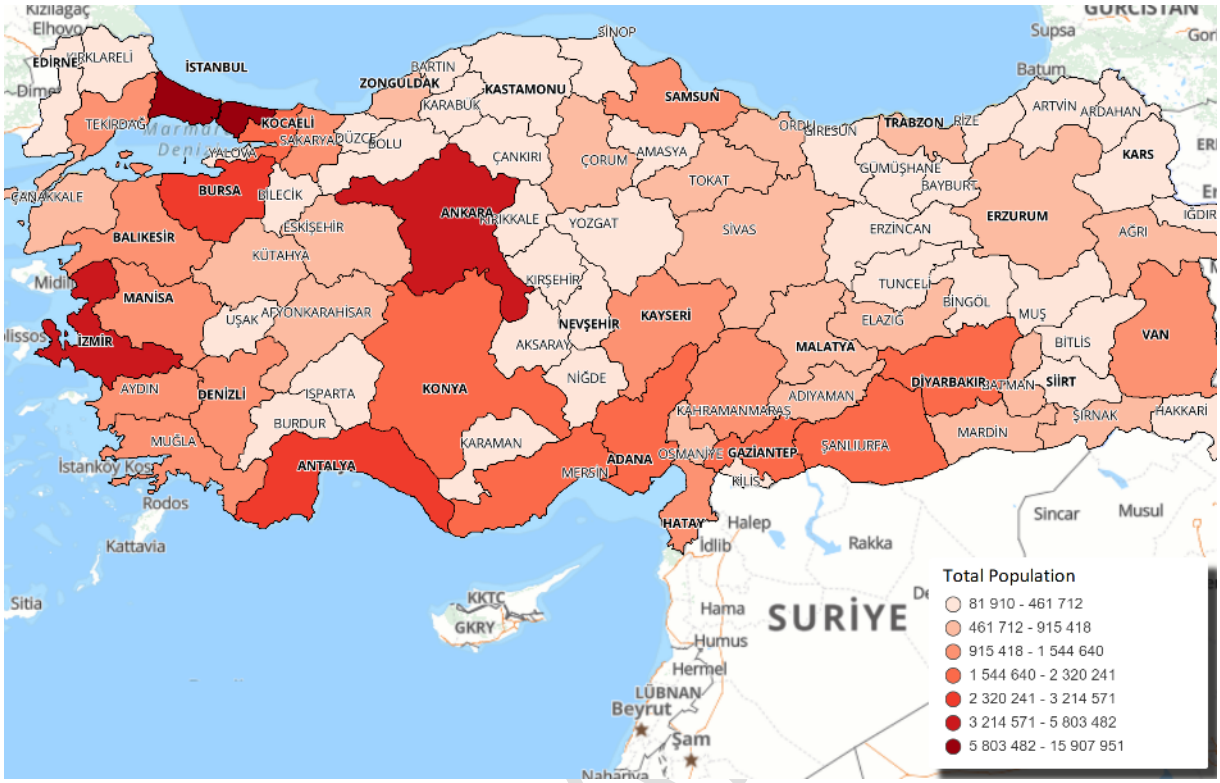

Figure 19. Population Map of Turkey (TUIK 2023)

According to TUIK Population forecast for Turkey until 2100 is shown below;

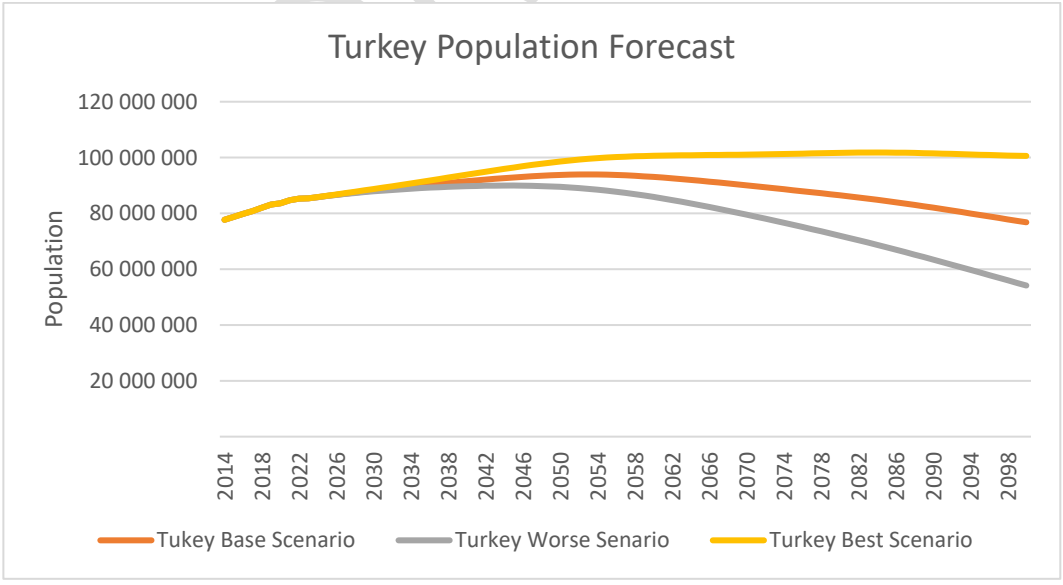

Figure 20. Turkey Population Forecast

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

According to Base Scenario, Turkey population growth will continue until 2054 and reach 93.9M at peak and start decreasing. According to Worse Scenario, Turkey population growth will continue until 2045 and reach 89.9M at peak and start decreasing. According to Best Scenario, Turkey population growth will continue until 2085 and reach 101.8M at peak and starts decreasing.

TUIK provides provincial population forecasts only until 2030. Below figure shows the TUIK's province base forecast until 2030. After 2030, we applied TUIK's Turkey base scenario growth rates for each province that are considered in the catchment zone.

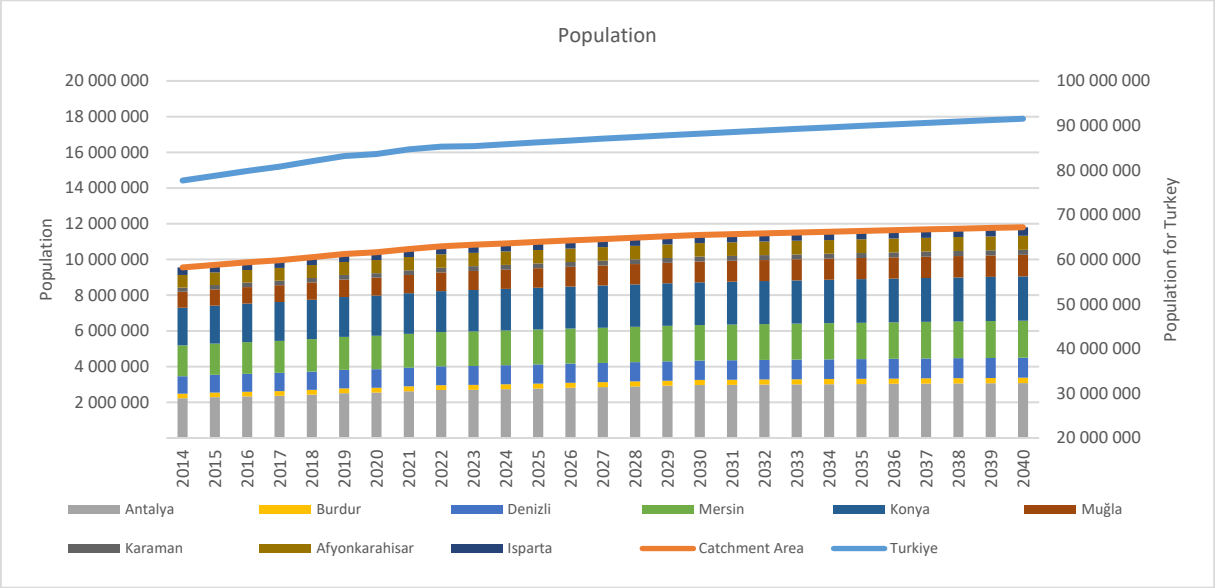

Figure 21. Population Forecast

As can be seen in the table, the population of inner catchment provinces increased by approximately 1.3M in the past 10 years according to the data provided by TUIK. According to the population forecast study, population of Antalya will increase from 2.7M to 3.1M until 2040 and overall catchment area population will increase from 10.8M to 11.8M until 2040. Population of Antalya equals to 3.16% of Turkey's population while the catchment area's population equals to 12.68% of Turkey's population as of 2023.

For 10 years, the average annual population growth rate of 1.4% in the motorway provinces and 2.2% in Antalya are significantly higher than the national growth rate of 1.1%. Population growth has a direct relationship with traffic generation, therefore, will increase AADT as the population grows.

Table 4. Population Growth Rate (TUIK 2024 June)

Population Growth Rate	2015	2016	2017	2018	2019	2020	2021	2022	2023
Turkey	1.35%	1.36%	1.25%	1.48%	1.40%	0.55%	1.27%	0.71%	0.11%
Catchment Area	1.50%	1.49%	1.17%	1.74%	1.71%	1.02%	1.68%	1.42%	0.84%
Antalya	2.96%	1.75%	1.54%	2.62%	3.52%	1.46%	2.81%	2.60%	0.31%

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Population growth has a positive impact on traffic demand which has been factored into the CAGR in the O-D matrices of the traffic modelling.

3.3.2MACRO-ECONOMIC DATA (GDP, INFLATION, TOLL RATE CHANGES)

Below figures shows the GDP and GDP per capita according to TUIK.

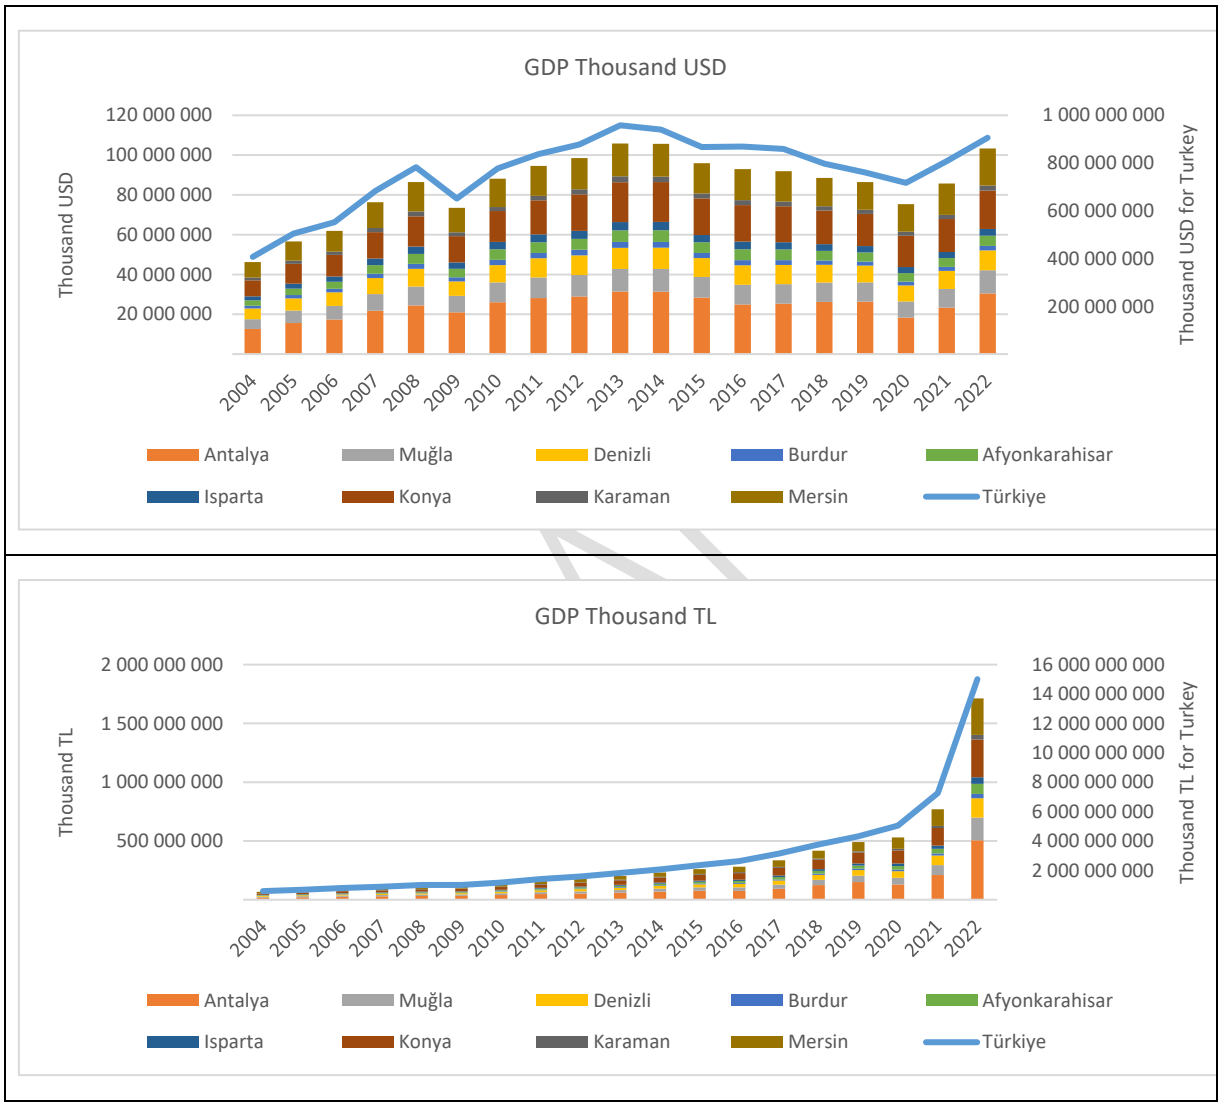

Figure 22. GDP for Turkey and Catchment Area

Above GDP charts illustrate the consistent GDP growth of Türkiye and the provinces within the Antalya-Alanya Motorway's catchment area between 2004 and 2022. While all provinces have experienced economic expansion, Antalya exhibits the most significant growth, consistently outpacing the national average, indicating a strong and dynamic regional economy. This robust economic performance suggests a positive outlook for future traffic demand on the Antalya-Alanya Motorway, driven by increased commercial activity and rising personal incomes.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Turkey's GDP in 2023 is 1.1 trillion USD (26.3 trillion TL) according to the latest published TUIK data which doesn't show GDP of each province for 2023.

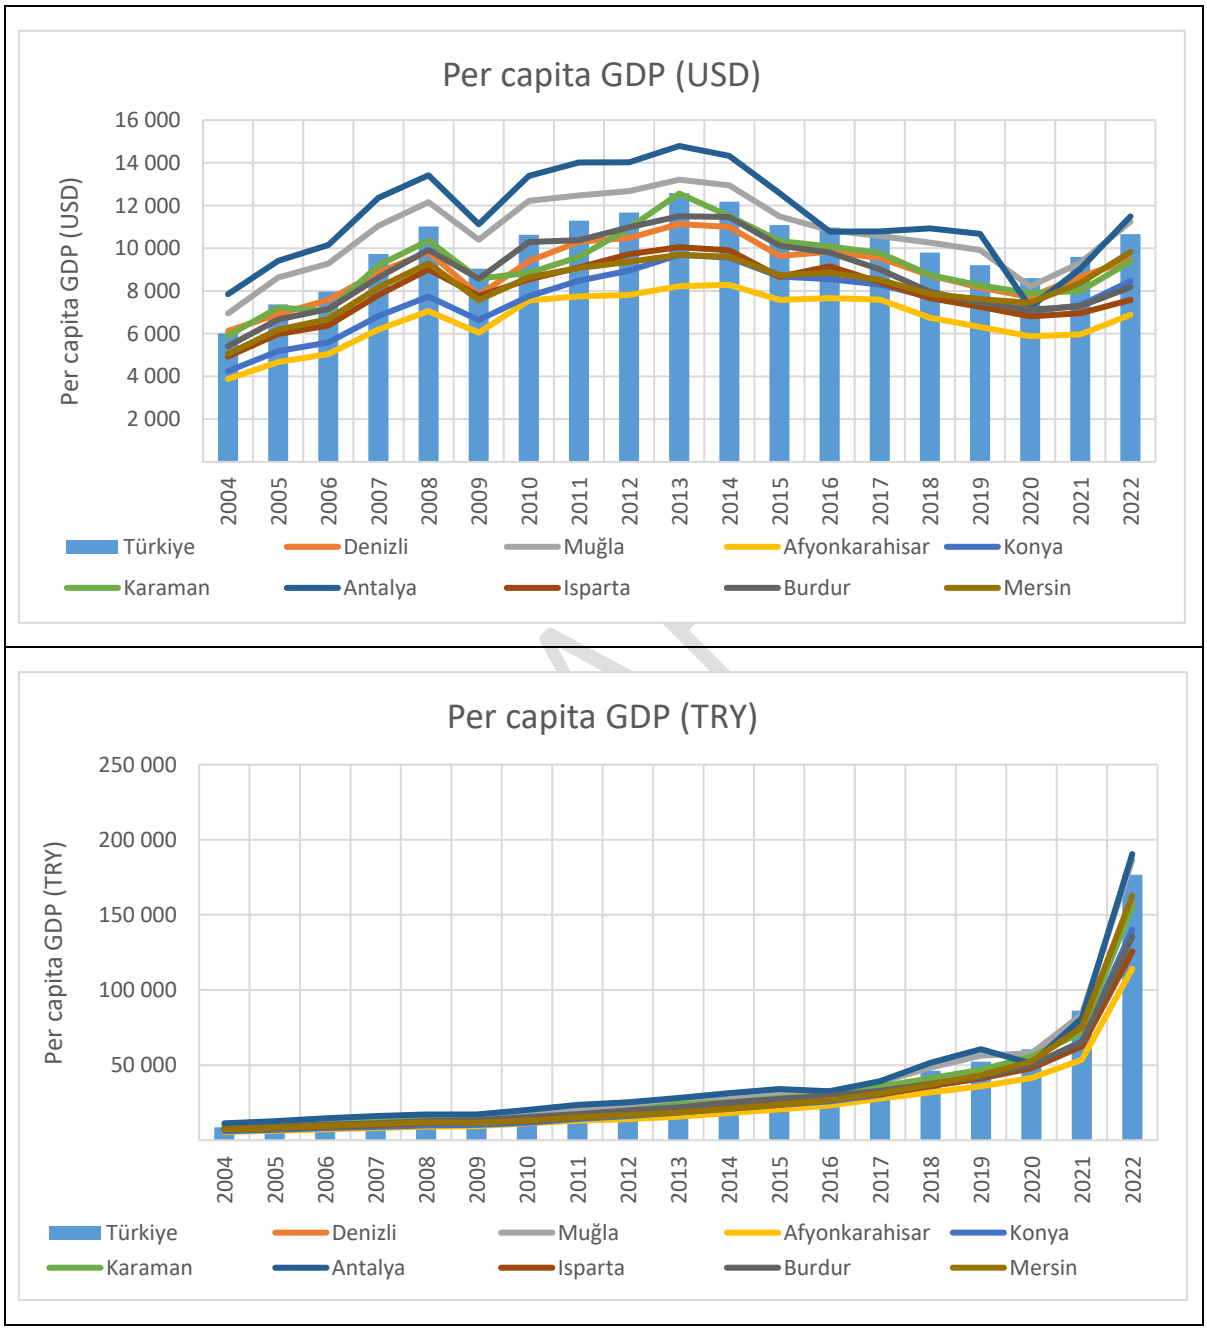

Figure 23. GDP per capita for Turkey and Catchment Area

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Above charts depicts per capita GDP trends for Türkiye and the provinces within the Antalya-Alanya Motorway's catchment area from 2004 to 2022. While exhibiting some fluctuations, per capita GDP has generally increased across the region and nationally, indicating a trend of rising incomes and improved living standards. This positive trend suggests a potential for continued growth in car ownership and travel demand, factors that will be critical for the success of the Antalya-Alanya Motorway. Among the catchment area provinces, Antalya has the highest GDP per capita with 11,495 USD (190,499 TL) in 2022 while Turkey's average GDP per capita is 10,659 USD (176,651 TL).

IMF only provides forecasts for Turkey until 2029. Below figure shows the IMF's forecast until 2029. After 2029, we applied trendline of the forecasted years.

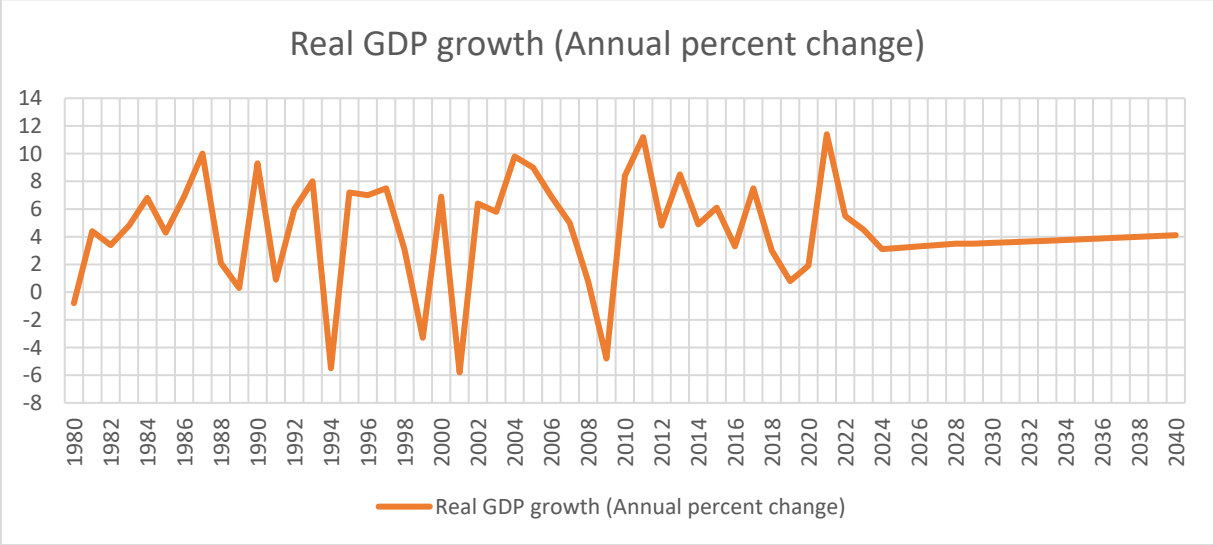

Figure 24. IMF Real GDP Growth for Turkey

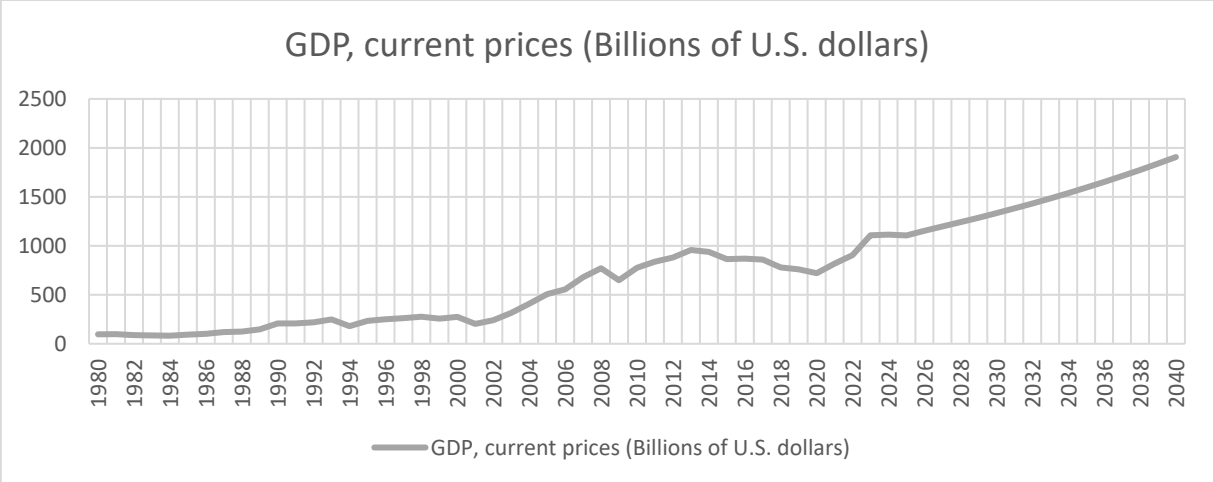

Figure 25. IMF GDP Current Prices (USD) for Turkey

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

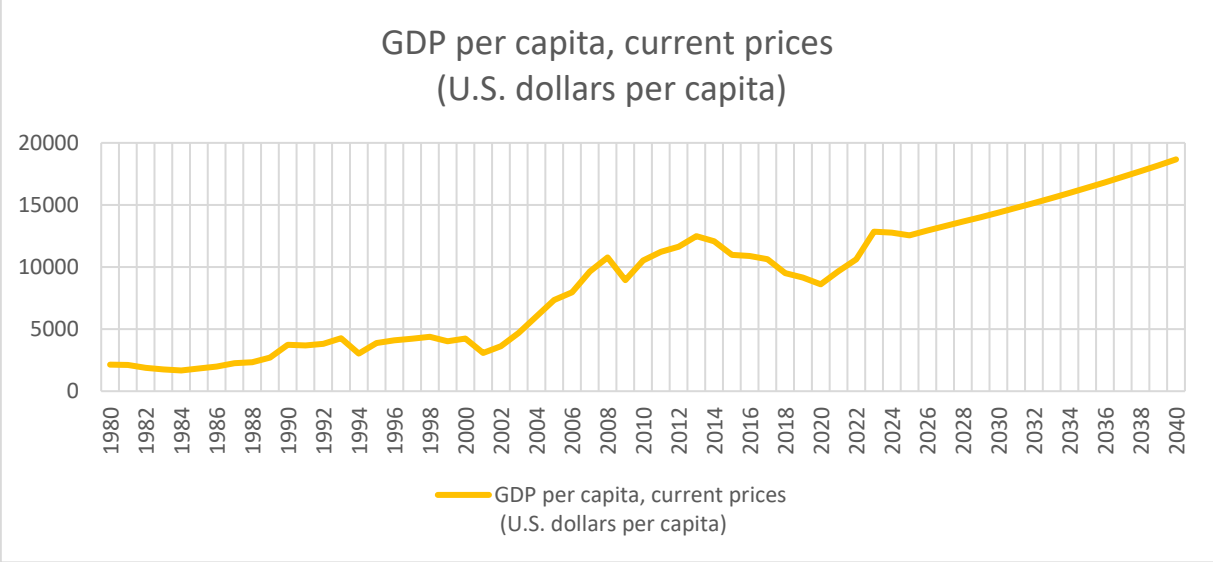

Figure 26. IMF GDP per capita Current Prices (USD) for Turkey

Türkiye's real GDP growth has exhibited significant volatility in past decades, experiencing periods of both robust expansion and sharp contractions. However, IMF projections through 2029, coupled with a trendline analysis, suggest a period of relative stability in the coming years, with real GDP growth hovering around a moderate 4%. This stable growth outlook, while not as dynamic as some previous periods, is still favorable for the Antalya-Alanya Motorway project, as it indicates continued economic activity and potential for increased travel demand in the long term. According to this forecast, Turkey's GDP can reach up to 1.9 trillion USD in 2040 and GDP per capita can reach up to 18,669 USD in 2040.

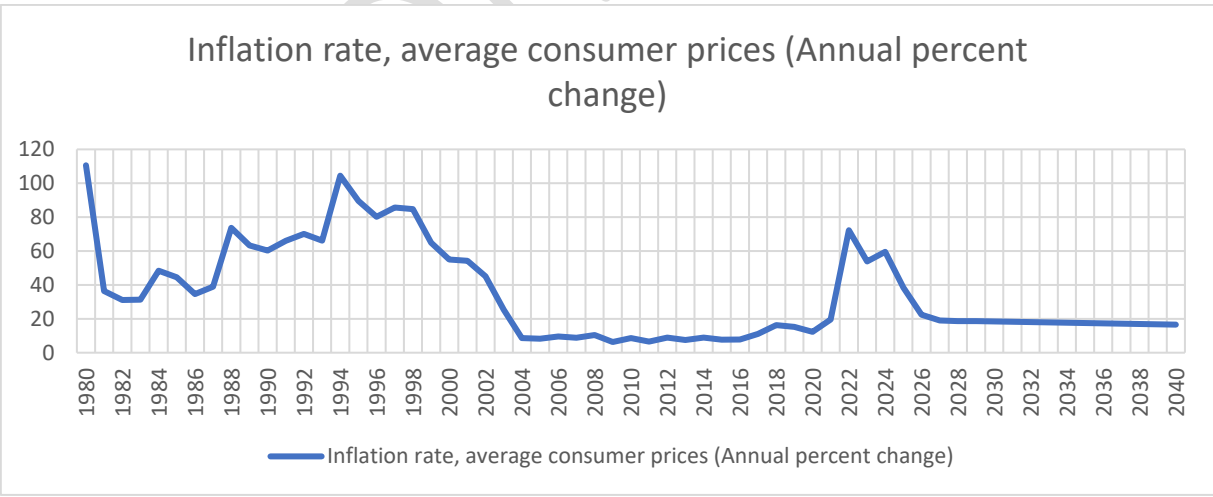

Figure 27. IMF Inflation Rate for Turkey

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Türkiye has a history of fluctuating inflation rates, with periods of sharp increases and relative stability. While recent years have seen elevated inflation, the IMF forecasts a downward trend towards a more moderate level, approaching 18% by 2029. Maintaining this trajectory of declining inflation will be crucial for the long-term success of the Antalya-Alanya Motorway, as high inflation can erode consumer purchasing power and potentially impact the affordability of toll fees.

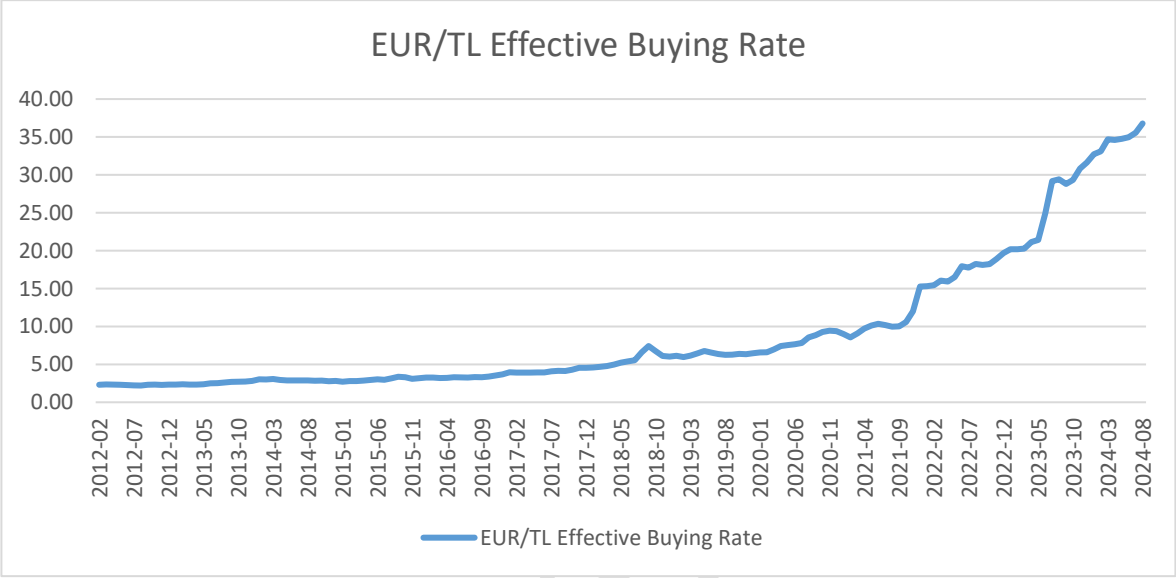

Figure 28. EUR/TL Effective Buying Rate

According to the Turkey Central Bank Data, above figure shows the historical data of EUR/TL Effective Buying Rate. Above chart depicts the steady depreciation of the Turkish Lira (TL) against the Euro (EUR) from 2012 to 2024. The significant weakening of the TL, particularly in recent years, has implications for the Antalya-Alanya Motorway project as it can impact construction costs, financing arrangements, and the affordability of toll fees, which are likely to be denominated in EUR.

According to the Sponsor's FM inputs, below figures shows the forecasted Turkish CPI, Eurozone CPI, EUR/TL Rates.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039	2040
Turkish CPI	70.00%	35.00%	30.00%	20.00%	15.00%	12.00%	10.00%	8.00%	6.00%	6.00%	6.00%	6.00%	6.00%	6.00%	6.00%	6.00%	6.00%
Eurozone CPI	2.70%	2.30%	2.20%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%	2.10%
Average EUR/TL	39.40	53.58	69.26	84.35	96.91	107.64	116.98	124.84	130.80	135.79	140.98	146.36	151.95	157.76	163.79	170.04	176.54

Figure 29. Sponsor's Financial Forecast for CPI and EUR/TL Exchange Rate (Received August 9, 2024)

The Sponsor's financial model anticipates a sharp decline in Turkish CPI from 70% in 2024 to 6% in 2032, stabilizing at that level through 2040. In contrast, Eurozone CPI is projected to remain relatively stable at 2.1% over the same period. The EUR/TL exchange rate, currently at 39.40, is forecasted to appreciate steadily, reaching 176.54 by 2040, indicating continued weakening of the Turkish Lira. This divergence in inflation and exchange rate trends highlights the potential volatility and risk associated with the project's financial performance, particularly as toll rates are denominated in EUR.

Instead of utilizing the IMF data provided above, the Sponsor's forecasts for inflation and the EUR/TL exchange rate have been incorporated as inputs into our model.

3.3.3 CORRELATION BETWEEN TRAFFIC TRENDS AND SOCIO-ECONOMIC/MACRO-ECONOMIC FACTORS

Since 2001, Turkey maintained a long-term focus on implementing ambitious reforms in many financial and fiscal areas. This was initially aligned with the financial reforms adopted as part of an IMF program, agreed for implementation following a major domestic financial crisis in 2001. With the program and the extensive reforms implemented as part of it, as well as harmonizing many laws and regulations with European Union (EU) standards, the country's economic fundamentals were strengthened, leading to an era of strong growth, averaging more than 6% annually until 2008. Further to the reforms, a well laid out and rapid privatization program also contributed to country's strong economic outlook, reducing state involvement in industry, banking, transport, power generation, and communication sectors. Turkey also urbanized dramatically during this time. The significant growth trend reversed in 2008 due to the 2008/2009 global economic crisis and bounced back after 2010. However, since 2016, reforms in several areas slowed down, and a number of economic vulnerabilities and risks reversed some of the progress. Most importantly, current account deficit means the country has to rely on external investments to finance growth, making it vulnerable to external shocks. Furthermore, unemployment and inflation have been rising in current years, with the Turkish Lira continuously depreciating against the US dollar (CIA, 2019) (OECD, 2018) (World Bank, 2020). Recognizing the need for sustained growth and the limitations of an aging transportation system, the Turkish government has prioritized infrastructure investment, with a significant

DRAFT

emphasis on expanding the motorway network, recognizing its role in stimulating economic activity and enhancing regional connectivity.

GDP and GDP per capita growth are key indicators of long-term traffic generation potential. An analysis of regional and national economic data reveals the following trends relevant to the Antalya-Alanya Motorway Project:

- National GDP in 2022, the last available data year from TurkStat, is around 15,011 billion TRY or 906 billion USD. Although Turkey's GDP in USD terms experienced a decline after 2013, it has shown a resurgence since 2020. Notably, the GDP increased by 13% in 2021, followed by a further 12% rise in 2022, indicating a return to a growth trajectory.
- Shift Towards Services and Tourism: Türkiye is experiencing a shift towards a service-oriented economy, with tourism playing a crucial role. The Akdeniz Region, encompassing the Antalya-Alanya corridor, is a major beneficiary of this trend, with tourism contributing significantly to regional GDP growth. (EY Tourism Update 2023).
- GDP per capita for 2022 is 10,659 USD. As is the case with GDP, GDP per capita has also been increasing after 2020.
- The share of Motorway Catchment provinces' total regional GDP in total GDP of Turkey is c.11.4% since 2004. Antalya have the largest share among the other motorway catchment provinces.
- While Turkey demonstrates strong performance in areas like accessing Direct Foreign Investment (ranked 33th globally) and protecting minority investors (21st), challenges remain in aspects such as starting a business (77th) and resolving insolvency (120th). These areas highlight opportunities for continued improvement in streamlining business processes and strengthening the legal framework for investors.
- Labour productivity is strong as the economy shifts from low-cost production driven economy to focusing on productivity driven investments such as skilled labour and innovation.
- Labour flexibility has been improving, with employers providing part-time employment opportunities and severance payments.

Enhanced economic activity is directly related to traffic generation. The Antalya-Alanya Motorway Project is strategically positioned within the Akdeniz Region, a dynamic area experiencing a surge in both tourism and agricultural activity. While national GDP growth has faced challenges in recent years, the tourism sector, a key driver for the Antalya-Alanya corridor, has demonstrated remarkable resilience and growth. (EY Tourism Update, 2023). The combined GDP contribution of the catchment provinces (Antalya, Muğla, Denizli, Burdur, Afyonkarahisar, Isparta, Konya, Karaman, and Mersin) to Türkiye's annual GDP in 2022 was 11%, reflecting increasing economic significance for these provinces. If these trends continue, the region is expected to experience a surge in traffic, driven by both tourism-related activities and the movement of agricultural goods, benefitting the Antalya-Alanya Motorway

3.4 Catchment Area Economic Outlook

While Türkiye has historically demonstrated robust economic growth, recent years have been marked by significant challenges. The country's economic growth in the 2019-2023 period was noticeably subdued compared to previous years, influenced by factors such as currency fluctuations, global trade tensions, and the COVID-19 pandemic. The devastating earthquakes in Kahramanmaraş and Hatay in February 2023 further strained the economy, leading to a downward revision of growth projections for the year. (12. Turkey Development Plan, 2023) However, the government's commitment to infrastructure investment, including the Antalya-Alanya Motorway Project, is expected to stimulate economic activity and contribute to a rebound in growth over the medium to long term. (2053 Transportation and Logistics Master Plan, 2022)

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Antalya is known as the tourism capital of Turkey and is one of the most visited regions of the country. Thanks to its location on the Mediterranean coast and its history and natural beauties, it is considered one of Turkey's gateways to the outside world. It is also an important center in many fields such as agriculture, trade, logistics and education:

- Trade: Antalya stands out with its trade in agricultural products and tourism services. Especially citrus fruits, cotton, wheat and corn are produced and exported. In addition to agricultural products, Antalya Port also plays an important role in maritime trade. Antalya Free Zone serves as a production and export center for various industrial products, especially yacht production.
- Tourism: Antalya is one of the most important tourism destinations in the world. It attracts millions of tourists annually and this constitutes an important part of the provincial economy. According to 2023 data, approximately 14-16 million foreign tourists and 4-5 million domestic tourists visited Antalya. These statistics make Antalya the 2nd most visited city in Turkey after Istanbul and the 10th most visited city in the world.
- Education: As of 2024, there are a total of 6 universities in Antalya, 2 of these universities are public universities while 4 of them are private universities.
- Hospital: Antalya is a highly developed city in terms of health services and offers comprehensive health services with various hospitals. There are over 30 hospitals in the city in total. 15 of these hospitals are public hospitals, while the rest are private hospitals and university hospitals. Antalya also has many medical centers, polyclinics and specialty hospitals. Antalya is also an important center for health tourism and offers a wide range of health services for both locals and tourists.
- Industry: Antalya has an important position in industrial production and there are 3 Organized Industrial Zones (OIZ) in the city, namely Antalya OIZ, Antalya Free Zone and Alanya OIZ. Food processing, furniture production, textiles, construction materials and construction materials are the prominent industries in the province. In addition, yacht production and agricultural machinery production are also among the important industrial branches.
- Logistics: Antalya's location is quite advantageous in terms of logistics. Antalya Port is an important trade gateway to the Mediterranean Sea and is a critical point for both domestic and foreign trade. It is also easily accessible by road to other parts of Turkey, especially to the Mediterranean, Aegean and Central Anatolia regions. Antalya is also an important logistics center for the shipment of tourism and agricultural products.
- Airports: Antalya Airport is one of the airports with the busiest air traffic in Turkey. Millions of local and foreign tourists enter Antalya through this airport every year. It has very busy traffic especially in the summer months due to the tourism season. Within the scope of the expansion projects initiated at the airport in 2022, terminal buildings, runways and apron areas were renovated, and capacity was increased in order to meet this high demand. With these works, the airport's annual passenger capacity was increased from 35 million to 50 million. Apart from this, Gazipasa-Alanya Airport is also located in the east of the city and serves regions such as Alanya and Gazipasa. Airports are one of the important elements that increase Antalya's tourism and trade potential. According to DHMI statistics, monthly total passenger traffic for each airport for 2023 is presented in the figure below. The table comparing the cumulative passenger numbers in 2022 and 2023 as of the ends of years is given below.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Table 5. Airport Passenger Traffic 2019

Airports	End of 2022	End of 2023	Increase Rate
Antalya	31,108,181	35,538,387	12.47%
Gazipaşa Alanya	682,654	868,003	21.35%
Muğla Dalaman	4,535,600	5,247,488	13.57%
Muğla Milas-Bodrum	3,898,527	4,056,447	3.89%
Denizli Çardak	391,112	441,360	11.38%
Isparta Süleyman Demirel	72,410	82,692	12.43%
Konya	801,033	899,498	10.95%

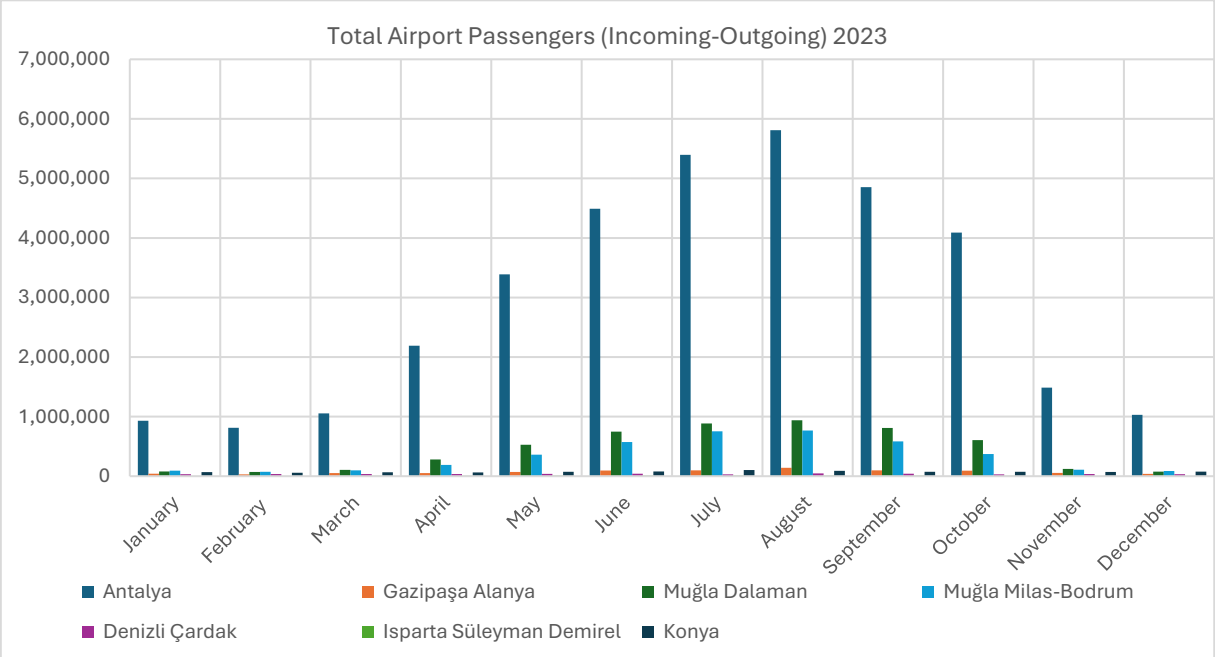

Figure 30. Airport Passenger Traffic 2023

Catchment provinces of the Motorway are expected to grow significantly in the future in terms of industry, trade, tourism, services and logistics potential. Only Antalya contributed approximately 3.4% of the entire Country's GDP in 2022 and all catchment area contributed approximately 11.4% of the entire Country's GDP in 2022.

Tourism, both international and domestic, drives the Turkish economy, and the Antalya-Alanya corridor is a prime beneficiary. Antalya boasts renowned coastal destinations like Belek, Side, and Kemer, attracting millions of tourists annually. These destinations offer a range of accommodation options, from all-inclusive resorts to charming boutique hotels, catering to diverse preferences and budgets. (EY Tourism Update 2023). Domestic tourism flourishes during the summer months, as residents from nearby provinces, including Denizli, Burdur, Afyonkarahisar, Isparta, Konya, and Karaman, flock to the coastline. The Antalya-Alanya Motorway will offer a safe and efficient alternative to the congested D400, facilitating seamless travel for tourists and residents alike.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

The city of Antalya, renowned for its resorts and vibrant tourism sector, holds a prime position within the Turkish tourism landscape. Antalya secured the second position among the most visited cities by tourists in FY 2022, following Istanbul. İstanbul welcomed 16.02 million foreign visitors in 2022, while the other cities in Türkiye welcomed 28.55 million. Antalya, located on the Mediterranean coast and well known for its resorts, followed İstanbul with 12.82 million foreign visitors in 2022.

The Ministry of Culture and Tourism highlights Antalya's dominance in the tourism sector:

Accommodation Capacity: As of May 2023, Antalya leads Turkish cities in tourism operation licenses, boasting an impressive 228,394 rooms.

Investment Attractiveness: Antalya also leads in tourism investment licenses, indicating continued growth in the sector, with 15,642 rooms under development.

From January 2019 to May 2023, please note that Antalya showcases the following metrics, compared to other major cities in Türkiye

• Occupancy rates – Following a dip in 2019-2020 due to the COVID-19 pandemic, Antalya has a 47% occupancy rate (as of May 2023)

• Daily room rate – Antalya has the second highest average daily room rate, following Istanbul (EUR 101.00 per night as of May 2023)

• Revenue per available room – Antalya has the second highest average revenue per available room (EUR 48.00 as of May 2023)

The motorway will also enhance connectivity within the broader catchment area, linking key agricultural and industrial centers. Antalya, Denizli, and Burdur are significant agricultural producers, supplying citrus fruits, vegetables, and textiles to both domestic and international markets. (Ministry of Transport Master Plan, 2022). The motorway will facilitate the efficient movement of these goods, reducing transportation costs and enhancing regional competitiveness. Furthermore, the project aligns with the planned expansion of the Turkish motorway network, connecting with future motorways that will extend eastward toward Konya and Karaman, further amplifying its importance in facilitating regional trade and tourism. (Ministry of Transport Master Plan, 2022).

Antalya International Airport (AYT) serves as the primary air travel hub for the region, offering numerous domestic and international connections. The airport's capacity is continually expanding to accommodate the growing influx of tourists, making it a vital gateway to the region. (EY Tourism Update 2023).

The Antalya-Alanya Motorway will provide a convenient and direct link between AYT and major tourist destinations, streamlining travel for international and domestic tourists arriving by air.

The Antalya-Alanya Motorway's strategic alignment with the region's economic engines, coupled with its role in expanding the Turkish motorway network and facilitating efficient transportation, positions it to become a critical artery for economic growth, increased tourism, and improved quality of life in the region.

3.5 Tourism in Antalya Province and Akdeniz Region

Tourism plays a crucial role in the Turkish economy. In 2022, Türkiye attracted 51M of the 963M tourists globally representing c.5% of global tourism. (EY Tourism Update 2023). The country witnessed a strong rebound in tourism receipts, reaching USD 46.5 billion in 2022, a 19% increase compared to pre-pandemic levels in 2019. Average tourist expenditure in Türkiye reached USD 905 per capita in 2022, marking a 21% rise from 2019. Notably, Germany and the United Kingdom were among the top three countries of origin for visitors to Türkiye.

The Antalya region, renowned for its extensive tourism infrastructure, boasts nearly 900 accommodation facilities offering approximately 500,000 beds as of 2023. The Project's strategic location will significantly enhance accessibility and connectivity within this vital tourism hub.

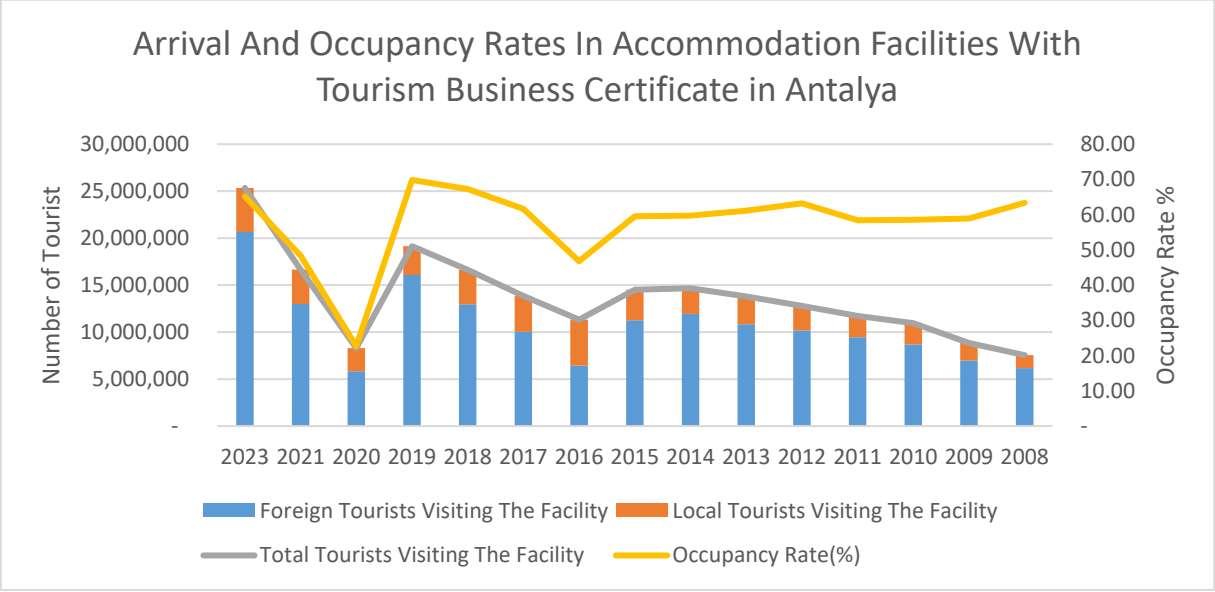

Figure 31. Ministry of Culture and Tourism of Turkey - Tourism Business Certificated Accommodation Statistics.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Antalya is experiencing a significant surge in tourism, with foreign tourist arrivals reaching over 20.6 million in 2023. This growth aligns with a broader trend of increased tourism revenue in the region (EY Tourism Update 2023). Overnight stays in Antalya's accommodations also reached a record high of 94 million in 2023, indicating both increased visitor numbers and potentially longer stays.

While the average length of stay for foreign tourists has shifted slightly in recent years, Antalya continues to attract a diverse range of visitors. The Antalya-Alanya Motorway is well-positioned to support this growth by:

- **Improving accessibility:** The motorway will enhance access to key tourism hubs and reduce travel times, catering to the growing influx of tourists.
- **Enhancing visitor experience:** By facilitating smoother travel, the motorway will allow tourists to explore more of the region, potentially extending their stays and boosting local economies.
- **Accommodating evolving travel patterns:** The motorway caters to both longer and shorter journeys, reflecting the changing preferences of both domestic and international tourists.

Antalya's Growing Tourism Infrastructure

Antalya boasts a robust tourism infrastructure, with over 800 hotels currently in operation, including a significant number of four- and five-star establishments (Anadolu Ajansi, 2024). This, combined with the city's commitment to diverse and luxury accommodations, showcases its ability to attract a wide range of tourists.

Diversification of Tourism Markets

Importantly, Antalya is experiencing a diversification of its tourism source markets. European tourists, particularly from Germany, are becoming increasingly prominent, reducing reliance on any single nationality. This diversification enhances the resilience of the Antalya-Alanya Motorway Project to potential fluctuations in specific tourism markets.

Beyond Sun and Sea

Antalya is actively diversifying its tourism offerings beyond traditional "sun-and-sea" tourism. The development of golf resorts, cycling-friendly facilities, and sports tourism infrastructure aligns with the motorway's goal of facilitating access to a broader range of experiences.

Conclusion

The Antalya-Alanya Motorway Project is strategically positioned to support Antalya's thriving tourism industry. By improving connectivity, accommodating evolving travel patterns, and facilitating access to a diverse range of attractions, the motorway will play a crucial role in the continued growth and diversification of Antalya's tourism sector.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

4.0 *The Project*

This section is geared towards an analysis of the transportation market in Project's catchment area by providing historical, demographical, and socio-economic analysis and a prediction of the possible future outlook towards identifying traffic patterns.

4.1 Alternate route – State Road Information

The existing D400 state highway, while serving as the primary connection between Antalya and Alanya, suffers from significant drawbacks that hinder efficient and reliable transportation:

- Urban Traffic Congestion: The D400 passes through numerous settlements, leading to traffic patterns characteristic of urban environments. Frequent stop-and-go conditions and increased congestion result in reduced travel speeds, impacting travel times and efficiency.
- Tourism-Related Traffic: Antalya International Airport, a major entry point for tourists, is located near the project's starting point. The existing D400 experiences substantial traffic volumes due to tourists traveling to popular destinations like Side, Manavgat, and Alanya. This heavy traffic flow further exacerbates congestion and underscores the need for an alternative route.

The Antalya-Alanya Motorway offers a solution to the shortcomings of the existing infrastructure:

- Enhanced Connectivity: The motorway will provide a faster and more direct connection between Antalya city center, Antalya International Airport, and the eastern tourism hubs of Antalya province.
- Reduced Congestion: By diverting through-traffic from the D400, the motorway will alleviate congestion on the existing highway, benefiting both local commuters and those traveling longer distances.
- Improved Safety: The motorway's modern design, including safety features and controlled access points, is expected to significantly enhance road safety compared to the existing D400.

The Antalya-Alanya Motorway project strategically addresses pressing transportation needs in a region experiencing rapid growth in both tourism and local traffic. The current D400 highway, characterized by its passage through numerous settlements, exhibits traffic patterns akin to urban environments, leading to congestion and reduced travel speeds. (Environmental Impact Assessment, 2018) This situation is further exacerbated by the heavy traffic flow between Antalya International Airport and popular tourist destinations along the coast. The new motorway will not only provide a faster and more direct connection between key points but also significantly alleviate congestion on the D400, improving travel times and road safety for both residents and tourists.

We calculated that the Motorway will likely result in c. 30 min of travel time savings for long distance users of the Motorway, while local traffic is likely to continue using the existing state road.

DRAFT

Figure 32. Competing Route

4.2 Economic Growth vs. Traffic

It is typical to expect increased traffic with positive economic growth. We have selected a total of 11 points along the state roads that constitute alternatives to the Project route and investigated change in traffic density based on the historical average daily traffic data provided by KGM and the Turkish GDP data provided by TurkStat.

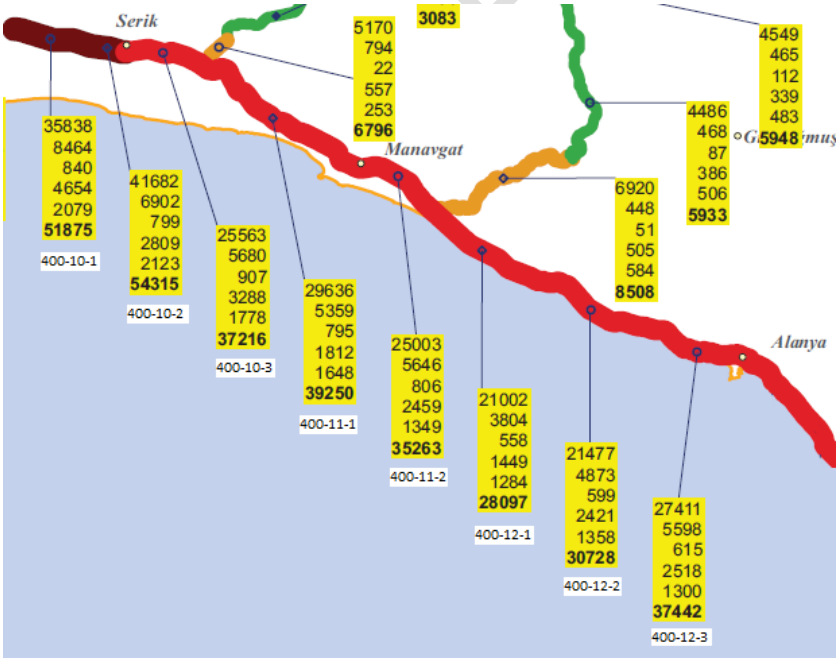

Figure 33. KGM Traffic Volume Map

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Control Section	Segment Number	Length Km	Total	Car	Medium Goods Vehicle	Bus	Truck	Articulated Truck
2023

Figure 34. KGM Annual Average Daily Traffic Data

We converted the vehicle counts from various counting points on the State Road, provided by KGM, into Passenger Car Unit (PCU) values by applying the corresponding Vehicle Equivalent Coefficients. Subsequently, we calculated the Average Annual Daily Traffic (AADT) in PCU. To generate an average traffic data for the State Road, we multiplied these AADT values by the lengths of the sections where the counts were conducted, summed the results, and then divided by the total length of the State Road. As a result of these calculations and comparing them with the Antalya GDP in USD, we created below figure.

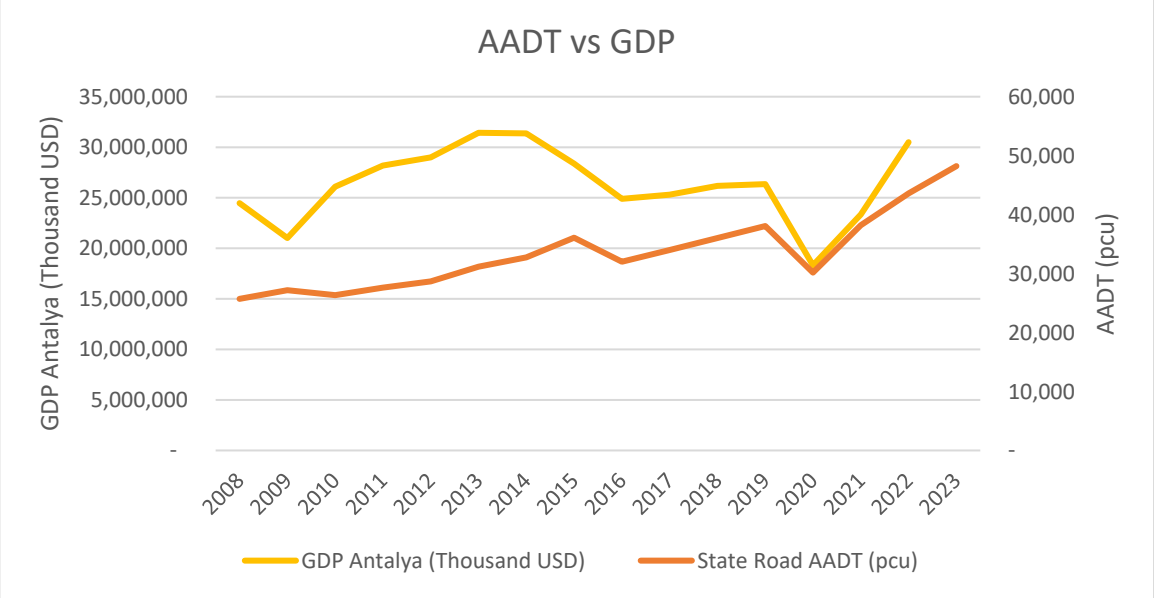

Figure 35. State Road Annual Average Daily Traffic and Antalya GDP over the Years

As visualised in above figure, we found there is a high level correlation between the total traffic and regional economic performance. This is logical as there is a relationship between vehicular activity, vehicle ownership and economical performance, as seen through many large metropolitan cities across the world.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

4.3 Catchment Area Traffic Analysis

According to TomTom Traffic Index 2023, travel time increased in Antalya last year. The data suggests that average time of travel 10 km road increased by 30 seconds in the City Center and 10 seconds in metropolitan area compared to 2022. World rank of Antalya in 2023 is 123 in city center and 74 in metropolitan area.

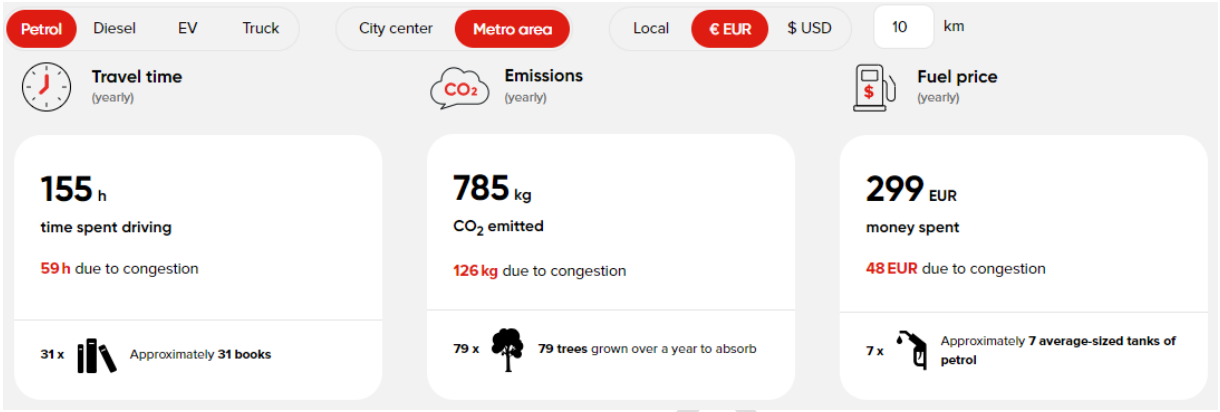

Figure 36. Cost of Driving for Antalya (TomTom Traffic Index 2023)

Travel Time and Congestion

The TomTom Traffic Index reveals that drivers in Antalya's metropolitan area spend a significant amount of time behind the wheel, with an average of 155 hours annually dedicated to driving for a one-way 10km commute. Notably, traffic congestion accounts for a substantial portion of this time, with drivers losing 59 hours per year due to delays caused by traffic. This lost time underscores the existing challenges of traffic congestion in Antalya and the need for infrastructure improvements to enhance travel efficiency and reduce the economic and personal costs associated with time spent in traffic.

CO2 Emissions and Environmental Impact

The environmental impact of traffic congestion in Antalya is also significant. According to the TomTom Traffic Index, petrol car usage for a 10km one-way commute in the metropolitan area results in the emission of 785 kg of CO2 annually for cars which uses petrol. Congestion contributes to an additional 126 kg of CO2 emissions per year, highlighting the environmental burden associated with traffic delays. The Antalya-Alanya Motorway Project, by alleviating congestion and promoting more efficient traffic flow, can contribute to a reduction in CO2 emissions in the region, supporting efforts to mitigate the impacts of climate change.

Fuel Costs and Congestion-Related Expenses

Traffic congestion also places a financial burden on drivers in Antalya. The TomTom Traffic Index estimates that drivers spend 299 EUR per year on fuel for a one-way 10km commute in petrol cars. Congestion adds an additional 48 EUR to fuel expenses, highlighting the direct financial cost of traffic delays. The Antalya-Alanya Motorway, by providing a faster and more efficient route, can help drivers save both time and money on fuel, further strengthening the project's economic benefits for users.

per 10 km

Figure 37. Travel Time Driving Patterns for Antalya (TomTom Traffic Index 2023)

Antalya's metropolitan area experiences significant fluctuations in travel time throughout the day and week, with peak congestion occurring during the morning and evening rush hours, particularly between 08:00 AM and 10:00 AM and 04:00 PM to 06:00 PM. The longest travel times, exceeding 20 minutes for a 10km journey, are observed on weekday evenings, highlighting the need for transportation solutions to address peak-hour congestion.

Figure 38. Travel Speed Driving Patterns for Antalya (TomTom Traffic Index 2023)

Traffic speeds in Antalya's metropolitan area generally peak during the late night and early morning hours when traffic volumes are lowest. Weekday mornings between 04:00 AM and 06:00 AM consistently see the highest speeds, often exceeding 50 km/h. However, speeds drop significantly during peak commuting hours, falling below 30 km/h on weekday evenings between 06:00 PM and 08:00 PM, indicating periods of heavy congestion.

In addition to congestion in the cities, traffic volume maps and data provided by KGM for state roads were also reviewed to identify the intercity traffic conditions along roads that constitute alternatives to the Project route. KGM categorises traffic volume on state roads based on total number of vehicles passing daily from road sections. On KGM's scale, which is divided to 6 levels of traffic volume, the alternative road for the motorway which is the state road have very high, high or moderate to high traffic volumes: Over 50,000 daily vehicles indicates very high traffic volume, 20,000 to 49,999 daily vehicles indicates high traffic volume and 10,000 to 19,999 indicates moderate to high traffic volume.

The level of service measures the traffic congestion which will define the growth potential of the road network and the attractiveness of each road asset driven by time savings offering.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Table 7. LOS Classification

Level of Service (LOS)	Description	Volume / Capacity	
		2+2/3+3	4+4
A	Free-flow conditions with unimpeded manoeuvrability	0.01 - 0.32	0.01 - 0.42
B	Reasonably unimpeded operations with slightly restricted manoeuvrability. Presence of other vehicles becomes noticeable.	0.33 - 0.50	0.43 - 0.60
C	Influence of traffic density becomes marked. Ability to manoeuvre within traffic stream is affected by other vehicles	0.51 - 0.72	0.61 - 0.82
D	Ability to manoeuvre is severely restricted due to traffic congestion. Travel speed is reduced by the increasing volume.	0.73 - 0.92	0.83 - 0.92
E	Represents operations at or near capacity, an unstable level. Vehicles are operating with minimum spacing for maintaining uniform flow.	0.93 - 1.00	0.93 - 1.00
F	Represents forced or breakdown flow. Occurs when vehicles arrive at a rate greater than the rate at which they are discharged or when the forecast demand exceeds capacity.	> 1.00	> 1.00

Figure 39. LOS Classification

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

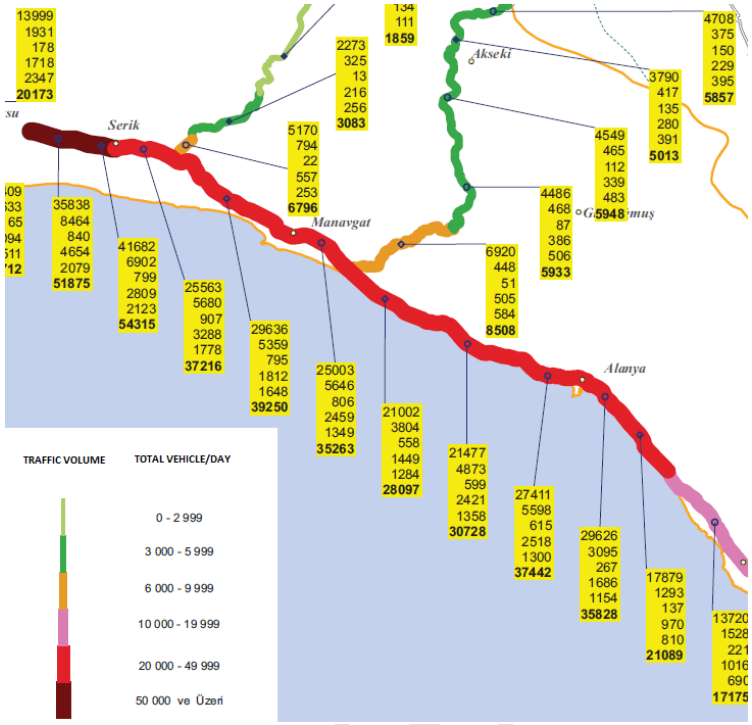

Figure 40. KGM Traffic Volume Data for State Road

The competing route to the Project at most of the sections are running at LOS C or D. Additionally, there are certain sections of the existing KGM roads with poor roadway safety and municipal crossings with multiple traffic signals, thus have reduced and limited traffic flow.

We expect LOS classifications to worsen in the upcoming years with reduced maintenance on the state highways and increased traffic; therefore, conclude that the Project will be benefiting from serving a safer and faster pathway

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

4.4 Traffic Volume and Composition Analysis

Analyzing historical traffic trends forms the foundation for understanding current traffic patterns and projecting future demand. This analysis utilizes historical traffic data from KGM reports spanning from 2007 to 2023, focusing on the existing state road that runs parallel to the planned motorway.

Two key indicators are used to assess traffic patterns:

1. **Traffic Volume at a Cross-Section:** This indicator represents the number of vehicles passing a specific point on the road over a given time period. While valuable for capacity planning and level-of-service assessments, it does not provide a complete picture of traffic demand along the entire corridor, especially considering the multiple entry/exit points of the planned motorway.

2. **Vehicle Kilometers Traveled (VKT):** This measure provides a more comprehensive view of traffic load by considering both the number of vehicles and the distance they travel within the corridor. VKT is calculated for each vehicle category (cars, trucks, buses, etc.) using the following formula:

$$\text{VKT (Vehicle Type)} = \text{Traffic Volume (Vehicle Type)} * \text{Segment Length}$$

The sum of VKT values across all segments and vehicle categories represents the total corridor traffic load. Total length of the segments (400-10-1 and 400-12-3) of the state road is 111km according to the KGM data.

Table 8. Total Volume of the State Road

Year	Car-VKT	Small Truck-VKT	Bus-VKT	Truck-VKT	Other VKT	Total VKT PCU
2007	1,613,113	178,871	83,288	276,246	38,286	2,875,443
2008	1,612,092	181,126	77,930	256,370	43,190	2,833,357
2009	1,557,207	206,158	94,248	323,099	50,738	3,041,687
2010	1,524,729	209,005	97,205	320,202	55,082	3,025,896
2011	1,663,076	208,684	88,242	313,540	64,190	3,158,875
2012	1,756,097	214,550	80,404	313,808	74,601	3,280,172

4.5 Traffic Determinants

4.5.1FUTURE PROJECTS

The proximity of several established industrial zones to the Antalya-Alanya Motorway project route highlights the potential for the motorway to stimulate economic activity and freight traffic. The Serik Industrial Zone, situated a mere 6.6 kilometers from the motorway, and the Manavgat Industrial Zone, located just 4 kilometers away, are likely to benefit from enhanced accessibility and reduced transportation costs, potentially leading to increased production and freight movements. This suggests a promising prospect for the motorway to capture a substantial share of commercial traffic, contributing to its overall traffic and revenue performance. The motorway's strategic location, facilitating the efficient movement of goods between these industrial zones and other regional/national markets, reinforces its significance in supporting economic development in the Antalya-Alanya corridor.

Table 9. Distance of Industrial Zones to Project Route (Environmental Impact Assessment (2018))

No	Name of Industrial Zone	Distance
1	Antalya Industrial Zone	24 km
2	Serik Industrial Zone	6.6 km
3	Manavgat Industrial Zone	4 km
4	Alanya Industrial Zone	2.7 km

According to the 2053 Transportation and Logistic Master Plan, planned projects between 2023-2053 is shown below;

Table 10. Planned Motorway Projects in Turkey (2053 Transportation and Logistic Master Plan)

Project Name	Planned Year
Ankara - Kırıkkale - Delice Motorway	2029
Ankara - Sivrihisar Motorway	2029

Project Name	Planned Year
Railway Connections to Industrial Zones Phase 1	2024-2029
Railway Connections to Factories Phase 1	2024-2029
Railway Connections to Ports	2024-2029
Railway Connections to Mines Phase 2	2030-2035
Railway Connections to Industrial Zones Phase 2	2030-2035
Railway Connections to Factories Phase 2	2030-2035
Railway Connections to Ports	2030-2035

Below list shows the planned projects according to the 2053 Transportation and Logistic Master Plan that fall within the Antalya-Alanya Motorway catchment area:

Motorways:

- Antalya - Alanya Motorway
- Aydın - Denizli Motorway
- Afyon-Burdur Motorway
- Alanya-Silifke Motorway
- Denizli-Burdur-Antalya Motorway
- Sapanca-Afyonkarahisar Motorway

Divided Roads (Çevre Yolu):

- Antalya Çevre Yolları (Antalya Ring Roads)
- Afyonkarahisar Güney Çevreyolu (Afyonkarahisar Southern Ring Road)
- Karaman Çevre Yolu (Karaman Ring Road)
- Konya Çevre Yolu (Konya Ring Road)
- Isparta Doğu Çevreyolu (Isparta Eastern Ring Road)
- Denizli Çevreyolu (Denizli Ring Road)
- Muğla Kuzey Çevreyolu (Mugla Northern Ring Road)
- Aydın Kuzey Çevreyolu (Aydın Northern Ring Road)
- Dinar Kuzey Çevreyolu (Dinar Northern Ring Road)

High-Speed Train:

- Konya-Seydişehir-Antalya High-Speed Train

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Positive Impacts:

- Afyon-Burdur Motorway: This project will extend the motorway network from Afyonkarahisar, a major junction in central Türkiye, to Burdur, directly connecting with the Antalya-Alanya Motorway. This will likely increase traffic from central Anatolia, including tourism and freight traffic to/from Antalya, benefitting the motorway.
- Denizli-Burdur-Antalya Motorway: This project will create a direct high-speed link between Denizli, a significant industrial and agricultural center, and Antalya, bypassing the existing state road. This is likely to increase both passenger and freight traffic on the Antalya-Alanya Motorway.
- Alanya-Silifke Motorway: This eastward extension from Alanya will enhance connectivity to Mersin, a major port city. It could generate additional traffic on the Antalya-Alanya Motorway, particularly for those traveling beyond Alanya.
- Konya-Seydişehir-Antalya High-Speed Train: This planned rail line could have a synergistic effect with the motorway. While potentially drawing some passengers away, it may also stimulate regional development and tourism, generating overall higher traffic volumes, some of which could benefit the motorway.
- Sapanca-Afyonkarahisar Motorway: Upon completion of the Afyon-Burdur and Denizli-Burdur-Antalya motorways, the Sapanca-Afyonkarahisar Motorway will establish a direct high-speed link between the heavily populated and industrialized northwest region of Türkiye (including Istanbul and the surrounding areas) and the Antalya-Alanya corridor. This improved connectivity could generate substantial additional traffic on the Antalya-Alanya Motorway, particularly from tourists and businesses seeking efficient transportation routes to the southern coast.

Neutral Impacts:

- Projects Outside the Catchment Area: Projects like the Ankara-Kırıkkale-Delice Motorway and others not directly connecting to the Antalya-Alanya corridor are unlikely to have a significant direct impact on its traffic. However, they could contribute to overall economic growth and traffic demand in Türkiye, indirectly benefitting the motorway.

Additional Considerations:

- Integration with Other Modes: The success of the Antalya-Alanya Motorway will also depend on its efficient integration with other transportation modes. Seamless connections to airports, ports, and railway stations will be crucial for attracting passengers and freight traffic.

The model considered future projects and new points of interests that are expected to drive traffic growth on the project assets in foreseeable future. To verify the this claim about the future projects and traffic drivers, we considered a multitude of governmental data sources, reports, news articles and strategy documents were utilized, with National Transportation Master Plan developed by the Ministry of Transport and Infrastructure constituting the basis for all transportation projects. In this respect, we identified attraction and traffic generation points, referred to as future projects. Although the current plans create this timeline, we researched future projects and that they may or may not happen at the assumed timelines.

Completion of future projects could significantly increase the achievable traffic volume of the Antalya-Alanya Motorway, potentially leading to an upward impact on traffic projections.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

It is anticipated that future projects may increase regional economic activities and thus the traffic demand of the highway. New industrial zones, logistics centers and tourism investments may lead to an increase in both passenger and freight transportation.

It can be challenging to accurately measure the traffic impact of future projects because the timelines and scopes of these projects are subject to change. Therefore, it is more appropriate to include the traffic impacts of these projects in the upside scenario.

4.5.2LAND DEVELOPMENT PROJECTS ALONG THE MOTORWAY

Future land development along the Motorway at locations closer to the provincial ring roads and smaller towns along the western coastal line. GDP and population growth factors have an allowance for future developments along the Motorway. On the other hand, an in depth review of future land development projects have not been carried out and this item can be considered as an upside to the traffic demand forecasted, if can be quantified.

The planned land development projects along the highway route have been examined. A mass housing and landscaping project with 357 houses is being implemented by the Housing Development Administration of Turkey (TOKİ) in Kocayatak Neighborhood, Serik District of Antalya. The project is planned to be completed by the end of 2024 . Once the project is realized, it can be considered as a increase to traffic demand.

4.5.3OTHER POTENTIAL PROJECTS

A research has been conducted on other ongoing projects in the region and the information on the identified projects is given below.

- Antalya Airport Expansion Project: Antalya Airport, which is currently being operated by TAV Airports at its maximum capacity, has undergone a comprehensive expansion project to increase its capacity in order to be prepared for future periods. The project will be completed in 3 phases in total, phase 1 will be realized between 2022-2025, phase 2 between 2028-2029 and phase 3 between 2038-2039, and the majority of the works to be completed within the scope of the expansion will be carried out in the first phase. Within the scope of Antalya Airport expansion and enlargement project investments, the Terminal 2 Building, which currently serves international flights, will be transformed into a new terminal building of 223 thousand square meters. At the same time, the Domestic Terminal building, which is currently 37 thousand square meters, will be enlarged to 75 thousand square meters. In 2038, a new international terminal of 70 thousand square meters will be built.
- Hotel Construction: Antalya Province, which is the 2nd most visited city in Turkey in terms of tourism, stands out as a destination that hosts millions of domestic and foreign tourists every year. The new hotels planned to be built in the region for this dynamic tourism sector aim to increase Antalya's tourism capacity and contribute to the regional economy. From luxury hotels to boutique hotels, new hotel projects are planned every year, especially along the coastline. There are 10 hotel projects planned to be completed in Antalya Province by the end of 2024

4.6 Conclusion

In review, we note that Turkey is strategically located at the cross-roads of Europe and Asia with a growing population and a thriving economy. The Project is also strategically located in some of the most densely populated and economically advanced areas of Turkey.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

The existing D400 state road, while serving as the primary connection between Antalya and Alanya, faces significant challenges related to urban traffic congestion and heavy tourism-related traffic, leading to reduced travel speeds and extended journey times. The Antalya-Alanya Motorway directly addresses these shortcomings by providing a faster, safer, and more efficient alternative route, enhancing connectivity between key tourism hubs and supporting the region's overall economic development.

The motorway is expected to reduce travel times for long-distance users by approximately 30 minutes compared to the existing state road.

Analysis of historical data reveals a correlation between traffic volume on the existing state road and Antalya's GDP. This suggests that economic growth in the region will likely translate into increased traffic demand, benefitting the Antalya-Alanya Motorway.

The TomTom Traffic Index highlights significant congestion on Antalya's existing road network, particularly during peak hours. This, coupled with the presence of industrial zones along the Motorway's route, underscores the need for improved connectivity and efficient transportation solutions.

Several planned infrastructure projects, including new motorways, high-speed rail lines, and ring roads, are expected to significantly impact the region's transportation landscape.

Ongoing and planned land development projects, particularly those focused on tourism and housing, will further contribute to traffic demand along the Motorway corridor.

The ongoing expansion of Antalya Airport, a major driver of tourism in the region, will significantly increase passenger capacity and likely generate additional traffic on the Motorway.

The Antalya-Alanya Motorway is strategically positioned to capitalize on the region's projected economic and population growth. By providing a faster, safer, and more efficient transportation alternative, the Motorway is well-positioned to attract a significant share of both passenger and freight traffic. While the precise impact of future projects and developments remains subject to various factors, the overall outlook for traffic demand on the Antalya-Alanya Motorway is positive. The findings presented in this section provide a strong foundation for traffic and revenue forecasting, highlighting the Motorway's significant potential as a infrastructure asset for the region's continued growth and prosperity.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

5.0 *Traffic Analysis*

5.1 Introduction

This section describes the traffic model approach and assumptions of the traffic demand forecast.

5.2 Traffic Demand Criteria

Motorway vehicle demand/traffic demand (load) is estimated by employing demand estimation models that consist of the following stages:

- Analysis and understanding of the composition of existing traffic on the existing corridor (state road) by vehicle (cars, small trucks, trucks, buses, other)
- Annual trends of vehicle volumes in the current corridor (D-400 highway) (2007-2023) (It is recommended to examine at least 30-year trends in time series analyses. However, reliable data for population and socio-economic variables have not been provided in Turkey since 2007, highway volumes are collected for 2007-2023.
- Trends of total vehicle traffic demand/load per vehicle type in the existing corridor (D-400 highway) by types (vehicle.km) (*vehicle kilometres travelled: VKT*) (2007-2023).

There are two basic indicators of D-400 highway traffic demand/load:

- Vehicle volume on a specific section: Although this is an important demand indicator, it is used for capacity planning and demand analysis in specific sections like bridges, and entrances. It is a basic indicator in feasibility studies on bridge crossings or estimating entries for specific toll collection points. However, it is not enough to predict the demand only in a certain section of a highway corridor. The number of vehicles in the section is a variable used in capacity planning and level of service measurement.
- Vehicle kilometre travelled: Traffic demand/volume on several sections/segments of a highway corridor varies. In that case, each road segment accommodates a certain traffic but, total traffic demand can be measured as an aggregate demand indicator. If there are many entrances/exits on the highway corridor and tolls are charged about the distance, the number of vehicles that travel on each segment is estimated separately. In the current state, the volume of each segment is measured for each vehicle type. Multiplying the volume and the section length (for vehicle type) gives the traffic demand/load which is represented by vehicle-kilometre travelled (VKT) measure for a specific road section. The result is car-kilometre travelled, bus-kilometre travelled, truck-kilometre travelled and other vehicle-kilometre travelled). The sum of vehicle kilometres of sections gives the corridor traffic demand/load.

Travel demand models, in principle, specify independent variables that contribute to traffic demand, represent the current state by equations, and employ the equations to estimate future demand.

Data are obtained for independent variables that may have a significant role/impact, like population, income per capita, number of vehicles, tourism, production, and hotel's bed capacity.

The conventional methods employ multiple regression equations. Statistical analysis provides selecting of explanatory variables and coefficients.

Significant variables influencing/generating traffic volume/demand are used to estimate traffic demand in the future.

Some of the variables/factors that contribute to traffic generation are as follows:

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

- Local population, and growth trend (2007-2023), population growth trends of the districts around the corridor (2007-2023)
- Bed capacity (hotels/accommodation facilities) in the province (2007-2023)
- Hotel/accommodation facility bed capacities and visitor numbers in the districts around the corridor (2007-2023)
- Average income per capita in the province (*GDP per capita, Antalya province)*
- Number of vehicles (by type) in Antalya Province (2007-2023)

Antalya province is one of the most important tourist destinations in Turkey. Antalya is also an important agricultural production region. It is an important consumption center due to its population and economic development. For these reasons, the traffic in the Antalya-Alanya corridor is not only generated by local activities. The country's population, economy, and tourism activities contribute to the traffic generation. Therefore, some factors at the national level may be explanatory variables of the Antalya-Alanya highway corridor.

- Average national income per capita in Turkey (2007-2023) (*GDP per capita , Turkey*)
- Türkiye population (2007-2023)
- Number of foreign visitors to Türkiye (2007-2023)
- Number of vehicles in Türkiye (2007-2023)

5.2.1MOTORWAY USERS

Most of the traffic crossing between Serik and Alanya on the D400 is a mix of local and long-distance trips, with the motorway carrying a significant portion of the longer-distance traffic, particularly those connecting Antalya with Alanya and beyond. The motorway also serves as a critical section of the broader Afyonkarahisar-Alanya Motorway, positioning it as a vital link that not only supports the local tourism-driven economy within Antalya province but also extends its influence deep into central Anatolia. The strategic location of the Antalya-Alanya Motorway within a region poised for substantial economic growth further amplifies its importance. As a result, the motorway is expected to stimulate economic activity across a wide geographic area, including the outer catchment zones of Muğla, Burdur, Isparta, Konya, Karaman, Mersin, Denizli, and Afyonkarahisar, all of which have significant potential for growth in sectors such as agriculture, industry, and logistics.

5.2.2RAMP UP

The ramp-up period refers to the initial phase following the road's opening, during which there is a slight delay in drivers adjusting their travel patterns to utilize the new road fully, especially in terms of the time it takes for induced demand to materialize. The ramp-up factors are obtained from the previous projects. It is found that potential demand is attracted 3 years after the opening.

Table 15. Ramp Up Assumptions

Duration	Light Vehicles	Heavy Vehiicles
Year 1	85%	90%
Year 2	95%	100%
Year 3	100%	100%

DRAFT

5.2.3INDUCED TRAFFIC

The Antalya-Alanya Motorway Project (Project) is expected to generate induced demand, attracting additional traffic volume due to improved accessibility and reduced travel times. This phenomenon occurs when drivers perceive the new motorway as a more attractive option, leading to changes in travel patterns, including:

Increased Trip Frequency: Existing users of the D400 may opt to travel more frequently between Antalya and Alanya, or to destinations along the route, due to the time savings offered by the motorway.

Shift in Destination Choice: Travelers may choose destinations within the Project corridor that were previously considered less accessible due to longer travel times or congestion on the existing road network.

Generation of New Trips: The improved connectivity provided by the motorway may lead to entirely new trips that were not previously considered feasible or convenient, as drivers take advantage of the reduced travel times and enhanced accessibility.

Estimation Methodology:

Estimating induced demand for the Antalya-Alanya Motorway requires a nuanced approach that considers the unique characteristics of the region and the project itself. While traditional methodologies, such as those outlined in the UK Department for Transport (DOT) guidelines, provide valuable insights, they may need to be adapted to account for local factors. These guidelines typically establish a relationship (elasticity) between induced demand and reductions in travel time, offering a range of elasticities (minimum, maximum, and medium) based on project characteristics.

Factors Influencing Induced Demand:

Several factors will influence the magnitude of induced demand for the Project:

- Magnitude of Time Savings: The extent to which the motorway reduces travel times compared to the existing D400 will be a key driver of induced demand. Larger time savings are likely to result in higher levels of induced demand.
- Toll Rates: The motorway's toll rates, relative to fuel costs and perceived value of time, will influence driver choices. Higher toll rates may dampen induced demand, particularly for price-sensitive users.
- Land Use and Economic Development: Induced demand is often linked to new development spurred by improved accessibility. The extent to which the motorway triggers new residential, commercial, or industrial development along the corridor will influence long-term traffic growth.
- Competition from Alternative Modes: The availability and quality of alternative transportation options, such as existing and planned rail services, will influence the attractiveness of the motorway and, consequently, induced demand.

Benchmarking and Calibration:

To ensure a realistic estimate of induced demand, it is essential to benchmark against similar motorway projects, particularly those that have demonstrated significant induced demand following their completion.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

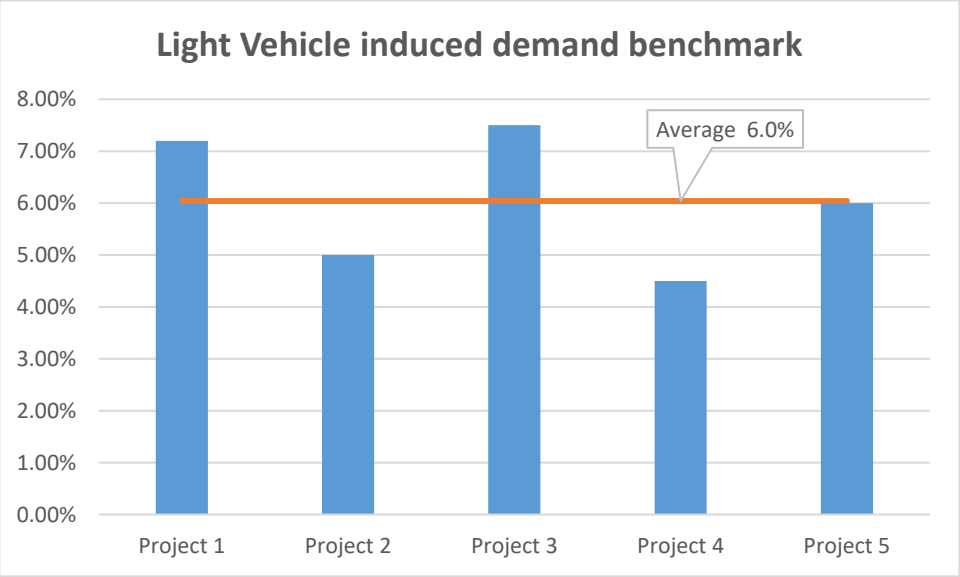

Figure 41. Light Vehicle Induced Demand Benchmark

This approach involves analyzing historical traffic data and identifying the portion of traffic attributable to induced demand, considering factors such as the magnitude of time savings, toll rates, and land use changes.

It is crucial to conduct sensitivity analyses to assess the impact of varying induced demand levels on the project's traffic and revenue projections. This analysis will explore different elasticity values (minimum, maximum, and medium) based on the chosen methodology, as well as scenarios considering variations in toll rates, economic growth, and the development of alternative transportation modes.

By adopting a comprehensive approach that incorporates these considerations, this traffic due diligence report will provide a robust and realistic assessment of induced demand for the Antalya-Alanya Motorway Project, contributing to informed decision-making for lenders and project stakeholders. Observations reveal that induced trips by car are much higher than bus and truck.

Table 16. Induced Demand Assumptions

Duration	Light Vehicles	Heavy Vehiicles
Year 1	4,8%	1.6%
Year 2	0.9%	0.3%
Year 3	0.3%	0.1%

5.2.4CONTINUITY

Travellers often make their route choice decisions at the origin of their trips by considering the entire travel from the origin to the destination. It is often less likely that a long-distance travel starting on a motorway to switch to local roads. According to researchers in literature, unless there is a problem on the existing road in terms of condition etc., the capture rate of the new road is not expected to change drastically.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

5.2.5VALUE OF TIME

The Value of Time (VoT) is a critical parameter in traffic modeling as it quantifies the monetary value drivers assign to time saved during their journey. This parameter is crucial for understanding the trade-off drivers make between using the toll road (with higher costs but potentially faster travel times) and opting for alternative, toll-free routes.

Accurately estimating VoT is essential for Traffic Forecasting. VoT is a key input for the traffic model, influencing the proportion of drivers choosing the toll motorway versus alternative routes. VoT directly affects the project's revenue potential, as it determines the trade-off drivers make between toll costs and time savings. Sensitivity analysis of VoT variations will help assess the project's financial resilience to changes in driver behavior and economic conditions.

Methodology:

Given the project's context and drawing upon international best practices, a combination of methodologies will be employed to estimate VoT for the Antalya-Alanya Motorway Project:

- Percentage of Hourly Wage Rate: VoT for light vehicles will be estimated as a percentage of the average hourly wage rate in the region. This method aligns with the US Department of Transportation (USDOT) guidelines, which recommend using 50%, 70%, and 100% of the hourly wage rate for local, intercity, and business trips, respectively. (USDOT, 2016).
- Calibration and Benchmarking: To ensure a realistic estimate, the initial VoT derived from the hourly wage rate method will be further calibrated based on benchmarking against recent studies in Türkiye. Additionally, international benchmarks from similar projects in countries with comparable GDP per capita, such as Mexico and Greece, will be considered.

Data Sources:

The following data sources will be utilized:

- Average Hourly Wage Rate: With the decision of the Minimum Wage Determination Commission dated 27.12.2023 and numbered 2023/2, published in the Official Gazette dated 30.12.2023, the minimum wage for one day of normal work has been determined as 666.75 Turkish liras. The net amount of this amount is 566.74 TL per day. The daily minimum wage is calculated based on legal working hours. Accordingly, the working hours are 45 hours per week. These 45 hours are distributed equally to the other days, assuming that there is 1.5 days off per week. According to this calculation, the daily working hours are 7 hours and 30 minutes. The hourly gross minimum wage in 2024 is calculated as 88.90 TL. The hourly minimum net wage is 75.56 TL.
- According to TUIK Earnings Structure Statics results, November 2022 as reference, the total number of hours worked as a monthly wage was 201.3. The average monthly gross wage-salary per person in 2022 was $600 in total. The average hourly gross wage-salary was $3 in total. The average monthly per person earnings were $670 in total. The annual average gross earnings in 2022 were $7763.
- However, GDP per capita was $10,622 in 2022 and GPD per capita $12,849 in 2023.
- Previous Studies and Benchmarks: We reviewed VoT values and methodologies from similar projects and studies. According to NMH Traffic Study, VoT was estimated as 6.5 USD/hr in 2015. According to Çanakkale Motorway Traffic Study done in 2019, VoT was estimated as 12.4 USD/hr. Kınalı Malakara

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Motorway traffic study done in 2023 estimated 11 USD/hr. Nakkaş Başakşehir Motorway Traffic Study estimated 4.5, 6.4 and 6.8 USD/hr for light vehicles short, long and business demand segments in 2021.

- Value of Time in TR is c.US$7/hr as has been calculated and reported in the NTMP2017, completed in 2017 through EU funding. The literature on this refers to a wide range of VoT used for modelling purposes. 40% to 50% of average wage rates seems to be widely accepted for non-"business" trips ("business" trips are those made during employers' time). The latter tend to be valued at higher rates of up to 80%-100% of the wage rate.

Future VoT Projections:

VoT is expected to increase over time due to rising income levels. The projected growth in VoT will be linked to the forecasted growth in GDP per capita, using an elasticity value based on historical trends and benchmarking against comparable projects.

Value of Time growth to GDP/capita elasticity is considered 0.5 to 1. Some scholars expect the car ridership to be included in the VoT calculations. We believe this should be driven by who is paying the bills. In other words, this could be appropriate for business makers traveling since ultimately a company is paying for wages and vehicle operating and maintenance and the toll. On the other hand, in case of leisure travel or independent people traveling, the mode choice is solely driven by the driver and therefore, the drivers' VoT is key.

National Highway Institute concludes that the elasticity of highway travel with respect to users' generalized cost (travel time and financial expenses) is typically -0.5 (NHI 1995).

For 2023, value of time was determined as 8.24 USD/hr (7.72 EUR/hr) by using GPD per capita and average working hours in one year. This is assumed to increase in future years based on an elasticity to income (using GDP per capita) of 0.8.

To ensure currency consistency, we converted Value of Time (VoT) values from USD to EUR using a projected average EUR/USD exchange rate of 1.012, based on The Economy Forecast Agency's prediction for 2028, and applied this rate through 2040 in our base case modeling exercise. Using a fixed EUR/USD exchange rate for projections until 2040 introduces risk due to potential volatility, as economic and geopolitical factors can significantly influence currency fluctuations. We have carried scenarios with varying EUR/USD rates to assess the impact on the model's outputs further to sensitivity testing carried out within the scope of this review.

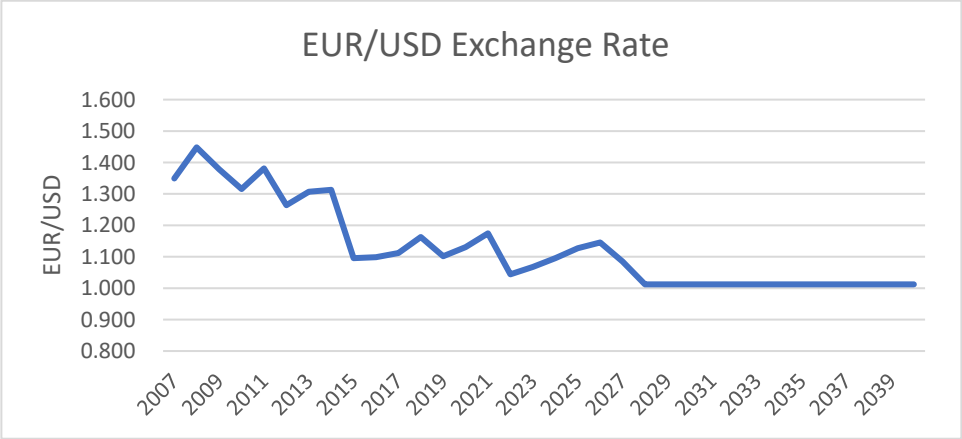

Figure 42. EUR/USD Exchange Rate Forecast

DRAFT

Value of time is a function of travelers' income (GDP per capita).

Table 17. Value of Time Assumptions

	2023	2028	2040
GDP per capita	12,849 USD	13,656 USD	18,669 USD
VoT	8.24 USD/hr 7.72 EUR/hr	9.86 USD/hr 9.74 EUR/hr	13.13 USD/hr 12.96 EUR/hr

5.2.6VEHICLE MIX

Approximately 15% of the current traffic of state road is generated by heavy vehicles.

NTMP 2017 predicts that "the immense growth in person car trips in the next two decades (from 2023 to 2042) is driven by the significant increase in GDP per capita driving car ownership and consequently person car trip ends."

NTMP2017 states that "the development of freight transport is based upon the economic activity, import/export performance, and tourism activities. These trends and developments are crucial for future freight traffic.

The heavy vehicle ratio will either remain steady or reduce in the forecast horizon.

5.2.7GDP/CAR OWNERSHIP IMPACT

The background traffic growth projections are derived from socioeconomic indicators, which serve as input data. Due to the differing characteristics of light vehicles (LV) and heavy vehicles (HV), separate methodologies have been used for modeling each:

- HV traffic growth is tied to future real GDP growth.
- LV traffic growth is modeled as a function of car ownership, which is itself influenced by both GDP growth and population growth.

A panel regression analysis of HV traffic growth against key economic indicators, including normalization of the trend to adjust for irregularities in the dataset, yielded a statistically significant elasticity of 0.85 with respect to GDP.

For LV traffic demand growth, we have utilized a car ownership model. This approach assumes that an increase in car ownership translates into a corresponding increase in traffic on the project. Dargay and Gately (2001) developed a car ownership model using historical data on car ownership and GDP per capita across multiple countries, including Turkey. Their model operates on the premise that GDP per capita growth, as a proxy for rising disposable income, is the primary driver of car ownership growth.

The results of their study provide the model structure and relevant coefficients. We have calibrated these coefficients using observed car ownership rates published by TUIK, as illustrated in the adjacent figure. Future car ownership growth will be determined by the calibrated parameters of this curve and the projected real GDP per capita growth.

Our analysis is based on forecasted real GDP growth rates and population projections for Turkey, assuming similar growth trends for Antalya. Given its proximity to a major city, we have applied a conversion rate of 1.25 from car ownership growth to traffic growth, calibrated against observed data.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

5.2.8SEASONALITY

For Seasonality, we requested the traffic measurements made on the State Road between 2019-2023 on a monthly basis with an official letter from KGM. The data is categorized into five distinct vehicle groups: Automobiles, Medium-Loaded Commercial Vehicles, Buses, Trucks, and "Truck + Trailer, Tractor + Semi-Trailer." An analysis of these counts has enabled us to determine the monthly distribution of annual traffic for each vehicle type.

The results indicate that for Automobiles, which represent the majority of the total traffic load, the lowest traffic volume occurs in January, with traffic falling approximately 25% below the annual average. In contrast, the highest volume is observed in July, where traffic exceeds the annual average by approximately 40%.

Although Buses constitute a smaller proportion of the total traffic, they exhibit the highest variability in seasonal patterns. The lowest bus traffic occurs in December, with traffic levels 43% below the annual average, while the highest levels are recorded in August, where traffic surges to approximately 60% above the annual average.

The results provide key insights into the traffic behavior and its impact on overall road usage, aiding in a more accurate forecasting of annual traffic flows.

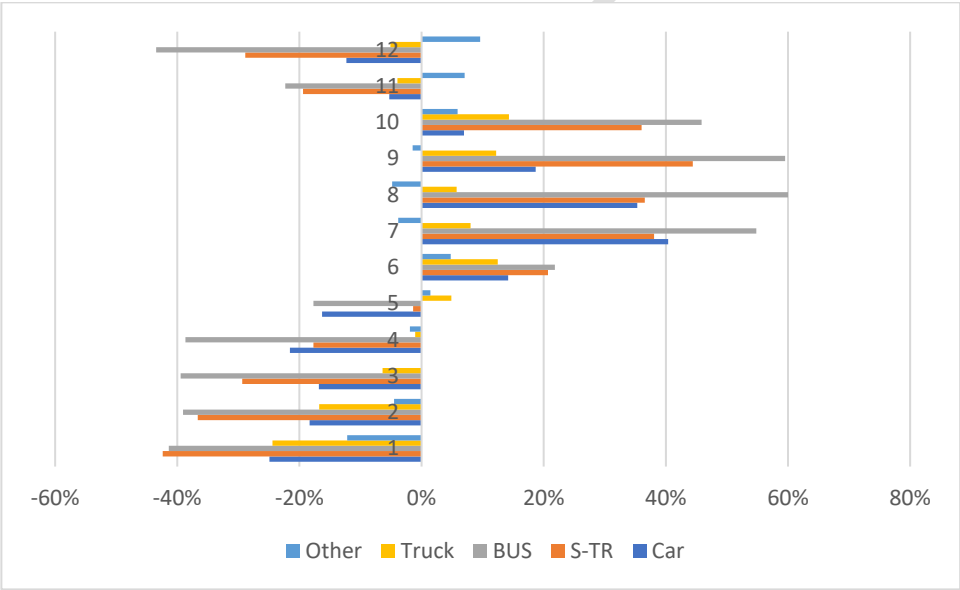

Figure 43. Seasonality

5.2.9CAPTURE RATES

Capture rates are a function of the diverted traffic over time into the project from other routes. There are multiple factors leading to diversion of traffic into this project, resulting in forecasted capture rates. The traffic models estimate the amount of this traffic based upon the analysis of comparative generalised costs of making a given trip by different routes or modes.

Current capture rates specific sections of motorways in Turkey;

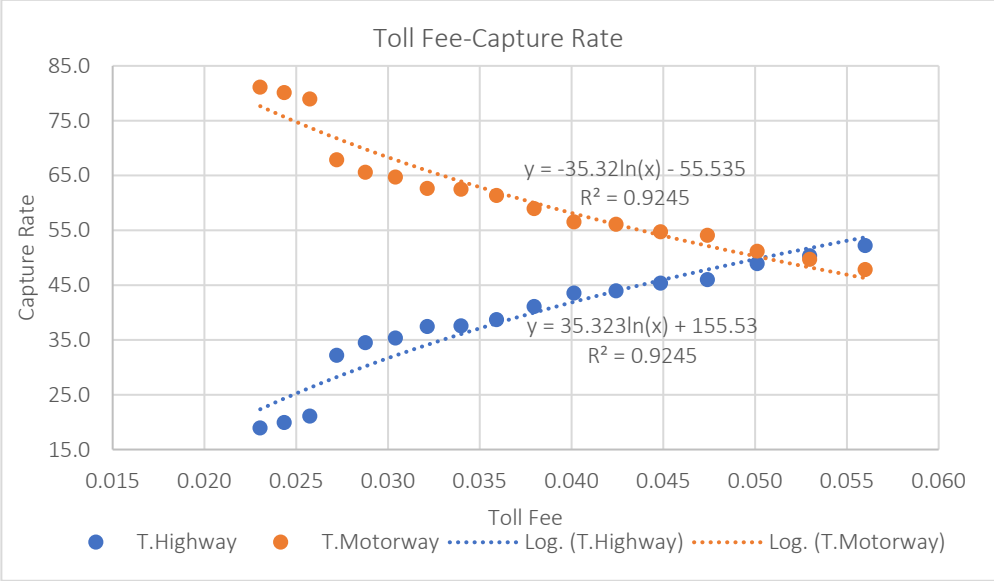

Figure 44. Toll Fee vs Capture Rate

This table and figure provide an analysis of toll fee capture rates for various motorway projects in Türkiye, showcasing the relationship between toll fees and the percentage of traffic choosing to use the toll motorway versus existing state roads. The figure highlights that for projects with lower toll fees, the capture rate for motorway is high, indicating a strong preference for the toll-free option. However, for projects with higher toll fees, the capture rate for motorway is lower.

The accompanying figure visually depicts this relationship, showing a clear negative correlation between toll fees and capture rates for both light and heavy vehicles. As toll fees increase, the percentage of traffic opting for the toll motorway decreases. This analysis is essential for understanding driver sensitivity to toll fees and informing toll rate setting for the Antalya-Alanya Motorway Project. The findings suggest that higher toll fees may result in lower

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

capture rates, particularly for light vehicles, emphasizing the need to balance revenue generation with traffic volume objectives.

5.3 Comparison with Competing Routes

This stage is one of the most critical stages in the traffic load estimation required for the feasibility study. Depending on vehicle type and income, drivers choose between motorway and highway taking several factors such as fuel consumption, tolls, time, and accident risk.

The following results were found in previous field studies (literature survey, and case studies):

- Car drivers are more sensitive to travel time in direct proportion to their income. However, the degree of sensitivity varies between countries and regions. It is understood that the most important reasons for this are factors such as the relatively high incomes of car users, the short journey time that makes them prefer cars instead of buses, time being more valuable, and the high-speed limit on highways (130 km/h).
- Truck drivers are more sensitive to trip costs (fuel consumption and toll). However, the degree of sensitivity varies between countries and regions. Reasons such as reducing fuel and transit costs for competition in transportation, not having a big difference between D-400 highway and highway travel times due to low-speed limits (80 km/h), adjusting departure time according to arrival time, explaining the low rates of truck drivers' preference for highways.
- Bus drivers are sensitive to both trip cost (fuel consumption and toll) and trip time. However, the degree of sensitivity varies according to countries, regions and bus terminal locations. Although passengers are sensitive to time when choosing a company, reasons such as companies' preference to reduce fuel and toll costs for competition, no significant difference between the two options due to speed limits, and the necessity of entering and exiting more than one terminal on the route cause highway preference rates to remain low.
- Since the share of other vehicle types in total traffic is low, it is difficult to obtain statistically significant results. Since most of them are local traffic vehicles and prefer the highway, it is understood that their sensitivity to time is low and sensitivity to fuel consumption is high.

It is necessary to examine the base year (2023) traffic and measure the *elasticity* of current demand according to cost and time. However, it is not possible to test flexibility as there is currently only a highway between Antalya and Alanya and there are no options for drivers. However, driver preferences and flexibility are similar across the country depending on certain variables (income, vehicle type, distance, duration, cost). In this context, examining and modelling (explaining with equations) the demand in corridors with similar characteristics can be used in demand forecasting for the Antalya-Alanya highway corridor and can provide reliable results. Both highway and highway corridors serve between Bursa-İzmir, Niğde-Ankara, Ankara-Konya, Mersin-Adana, Adana-İskenderun. The level of sensitivity of drivers between the two options, depending on which variable, will be measured using the General Directorate of Highways Transportation and Traffic Data in 2023 and, if necessary, in the previous period. Accordingly, it will be determined at what rate which of the two options is preferred for each vehicle type, and the choice and demand elasticity between time and cost will be measured according to vehicle types.

In the literature and in practice, the urban traffic assignment phase is carried out according to various models and assumptions. *Probabilistic/econometric* models are used in traffic assignments in regional corridors. In these models, the choice between two options (state road and motorway) is explained by a probability function.

While a direct comparison with an existing competing motorway is not feasible for this project, the model incorporates a probabilistic/econometric approach to simulate route choice behavior. This approach utilizes a

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

probability function to estimate the likelihood of drivers choosing the new motorway versus the existing state road, based on a comparison of generalized costs.

The probability function is expressed as:

Pm = e^(-Cm) / (e^(-Cm) + e^(-Ch))

Where:

- *Pm* = Probability of choosing the motorway
- *e* = Exponent (mathematical constant)
- *Cm* = Total generalized cost of using the motorway
- *Ch* = Total generalized cost of using the existing highway

The generalized costs for both routes are calculated using the following equation:

C = k1*Cf + k2*Cl + k3*Ct

Where:

- *C* = Total generalized cost
- *Cf* = Fuel cost (influenced by distance and fuel efficiency)
- *Cl* = Toll fee (motorway only)
- *Ct* = Time cost (value of time x travel time)
- *k1, k2, k3* = Coefficients representing the relative weights of each cost component (calibrated based on observed driver behavior)

This probabilistic approach provides a realistic estimate of traffic diversion to the new motorway, considering the factors influencing driver route choices.

Historical gasoline prices has been obtained from Petrol Ofisi A.Ş. Future prices in EUR has been forecasted by using Heat Roadmap Europe Analysis.

DRAFT

Generalized Time ("GT") is the combined effect of time spent travelling and the cost of travel. Cost of travel is divided by the VoT to transform it to corresponding hours.

The GT for vehicles is made from the following elements:

- in-vehicle time (hr);
- vehicle operating costs ("VoC") (€/km*km); and
- tolls or other user charges (€).

VoC only includes fuel costs for non-business trips, that being the only cost that is actually 'perceived' by the user, in his travel decision-making process. It includes other non-fuel elements of vehicle costs (e.g. maintenance) for.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

For both alternatives, we estimated total travel times, distances, required fuel, price for fuel, and fees presented in the table below.

5.4 Traffic Modeling and Forecasting

The purpose of traffic modelling is to predict the private vehicle, light trucks/van, bus, truck, and other vehicle traffic between the settlements (zones). We followed a four-step model approach for this study.

The model was calibrated for the base year of 2023 and the horizon years of 2028 (start date) and 2040 (end year). The model considers the following main variables when establishing traffic route selection:

- Toll Rate;

- Route length;
- Average Speed;
- Value of Time;
- Travel time
- Toll fee
- Travel cost

Following the calibration, the base year traffic forecast model is employed for the concession term (2028-2040). Furthermore, a thorough review and validation of the data have been completed using historical patterns and considering externalities.

The traffic model assumes trips are produced at an origin and attracted to a destination. They are directly proportional to the total trip productions at the origin and the total attractions at the destination. A friction factor represents the reluctance of persons to make trips of various durations or distances. Generally, as travel time increases the drivers are less likely to make trips, therefore, the friction factor increases. The friction factor is also treated as a socioeconomic factor, total trip costs, total production, and attraction for a study area.

The current zones of the traffic model are based on the catchment areas as described in previous sections of this report. The centroids refer to center of the population of zones and GDP per capita per zone and have been loaded to the traffic model.

The catchment area used for the model starts from at west of Serik and ends at the west of Alanya. whereas the Road Network, represented as a connection of the links of the model consisting of Motorways and state roads.

Attributes of the links are given as factors to traffic flow, such as speed and capacity, if the road link has no tolls. The toll rates are assigned on the related links. Toll rates comprise one of the most important parameters in decision making regarding trips because it has direct cost impact.

The Project's overall connectivity to main arterials was commissioned in stages which resulted in lower accessibility and usage of the Project at the initial stages. Additionally, initial usage is expected to be proportioned by the public awareness for the Project which is expected to pick up in future. We note the limitation on the projected traffic growth accuracy from effects of public awareness and connectivity due to limited data. That is to say, the Antalya-Alanya Motorway was fully operational only since 2028 and the data made available by the SPV was used to establish the weighted traffic contribution for these factors. Traffic forecasting on toll roads typically diverges due to elasticities concerned with the actual setting and since each motorway has a unique usage profile and value proposition. Assumptions of the forecast have been provided throughout the report and the results may differ based on road-specific elasticities that are yet to be observed.

5.4.1FORECASTED TRAFFIC

Building upon the historical traffic analysis, this section presents the forecasted traffic volumes on the proposed Antalya-Alanya motorway. We employ a mathematical traffic forecasting model that leverages multiple regression analysis and considers key socioeconomic drivers.

Our methodology defines forecasted traffic as the combination of Start-up traffic at the base date and traffic growth into future years:

$$Forecasted\ Traffic = Start\ up\ Traffic + Traffic\ Growth$$

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

Start-up traffic is the sum of induced traffic, diverted traffic and existing traffic:

$$Startup\ Traffic = Induced\ Traffic + Diverted\ Traffic + Existing\ Traffic$$

- Existing traffic is considered as "0" due to the Project's greenfield nature.
- Diverted traffic is a function of the capture rate of the newly built or improved carriageway facility from the in-scope traffic based on the cost, travel time, and comfort advantages of the newly constructed road.
- Induced traffic is the increase in total travel resulting from a reduced travel times and costs in favor of the Motorway, or improved, means of transportation whereas diverted demand is the equivalent reduction in travel demand from the state road due to increased travel times and costs.

Traffic growth is a function of organic growth and development growth.

$$Traffic\ Growth = Organic\ Growth + Development\ Growth$$

Within this scope, we note the following:

- In terms of diverted traffic, the Model suggests that after the Motorway project the state road traffic will decrease by about 50%, diverted to the motorway.
- The opening of the motorway will generate additional traffic (induced traffic) demand due to the improvement in accessibility it provides and further to the suppressed traffic in recent years based on the lack of capacity in the existing infrastructure.
- Organic growth can be analyzed based on macroeconomic trends and regional demographics such as population growth, leading to car ownership thus traffic demand. Similarly, freight transportation as a function of truck numbers (in relation to GDP) leads to increased transportation with heavy vehicles.
- A very important element that could not be modelled in the traffic forecasts is that the increased accessibility to be provided by the motorway is likely to have considerable impacts on the land-use pattern in the project area. This is a very common land use impact of major transportation projects in Turkey. The resulting increases in traffic demand are estimated by the model (traffic demand of the population and economic activities). In addition traffic generators and attractors such as additional hotels, organized industrial zones and other facilities.
- Another consideration of importance that cannot be quantified and therefore not included in the model is the social response towards projects of this scale. West-Southern Turkish regions and Turkey in general had seen an initial mixed positive and negative response to multiple large-scale transport infrastructure projects, which in time shifted partially towards a more positive view once people experienced the advantages first hand, such as time efficiency and safety, contributing gradually to increased usage.

Traffic demand forecast was initiated to estimate traffic volumes on the road sections. Model results proved that traffic demand is influenced by economic, demographic factors. Therefore, HV traffic growth is tied to future real GDP growth and LV traffic growth is modeled as a function of car ownership, which is itself influenced by both GDP growth and population growth.

5.4.2TRAFFIC MODEL CALIBRATION AND OD MATRICES

The traffic model utilizes historical traffic data and socioeconomic indicators as inputs to establish relationships between traffic demand and its influencing factors. Through the calibration process, the model's parameters are estimated and calculated to ensure it accurately reflects observed traffic patterns.

This calibration involves:

- Total Traffic and Observed Demand: Total traffic demand is measured by vehicle kilometer traveled by cars, buses, vans, trucks, and other vehicles. Vehicle volume at the western and eastern sections provide row and column total of the corresponding zones. In this stage simulated and actual traffic volumes and vehicle kilometers traveled are compared with the actual case. The calibration process is run by iterations until a significant and consistent results are obtained.
- Segment Volume Validation: The model's estimated traffic volumes for specific motorway segments are compared to observed volumes to further refine its accuracy.
- The traffic forecasting model leverages multiple regression analysis to establish a relationship between historical traffic load (VKT) and key independent variables, including:
    - Population
    - GDP
    - Hotel bed capacity
    - Number of vehicles
    - Other relevant socioeconomic indicators
- Identification and understanding of the sources of state road traffic demand (transit, local traffic). Measurement/estimation of vehicle entry/exit at each entrance/section (or district).
- Estimating the total vehicle traffic generation in the corridor (between Antalya and Alanya) (estimating the number of cars, trucks, buses, and other vehicle entries.
- Estimating the current state (2023) origin/destination OD matrix (trip distribution) and testing its accuracy/consistency. Estimating the number of vehicles traveling between the starting and ending points of the journey and obtaining the parameters/coefficients that determine/affect this traffic are used to estimate the vehicle traffic between these points in the future.

Development of a trip distribution model that describes the destination resource matrix. Equation variables/coefficients that determine vehicle distribution matrices in the model are obtained. These matrices are developed separately for cars, buses, trucks and other vehicles. The main purpose of the distribution model is the deterrent effect of distance on the distribution of travel between settlements and cities. High travel demand is expected between close settlements (for example, between Antalya and Serik) and low travel demand between distant settlements.

In the literature, instead of the deterrent effect of distance, the deterrent effect of travel time is also used as a variable. Since time and fuel consumption are functions of distance in intercity trips, the distance variable was used in trip distribution estimation (what proportion of vehicles will travel from district i to district j). On the other hand, both time and fuel consumption variables were used together according to vehicle types in estimating the traffic demand in the corridor, the volume in the sections and the vehicle load.

DRAFT

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

We assigned the vehicle volume (between source/target) in the matrix to the corridor. With this assignment, vehicle volumes are estimated in the sections in the corridor.

We directly communicated with KGM to request roadside survey data and existing traffic analyses conducted in the region. However, we were informed that data sets are not shared outside the organization.

A matrix representing travel patterns between origin and destination zones is developed according to TomTom Database and KGM historical traffic data.

Calibration of the distribution matrix obtained by TomTom is ensured by comparing the estimated cutting volumes with the observed General Directorate of Highways 2023 vehicle volume data.

According to the TomTom, the passenger category is mainly data derived from smartphones, PNDs, and specific car brands that manufacture passenger vehicles. The fleet category is related to some truck manufacturers, taxi/delivery services, and other sources categorized as a "fleet" company. Our assumption is that the passenger distribution is Light Vehicle (car + small truck) and the fleet distribution is Heavy Vehicle (bus + truck + other).

Calibrated matrices (flows between each origin and destination pair) by vehicle type are calculated. According to TomTom Traffic Database, in October 2022, the OD Matrix for the state road is calculated as follows;

Konaklı	0.88%	0.05%	0.42%	0.28%	1.93%	0.00%	5.17%
Alanya	4.57%	0.31%	1.72%	1.00%	3.56%	5.29%	0.00%

The calibration process is based on the estimation matrix (estimated matrix) is the process of reciprocal iteration process which adjust the simulated matrix with reference to the observed one (origin destination table).

After this stage, the coefficients of the calibrated matrix and the deterrent effect of the distance determining production/attraction are determined (car βc , small trucks βs, truck βt , bus βb and other vehicles βo). In the next stage, demand forecast matrices for cars, trucks, buses and other vehicles based on the estimated population, average national income per capita, number of vehicles variables and target/source traffic production volumes in target years (from 2028 to 2040) are estimated.

In this method the following equation explains the traffic demand on a corridor:

- Tij =Pi* Aj *e $\beta^{Dij,}$ where Tij is the trips between I an j, Pi is produced trips by a settlement, Bj is the attracted trips by a settlement, and *B* is the impedance coefficient.

Estimating origin-destination (OD) matrices in complex urban networks is a challenging task, as noted by Tamin and Willumsen (1989). However, since regional highway networks are generally simpler than urban networks, their method can be adapted for use in corridor studies.

Together with the KGM historical traffic data and the Probability of Choice Behavior Analysis, we modified the OD matrix as follows;

Table 25. Adjusted OD Matrix for Light Vehicle

5.4.3TOLL ELASTICITY

Toll elasticity is an indicator to estimate diverted traffic from state road to motorway. It is observed that a revenue stream based on a motorway toll to traffic demand elasticity is about -0.5 (-0.45 to -0.55), which we consider reasonable based on previous research on the subject, noting that location and project specificity would have a direct implication on the accuracy of this assumption. Based on tender year tolling level of €0.0598, the base case is a reasonable assumption.

Toll rate elasticity is related to the driver income and total travel costs. Elasticity is a generalized average of all drivers.

5.4.4CAPACITY OF MOTORWAY SECTIONS

Coping with the traffic demand in multifunctional regions (tourism, agriculture, commerce) is a complicated work. Accordingly, there are significant changes in travel demand at different hours of the day, days of the month, and months of the year. Studies and observations have shown that the road network in tourism regions has to accommodate intensive traffic flows at certain periods of the year (Rosselló and Saenz-de Miera, 2011). Such problems cause time losses, therefore some visitors may choose different destinations for their future holidays.

When the capacity utilization rate exceeds 0.40 (AADT/Daily Capacity) travel speed declines. The annual average capacity utilization rate between 0.20 and 0.40 implies the efficient use of the road. CUR less than 0.20 implies an underutilized roadway. A range of 0.20-0.40 can be considered the optimal usage level. In that case, road sections are used at full capacity at certain time intervals due to seasonal, monthly, daily, and hourly peaks (monthly, daily, and hourly peak factors). Peak season, day and hour factors (coefficients) vary in regions. Therefore, if the annual average capacity utilization rate (AADT/ daily capacity) is higher than 0.40, insufficiencies may be observed on peak days, and peak hours of the tourism season. Theoretically, the volume/capacity ratio can be at most 1.00. However, in practice, if the highway demand is higher than the capacity, queuing and congestion problems occur on the highway.

According to the Highway Capacity Manual (HCM, 2010) method, the one-way capacity of the motorway is calculated as 5,400 vehicles/hour (1,800 personal car equivalent units of vehicles (p.c.u)/lane).

According to the Highway Capacity Manual (HCM, 2010) method, the one-way capacity of the state road (highway) is calculated as 2,540 vehicles/hour (1,800 p.c.u/lane).

DRAFT

5.4.5MAIN ASSUMPTIONS FOR TRAFFIC MODEL

Several key assumptions underpin the traffic forecasting model and are crucial for interpreting the projected traffic volumes:

- Driver Behavior: The model assumes that drivers make rational route choices based on a combination of factors, including travel time, fuel costs, toll fees, and perceived safety.
- Sensitivity to Time and Cost: Recognizing the varying sensitivities among different vehicle types, the model incorporates elasticity parameters to account for the impact of toll fees, fuel costs, and travel time on route choice. For instance:
    - Car drivers are assumed to be more sensitive to travel time due to factors like higher income levels and a greater value placed on time savings.
    - Truck drivers are expected to be more sensitive to travel costs (fuel and tolls) to minimize operational expenses and remain competitive.
    - Bus drivers demonstrate sensitivity to both time and cost, balancing passenger preferences for shorter travel times with the need to control operational costs.
- Existing Alternative Route: As there is currently no alternative motorway route between Antalya-Alanya, directly observing route choice elasticity is not possible. To overcome this limitation, the model draws insights from similar corridors in Turkey (Bursa-Izmir, etc.) where both state road and motorway options exist. By analyzing traffic patterns in those corridors, the model estimates elasticity parameters for different vehicle types based on observed driver behavior in comparable contexts.

Traffic and revenue forecasts included in the report are based on certain assumptions and forecast of future economic growth, population and other factors, which are ultimately subject to some level of uncertainty.

5.4.6THE PROJECTED TRAFFIC WITH BASE ASSUMPTIONS

Using the calibrated model and considering the projected values for key socioeconomic indicators, we estimate base-case traffic volumes for the motorway for each target year.

5.5 Conclusions of the Traffic Forecast

We ran regression tests for each of the vehicle type for each district through which the state road passes. As a result of the regression analysis, we deduced the below points;

- The traffic demand of the eastern Antalya region is proportional to population growth, vehicle ownership, and tourism activities. LV traffic growth is modeled as a function of car ownership, which is itself influenced by both GDP growth and population growth.
- Small truck/van traffic demand shows similarities with car traffic.
- Bus traffic has declined in the last decades due to several factors. Such as, increased car ownership. Reduced air transportation costs have likely diverted traffic to air. Income and travel time value have increased therefore people do not prefer traveling by bus. On the other hand, HV traffic growth is tied to future real GDP growth in our observations.
- Truck traffic shows a fluctuating pattern. Although the truck number has increased gradually, the demand declined. Several factors can explain this trend. Declining commodity weights and fluctuating economic

DRAFT

activity as well as e-commerce and last mile freight are largely unstudied topics in the locality. However, HV traffic growth is tied to future real GDP growth in our observations.

- In the last decades the number of other vehicles and traffic has increased gradually.

After getting the overall volume of the traffic in the region, we used modified OD Matrixes to distribute the traffic together with the capture rates calculated with the Probability of Choice Behavior Analysis.

We calculated toll to toll traffic demand together with seasonality and applied Induced Demand and Ramp-up assumptions discussed previously to the forecasted results.

Monthly and Yearly traffic demand forecast outputs are shown below;

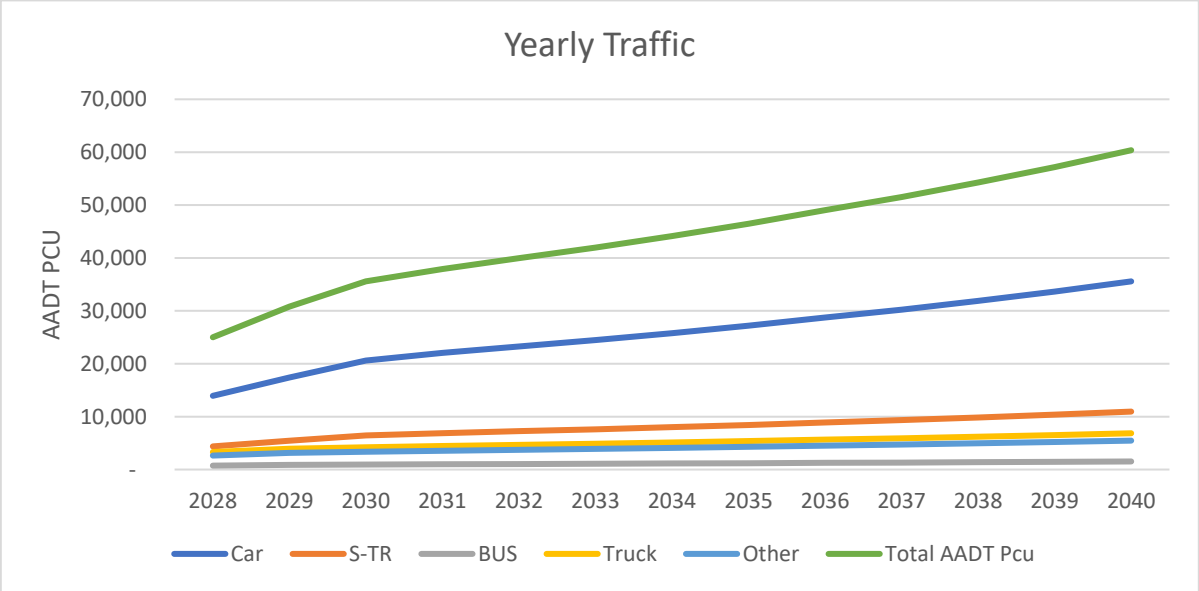

Figure 47. Traffic Model Outputs Yearly

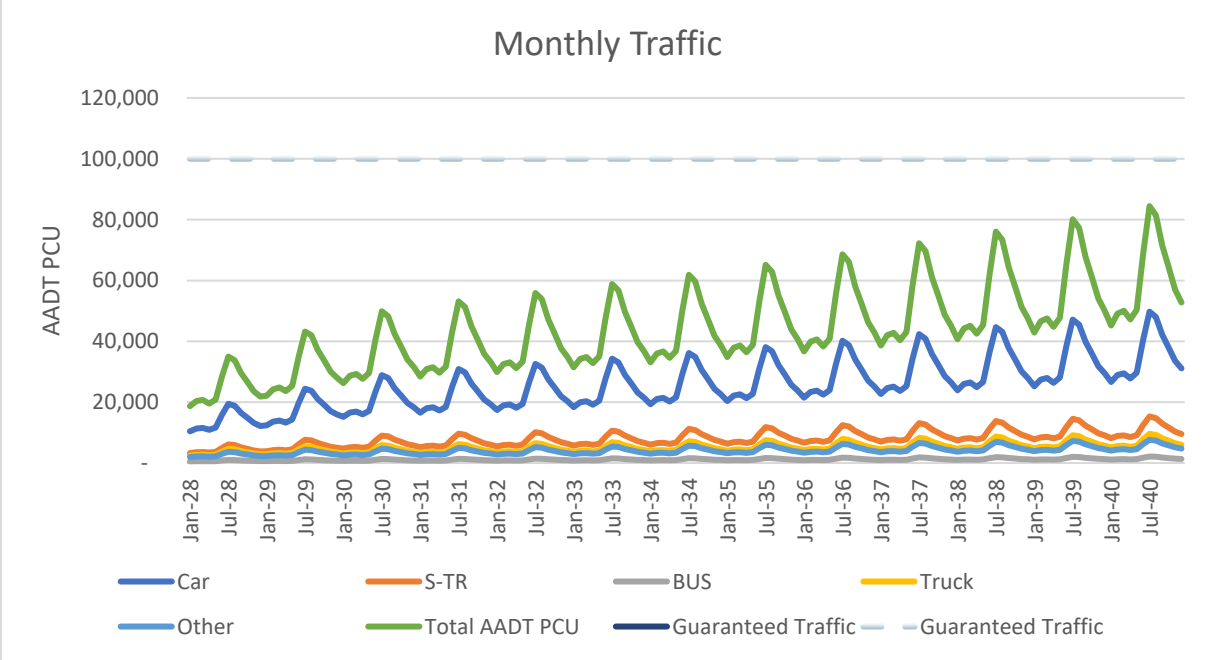

Figure 48.Traffic Model Outputs Monthly

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

The traffic model projects a significant increase in traffic volume on the Antalya-Alanya Motorway from its opening in 2028 to 2040. The model predicts a steady rise in Average Annual Daily Traffic (AADT) from 25,007 Passenger Car Units (PCU) in 2028 to 60,372 PCU in 2040. This growth is primarily driven by several factors.

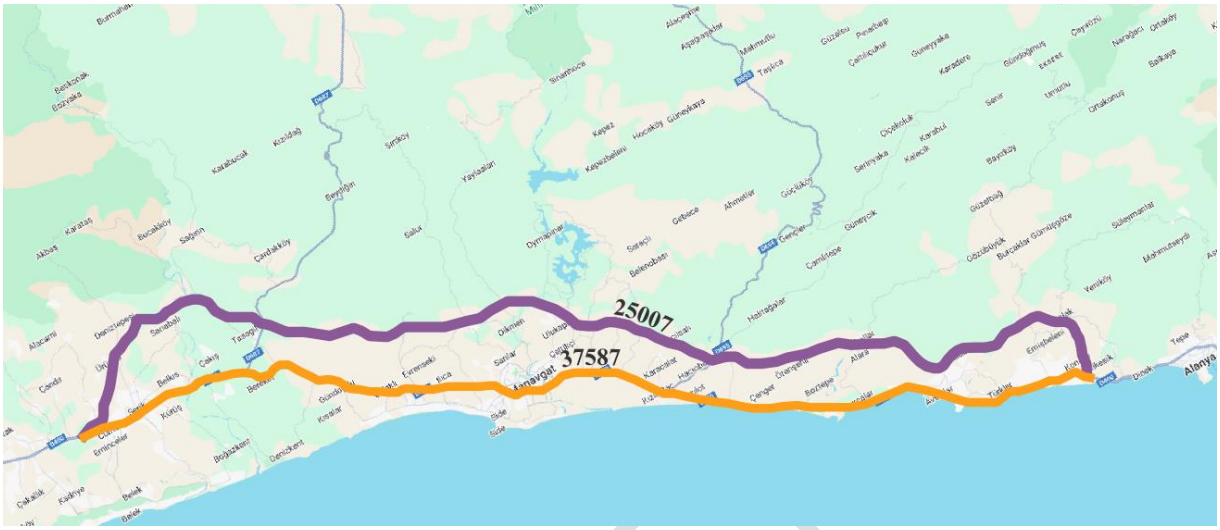

Figure 49. State Road and Motorway AADT PCU in 2028.

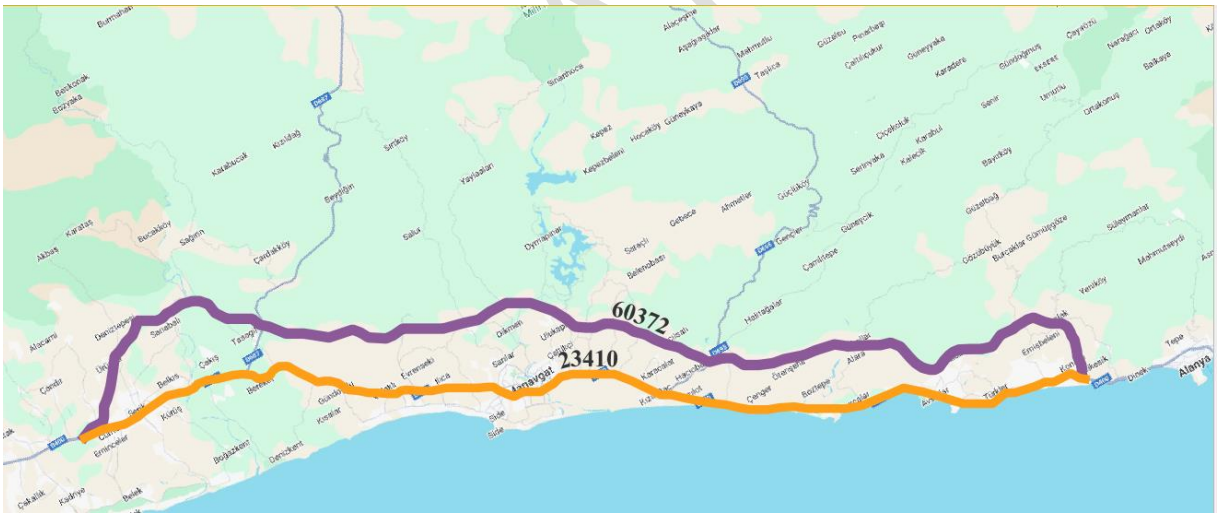

Figure 50. State Road and Motorway AADT PCU in 2040

However, the monthly traffic forecast suggests that the guaranteed traffic amount of 100,000 AADT PCU will not be achieved within the analyzed timeframe.

Several assumptions underpin this forecast, including:

- Induced Demand: The model accounts for induced demand, assuming a higher initial impact in the first three years after the Motorway's opening, gradually decreasing over time.

This report has been prepared at the request of Deutsche Bank and is the exclusive property of BTY Group. The information must be treated as confidential and not to be disclosed, reproduced or permitted to be disclosed to any party without the prior consent of BTY Group.

- Ramp-Up Period: A ramp-up period is incorporated, reflecting the gradual increase in traffic as road users become familiar with the new Motorway and adjust their travel patterns.
- Value of Time (VoT) Projection: The model considers the evolving VoT, assuming an increase in line with rising GDP per capita.
- Capture Rate Measurement and Estimation: The calculations for capturing traffic from competing routes consider factors like VoT and fuel prices, which are projected to increase over time.
- HV traffic growth is tied to future real GDP growth.
- LV traffic growth is modeled as a function of car ownership, which is itself influenced by both GDP growth and population growth.

The model utilizes forecasts from reputable organizations:

- GDP Growth Rate: Forecasts from the IMF are used to project future economic growth in the region.
- Population Growth: Population projections from TUIK (Turkish Statistical Institute) inform the model's estimates of future traffic demand.
- Forecast for EUR/TL exchange rate is sourced from the project sponsor
- Forecast for EUR/USD exchange rate is sourced from The Economy Forecast Agency.
- European fuel prices are sourced from the project sponsor Heat Roadmap Europe Analysis.

While these forecasts provide a robust foundation for the traffic model, it is crucial to acknowledge potential uncertainties. The actual traffic volume on the Antalya-Alanya Motorway may deviate from the projections due to unforeseen economic fluctuations, changes in government policies, or shifts in travel behavior. Continuous monitoring of key economic and demographic indicators, along with periodic reviews and adjustments to the model, will be essential to ensure the accuracy of future traffic projections.

DAĞITIM YERLERİNE

İlgi : Limak İnşaat Sanayi ve Ticaret Anonim Şirketi'nin 12.05.2025 tarihli ve 3 sayılı yazısı.

İlgi yazıda; Antalya-Alanya Otoyolu Projesi kapsamında Manavgat İlçesi, Taşağıl Mahallesi sınırları dahilinde, 66.449.77 m^2 lik alanda 1000 kişilik çalışanın bulunduğu şantiye alanı için planlanan 200 m^3/günlük evsel nitelikli atıksu arıtma tesisi çıkış sularının deşarj edileceği nokta için Kurum görüşümüz istenmektedir.

Bahse konu deşarj noktası incelenmiş olup, yapılması planlanan atıksu arıtma tesisinden çıkacak arıtılmış atıksuyun 31.12.2004 tarih ve 25687 sayılı "Su Kirliliği Kontrol Yönetmeliği'nde" belirtilen alıcı ortam deşarj standartlarının sağlanması kaydıyla belirtilen noktadan Kaymazboğazı Deresi'ne deşarj edilmesi Bölge Müdürlüğümüzce uygun bulunmaktadır.

Bilgilerinizi ve gereğini rica ederim.

Oğuzhan KARABULUT

CUMHURBAŞKANI KARARI

Karar Sayısı: 9708

Antalya-Alanya Otoyolu (Serik ile Alanya Arası) ve Bağlantı Yolları Projesi kapsamında bazı taşınmazların Karayolları Genel Müdürlüğü tarafından acele kamulaştırılmasına ilişkin ekli Kararın yürürlüğe konulmasına, 2942 sayılı Kamulaştırma Kanununun 27 nci maddesi gereğince karar verilmiştir.

29 Mart 2025

Recep Tayyip ERDOĞAN
CUMHURBAŞKANI

29/3/2025 TARİHLİ VE 9708 SAYILI CUMHURBAŞKANI KARARININ EKİ
KARAR

MADDE 1- (1) Antalya-Alanya Otoyolu (Serik ile Alanya Arası) ve Bağlantı Yolları Projesi (km:52+000-136+000) kapsamında, ekli krokide gösterilen güzergâh üzerinde bulunan Antalya İli;

a) Serik İlçesi, Deniztepesi, Sarıabalı, Üründü, Belpınarı, Burmahancı, Cumalı, Aşağıçatma, Çandır, Kayaburnu, Aşağıkocayatak, Yukarıkocayatak ve Abdurrahmanlar mahalleleri,

b) Manavgat İlçesi, Çakış, Taşağıl, Hocalar, Gündoğdu, Yavrudoğan, Çolaklı, Seki, Kalemler, Yeniköy, Şişeler, Evrenleryavşi, Dolbazlar, Yukarışıklar, Dikmen, Evrenseki, Ilıca, Kızılot, Bucakşeyhler, Ulukapı, Aşağışıklar, Demirciler, Karaöz, Aksaz, Hacıali, Cevizler, Sülek, Hacıisalı, Hacıobası, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Odaönü ve Karakaya mahalleleri,

c) Alanya İlçesi, Alara, Çakallar, İncekum, Avsallar, Akdam, Türkler, Payallar, Emişbeleni, Toslak, Elikesik ve Telatiye mahalleleri,

sınırları içerisinde söz konusu Proje güzergahına rastlayan kesimde araziye girilebilmesi ve yol yapım çalışmalarının yürütülmesi ile şantiye, yol bakım hizmetleri, otoyol hizmet tesisleri, malzeme ocakları, plent ve döküm sahaları ve benzeri sahaların yapımı için ihtiyaç duyulan taşınmazlar ve üzerlerindeki müştemilatın Karayolları Genel Müdürlüğü tarafından acele kamulaştırılmasına karar verilmiştir.

MADDE 2- (1) Bu Karar yayımı tarihinde yürürlüğe girer.

MADDE 3- (1) Bu Karar hükümlerini Ulaştırma ve Altyapı Bakanı yürütür.

DAĞITIM YERLERİNE

Antalya İli, Kepez, Aksu, Döşemealtı, Alanya, Manavgat, Serik İlçeleri Mevkii'nde, T.C. Ulaştırma ve Altyapı Bakanlığı Karayolları Genel Müdürlüğü tarafından yapılması planlanan "(Ankara-İzmir) Ayr.-Afyonkarahisar-Antalya-Alanya Otoyolu ve Malzeme Ocakları (Antalya-Alanya Kesimi) Projesi" ile ilgili olarak Bakanlığımıza Çevrimiçi ÇED süreci Yönetim Sisteminden sunulan ÇED Raporu, İnceleme Değerlendirme Komisyonu tarafından incelenmiş ve değerlendirilmiştir.

"(Ankara-İzmir) Ayr.-Afyonkarahisar-Antalya-Alanya Otoyolu ve Malzeme Ocakları (Antalya-Alanya Kesimi) Projesi" hakkında ÇED Yönetmeliğinin 14. maddesi gereğince Bakanlığımızca "Çevresel Etki Değerlendirmesi Olumlu" Kararı verilmiş olup, Antalya Valiliği (Çevre ve Şehircilik İl Müdürlüğü) tarafından kararın halka duyurulması gerekmektedir.

Söz konusu projeye ait Nihai ÇED Raporu ve eklerinde belirtilen hususlar ile 2872 sayılı Çevre Kanununa istinaden yürürlüğe giren yönetmeliklerin ilgili hükümlerine uyulması, mer'i mevzuat uyarınca ilgili kurum/kuruluşlardan gerekli izinlerin alınması, projede yapılacak Yönetmeliğe tabi değişikliklerin de Bakanlığımıza veya Antalya Valiliği (Çevre ve Şehircilik İl Müdürlüğü) 'ne iletilmesi gerekmektedir.

Bilgilerinizi ve gereğini arz ve rica ederim.

CODE OF CONDUCT

Purpose and Scope:

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş ("AAOİAS") Code of Conduct articulates the principles that all employees, offıcers, and directors of the AAOİAS, as well as contractors and other third parties who conduct business on AAOİAS's behalf (collectively "individuals and entities associated with AAOİAS") must follow.

Responsibilities:

Ali individuals and entities associated with AAOİAS are required to read the Code of Conduct, familiarize themselves with the Code of Conduct, and act accordingly with rules, principles, and values set forth in the Code of Conduct. Of utmost importance, all individuals and entities associated with AAOİAS will adhere to these principles when interacting with government entities, customers, shareholders, suppliers, business partners and other employees.

Of utmost importance, all individuals and entities associated with AAOİAS will adhere to the principles defined below when interacting with government entities, customers, shareholders, suppliers, business partners and other employees. Compliance with this Code of Conduct shall also constitute a contractual obligation for contractors, subcontractors and third parties engaged in the Project.

Principles:

- √ **Non Discrimination**

AAOİAS explicitly prohibits decisions made on any attributes of its employees which are unrelated to the said personnel's performance and qualifications. Such unrelated issues may relate to race, ethnicity, color, gender, religion, associations, age, disability, political beliefs, marital status, sexual orientation and family responsibilities. AAOİAS also expects that its personnel shall abide by these rules, and treat each other fairly, equally and never based on any of the grounds defined, without limitation, above.

- √ **Adherence to the Law**

All individuals and entities associated with AAOİAS will execute all of their activities and transactions in compliance with the laws and regulations of the Republic of Türkiye and any applicable international law or norm.

- ✓ **Ethics, Integrity and Respect**

AAOİAS values truth, honesty, and integrity. It believes in good corporate citizenship. All individuals and entities associated with AAOİAS will conduct their business honorably, with honesty, integrity and respect for others.

AAOİAS will strive to meet the highest possible standards of ethical business conduct. All individuals and entities associated with AAOİAS will conduct business without any expectation of personal benefit.

- ✓ **Environmental Impact**

AAOİAS conducts its activities in accordance with high environmental standards. To that effect, all operational resolutions must be in line with applicable environmental laws and be applied with the principle that the impact of our business on the natural environment and human communities are minimum.

- ✓ **Sustainable Profıts**

AAOİAS seeks consistent, balanced, and sustainable growth. To accomplish this, AAOİAS will avoid taking on unmanageable risks. AAOİAS will act in a fiscally disciplined manner, manage its resources productively, and focus its investments on sectors where AAOİAS can sustainably grow and profıt.

- ✓ **A Healthy Work Place**

AAOİAS promises its employees a safe, healthy, and fair working environment. AAOİAS will not tolerate substance abuse, violence, threats, harassment, or intimidation in the workplace.

AAOİAS recognizes that creating a healthy work environment goes further than prohibited behavior in the workplace. AAOİAS will be attentive to the personal growth and improvement of its employees, and will encourage its employees to voluntarily participate in educational, social, and community activities.

AAOİAS also strictly prohibits any form of Gender-Based Violence and Harassment (GBVH). This includes, without limitation, sexual harassment, sexual exploitation, bullying, intimidation, or any other form of gender-based misconduct. Such behaviours are explicitly deemed unacceptable under this Code of Conduct.

- ✓ **Customer Responsibility**

AAOİAS will be responsive to the needs and demands of its clients and customers. In doing so, AAOİAS and all individuals and entities associated with AAOİAS will consistently endeavor to satisfy customer needs and demands in a timely manner.

√ Responsibility to Suppliers and Business Partners

AAOİAS treats both suppliers and business partners with the same fairness and respect as it treats its employees and customers. All individuals and entities associated with AAOİAS will always endeavor to fulfil their agreements on time, at cost, and at the level of quality demanded by AAOİAS's high standards. In working with suppliers and business partners, all individuals and entities associated with AAOİAS will diligently protect the confidential information of the entities and people they do business with. Not only will all individuals and entities associated with AAOİAS not violate confidentiality, they will not accept confidential information that they are not entitled to receive.

√ Anti-Bribery and Corruption

AAOİAS understands that the culture and environment in which it operates may sometimes necessitate, as a social norm, the giving and receiving of small gifts, tokens or related business courtesies by the employees to and from third parties. With this kept in mind, AAOİAS has a zero-tolerance policy for bribery, influence peddling or any crime which may fall afoul of its Policy governing full compliance with any and all applicable anti-bribery and corruption rules. In that respect, all AAOİAS personnel are prohibited from extending gifts or business courtesies that are not strictly within the scope of the Turkish Public Officials Act to, or receiving gifts or business courtesies from Public Officials in the course of the performance of their duties as AAOİAS personnel.

All employees are reminded that any breach of AAOİAS's anti-bribery and corruption Policy shall give grounds to AAOİAS to terminate an employment contract with direct effect, without compensation, for just reasons.

All employees are directed to cooperate to the fullest extent with the compliance officers for any investigation, routine or directed, pursued by the compliance officers to ensure AAOİAS's compliance with the applicable laws.

√ Public Officials

Public Officials are persons who oversee the functioning of state services, services for the benefit of the public, as well as persons who represent associations or foundations for public benefit, vocational organizations, and publicly listed companies. As such, these persons directly contribute to the proper functioning, administration and good governance of the Republic of Türkiye and AAOİAS operates. Accordingly, all AAOİAS personnel are directed to treat all Public Officials with the utmost respect and dignity that is due to a public servant, regardless of his or her capacity, powers or status, and similarly, to treat all the representatives of international institutions and organizations in the same manner as he or she would treat a Public Official in Türkiye.

✓ **Money Laundering**

Money laundering is the process of concealing illicit funds or making them look as they are legitimate, including with the pw-pose of fınancing criminal or terrorist activities. AAOİAS prohibits money laundering which means that AAOİAS and its employees shall always comply with anti-money laundering provisions under applicable laws.

✓ **Antitrust Breach**

Competition legislation prohibits agreements or actions that might impede competition. All AAOİAS employees are obliged to (i) leave or physically distance themselves from any conversations during or outside working hours which they suspect may relate to the breach of competition legislation; and (ii) distance themselves from any electronic correspondence which they suspect may relate to the breach of competition legislation.

✓ **Assets and Confidential Information**

AAOİAS assets - including physical and intellectual property - can only be used in accordance with the authority provided by management. Company assets are not to be used for personal use or to be provided to third parties for their use unless specifıcally authorized. All our equipment and any equipment provided for AAOİAS's use by third parties must be treated with respect and care.

Our confidential or proprietary information is a valuable asset and it must not be shared with any third parties unless there is a legitimate business reason for doing so and the third party has a legitimate need to know the information. Accordingly, our employees have to protect our confidential and proprietary information and are forbidden to disclose it to any person other than in the proper discharge of their duties.

Fully cognizant of the fact that all employees live in a world defıned by the social media, all Employees are neveı1heless encouraged never to discuss business related with AAOİAS or any of its business partners on the internet, and reminded that their duties of confıdentiality extend to the network as well.

✓ **Consequences of Violations**

Any violation of this Code of Conduct, including but not limited to bribery, corruption, harassment, violence, and Gender-Based Violence and Harassment (GBVH), shall be subject to disciplinary measures:

- For AAOİAS employees: disciplinary action up to and including suspension or termination of employment for just cause and without compensation.

- For contractors and subcontractors: removal from the Project site, termination of the relevant contract, and ineligibility for future work with AAOİAS.

- For all individuals and entities associated with AAOİAS: where applicable, violations will also be reported to competent legal authorities in line with national and international law.

✓ **Whistleblowing and Reporting Channels**

AAOİAS encourages all employees and stakeholders to report any suspected or actual violations of this Code of Conduct, including GBVH, bribery, corruption, or any other misconduct. Reports may be made confidentially and without fear of retaliation through the following channels:

E-mail: .....@aaoias.com.tr

Phone (confidential line): +90 (XXX) XXX XX XX

Mail: AAOİAS Office

All reports will be treated with strict confidentiality. Retaliation against individuals who make reports in good faith is strictly prohibited.
