A stakeholder engagement analysis was also carried out to assess the participation of women in consultations and to evaluate the effectiveness of methods used to reach women and other marginalized groups, identifying any barriers in access to information and decision-making processes. Gender-related risks were then assessed separately for the construction and operation phases, focusing on potential constraints to employment, limited access to project information, and exposure to gender-based violence or harassment.

This analysis considered the local socio-cultural context, including entrenched patriarchal norms and the presence of a transient construction workforce. Findings from this process were integrated into the broader social impact assessment, ensuring a comprehensive understanding of how different demographic groups, particularly women, may be affected by the Project.

Finally, targeted mitigation measures were developed based on the identified risks and local context, aiming to promote gender equity, prevent gender-based violence, and ensure women's meaningful access to the benefits of the Project. This methodology ensures that gender is not addressed in isolation but is mainstreamed throughout project design, implementation, and monitoring activities.

XIV.3.4. Ecosystem Services

The assessment of ecosystem services impacts follows a structured, stepwise methodology. First, the relevant ecosystem services that may be affected by the Project are identified and prioritized according to their significance and connection to Project activities. Baseline data are then collected and analyzed to establish the current status of these priority services. Based on this information, the services are categorized according to their importance and the potential level of impact. The Project's likely effects on these services are subsequently evaluated, and appropriate mitigation measures are defined to minimize adverse impacts and ensure sustainable management of ecosystem services.

Ecosystem services provide a wide range of benefits; however, this Project primarily focuses on Provisioning Services (Type I) and Regulating Services (Type II), as these are most directly linked to the Project's activities and environmental aspects. There are no anticipated Project activities or effects associated with cultural services, such as sacred or recreational sites (Type III), or supporting services, such as soil formation and nutrient cycling (Type IV).

Accordingly, this section evaluates the Provisioning and Regulating Services, with emphasis on how Project activities may influence these services and the potential impacts on local communities and the surrounding environment.

Table XIV.38 Project Impacts Related to Ecosystem Services

Service	Ecosystem Service Type	Description	Impact Significance (Prioritization)	Mitigation
Agricultural land use, pastureland use, forest	Provisioning Services (Type I)	Greenhouse farming and animal husbandry are the predominant livelihood sources in the	High – direct impact due to land acquisition and	RAP including LRP is developed to provide fair compensation,

Service	Ecosystem Service Type	Description	Impact Significance (Prioritization)	Mitigation
products collection, beekeeping, fishing		settlements. Beekeeping practiced as a hobby practice. Certain agricultural lands and greenhouses will be acquired for the Project. Forest use and beekeeping activities are not common within Project AoI.	livelihood disruption	alternative livelihood support and resettlement assistance.
Water sources	Regulating Services (Type II)	Some settlements in the regions use spring and well water. These water sources are not expected to be impacted by Project activities since no water abstraction is anticipated for the Project, and surface waters will not be used as a water supply. As discussed in the Physical Impact section, if the construction of a groundwater well becomes necessary, this issue will be included in Water Quality, Wastewater and Storm Water Management Plan which will be prepared and implemented, and the impact factor of groundwater depletion will be assessed.	Low – no significant impact expected	Regular monitoring of water sources and quality; Development and implementation of a Water Quality, Wastewater and Storm Water Management Plan.
Sacred sites, scenic landscapes, recreational areas	Cultural Services (Type III)	No cultural services such as spiritual or recreational land use are present in the Project Area.	None	No mitigation needed.
Natural processes (nutrient cycling, pollination, habitat provision)	Supporting Services (Type IV)	No significant supporting services are identified in the Project Area.	None	No mitigation needed.

The Project's main impacts relate to provisioning services**,** particularly the loss of agriculture and pastureland. These impacts were addressed through RAP with livelihood restoration measures to provide compensation and alternative income opportunities. Early and continuous stakeholder engagement will ensure community participation and allow for the timely integration of additional mitigation measures where required.

XIV.4. Potential Impacts

Motorway projects have both negative and positive impacts from socio-economic standpoint. Loss of livelihoods (such as agricultural lands, structures, greenhouses etc.), impacts on social infrastructures, noise and dust emissions generated by construction activities can be characterized as negative impacts; while short and long term employment opportunities and transportation benefits can be described as positive impacts.

This section outlines the anticipated socio-economic impacts of the Project under two distinct phases:

- **Construction Phase**
- **Operation Phase**

In this ESIA Report, socio-economic impacts of other issues in relation to Chapter 5 ("Land Use and Property") and Chapter 15 ("Community Health and Safety") are dealt within more detail in the relevant chapters.

XIV.4.1. Land Preparation and Construction Phase

The construction phase - lasting approximately 3 years - will require significant workforce mobilization and large-scale infrastructure activities along the corridor. With an estimated peak workforce of 3,300, local employment from Serik, Alanya, and Manavgat districts will be prioritized; however, pressure on local infrastructure and services may arise depending on actual recruitment patterns.

Various social impacts are expected to occur within the scope of the Project's land preparation and construction phase. These impacts can be categorized as follows:

- Impacts on livelihoods due to the expropriation and land acquisition activities.
- Restriction of access to the agricultural and pasturelands due to the route design.
- Impacts on local business.
- Impacts of noise and dust emissions generated by construction activities on human health and livelihoods.
- Effects on infrastructures and distribution of utility services.
- Short and long term employment opportunities created by project activities.
- Changes in the demographic structure of the settlements.
- Increase of tensions and conflicts in the local community.

Livelihood, Economic and Physical Displacement

Despite efforts to minimize physical displacement through route selection, the current alignment of the Project still intersects with privately owned and public parcels containing residences, greenhouses, and commercial structures. According to expropriation data (GEM, May 2025), 935 structures will be affected in total, comprising 299 houses, 599 greenhouses, and 37 business structures (include 8 informal business structure in RAP).

Impacts on livelihood related to the project are addressed in detail through land acquisition studies and RAP. The primary impact related to the project is the loss of land and assets due to expropriation and land acquisition. Such processes, if unmanaged, can disrupt communities, reduce available agricultural land, and weaken cultural and social ties to the land. Alongside this, affected households and businesses face resettlement and livelihood displacement, leading to a potential decline in income, food security, and living standards if no restoration efforts are provided.

Another important impact arises from the shift in agricultural practices. The Project may disrupt greenhouse operations, affecting both owners and long-term tenants. Impacts include relocation to alternative land, partial loss of land or assets, or termination of operations where no suitable land is available. This can lead to temporary or permanent loss of income for affected households and businesses. This transition carries risks of skill gaps, adaptation challenges, and vulnerability to market fluctuations. To address these issues, LRP which packages have been developed as part of the RAP have been developed to mitigate the impact of knowledge and technical limitations, ensuring that farmers receive the necessary training and consultancy support to successfully adopt greenhouse farming, pest management, and modern cultivation techniques.

At the household and community level, displacement can create further social and psychological impacts, including stress, weakened social cohesion, and a sense of loss tied to farming traditions. Effective livelihood restoration and income-generating activities are therefore essential to maintain community well-being and stability. Finally, the mitigation measures also respond to the long-term economic risks associated with new livelihoods such as banana and tropical fruit farming, which may face challenges from pests, environmental factors, and uncertain market demand. By offering diverse and resilient livelihood options, the project aims to reduce these vulnerabilities and secure sustainable income sources for all affected groups.

These figures demonstrate that the Project's impacts extend beyond physical displacement to include significant risks to agricultural production systems and local economic activities. Displacement is expected to affect owners, tenants, and informal users in different ways, potentially leading to loss of shelter, livelihood insecurity, and psychosocial stress.

Although the overall scale of displacement is limited compared to the total project footprint, the impacts are nonetheless significant at the household level. Owners may face uncertainties regarding compensation or rental income, while tenants and informal users may struggle with the loss of housing or productive assets. Such stressors - emotional, economic, and social - must be anticipated and addressed in both compensation and resettlement planning.

In line with IFC Performance Standard 5 (PS5) and national legislation, a Resettlement Action Plan (RAP) has been prepared to address these risks. The RAP provides detailed socio-economic assessments and defines compensation, livelihood restoration, and support mechanisms, with a particular focus on vulnerable groups such as female-headed households, elderly persons, and people with disabilities. For a comprehensive breakdown of displacement impacts and settlement-specific data, reference should be made to the RAP Report.

Restriction of Access to the Agricultural Lands and Greenhouses

The motorway alignment intersects agricultural lands, greenhouses, and forest parcels, leading to the fragmentation of land and restricted access between separated plots. This is particularly disruptive in regions where irrigated citrus orchards and greenhouse farming are prevalent, as it directly affects agricultural productivity and operational efficiency.
According to findings from the social field study, such fragmentation may reduce yields, increase transportation and labor costs, and create logistical challenges - particularly for non-mechanized, small-scale farmers who rely on direct and continuous access to their plots. While pasturelands are not expected to be significantly affected, citrus and greenhouse cultivation areas face notable risks.
Key locations where access restrictions are expected to be most severe include:

- Emişbeleni (Alanya): 52 affected greenhouse plots,
- Toslak (Alanya): 49 affected greenhouse plots,
- Karakaya (Manavgat): 17 affected greenhouse plots.

In response, the Project design incorporates engineering structures - such as underpasses, culverts, and overpasses - to facilitate continued access. These structures are dimensioned to accommodate agricultural vehicles, including harvesters. However, residual access limitations may persist depending on local topography and land use intensity.

Spatial analysis further illustrates the site-specific variation in impact severity. For instance:

- In Merkez and Ulukapı, the alignment avoids core agricultural and residential areas.
- In Karakaya and Toslak, the route intersects directly with both residential zones and cultivated lands.
- In Taşağıl, the motorway cuts through forested areas, which may impact access and ecosystem continuity.

These differences are visually demonstrated in Figure XIV.14 through Figure XIV.18, which present route overviews near the respective neighborhoods.

These risks are addressed in accordance with the principles of IFC Performance Standard 5 (Land Acquisition and Involuntary Resettlement), which considers loss of access to land-based resources as a form of economic displacement. The Project will ensure that affected individuals - including informal and seasonal land users - are consulted and compensated where appropriate, and that access restrictions are minimized through design and mitigation measures. Accordingly, mitigation measures will be tailored to the local context of each affected settlement. Continued stakeholder consultation will be conducted throughout construction, and where technically feasible, design adjustments may be introduced to address access-related concerns raised by local communities.

Figure XIV.18 Overview of the Route Passing in Vicinity of Taşağıl Neighborhood

Impacts on Local Business

Economic displacement of local businesses - particularly tenant-run shops - is expected during the construction phase due to:

- Temporary road closures or detours,
- Dust, noise, and other nuisances,
- Reduced accessibility and customer traffic.

While local businesses are not highly concentrated, a total of 37 business structures have been identified as affected by the Project. These include small enterprises such as shops, workshops, and service providers.

These businesses, especially in tourism-dependent economies, may suffer seasonal revenue losses, particularly if construction overlaps with the high summer season. Where applicable, the Project will assess economic loss claims and compensate in accordance with Turkish law and IFC standards.

Effects on Infrastructures and Distribution of Utility Services

During the construction phase of the Project, the transportation of materials, equipment, and personnel will substantially increase traffic on the existing road network - particularly around campsites, quarries, and borrow pits. This additional traffic, primarily composed of heavy construction vehicles, is expected to result in travel delays, congestion, and accelerated deterioration of local roads, especially unpaved or poorly maintained ones.

Moreover, the use of heavy machinery and excavation works may place considerable strain on local infrastructure and utility systems. The risk of service interruptions is especially high where construction activities intersect with underground infrastructure such as:

- **Water pipelines**
- **Electricity lines**
- **Sewer systems**

Specific concerns include:

- **Road Network**: Vulnerable segments, especially gravel or dirt roads, may experience structural damage or temporary closures.
- **Public Utilities**: There is potential for unintentional disruptions to essential services, which could impact households and businesses in nearby communities.

Where planned utility disruptions are unavoidable, local authorities and affected communities will be notified in advance. In cases where disruptions are unplanned, information will be provided immediately, and a response mechanism will be triggered through the Project's grievance system to resolve the issue efficiently and transparently.

Noise and Dust Emissions Generated by Construction Activities

Construction activities, expected to span 2–3 years, will generate considerable levels of noise and dust, particularly in areas where surface works and earthmoving are taking place. These impacts, although temporary, are anticipated to be disruptive - especially during nighttime operations and in proximity to residential or agricultural zones.

Noise Pollution is expected to arise from excavation works, the movement of heavy vehicles, and general construction operations. Continuous exposure, especially at night, can affect the well-being of nearby communities and disturb local living conditions.

Dust Emissions will mainly result from surface excavation, transportation of materials, and the disturbance of potentially contaminated soil. These emissions will be most pronounced during dry and windy weather conditions and may:

- Affect nearby households,
- Impact respiratory health - particularly among children, the elderly, and individuals with pre-existing conditions,
- Negatively influence greenhouse crops and open-field agricultural production.

Such environmental nuisances are of particular concern in rural and semi-rural settlements along the Project corridor where agricultural activities and vulnerable populations coexist.

Changes in the Demographic Structure of the Settlements

During the construction phase of the Project, temporary employment opportunities - both direct and indirect - are expected to influence the demographic composition of the project area. In particular, the arrival of workers may result in temporary population growth in settlements near construction sites and campsites.

Although the total number of jobs and the exact source of labor (local, provincial, or national) cannot yet be determined, demographic changes are anticipated. Workers will primarily be accommodated in self-sufficient construction camps, which are designed to reduce unnecessary interaction with local communities. Nevertheless, the presence of a concentrated, transient workforce can alter local social dynamics, even when interaction is limited.

Key anticipated effects include:

- **In-Migration**: A temporary influx of non-local construction workers, altering the demographic profile of host communities.
- **Out-Migration**: Some residents, especially from more sensitive or traditionally structured communities, may relocate due to noise, perceived insecurity, or disruptions.
- **Resource Pressure**: Local services and infrastructure (e.g., housing, water supply, sanitation) may be strained, especially in smaller or underserved settlements.
- **Increased Social Risks**: The influx of male-dominated labor forces can, in some contexts, heighten the risks of gender-based violence and tensions within the host community.
- **Burden on Public Services**: Schools, healthcare centers, and community services may experience increased demand, albeit temporarily.

Increase of Tensions and Conflicts in the Local Community

During the construction phase, there is potential for increased tensions and conflicts both within and between communities affected by the Project. These tensions may stem from a variety of direct and indirect factors related to land use, resource access, and the social dynamics introduced by the Project workforce.

One significant source of friction is the perception of unfairness - particularly with regard to expropriation and compensation processes. If landowners or users believe that land acquisition activities are not implemented in an equitable and transparent manner, mistrust may develop, leading to disputes among landholders or between communities and project authorities.

Furthermore, frustration may arise when economic benefits, such as employment or procurement opportunities, are perceived to be unevenly distributed. This could lead to feelings of exclusion or neglect, especially among vulnerable or historically disadvantaged groups within the local population.

Another factor that may increase social tension is the influx of workers employed directly or indirectly by the Project. In areas where construction camps are located near settlements, close contact between workers and local residents may lead to:

- Disruption of daily life due to increased noise, traffic, and dust,
- Strain on shared resources such as water, sanitation, and housing,
- Cultural or behavioral clashes between local customs and the conduct of incoming workers.

These dynamics are especially critical in smaller or more traditional communities where sudden social shifts can have a more pronounced effect on community cohesion.

Locals and Non-Locals Employment Opportunities Created by the Project

The construction phase of the Project will create both direct and indirect employment opportunities across various skill levels. The recruitment strategy will prioritize hiring from the project's area of influence - particularly from Serik, Alanya, and Manavgat districts and nearby neighborhoods along the motorway corridor. If suitable candidates are not available locally, recruitment will expand to the wider Antalya region, followed by the broader Mediterranean Region, and then nationally.

Local employment, though limited in scale compared to the overall workforce, can yield important social and economic benefits. Employing residents from surrounding settlements fosters goodwill, strengthens ties between the Project and the host communities, and contributes to local acceptance and support for construction activities.

In addition to direct employment, the Project is expected to stimulate indirect employment opportunities. These include jobs generated along the supply chain - such as local procurement of goods and services - and roles linked to the increased consumption of Project staff within the local economy (e.g., food vendors, retail, accommodation services).

While the arrival of non-local workers and the increased income of employed locals may lead to a modest economic boost in the area through higher spending, this effect is expected to remain limited due to the proximity of large urban settlements with established service networks. Therefore, while the economic ripple effects exist, their scope may not be extensive.

The Project will implement a transparent, inclusive, and non-discriminatory recruitment process, ensuring equal opportunity regardless of ethnicity, language, gender, or religion. Employment-related announcements will be disseminated through local communication channels such as village mukhtars and community centers, and job descriptions will be clearly defined with information about roles, responsibilities, and working conditions.

To ensure compliance with Turkish labor legislation and international labor standards (e.g., IFC PS2), the Project Sponsor will develop a Human Resources Management Procedure. This will cover fair hiring practices, working conditions, rights and responsibilities of employees, and a grievance mechanism to address labor-related complaints.

Gender-Specific

During the construction phase of the Project, women in rural areas may be disproportionately impacted due to prevailing patriarchal social structures and generally lower levels of education. These factors can lead to gender-specific vulnerabilities and limit women's ability to benefit from the opportunities associated with the Project. Identified gender-related risks and inequalities within the Project's Area of Influence (AoI) include:

- Limited access to timely and accurate information about the Project,
- Barriers to participation in employment and skills development opportunities due to traditional gender roles and lower educational attainment,
- Increased risk of gender-based violence and sexual harassment (GBVH).

The risk of GBVH is particularly relevant in the national context. According to Human Rights Watch (Combatting Domestic Violence in Türkiye, 2023), nearly 40% of women in Türkiye have experienced

physical and/or sexual violence during their lives. Although legal frameworks such as Law No. 6284 exist to protect women, Türkiye's withdrawal from the Istanbul Convention in 2021 has reportedly weakened preventive mechanisms and accountability. Women's rights organizations and independent media continue to document high numbers of femicides annually, highlighting the critical need for strengthened protection and enforcement measures.

XIV.4.2. Operation Phase

The operation phase will begin immediately after construction is completed and will continue for 12 years under the 15-year Build-Operate-Transfer (BOT) contract. Approximately 250 personnel will be employed during this phase to manage toll collection, traffic control, routine maintenance, and service area operations. While direct impacts during operation are limited, ongoing labor presence and associated service areas may influence land use, traffic patterns, and socio-economic dynamics in nearby communities. Key areas of potential impact include:

Improved Regional Connectivity and Access to Services

The new motorway will enhance the connection between Antalya and broader national and regional transportation networks. This improved accessibility is anticipated to:

- Enable faster, safer, and more efficient travel between rural and urban centers,
- Improve access to critical services such as healthcare, education, and markets, especially for previously underserved communities,
- Strengthen logistics and supply chains for agricultural producers in remote areas.

The enhanced transport infrastructure will significantly reduce travel times and transportation costs, contributing to greater economic inclusion, particularly for low-income and geographically isolated households.

Employment Opportunities and Indirect Economic Benefits

Although direct employment opportunities during the operation phase (such as maintenance, toll collection, and monitoring) will be limited, the Project is expected to drive broader regional economic growth by:

- Attracting investments in logistics hubs, service sectors, and transportation-based industries, particularly at motorway junctions and rest stops,
- Supporting the development of tourism in popular destinations like Alanya, Side, and Manavgat,
- Stimulating local entrepreneurship, including the establishment of road-side businesses such as fuel stations, markets, restaurants, and agritourism ventures.

The project will also contribute to an increase in property values, particularly near motorway interchanges, potentially creating a gentrification effect in some areas. While this may benefit landowners, it should be closely monitored to prevent displacement of vulnerable residents.

Risk of Unequal Distribution of Benefits

Despite the overall economic uplift, some areas may not benefit equally. Specifically:

- Communities bypassed by the motorway may experience a decline in commercial traffic, leading to reduced revenue for existing roadside businesses,
- The Project may inadvertently exacerbate spatial inequalities between well-connected and disconnected regions.

To address this, inclusive development strategies and continuous impact monitoring are necessary. This includes supporting secondary road connections to ensure broader access to the motorway's benefits.

Road Safety and Traffic Risk

The introduction of high-speed infrastructure increases road safety risks, particularly in zones where the motorway intersects local paths or is adjacent to residential areas. Vulnerable groups such as:

- Pedestrians and cyclists,
- Children and the elderly, especially near entry and exit ramps are at elevated risk. To mitigate these risks, the Project will implement:
- Adequate signage, fencing, and lighting,
- Underpasses and overpasses for safe pedestrian crossings,
- Road safety awareness programs, particularly in schools and community centers.

Noise and Air Emissions

While reduced congestion on older roads may lead to emission reductions in urban centers, areas directly adjacent to the motorway may face:

- Chronic noise exposure, particularly near interchanges and toll plazas,
- Air quality degradation, largely due to increased freight transport.

To protect public health, long-term environmental monitoring will be conducted in compliance with national regulations and IFC guidelines. Where necessary green buffer zones and noise barriers will be established.

Land Use Change and Urban Sprawl

The motorway's presence is likely to trigger speculative development and land use change, particularly around new exits and service areas. This may include:

- The spread of informal or unplanned settlements,
- Increased pressure on agricultural land and natural resources.

Such changes can transform the socio-economic fabric of rural regions. Therefore, local governments must integrate the motorway into spatial planning frameworks and apply land-use regulations that encourage sustainable and inclusive development.

This comprehensive approach ensures that the operation phase of the Project contributes to regional growth while minimizing long-term social and environmental risks.

Gender-Specific

During the operation phase of the Project, gender-related impacts may persist, albeit in different forms and to a lesser extent than during construction. Key potential impacts on women include:

- **Limited Access to Information:** Women may continue to experience difficulties in accessing up-to-date information regarding ongoing Project activities and opportunities. This limited access can hinder their ability to engage with or benefit from the Project's long-term outcomes.
- **Risks of GBVH:** While the number of employment opportunities is significantly reduced during the operation phase, the risk of GBV and sexual harassment remains a concern. Nonetheless, the likelihood of such incidents may be lower compared to the construction phase, as the operational workforce is expected to be smaller and primarily composed of local residents

rather than transient workers. Local recruitment can contribute to a safer and more socially cohesive environment, given existing social ties and shared community norms.

- **Limited Employment Opportunities for Women:** Due to the relatively low number of jobs available during this phase, women may face challenges in accessing employment, especially in technical or operational roles traditionally dominated by men. As a result, their ability to benefit economically from the Project may be limited in comparison to the construction phase.

XIV.5. Mitigation Measures

Mitigation measures are proposed in accordance with Turkish legislation and international standards (e.g. IFC PS 5). Relevant mitigation measures will be taken against potential social impacts during the Project's all phases are described under this section.

XIV.5.1. Land Preparation and Construction Phase

The construction phase of the Project is expected to last approximately 3 years and will involve extensive civil works, infrastructure development, and workforce mobilization across the Antalya–Alanya Motorway corridor. Up to 3,300 personnel - including both direct employees and subcontracted workers - will be employed during peak periods. The workforce, comprising white-collar and blue-collar workers such as engineers, drivers, and unskilled laborers, will be deployed across construction sites and administrative offices. In line with the recruitment strategy, priority will be given to hiring from the project's area of influence - particularly from Serik, Alanya, and Manavgat districts and nearby neighborhoods along the corridor. If needed, recruitment will be expanded to the wider Antalya region, the Mediterranean Region, and then nationally.

Livelihood and Economic and Physical Displacement

Mitigation measures related to displacement impacts are designed in alignment with the principles of IFC Performance Standard 5 (Land Acquisition and Involuntary Resettlement). PS5 aims to avoid or minimize involuntary resettlement and, where unavoidable, ensure that displaced persons are compensated for their losses and supported in improving or at least restoring their livelihoods and standards of living.

To address the livelihood of the project, a comprehensive set of mitigation measures has been developed through the RAP and related land acquisition studies. The focus is on compensating affected households and businesses for the loss of land and assets, ensuring timely and fair compensation to prevent disruptions to income, food security, and living standards. For agricultural stakeholders, especially greenhouse operators, targeted support is provided through LRPs, which include technical training, consultancy services, and guidance on modern cultivation practices, pest management, and greenhouse farming techniques. Alternative land and resources are made available where possible to maintain continuity of operations and reduce income loss. Additionally, diverse and resilient livelihood options, including banana and tropical fruit farming, are promoted to reduce economic vulnerability and enhance long-term income stability, while providing training to manage environmental and market-related risks.

All expropriation and land acquisition processes will be carried out in compliance with both national legislation and IFC PS5. The General Directorate of Highways (KGM) is the competent authority responsible for the implementation of expropriation, while the Project Sponsor will support the process, including the provision of required technical inputs and funding of valuation and other services.

In cases where displacement is unavoidable, Project-affected persons (PAPs) will be compensated for losses at full replacement cost. In addition to compensation mechanisms governed by Turkish law, affected families may also benefit from government-assisted resettlement under the 5543 Resettlement Law (Articles 9 and 12). These provisions define the eligibility and scope of support, including housing, agricultural inputs, workspaces, and relocation allowances, particularly for those residing on or using expropriated land.

Additional assistance (e.g., temporary housing, food, and relocation support) may be made available to eligible households in need as defined by the Ministry of Environment, Urbanization and Climate Change (MoEUCC). All expenditures for land acquisition and resettlement are allocated under a single budget item managed by KGM, as per Article 33 of Law No. 5543.

Restriction of Access to the Agricultural Lands and Pasturelands

Expropriation of privately-owned agricultural lands will be done by KGM in accordance with the relevant provisions of the Expropriation Law. In accordance with Turkish Expropriation Law, if the land portion remaining from expropriation would not be viable anymore, eligible persons have the right to request the expropriation of the entire parcel (application has to be in line with the requirements of the Law) including the remaining portion, even if this portion is out of the expropriation corridor.

- Several underpasses and culverts have been included in the design to ensure access of local people to agricultural lands. These underpasses and culverts will ensure sufficient dimensions for the passage of harvesters, vehicles, etc. where required. Detailed lists of underpasses and culverts planned in the Project are provided in Chapter 3 (“Project Description”).
- Access roads will be constructed adjacent to the Motorway near agricultural areas/zones to provide access to agricultural lands, if/where necessary.
- Legitimate requests of local people regarding the avoidance and/or minimization of the restriction of access between their settlement areas and agricultural lands will be considered by the Project Sponsor’s design team and feasible solutions will be developed and implemented, where possible.
- For the agriculture lands that will be separated by the Motorway (fragmentation of land), impacts on the public users of the lands will be mitigated by ensuring access between severed lands. In this scope, culverts, underpasses and over bridges have already been included in the design. However, additional passage ways that will be requested by local communities will be added in the design.
- It should be noted that, any change on Project design could be materialized once approved by KGM.

Impacts on Local Business

While business owners may be entitled to compensation under applicable regulations, proactive planning and community engagement will be key in minimizing disruptions and sustaining the resilience of the local economy throughout the construction phase.

- The affected business owners will be notified by the Community Liaison Officers (CLOs) under the supervision of the Social Chief and Environment and Social Manager at least 15 days before the start of construction activities.
- Construction scheduling will avoid peak touristic season.
- Compensation for temporary economic displacement will be provided in accordance with national guidelines and IFC PS5 guidelines.

Effects on Infrastructures and Distribution of Utility Services

The mitigation of impacts on infrastructures and utility distribution will partially address in the Supplementary ESIA Annex as "Solid Waste Management Procedures". The following mitigation measures will be applied throughout the construction phase:

- Mobile schooling times will be taken into account during the transportation of construction materials. The notification to local mukhtars regarding construction activities and mobile schooling times will be managed by the Community Liaison Officers (CLOs).

- All utility distribution networks intersected by Project components will be identified and appropriate construction techniques will be used to reduce disruptions to the extent possible All actions related to utility mapping, disruption management, and risk analysis will be coordinated by the Environment and Social Manager.
- Any planned disruption of utility distribution services will be communicated to local authorities and local communities with at least 72 hours' notice by the Community Liaison Officers (CLOs), under the coordination of the Environment and Social Manager. If planned disruptions are expected to last more than 12 hours, the Environment and Social Manager will ensure a specific risk analysis is conducted to assess the potential impacts on local communities and to identify additional mitigation measures.
- Any damage to utility distribution networks will be repaired promptly in accordance with the network owner or operator. Any unplanned disruption of utility distribution services will be managed through communication to local communities, written and/or verbal information to explain event occurred and repair measures needed. Grievance mechanism will be used to record and solve the relevant incidents results.
- Access to properties will be guaranteed or appropriate alternative access solutions that are agreed with users will be implemented. The existing irrigation networks affected by Project activities will be mapped and appropriate technical solutions will be implemented to reduce possible interferences; and if interferences are unavoidable, appropriate alternative solutions will be agreed with irrigation water users.

During the course of construction phase, grievance mechanism will be in effect in order to receive local community's nuisance and disturbance.

Noise and Dust Emissions Generated by Construction Activities

- Emission levels will be monitored by the Environmental Engineer, under the supervision of the Environment and Social Manager. Monitoring results will comply with national legislation and IFC EHS (Environment, Health and Safety) standards.
- Dust suppression measures (e.g. water spraying) during dry weather conditions will be implemented under the responsibility of the Environmental Engineer and H&S Chief, in coordination with the site technical team.
- Night-time construction activities will be limited, and inspection and oversight will be carried out by the Environmental Engineer and H&S Chief, in coordination with the Environment and Social Manager.
- Where necessary, the Environmental Engineer will supervise the installation of noise barriers to reduce noise levels in sensitive areas.
- Complaints regarding noise and dust will be received through the Grievance Mechanism operated by the Community Liaison Officers (CLOs). The complaint assessment and resolution process will be coordinated with the Social Chief and documented by the Environment and Social Manager.

Relevant mitigation measures regarding the noise emissions are given in Chapter 11 ("Noise and Vibration") while dust emissions are given in Chapter 10 ("Air Quality and Climate Change"). Additionally, potential impacts and mitigation measures regarding to the local communities' health and safety issues are explained in Chapter 15 ("Community Health and Safety").

Changes in the Demographic Structure of the Settlements

- Construction workers will be housed in self-sufficient camps to reduce interaction with local communities.
- Social impact monitoring will be carried out regularly.
- Community liaison officers will monitor social dynamics.
- Stakeholder engagement and grievance mechanisms will remain active throughout the phase.

Locals and Non-Locals Employment Opportunities Created by the Project

To maximize local benefits and ensure fair labor practices, the Project Sponsor will implement the following measures in line with Turkish legislation and IFC Performance Standard 2 (PS2):

- **Prioritization of Local Employment**: Where feasible, local labor will be prioritized for employment during the construction phase to enhance local economic participation and strengthen relations with host communities.
- **Transparent and Inclusive Recruitment**: The recruitment process will be designed to be transparent, publicly accessible, and non-discriminatory, providing equal opportunity regardless of ethnicity, language, religion, gender, or sexual orientation.
- **Human Resources Management Procedure**: A comprehensive Human Resources Management Procedure will be developed to ensure compliance with Turkish Labor Law and IFC PS2. This will cover recruitment, contracts, working conditions, and worker rights.
- **Community-Based Communication**: Employment opportunities will be announced through community-based channels such as local mukhtars, associations, and public notice boards. Informational materials (e.g., brochures, posters) will be distributed in Turkish. It is mandatory to provide information materials in different languages if needed.
- **Clarity in Employment Terms**: All job roles will have clearly defined job descriptions and working conditions. Employment contracts will include comprehensive information and will comply with national labor regulations. Contracts will be signed by both parties and a copy will be provided to the worker.

These measures aim to ensure that employment opportunities created by the Project are accessible, fair, and beneficial to local populations, while also upholding labor rights and international standards.

Increase of Tensions and Conflicts in the Local Community

To reduce the risk of social tension and conflict during the construction phase, the following mitigation measures will be implemented by the Project's internal social and environmental team:

- **Transparent Communication:** Community Liaison Officers (CLOs), under the supervision of the Social Chief and the Environment and Social Manager, will organize quarterly local consultation meetings and distribute printed informational materials (e.g., brochures, posters) in Turkish through village mukhtars and community associations. These materials will include information on land acquisition, employment opportunities, construction schedules, and community benefits to ensure transparency and awareness.
- **Codes of Conduct and Worker Training:** The Human Resources Manager, in collaboration with the H&S Chief, will implement a mandatory Code of Conduct for all employees. Induction training on community relations, local customs, and cultural sensitivity will be provided to all new workers. Refresher training sessions will be conducted every 6 months at worker accommodation sites.
- **Community Liaison and Grievance Mechanism:** Dedicated CLOs will actively engage with community stakeholders to identify concerns early. A formal and accessible Grievance Mechanism will be operated by the CLOs, with oversight from the Environment and Social Manager, to ensure timely and transparent resolution of community concerns.
- **Local Procurement and Hiring:** The Procurement Officer(s), under the coordination of the SPV General Manager, and the Human Resources Manager will implement a local-first approach in both procurement and recruitment. Locally available materials such as aggregates, concrete, and asphalt will be sourced from nearby quarries and suppliers when feasible. Local service providers for transportation, catering, and maintenance will be prioritized if they meet the required standards. Procurement practices will be reviewed quarterly to identify new local engagement opportunities.
  For recruitment, the Human Resources Manager will prioritize hiring from within the Project's area of influence, especially from Serik, Alanya, and Manavgat. Job announcements will be shared through local channels such as mukhtars and municipal notice boards. If no suitable local candidates are available, the recruitment scope will expand gradually - from local to national levels. Recruitment practices will be monitored for fairness and transparency.

- **Health and Safety Screening:** Pre-employment medical examinations will be conducted by the Site Doctor and Paramedics, under the supervision of the H&S Chief, to minimize the risk of disease transmission. The Environment and Social Manager will coordinate with local health authorities regarding communicable disease risks linked to labor influx.
- **Stakeholder Engagement:** Ongoing consultations with local authorities and affected communities will be conducted by the CLOs, following the procedures outlined in the Stakeholder Engagement Plan (SEP). The Environment and Social Manager will oversee these efforts to ensure transparency and build trust.
- **Compensation for Accidental Damages:** Any damages caused by Project activities - including to property, infrastructure, or agricultural assets - will be assessed and compensated by the Environment and Social Manager, in line with national standards and project-specific commitments.

These measures aim to proactively manage community relations and maintain a stable and cooperative environment in all areas affected by construction activities.

XIV.5.2. Operation Phase

Improved Regional Connectivity and Access to Services

- The Environment and Social Manager, in collaboration with the Social Chief, will organize semi-annual training workshops and capacity-building sessions in coordination with local chambers of commerce to support local entrepreneurs and small businesses.
- Micro-procurement mechanisms to engage local vendors in minor highway maintenance activities (e.g., cleaning, landscaping) will be coordinated by the Environment and Social Manager, with oversight from relevant technical departments.
- During the first two years of operation, the Environment and Social Manager will coordinate with local tourism associations to explore public-private partnerships for the development of culturally reflective rest stop services along the motorway corridor. The plan will be reviewed and updated annually in cooperation with local stakeholders.

Employment Opportunities and Indirect Economic Benefits

- The Environment and Social Manager, in coordination with the Social Chief, will organize semi-annual training workshops and capacity-building sessions in collaboration with local chambers of commerce to support local entrepreneurs and small businesses.
- Minor highway maintenance activities (e.g., cleaning, landscaping) will be implemented through micro-procurement mechanisms coordinated by the Environment and Social Manager, with technical oversight from the Environmental Engineer. Local vendors will be prioritized on a rolling basis, depending on their capacity and compliance with relevant standards.
- During the first two years of operation, the Environment and Social Manager, in collaboration with the Social Chief, will engage with local tourism associations to explore opportunities for public-private partnerships. These efforts aim to establish culturally reflective rest stop services along the corridor. The development plan will be reviewed and updated annually.

Risk of Unequal Distribution of Benefits

- The Social Chief, in coordination with Community Liaison Officers (CLOs) and under the supervision of the Environment and Social Manager, will carry out annual socio-economic assessments to identify disparities in income levels and access to basic services among affected communities.
- Community Liaison Officers (CLOs) will coordinate with Local Development Authorities to advocate for infrastructure investments - such as secondary roads - in communities bypassed by the highway. Progress will be monitored and reported every 12 months.

- The Social Chief, in collaboration with CLOs, will design and implement targeted local development initiatives for disadvantaged settlements. These initiatives will be reviewed semi-annually to track effectiveness and identify areas for improvement.

Road Safety and Traffic Risk

The H&S Chief, in coordination with local traffic authorities and under the supervision of the Environment and Social Manager, will oversee the installation of traffic safety infrastructure - including signage, lighting, fencing, and pedestrian crossings (e.g., overpasses and underpasses) - at high-risk junctions and settlements during the first year of operation. Necessary updates will be made as required.
Community Liaison Officers (CLOs), in collaboration with the Social Chief, will organize annual road safety awareness programs in local schools and community centers to promote safe behavior among children and community members.
Local traffic enforcement teams will carry out joint inspection campaigns every six months, supported by the Project's H&S Chief and H&S Specialist.
Emergency response protocols will be developed and reviewed annually by the H&S Chief, in coordination with municipal emergency services, including fire departments, police, and medical responders. The Environment and Social Manager will oversee coordination with public institutions.

Noise and Air Emissions

The Environmental Engineer, under the supervision of the Environment and Social Manager, will conduct quarterly air quality monitoring - including PM_{10}, $PM_{2.5}$, NO_x, SO_x, VOCs, and dust - at operational sites such as construction camps, borrow pits, asphalt and concrete plants, and surrounding residential areas.
Community Liaison Officers (CLOs), in coordination with the Social Chief, will review grievances related to air emissions every three months to ensure timely resolution and documentation in accordance with the Project's Grievance Mechanism.
The Environmental Engineer will also be responsible for the installation and maintenance of green buffer zones and noise barriers in sensitive areas. These measures will begin in the first operational year, with annual assessments to evaluate their effectiveness.

Land Use Change and Urban Sprawl

The Environment and Social Manager, in collaboration with the Environmental Engineer and relevant municipal urban planning departments, will implement annual awareness campaigns and provide regulatory support to prevent the formation of informal settlements and to protect agricultural land.
The Environmental Engineer, under the coordination of the Environment and Social Manager, will monitor land use changes through satellite imagery and site visits twice a year. Irregular developments or encroachments will be reported to local authorities for appropriate enforcement actions.

XIV.6. Summary of Assessment and Residual Impacts

Table XIV.39 provides a summary on the social impact assessments. Significance of the identified impacts before and after the implementation of mitigation measures are summarized in this table. As can be seen from the Table XIV.39, in general, potential impacts on the livelihoods, infrastructures and utility services and demographic characteristics etc. are anticipated to be reduced to low levels in the long-run with effective implementation of mitigation measures, with the exception of impacts on livestock activities within the affected settlements. However, residual impacts related to the livestock owners and land owners have been evaluated as medium due to their importance.

Table XIV.39 Summary of Social Impact Assessment

Affected Socio - economic Component	Definition of Potential Impact	Type of Impact	Impact Magnitude						Sensitivity/ Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Expected Significance of Residual Impacts
			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
Land Preparation and Construction Phases												
Construction Phase	Livelihood, Economic and Physical Displacement	Adverse	Restricted	Long	Medium	Irreversible	One-off	Moderate (B)	High (3)	High (B2)	● Activities will follow national laws and IFC PS5. ● Displacement will be avoided/minimized; compensation at replacement cost. ● No forced evictions. ● Continuous consultation with affected communities. ● Livelihoods and living standards will be restored/improved. ● Physically displaced persons will receive secure housing. ● KGM will handle expropriation and valuation; costs covered by Project Sponsor. ● Government-assisted resettlement available under Law No. 5543, Article 12. ● Eligible households may receive housing, land, credits, and in-kind/cash aid. ● Support includes basic needs and free transportation. ● Resettlement budget under KGM per Article 33 of Law No. 5543.	Low
	Restriction of Access to the Agricultural Lands and Greenhouses	Adverse	Restricted	Long	Medium	Irreversible	One-off	Moderate (B)	High (2)	High (B2)	● Expropriation of agricultural lands will be conducted by KGM under Turkish Expropriation Law. If the remaining land after partial expropriation is not viable, owners may request full expropriation of the entire parcel. ● Multiple underpasses and culverts are included in the Project design to ensure continued access to agricultural lands, enabling the passage of agricultural machinery and vehicles. ● Additional access roads will be constructed near agricultural areas if/where necessary. ● Project design team will consider legitimate requests by local communities to avoid/minimize restriction of access to farmlands, and feasible design modifications will be implemented accordingly. ● Fragmentation of agricultural lands will be mitigated by ensuring access between severed parcels through culverts, underpasses, and overpasses. ● Community requests for additional passageways will be evaluated and incorporated into the design, subject to KGM approval.	Low

Affected Socio - economic Component	Definition of Potential Impact	Type of Impact	Impact Magnitude						Sensitivity/ Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Expected Significance of Residual Impacts
			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
	Impacts on Local Business	Adverse	Restricted	Long	High	Irreversible	One-off	Major(A)	High(3)	High(A3)	• Affected business owners will be notified 15 days in advance by CLOs. • Notification process will be supervised by Social Chief and E&S Manager. • Construction works will avoid peak touristic season. • Compensation for temporary economic displacement will follow national legislation. • Compensation process will be overseen by Social Chief and E&S Manager..	Low
	Effects on Infrastructures and Distribution of Utility Services	Adverse	Local	Medium	Low	Short term reversible	Intermittent	Moderate (B)	Medium (2)	Medium (B2)	• CLOs will inform mukhtars; supervised by Social Chief. • Environmental Engineer will identify utilities; E&S Manager will supervise. • CLOs will notify planned outages; Environmental Engineer will conduct risk analysis. • CLOs will communicate unplanned outages; Social Chief will manage grievances. • CLOs will ensure property access; coordinated by Social Chief. • Environmental Engineer will map irrigation; E&S Manager will oversee solutions. • CLOs will manage complaints; monitored by Social Chief.	Low
	Noise and Dust Emissions Generated by Construction Activities	Adverse	Local	Medium	Low	Short term reversible	Intermittent	Moderate (B)	Medium (2)	Medium (B2)	• Emissions will be monitored by the Environmental Engineer and supervised by the Environment and Social Manager, in line with national law and IFC EHS standards. • Dust suppression (e.g. water spraying) will be applied in dry conditions under the responsibility of the Environmental Engineer. • Night works will be limited; monitored jointly by the Environmental Engineer and the Environment and Social Manager. • Noise barriers will be used when necessary, installed under the supervision of the Environmental Engineer. • Complaints on noise/dust will be managed via the Complaint Mechanism by CLOs, coordinated by the Social Chief.	Low
	Changes in the Demographic Structure of the Settlements	Adverse	Local	Medium	Low	Short term reversible	Continuous	Moderate (B)	Medium (2)	Medium (B2)	• Construction workers will be housed in self-sufficient camps to limit interaction with locals. • Regular social impact monitoring will be conducted. • Community Liaison Officers (CLOs) will monitor local social dynamics. • Stakeholder engagement and grievance mechanisms will remain active throughout the	Low

Affected Socio - economic Component	Definition of Potential Impact	Type of Impact	Impact Magnitude						Sensitivity/ Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Expected Significance of Residual Impacts
			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
											construction phase.	
	Increase of Tensions and Conflicts in the Local Community	Adverse	Wide	Medium	Low	Short term reversible	Intermittent	Moderate (B)	Medium (2)	Medium (B2)	● CLOs will organize quarterly consultation meetings; printed materials (e.g., brochures, posters) will be distributed through mukhtars and associations covering project updates and community-related topics. ● Environmental and Social Manager will implement a mandatory Code of Conduct; training on cultural sensitivity and community behavior will be provided at hiring and every 6 months. ● A Grievance Mechanism will be accessible; CLOs will proactively engage with the community to identify concerns early. ● Local-first procurement and hiring will be applied; materials and services will be sourced locally when feasible; job announcements will target project-affected districts first. ● Pre-employment medical screenings will be conducted; communicable disease risks will be managed with local health authorities. ● Ongoing consultation with stakeholders will be conducted as part of the SEP. ● Accidental damages to property or crops will be compensated in line with standards.	Low
	Locals and Non-Locals Employment Opportunities Created by the Project	Beneficial	Wide	Medium	Medium	Short term reversible	Intermittent	Moderate (B)	Medium (2)	Medium (B2)	● Local labor will be prioritized during construction to support local economies. ● Recruitment will be transparent, inclusive, and non-discriminatory. ● HR Management Procedure will comply with Turkish Labor Law and IFC PS2, covering contracts, working conditions, and rights. ● Job postings will be shared through mukhtars, associations, and public boards in Turkish (additional languages if needed). ● Job descriptions and employment contracts will be clear and legally compliant; signed contracts will be provided to workers.	Low
	Gender Specific Risks	Adverse	Local	Long	Medium	Long term reversible	Intermittent	Moderate (B)	Medium (2)	Medium(B2)	● Ensure that project-related information is shared in ways accessible to women, including through women-focused meetings, use of local languages, and culturally appropriate formats. ● Engage female community members in consultation processes to ensure their concerns and expectations are addressed. ● Promote the inclusion of women in the workforce by reserving a percentage of non-technical roles for female applicants. ● Offer vocational training and capacity-building programs tailored to women to increase their employability during construction.	Low
Operation Phase												
Operation Phase	Improved Regional Connectivity and Access to Services	Adverse	Local	Medium	Low	Long term reversible	Intermittent	Moderate (B)	Medium (2)	Medium (B2)	● Environment and Social Manager, in coordination with the Social Chief, will organize semi-annual training workshops and capacity-building sessions in collaboration with local chambers of commerce to support local entrepreneurs and small businesses.	Low

	Cultural Rights (Nomadic / Traditional Communities)	Adverse	Restricted	Medium	Moderate	Short term reversible	Intermittent	Moderate	Mrdium	Medium	● Route preservation ● Consultation with affected communities ● Cultural heritage assessment	Low
	Labor Rights (Workers)	Adverse	Wide	Long	Moderate	Reversible	Continuous	Moderate	Medium	Medium	● Implementation of Labor Management Plan (LMP) ● Worker Grievance mechanism ● Monitoring fair wage compliance	Low
	Health & Safety (Dust, Noise, Traffic)	Adverse	Local	Long-	Major	Reversible	Intermittent	Major	Medium	Medium-High	● Community Health and Safety Plan (CHSP) ● Occupational Health and Safety Plan (OHSP) ● Noise, dust, traffic mitigation	Low

XV. CHAPTER - COMMUNITY, HEALTH AND SAFETY

The Antalya-Alanya Motorway Project will involve typical community health and safety impacts and/or risks applicable in most large-scale infrastructure projects. Especially the construction phase will include significant earth-moving activities and the involvement of many workforces. However, due to the temporary nature of the construction activities, associated impacts on the health and safety of the community will be short-term and temporary. During the operation phase, pedestrian safety, traffic safety, and emergency preparedness and response would be among the most critical community health and safety issues to be managed appropriately throughout the long-term operational activities. It should be noted that, with the improved road standards, accident rates for the associated routes are anticipated to reduce, providing an overall benefit to community safety and public welfare. The Project's socioeconomic impacts and benefits related to public welfare are discussed in Chapter-14 in the ESIA ("Socio-economic Environment").

The main community health and safety issues to be covered in the following sections are summarized below:

- Traffic safety.
- Impacts of blasting operations during construction.
- Impacts on water quality and availability.
- Airborne/communicable diseases due to construction workforce inflow.
- Pedestrian safety.
- GBVH
- Community Severance
- Use of Chemical
- Emergency preparedness and response.
- Disturbance of public health and welfare due to air emissions, noise generation, water-borne, and water-related.
- Security personnel arrangements.
- Structural safety.

XV.1. Assessment Methodology and Data Sources

Impacts of the Project on the community health and safety will be assessed based on qualitative approaches. As some of the potential impacts on the community health and safety are primarily associated with other direct environmental impacts such as air emissions, noise generation, wastewater and waste production, etc., methods are available on how to analyze and interpret the results of the assessments made for these impacts in the previous sections of this Draft ESIA Report, see in Chapter 4 in the ESIA (“Methodology”).

This chapter is developed and interpreted based on the following data sources.

- TurkStat’s transportation statistics (accidents, fatalities, etc.)
- TurkStat’s population statistics
- TurkStat’s woman statistics
- TurkStat’s health statistics
- Antalya Metropolitan Municipality’s database
- ENCON Environmental and Social Field Studies
- GEM Field Studies

Study area for the community health and safety impacts have been determined as 2 km corridor (1 km from each side of the Motorway axis) as the settlements located within this area would be more likely to be subject to associated risks and impacts when compared to the settlements located at farther distances.

Significance Criteria

The significance criteria for the impacts on community health and safety will be determined as high, medium, or low based on evaluating the magnitude of impact and sensitivity/value of the receptors/resources. The criteria previously presented in Chapter 4 ("ESIA Methodology") will be used to determine the magnitude of impact on the health and safety components, while sensitivity/value criteria to be used in the scope of impact assessment is summarized in Table XV.1. A detailed explanation of the sensitivity components for each resource/receptor is provided in the following "Baseline Conditions" section.

Table XV.1. Criteria for Sensitivity/Value of Resource/Receptor

Resource/Receptor		Sensitivity/Value Level		
		High (3)	**Moderate (2)**	**Low (1)**
Local Communities (Risk of Construction Accidents)		Settlements within the expropriation corridor having affected population of >500 habitants Settlements within the study corridor having affected population of >1,000	Settlements within the study corridor (inc. exp. corridor) having affected population of 500-1.000 habitants	Settlements within the expropriation corridor having affected population<500 habitants
Local Communities (Blasting Effects)		Settlements where number of residential buildings within the expropriation corridor	Settlements where number of residential buildings within the expropriation corridor between10-20	Settlements where number of residential buildings within the expropriation corridor<10
Local Communities (Water Supply)		Settlements with limited water availability	-	Settlements with sufficient water availability
Local Communities (Airborne/ communicable diseases)		Settlements with particular sensitivity/past issues related with improper acts of security	-	Settlements with no existing health issue
Local Communities (Disturbance due to acts of security personnel)		Located directly adjacent to construction sites or security-controlled areas Includes vulnerable groups (women, children, minorities) Limited access to grievance mechanisms or legal protection History of complaints or past tensions with security personnel	Near access roads or logistics areas with periodic presence of security personnel Partially urbanized or semi-rural areas Existing local governance or municipal channels to report incidents-	Urban settlements or municipalities with full legal protection and visibility Rare or no direct interaction with security staff Effective law enforcement and grievance response systems
Local Communities or Road Users (Risk of Chemicals and Fuels)		Settlements located in close proximity (<500 m) to chemical or fuel storage areas, refueling points, or construction/operation sites where large volumes of fuels and hazardous substances are handled. Communities relying on local water resources or agricultural lands that could be directly affected by leaks/spills. Presence of vulnerable groups (e.g., children, elderly)	Settlements located near transport routes frequently used for fuel and chemical delivery (e.g., <2 km from access or haul roads). Medium-level population exposure (500-1,000 inhabitants). Limited but potential risk of contact through air emissions, odors, or minor spillages.	Settlements or road users located far from chemical and fuel storage/usage areas (>2 km). Population exposure <500 inhabitants. Low frequency of fuel/chemical transportation through the area. Strong management systems, spill containment, and emergency preparedness plans in place.
GBVH	Seasonal Agricultural Workers (Women)	Isolated in mixed-gender accommodation areas Employed informally or daily without contracts No access to grievance mechanisms Hired via intermediaries without oversight	Shared accommodation but with gender separation Basic orientation or awareness training provided Grievance system exists but limited accessibility	Separate and safe accommodations ensured Formal contracts and safe transportation provided Access to female staff and active awareness initiatives available
	Female Tourists	Staying in rural or unsupervised areas	Short-term stays near project roads or facilities	Staying in regulated hotels or monitored areas

Resource/Receptor		Sensitivity/Value Level		
		High (3)	**Moderate (2)**	**Low (1)**
		Unable to access complaint channels due to language barriers Unmonitored interactions with security personnel	Limited access to information materials, but public institutions are accessible	Informed through brochures and emergency hotlines Minimal contact with security or project personnel
	Local Women in the Region	Frequent contact with project workers Silence due to social or patriarchal pressure Living in socially isolated or conservative rural areas	Living near access routes or contractor zones Some engagement with NGOs or community groups	Residing near urban centers with functioning support systems Engaged with municipalities, NGOs, or healthcare services Accessible and trusted grievance channels
Displacement		Entire households subject to physical relocation Loss of primary residences or agricultural lands Presence of vulnerable groups (e.g., women-headed households, elderly, ethnic minorities) No or limited access to legal land titles	Economic displacement without physical relocation (e.g., loss of farmland, grazing land, roadside businesses) Some access to support mechanisms and compensation frameworks	Only minor restrictions on land use or temporary impacts (e.g., access limitations during construction) No physical relocation or significant income loss Legal land tenure in place
Local Communities or Road Users (Traffic accidents)		Road sections with high traffic density (>5,000 vehicles/day), continuous heavy truck movements, and frequent pedestrian crossings. Settlements with >1,000 affected inhabitants located directly along project access or haul roads. Presence of sensitive receptors such as schools, hospitals, or markets adjacent to the road.	Road sections with medium traffic density (1,000–5,000 vehicles/day) and periodic heavy vehicle use. Settlements with 500-1,000 inhabitants located near construction access routes. Limited but existing pedestrian activity.	Road sections with low traffic density (<1,000 vehicles/day) and minimal heavy vehicle use. Settlements with <500 inhabitants or sparsely populated rural areas. Few or no sensitive receptors adjacent to roads.

XV.2. Baseline Conditions

An analysis of baseline conditions and infrastructures related to the road network, traffic volume load, and traffic accidents in Türkiye are detailed under the following subheadings.

Existing Transportation Infrastructure

State Highways and Provincial Roads are vital components of regional infrastructure, linking major areas and facilitating transportation. Their conditions and expansions can significantly impact community health and safety by improving access to essential services and reducing travel times.

Over the years, there has been a significant increase in the length of divided roads and motorways, indicating efforts to enhance safety and traffic flow. For example, the length of divided roads expanded from 1,798 km in 1990 to 21,680 km in 2023, potentially reducing the risk of head-on collisions and enhancing traveler safety. Additionally, the total length of motorways increased from 241 km in 1990 to 3,726 km in 2023, indicating an investment in high-speed, safer travel routes.

Motorway network of Türkiye is currently under development. As of 2023, total length of the Motorways was recorded as 3,726 km, which is around 5% of the total length of the road network in the country. The 2035 target of KGM is to complete construction of 7,800 km of motorway. Increase in the length of the roads in Türkiye between 1990 and 2023 is summarized in Table XV.2

Table XV.2 Road Lengths in Türkiye

Year	General Total (km)	State highways		Provincial roads		Motorways (km)	Village road (km)
		Divided road (km)	Other (km)	Divided road (km)	Other (km)		
1990	**367,956**	1,798	29,351	111	27,868	241	308,587
1991	**368,165**	1,836	29,426	136	27,824	342	308,602

Source: TurkStat, 2023

The number of vehicle ownership, vehicle movement density, and usage rate of the roads (vehicle kilometers) has increased rapidly, parallel to population growth, since the beginning of the 2000s. Türkiye's growing population and increasing urbanization necessitate the expansion and modernization of infrastructure. It is crucial to improve roads to support economic development and connectivity. Some regions, especially rural and less developed areas, may still require assistance developing adequate infrastructure. It is important to ensure equitable development to reduce regional disparities.

Table XV.3 below shows the change in the number of registered vehicles, the number of accidents, and the number of deaths by year. In the road network of Türkiye, a total of 1,314,136 traffic accidents occurred during the year 2023. Among all those accidents, 1,079,065 accidents resulted in material loss, while 235,071 accidents led to death or injury. Of the accidents involving death or injury, 83.1% of them occurred in inhabited areas, whereas 16.9% occurred in uninhabited regions.

Table XV.3 Number of vehicles registered, accident, persons killed and injured, 2009-2023

Year	Total Number of Vehicles Registered	Total Number of Accidents	Accidents Involving Material loss only	Accidents involving death or injury	Persons Killed (1)			Number of persons injured
					Total	At accident scene	Accident follow-up	
2009	14,316,700	1,053,346	942,225	111,121	4,324	4,324	-	201,380
2010	15,095,603	1,106,201	989,397	116,804	4,045	4,045	-	211,496
2011	16,089,528	1,228,928	1,097,083	131,845	3,835	3,835	-	238,074
2012	17,033,413	1,296,634	1,143,082	153,552	3,750	3,750	-	268,079
2013	17,939,447	1,207,354	1,046,048	161,306	3,685	3,685	-	274,829
2014	18,828,721	1,199,010	1,030,498	168,512	3,524	3,524	-	285,059
2015	19,994,472	1,313,359	1,130,348	183,011	7,530	3,831	3,699	304,421
2016	21,090,424	1,182,491	997,363	185,128	7,300	3,493	3,807	303,812

(1) Includes the deaths within 30 days after the traffic accidents due to related accident and its impacts for people who were injured and sent to health facilities.
- Denotes magnitude null.

When comparing accident trends and numbers with road lengths in Türkiye, two issues should be considered for community safety and sustainable development: balanced development and safety integration. While expanding divided roads and motorways is essential, it is crucial to integrate these developments with comprehensive road safety strategies. This includes improved enforcement, better driver education, and maintenance. Additionally, it's important to ensure that road infrastructure keeps pace with increases in vehicle numbers and changes in traffic patterns, significantly reducing traffic accidents. Increasing public awareness about road safety and implementing stricter regulations for driving behavior can contribute to lowering accident rates.

The Motorway Project is located within the authority and responsibility area of KGM's Antalya (13th) Regional Directorate. Relevant network and traffic volume maps of 2023 within this area are presented in Figure XV.1 and Figure XV.2.

Existing Health Status

This section provides a general assessment of the existing health status of the local population within the province of Antalya and the project's area of influence. The assessment is based on regional health statistics published by the Ministry of Health of the Republic of Türkiye and demographic and health indicators provided by the Turkish Statistical Institute (Turkstat). These data are essential for identifying potential risks that may affect community health during project implementation and for planning the necessary preventive and corrective measures. This analysis also serves as a baseline reference for monitoring and evaluation activities conducted in accordance with IFC Performance Standard 4.

Initially, data on the population and demographic characteristics of Antalya Province will be presented. Subsequently, the section will be further elaborated with public health data.

Demographic information for Antalya Province is presented in Table XV.4.

The number of applications to healthcare institutions and services in Antalya, as well as the number of hospital beds and healthcare personnel, can be accessed through Table XV.5, Table XV.6, and Table XV.7.

Table XV.4 General Demographic Indicators, 2023

City	Total Population	Rural Population Ratio (%)	Urban Population Ratio (%)	0-14 Aged Population Ratio (%)	65 and Over Aged Population Ratio (%)	Child Dependency Ratio (Aged 0-14) (%)	Elderly Dependency Ratio (Aged 65 and Over) (%)	Total Age Dependency Ratio (%)

An analysis of the general demographic structure of Antalya reveals that 99.1% of the population resides in urban areas, a figure significantly higher than the national average of 88.8% (Table XV.4). The same table indicates that the proportion of children (aged 0-14) and elderly (aged 65 and over) in Antalya is slightly below the national average (19.9% and 9.7%, respectively), resulting in a total age dependency ratio of 42.1%. This demographic profile suggests that health service planning in Antalya is primarily shaped around the needs of an active working-age urban population, with relatively limited rural access challenges.

Regarding health infrastructure, Antalya hosts 46 hospitals with a total of 7,545 beds, translating to 28 beds per 10,000 populations. While this is slightly below the national average of 31.2, the proportion of qualified hospital beds in Antalya stands at 89.4%, which is well above the national average of 82.5 (Table XV.5). The number of intensive care unit beds per 10,000 populations is 5.4, closely aligned with the national rate of 5.7. Additionally, the number of people per family medicine unit in Antalya is 3,033-very close to the national figure of 3,043. These indicators suggest that the physical health infrastructure in Antalya is balanced and adequate, though seasonal pressures on hospital bed capacity in certain districts should be taken into consideration.

In terms of human resources, Antalya has a strong health workforce comprising 7,005 physicians, 6,921 nurses, 1,790 midwives, and 8,635 other healthcare personnel (Table XV.6). This distribution supports the sustainability of both primary and secondary health services. Furthermore, the presence of 2,251 dentists and 1,651 pharmacists indicates robust access to dental and pharmaceutical services.

Healthcare utilization data show that the annual number of physician visits per capita in Antalya is 11.9, which is higher than the national average of 11.4 (Table XV.7). Similarly, the annual number of dentist visits per capita in Antalya is 0.70, compared to the national average of 0.68. These figures indicate that the public in Antalya has good access to healthcare services and actively utilizes the system.

However, some capacity limitations are evident in emergency healthcare services. Antalya has 72 emergency medical stations and 118 ambulances, equating to one emergency station per 37,448 people and one ambulance per 22,850 people. Nationally, these ratios are 24,963 and 14,450, respectively (Table XV.8). Therefore, Antalya-especially as a tourism destination with a rapidly increasing summer population-falls below the national average in terms of per capita emergency response capacity. This underlines the need for seasonal capacity planning and the strengthening of emergency medical infrastructure.

Overall, Antalya presents a solid healthcare access profile. Nevertheless, when evaluating the impacts of the project during the construction phase and beyond, special attention should be paid to the following issues:

- The vulnerability of the healthcare system to seasonal population surges,
- Limited emergency response capacity in peak periods,
- Potential delays in healthcare access for local residents due to temporary closures, route changes, or construction-related disruptions.

Accordingly, the project will ensure close coordination with local healthcare institutions, keep emergency access routes operational, provide temporary support through mobile health services, and actively monitor access-related grievances through community-based complaint mechanisms.

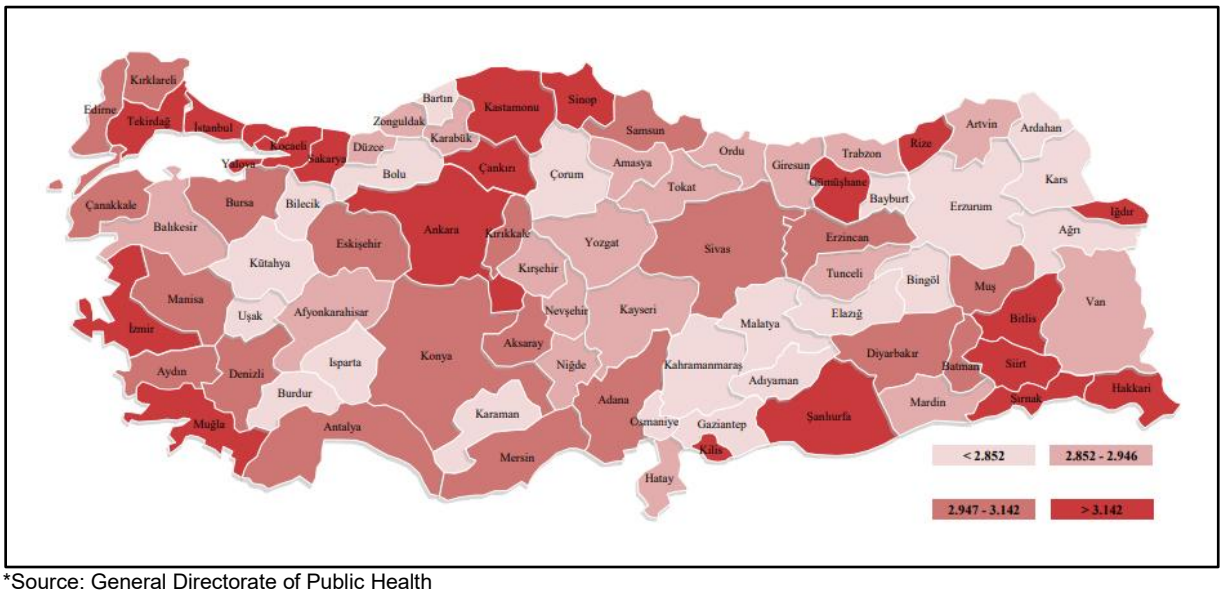
Figure XV.4 Number of Intensive Care Unit Beds per 10.000 Population by Provinces, All Sectors, 2023



*Source: General Directorate of Public Health

Figure XV.5 Populations per Family Medicine Unit by Provinces, 2023

In conclusion, based on the data presented below (Figure XV.3, Figure XV.4, Figure XV.), it is observed that the province of Antalya has better healthcare conditions compared to the national average in Türkiye. Since the majority of the personnel to be employed under the project are expected to be recruited from local settlements, no significant change in the regional population is anticipated. Therefore, the project is not expected to have any adverse impact on healthcare services or cause any disruption in service provision.

Table XV.9 Mortality by Cause Statistics (2020-2023)

Province	Year	Total	Diseases of the circulatory system	Neoplasms	Diseases of the respiratory system	Diseases of the nervous system and the sense organs	Endocrine, nutritional and metabolic diseases	External causes of injury and poisoning	COVID-19	Other	Unknown

Table XV.12 Mortality Statistics (2023)

Mortality Statistics (2023)	Antalya	Antalya, Isparta, Burdur	Akdeniz	Türkiye
Infant Mortality Rate (per 1,000 live births)	5,9	6,5	12,3	10
Under-Five Mortality Rate (per 1,000 live births)	7,7	8,3	27,4	14,5
Crude Death Rate (per 1,000 population)	5,1	5,6	8,5	6,2

* Source: TURKSTAT

When Table XV.9 is examined, it is observed that the most common cause of death in Antalya during the 2020-2023 period was diseases of the circulatory system. Deaths attributed to this cause increased from 4,674 in 2020 to 5,105 in 2023. Neoplasms (tumors) ranked second, showing a stable trend with an average of approximately 2,300 deaths per year.

COVID-19-related deaths were recorded as 223 in 2020, peaked at 1,522 in 2021-the height of the pandemic-and then declined significantly to 45 in 2023. This indicates that while COVID-19 posed a serious public health issue in Antalya in 2021, its impact was temporary.

Deaths due to respiratory system diseases rose from 1,508 in 2020 to 1,691 in 2023, indicating an upward trend. This suggests that factors such as air quality and the aging population should be taken into account.

External causes of injury and poisoning (e.g., traffic accidents, occupational accidents) accounted for 651 deaths in 2020 and increased to 902 in 2023. This rise points to the need for specific preventive measures against potential safety risks that may arise from the project.

When Table XV.10 is examined, it is observed that Antalya's infant mortality rate remains significantly below the national average in Türkiye. In 2023, the national infant mortality rate was 10.0 per 1,000 live births, whereas in Antalya it was recorded as 5.9 per 1,000. This gap reflects the effectiveness of maternal and child health services in Antalya, as well as the adequacy of the region's healthcare infrastructure.

When Table XV.11 is examined, a similar trend is observed in terms of under-five mortality rates. In 2023, the national rate was 14.5 per 1,000 live births, whereas in Antalya it was measured at only 7.7 per 1,000. Although there was a temporary increase in 2021 and 2022, the rate declined again in 2023. This indicates that Antalya is effective both in early childhood health services and in vaccination and monitoring systems.

When Table XV.12 is examined, the 2023 data shows that Antalya's crude death rate (5.1 per 1,000 population) is lower than both the Mediterranean Region average (8.5) and the national average (6.2). Similarly, the infant mortality rate (5.9 per 1,000 live births) and under-five mortality rate (7.7 per 1,000 live births) in Antalya are also significantly lower compared to other regions (Mediterranean Region: 12.3 and 27.4, respectively). These differences indicate that Antalya holds a relatively advantageous position in terms of healthcare infrastructure within Türkiye and that its public health indicators are generally strong.

Based on the evaluation of current statistical data, Antalya province demonstrates performance above the national average in terms of public health indicators. In particular, infant and under-five mortality rates are significantly lower than both the national and regional averages. This reflects the effectiveness of maternal and child health services in Antalya, the level of access to primary healthcare, and the success of the preventive healthcare system.

Furthermore, the fact that the crude death rate in Antalya remains below both the national and Mediterranean Region averages indicates that the province enjoys a high overall quality of life, effective management of chronic diseases, and a healthcare infrastructure with sufficient capacity to meet regional needs. The elevated mortality rates observed during the COVID-19 pandemic have almost entirely subsided by 2023, which demonstrates the resilience and recovery capacity of the local health system in the face of public health emergencies.

In this context, the planned project is not expected to result in any lasting, systemic, or widespread disruption to Antalya's existing healthcare system. Local capacity is deemed adequate to meet the essential healthcare demands. However, potential public health risks arising from dynamics such as temporary population movements, intensive construction activities, and increased traffic volume must not be overlooked during the project implementation phase.

In particular, the following areas require close attention:

- Traffic accidents and road safety,
- Construction-related occupational injuries and physical accidents,
- Risk of communicable diseases associated with temporary workforce (e.g., airborne or waterborne diseases).

To mitigate these risks, the project will incorporate preventive public health strategies, effective communication and awareness campaigns for the local population, enhancement of mobile health services, and the development of emergency preparedness protocols.

Within this framework, the public health management planned not only to preserve existing infrastructure but also to safeguard public health by preventing potential adverse impacts that may arise during project activities.

Existing Gender Based Violence and Harassment Status

Unfortunately, data specific to Antalya are not regularly disclosed by public institutions at the national level. According to data from the WWSFP, 13 femicides were committed in the province during the first ten months of 2024[3].

The “Provincial Action Plan for Combating Violence Against Women (2022-2025)”, prepared by the Antalya Provincial Directorate of Family and Social Services and approved by the Antalya Governorship, provides a comprehensive framework for combating GBVH at the provincial level [4]. The plan sets targets aligned with the national action plan under the headings of preventing violence, protecting survivors, punishing perpetrators, and developing policies and strategies. It also includes activities such as strengthening inter-institutional cooperation at the local level, conducting awareness campaigns, implementing training programs, and ensuring accessible support services through Violence Prevention and Monitoring Centres (ŞÖNİM). This action plan serves as a strategic roadmap for combating GBVH in Antalya[1].

Under the scope of employment, according to the Household Labour Force Survey, the employment rate of the population aged 15 and over was 48.3% in 2023. This rate was 31.3% for women and 65.7% for men. The highest employment rate was 54.5% in TR21 (Tekirdağ, Edirne, Kırklareli), while the lowest employment rate was 37.5% in TRC3 (Mardin, Batman, Şırnak, Siirt). Regarding female employment specifically, the highest rate was 38.9% in TR61 (Antalya, Isparta, Burdur), and the lowest rate was 19.8% in TRC3 (Mardin, Batman, Şırnak, Siirt) [2].

XV.3. Potential Impacts

Similar to most large-scale construction projects, the Antalya-Alanya Motorway Project is expected to present several community health and safety concerns during its construction phase and operation phase.

These include:

- Dust, noise, and vibration generated by construction equipment and vehicles,
- Social impacts potentially associated with the influx of temporary male construction workers,
- Increased risk of traffic accidents, particularly for pedestrians and vulnerable road users,
- Fire risks in proximity to construction areas, rest facilities and natural landscapes.

Mobile vehicle traffic throughout both the construction and operation phases may pose risks such as air and noise pollution, traffic congestion, and accidents, requiring proactive and continuous management. However, the improved road conditions offered by high-standard motorway infrastructure are also expected to reduce the overall number of accidents in the region, enhancing long-term community safety.

In addition, fire hazards-stemming from construction machinery, fuel storage, or surrounding vegetation-represent a significant risk to the health and safety of both nearby communities and motorway users. This is particularly critical for immobile populations such as the elderly, persons with disabilities, or informal settlement residents located near the alignment.

The following table outlines key community health and safety risks across project phases, specifically identifying vulnerable groups (e.g., women, children, elderly, low-income households, and persons with disabilities) and proposing tailored measures.

Recommended location-based measures for vulnerable groups are provided in Table XV.13

Table XV.13 Recommended location-based measures for vulnerable groups

Project Phase	Impact Source	Community Exposure	Some Affected Vulnerable Groups	Mitigation / Preventive Measures
Land Preparation	Vegetation clearance, excavation	Dust formation and increased equipment movement near settlements; disturbance to daily life	Elderly with chronic illnesses or limited mobility (e.g., in Taşağıl and Konaklı); housebound or chronically ill individuals (Ulukapı, Konaklı); illiterate elderly women (Toslak, Alara)	Advance community notification; distribution of protective masks to sensitive households; coordination with mobile health services; dust suppression through water spraying; ensuring safe pedestrian access near work zones
Construction	Heavy machinery operation	Increased noise and vibration levels; sleep disturbance and discomfort	Elderly individuals or chronic illness (e.g., Taşağıl, Konaklı); illiterate elderly women with low awareness (Toslak, Alara); people with mental disabilities (Akdam, Taşağıl)	Targeted noise reduction near elderly areas; awareness outreach through mukhtars and health workers; distribution of printed and verbal guidance
Construction	Influx of large male workforce from outside	Social tension or harassment risk, especially for women and girls	Women and girls in Merkez, Ulukapı and Konaklı; female-headed households ; widowed/divorced women	Mandatory gender-sensitive code of conduct for all workers; establishment of grievance mechanism; GBVH (Gender-Based Violence) awareness campaigns; assignment of woman liaison officers
Construction	Increased road traffic and heavy vehicles	Risk of traffic accidents for pedestrians, especially children and the elderly	Children walking to school; elderly individuals with mobility impairments; seasonal agricultural workers	Pedestrian safety training in schools; traffic signs and crossing guards at sensitive locations; rerouting of traffic during peak hours; targeted safety campaigns for rural households
Construction	Temporary labor camps	Strain on local resources (water, healthcare); risk of gender-based violence (GBVH)	Women in neighboring communities (especially in Merkez and Ulukapı); charity-dependent households; individuals with disabilities	Short-term skill development and employment programs can be developed based on local labor market needs.
Operation	High-speed traffic	Traffic accidents involving local vehicles or livestock	Rural families relying on small-scale livestock (Kalemler, Alara); illiterate drivers in agricultural areas	Installation of animal fencing in high-risk segments; reflective signs or underpasses for animal crossings
Operation	Continuous emissions and noise from vehicles	Chronic exposure, especially in roadside homes; long-term health impacts	Chronically ill or housebound individuals (Ulukapı, Konaklı); elderly and disabled persons in roadside villages	Noise barriers in densely populated areas; regular air quality monitoring
All Phases	Fire risks from fuels, equipment, and vegetation	Fire-related health threat for immobile or hard-to-evacuate individuals	People with physical or mental disabilities (Taşağıl, Akdam, Konaklı); elderly living alone; informal housing residents near forested zones	Community fire drills in high-risk areas; fire equipment in labor camps; bilingual awareness campaigns (Turkish and other); early alert systems via mukhtars and clergyman (they will make an announcement in case of emergency)

XV.3.1. Land Preparation and Construction Phase

Land preparation and construction phase impacts of the Project would include emissions of dust, noise, and vibration from earthmoving activities, construction vehicle transit, increased traffic load, water supply, material extraction, blasting, and communicable/airborne diseases (respiratory or allergic) associated with the influx of temporary construction labor. Workers' influx in the vicinity of a community may also strain existing infrastructure, in particular the water and sanitation, electricity, and transport systems (IFC/EBRD, 2009). These impacts can be managed through good management practices, and the significance of impacts would then be reduced to acceptable levels. Assessment of specific community health and safety issues associated with the land preparation and construction phase is provided below. Traffic-related impacts are addressed in the relevant management plan, while impacts caused by workers are examined in Chapters 15 and 16 in the ESIA. Detailed assessments of the impacts caused by air emissions and noise generation have been discussed in Chapter 10 in the ESIA ("Air Quality and Climate Change") and Chapter 11 in the ESIA ("Noise and Vibration"), respectively.

Vegetation Clearance and Excavation Activities

Vegetation clearance and excavation activities, particularly when conducted near residential areas, may pose short-term but locally significant risks to community health and safety. The increased movement of heavy machinery, elevated dust emissions, and construction-related noise may disrupt daily life and negatively impact public health.

Dust emissions generated during such activities are of particular concern for vulnerable population groups, including elderly individuals with chronic respiratory or cardiovascular conditions In the absence of timely information and protective measures, these individuals are at increased risk of experiencing acute respiratory symptoms such as eye irritation, coughing, and shortness of breath.

In addition, reduced visibility due to airborne dust can compromise pedestrian safety, especially in areas where excavation work is ongoing. Vulnerable individuals such as children and the elderly may face increased risk of accidents while crossing roads or passing near active construction zones. Furthermore, noise and visual disturbances associated with construction may contribute to psychological stress, discomfort, and perceived health risks among some community members.

Construction Traffic Safety

Significant numbers of trucks and other construction machinery will be involved in the land preparation and construction activities increasing the risk of accidents. Since the heavy machinery will work within the construction corridor, the risks posed on the users of public roads would be insignificant. On the other hand, delivery of the construction materials extracted at the quarries and material borrow sites to the construction site and transportation of the unused excavated materials from the work sites to the storage sites by means of trucks, delivery of construction materials (steel, beams, concrete, etc.) by means of trailers and trucks, transportation of personnel accommodating at campsites to the work sites will be the main activities associated with increased traffic.

Some of the public roads may need to be diverted or closed for a certain period of time during the construction and if these activities are conducted in the lack of proper measures (i.e. putting road signs, providing adequate lightning at night), risk of accidents may increase.

Especially, routes passing through settlements may pose significant risks and disturbances on the health and safety of the local communities including those who are the most vulnerable to road traffic accidents (e.g. animals, pedestrians, motorcyclists, children, and elderly).

During the construction of motorways, heavy vehicles operating on narrow village roads should be vigilant in observing small animals and take necessary precautions to prevent accidents. The presence of these vehicles close to wildlife can lead to dangerous encounters, especially as animals might unexpectedly cross paths or be startled by the noise and movement. Ensuring that drivers are aware of and prepared for such scenarios is essential for minimizing harm to both animals and pedestrians.

Behaviors of the drivers and construction machinery operators are among the most important factors related with the risk of traffic accidents, thus requirements for the training of drivers and operators would reduce the associated risks.

Community Severance

The construction approximetly 120-kilometer road corridor has the potential to create community severance, physically and functionally disconnecting local settlements from essential services such as healthcare, education, economic infrastructure, and public institutions. This impact will be particularly significant for rural, low-income households and vulnerable groups such as the elderly, women, children, and persons with disabilities who rely heavily on safe, short-distance, and pedestrian-based access to services.

The Project area-stretching across the Antalya-Alanya corridor is not only home to permanent residents but also characterized by intense seasonal population influx. During the summer months, the region experiences a significant increase in:

- Seasonal tourism workers who commute daily between accommodation sites and hotels,
- Temporary workers in tourism, domestic, service, and agriculture sectors who often reside in informal or isolated areas,
- Tourists and families staying in coastal areas with high pedestrian circulation.

As such, potential access disruption may not only affect local residents, but also temporary and tourism-related populations, in the following ways:

- Tourism workers may face extended or unsafe commutes between their accommodation and workplaces due to lack of designated crossings.
- Temporary female workers may lose access to critical public health services (e.g, emergency clinics).
- Local businesses, including small hotels and restaurants, may suffer from decreased customer and staff flow, affecting the regional economy.

From a broader social perspective, the road may fragment small rural settlements, weaken community cohesion, and reduce participation of women and youth in public life-particularly where physical barriers limit access to shared spaces or essential services.

Blasting Operations

Blasting operations planned at multiple quarry sites along the project route may pose localized but significant risks to the health, safety, and well-being of nearby communities and land users. If not properly managed, such activities may result in vibration, air shock, and fly rock, potentially affecting nearby settlements, agricultural areas, greenhouses, and public road users.

While some quarries are located away from residential zones, others are in close proximity to settlements or productive agricultural land, thereby increasing the risk of community disturbance, property damage, or disruption to agricultural activities. For example, Çakış (TOY4a) Quarry and Dikmen Quarry are located near residential areas, while Uzunlar, Sarıabalı, and Karamanlar Quarries are adjacent to active farmland and greenhouses. These sensitive receptors are more likely to be exposed to blasting-related nuisances, including noise, dust, and structural vibrations.

Furthermore, the cumulative operation period of up to 36 months at several quarry sites increases the likelihood of long-term community exposure, especially for vulnerable populations such as the elderly, children, and agricultural workers who spend significant time outdoors.

To minimize adverse effects, blasting activities must be carefully planned and executed with strict safety zones,, prior public notifications, and coordination with local authorities. Risk assessments should

consider site-specific conditions including distance to receptors, local topography, and the timing of agricultural activities.

Information regarding the quarry activities to be carried out is provided in Table XV.14

Table XV.14 Information on quarry activities

Quarry	Description
Çakış TOY4a - Quarry	TOY4a Quarry is located around Km 56+500 near Sarıabalı neighborhood of Serik district of Antalya province. The closest settlement is Çakış neighborhood. The quarry is 25 ha with a capacity of 375 m^3/h. The operational duration is planned to be 36 months.
Kuruçay (TOY4b) Quarry	Kuruçay (TOY4b) Quarry is located on an area of 24.3 hectares around Km 58+500. The operation period is planned for 36 months and has a capacity of 375 m3/h.
TO2, Bademliyar Quarry	TO2, Bademliyar Quarry is located around Km 104+750 near in Manavgat district of Antalya province. There are no nearby residential areas, but the quarry's location is very close to agricultural areas and another quarry. The quarry is 17.9 ha with a capacity of 375 m^3/h. The operational duration is planned to be 36 months
Çengel Stream Material Quarry	Çengel Stream Material Quarry is located on an area of 19 hectares around Km 105+000. The operation period is planned for 36 months and has a capacity of 375 m3/h.
Uzunlar TOY5 Quarry	TOY5 Quarry is located around Km 106+000 near Uzunlar neighborhood of Manavgat district of Antalya province. The quarry's location is very close to agricultural areas and greenhouses. The quarry is 24.7 ha with a capacity of 375 m^3/h. The operational duration is planned to be 16 months
Karakaya Quarry	Karakaya Quarry is located on an area of 25 hectares around Km 114+200. The operation period is planned for 16 months and the facility has production capacity of 375 m3/h
Saburlar Quarry	Saburlar Quarry is located on an area of 25 hectares around Km 117+000. The operation period is planned for 16 months and the facility has production capacity of 375 m3/h.
Karamanlar Quarry	Karamanlar Quarry is located on an area of 25 hectares around Km 119+500. The operation period is planned for 16 months and the facility has production capacity of 375 m3/h.
Soğukpınar Quarry	Soğukpınar Quarry is located on an area of 25.1 hectares around Km 134+000. The operation period is planned for 16 months and the facility has production capacity of 375 m3/h.
Sarıabalı Quarry	Sarıabalı Quarry is located around Km 53+800 near Sarıabalı neighborhood of Serik district of Antalya province. The quarry's location is very close to agricultural areas and greenhouses. The borrow pit is 24.9 ha with a capacity of 375 m^3/h. The operational duration is planned to be 36 months
Dikmen Quarry (Manavgat Connection Road)	Dikmen quarry (Manavgat Connection Road) is located around Km 83+000 near Yukarıışıklar neighborhood of Manavgat district of Antalya province. Besides, it is close to agricultural areas, greenhouses, and settlements. The borrow pit is 24.5 ha with a capacity of 375 m^3/h. The operational duration is planned to be 36 months.

Chemicals and Fuels

During the construction phase of the motorway project, a variety of chemicals and fuels will be used, including diesel fuel, lubricants, hydraulic oils, paints, solvents, adhesives, and cleaning agents. In addition, explosives and blasting materials will be required for quarry operations and rock excavation works.

If not properly managed, these substances pose significant risks to community health and safety. Potential risks include:

- Civilian access to the construction site may lead to risks
- Leakage or spills of fuels, oils, and solvents may lead to soil and groundwater pollution, potentially affecting agricultural lands, local water resources, and thereby public health.
- Improper storage and handling of fuels and explosives can create fire and explosion risks, which may endanger both workers and nearby communities.
- Direct or indirect exposure to hazardous chemicals (vapors, dust, or accidental contact) may result in respiratory issues, skin irritation, or other health problems for workers and local populations.

- Improper handling of chemicals, such as paints and solvents, may create strong odors that disturb nearby settlements and affect quality of life.

GBVH

The construction phase of the project overlaps with periods of high seasonal activity along the Project corridor, during which a large, male-dominated workforce-including subcontractors and security personnel-will be mobilized. This region is known for its high concentration of seasonal female agricultural workers and female tourists, both of whom are potentially vulnerable to gender-based violence and harassment (GBVH) risks.

Many of the seasonal female workers are employed informally, live in isolated and often mixed-gender accommodations, and lack access to support or complaint mechanisms. Female tourists, particularly those staying in rural or unmonitored areas, may also be at risk of unwanted interactions with project workers or third parties. For local women, traditional gender roles, patriarchal structures, and social pressures often act as barriers to reporting GBVH incidents, and access to grievance mechanisms tends to be limited or inadequate.

In this context, GBVH risks during the construction phase may not only result in individual harm but could also lead to loss of trust, social tension, and even community-level conflict between the project and surrounding populations.

Camp Site

If not properly planned, managed, and monitored, workers' camps established under the scope of the project may pose significant risks to the health of nearby communities. Overcrowded living conditions, inadequate sanitation, insufficient wastewater management, and contamination of drinking water sources can increase the spread of infectious diseases. Moreover, interactions between camp workers and local populations may facilitate the transmission of communicable diseases such as sexually transmitted infections (STIs), including HIV/AIDS. Therefore, the establishment, operation, and monitoring of workers' camps will be carried out in full compliance with IFC Performance Standard 4 and national legislation, with strict implementation of necessary health, safety, and hygiene measures.

Water Quality and Availability

During land preparation and construction activities, such as water extraction, wastewater discharges, and impoundment, there may be potential impacts on groundwater and surface water. This could affect the local community, especially if they rely on these resources for drinking or irrigation. As part of ESIA studies, a social field study was conducted to identify the situation of the local people (include water resources) living near the Motorway and construction sites. In Chapter 14 ("Socio-economic Environment") of the ESIA report, further details and findings from the social field study are given.

Additionally, Table XV.15 in the report summarizes the water resources and wastewater removal methods used by the settlements interviewed. According to the neighborhood representative (mukhtar), all the neighborhoods along the Motorway route rely on municipal distribution, groundwater, and surface water as sources of domestic water.

Table XV.15 Water Resources and Wastewater Management in the Settlements Interviewed

Name of the Settlement	Source of Water Used for Domestic Purposes	Perceived Quality of Domestic Water Source	Wastewater Management Method
Merkez	Municipal Water/ Spring water	Good	Sewage System
Ulukapı	Groundwater	Good	Septic tank
Karakaya	Surface Water (Alara Stream)	Good	Septic tank
Toslak	Groundwater	Good	Septic tank

Source: Social Field Study, June 2024

According to TurkStat (2022) data, daily water drawn per person (liters/person-day) is 229 L in Türkiye and 349 L in Antalya. It is assumed that the Project personnel in the campsites use %70 of average daily per capita water amount. As a result, Table XV.16 shows that 806.2 tons/day is expected to be drawn for the Project's personnel water demand.

Table XV.16 Daily Water Demand at Neighborhoods and Campsites

Location	Number of Personnel (Anticipated)	Estimated Daily Water Demand (tons/day)	Possible Source of Water Supply
Construction Camp Site 1 (near Taşağıl neighborhood)	3300	806.2 tons/day	Municipal Water
Construction Camp Site 2 (near Bucakşeyhler neighborhood)			
Construction Camp Site 3 (near Avsallar and Incekum neighborhoods)			

The wastewater generated at the campsites will be treated at the package wastewater treatment plants and then released into the nearest water bodies in accordance with the discharge permits from the MoEUCC. Since these water bodies are not used as drinking water sources for the communities, this process is not expected to have any significant impact.

Airborne/Communicable Diseases

Large-scale development projects involving significant workforce mobilization can pose considerable risks to community health. In particular, if worker camps are characterized by poor sanitation standards, inadequate wastewater management, limited access to clean drinking water, and insufficient food safety measures, the risk of communicable disease transmission increases. Such conditions may lead not only to health problems among workers but also to the spread of respiratory diseases, gastrointestinal infections, and skin conditions within local communities.

For local populations, an additional risk stems from potential water- and food-borne diseases originating in the camps. Contamination of drinking water sources or the improper handling of food can result in outbreaks of diseases such as typhoid, cholera, and hepatitis A. Moreover, the presence of a predominantly workforce in the area can create potential risks for the transmission of sexually transmitted infections (STIs), including HIV/AIDS, particularly affecting vulnerable groups such as informally employed women, youth, and seasonal agricultural workers.

Beyond communicable diseases, frequent interactions between workers and local communities may also lead to psychosocial impacts. Increased perceptions of health risks among community members can create anxiety, mistrust, and social tensions. This, in turn, may escalate into a loss of confidence in the Project and strained relations between the Project and surrounding communities.

Security Personnel Arrangements

Involvement of security personnel to control unauthorized access to work sites and safeguard the Project personnel and property would be another issue related with the community safety and welfare. Risks that may be posed by security arrangements may be due to use of disproportionate use of force and where applicable firearms, inappropriate conduct toward workers and local people. In the scope of the Motorway Project's security services will be provided by the Project Sponsor. Unarmed security service will be provided within the scope of Project Sponsor's support services unit. The working area of these personnel will be limited with the Project borders (e.g. campsites).

Straight forward measures such as proper inquiries to be done at the hiring stage for the personnel to be employed, good management of the related personnel, trainings to be provided to security personnel in relevant subjects, monitoring of legal compliance of the acts of the personnel, applying contractual sanctions, etc. would be effective in avoiding and/or minimizing associated risks so that no significant impact is anticipated due to security personnel arrangements of the Project.

Emergency Preparedness and Response

An emergency is an unplanned event when a project activity/operation loses control, or could lose control, of a situation that may result in risks to human health, property, or the environment, either within the facility or in the local community. Emergencies do not normally include safe work practices for frequent upsets or events that are covered by occupational health and safety (IFC, January 2012).

Emergency situations that may be encountered during the land preparation and construction phase of the Project may include accidents, fires, spills, leakages, and geotechnical stability issues for the large engineering structures, earthquakes, etc. Suppose the consequences of these situations cannot be controlled within the borders of the work sites (e.g., construction corridors, campsites, quarries, etc.). In that case, risks may be posed to the health, safety, and security of the local communities. Nevertheless, with effective implementation of the measures/actions defined in the Project's Emergency Preparedness and Response Plan, (Annex-3) emergency situations can be controlled without causing significant risks and/or impacts on the health and safety of the local communities.

Risk of forest fires and spills/leakages have been covered in Chapter 5 in the ESIA ("Land Use and Property") and Chapter 6 in the ESIA ("Topography, Soils and Geology")

Public Health and Welfare

Air emissions and noise generation during land preparation and construction activities, especially at dry periods, may cause disturbance and discomfort for some of the local people, especially in settlements living in close distance to the construction/working sites. Impacts caused by construction phase emissions will be removed upon the completion of construction activities, nevertheless gaseous emissions and traffic noise will remain to be a concern of the subsequent operation phase. Impacts on public health and welfare due to air emissions and noise have been covered in Chapter 10 in the ESIA ("Air Quality and Climate Change") and Chapter 11 in the ESIA ("Noise and Vibration").

Campsites will be established in the construction sites in sufficiently large areas, and most of the construction workers are expected to be accommodated in these sites. Precautions will be taken to prevent GBVH and sexual abuse, exploitation, and harassment in the controlled areas where the Project employees are accommodated. The risks to the local community due to the influx of a large number of workers to the region will be evaluated primarily for the campsites that are located in the vicinity of settlements and a basic training program for the Project workers regarding these subjects will be provided by Project Sponsor.

Displacement

During the construction and operation phases of the project, there is a risk of physical (loss of housing) and/or economic (loss of livelihoods) displacement, particularly due to land acquisition and site installations. In this regard, the project will act in compliance with IFC Performance Standard 5 (Land Acquisition and Involuntary Resettlement), implementing a transparent, fair, and participatory displacement process aimed at restoring or improving the living conditions and livelihoods of affected persons. For this cause, Resettlement Action Plan (RAP) is developed, and compensation will be provided in a timely, fair, and adequate manner.

In addition to land acquisition and physical resettlement, temporary economic displacement is expected during the construction phase due to reduced accessibility, road closures, and increased nuisance (dust, noise). These effects may negatively impact local businesses-especially those located along main roads and in tourism-dependent areas-by limiting customer access and reducing daily revenue.

Examples of areas where displacement will occur are provided in Table XV.17

Table XV.17 Examples of Locations at Risk of Displacement and Experience Partial Loss of Land and/or Assets

Location	Type	Status
Emişbeleni (Alanya)	Local market and barbershop (tenant-operated)	Currently operational
Telatiye (Alanya)	Auto repair shop (formerly tenant-run)	Not operational; renter moved to Antalya
Emişbeleni (Alanya)	Multi-storey apartment building used as permanent residences by multiple households, including a formal tenant on the ground floor	The structure is currently in use
Telatiye (Alanya)	Multi-storey apartment building used as permanent residence by multiple households (relatives); egg packaging facility owned and operated by households on the ground floor	The structure is currently in use
Taşağıl (Manavgat)	House used as permanent residence by a single household	The structure is currently in use
Bucakşeyhler (Manavgat)	Vacant vineyard house	Not operational
Evren, Manavgat	Retail Stores	Currently operational
Hacıobası, Manavgat	Roadside Local Product Vendors	Currently operational
Hacıobası, Manavgat	Roadside Local Product Vendors	Currently operational
Evren, Manavgat	Retail Stores	Currently operational
Evren, Manavgat	Workshop (marble)	Currently operational
Taşağıl, Manavgat	Local Cafe	Currently operational
Telatiye, Alanya	Retail Store (Tent, Awning, Tarpaulin)	Currently operational
Telatiye, Alanya	Retail Store (Pool Chemicals)	Currently operational
Toslak, Alanya	Retail Milk Production and Store	Currently operational

Despite efforts to avoid residential areas during route selection, a limited number of buildings and houses are expected to be physically displaced within the expropriation corridor. Physical displacement may cause psychological stress, emotional detachment, and uncertainty for both owners and tenants.

Households engaged in agriculture, greenhouse farming, and livestock will experience economic displacement due to land acquisition. Seasonal revenue loss risk is particularly high in tourism-dependent regions and agricultural zones. Businesses located near construction zones may face reduced customer traffic due to access restrictions, dust, and noise.

For more detailed information, please refer to the Resettlement Action Plan (RAP) in the ESIA.

XV.3.2. Operation Phase

Once the Project is taken into operation, it is anticipated to host significant numbers of motor vehicles, including passenger cars and heavy vehicles. The feasibility study for the AAOİAŞ assumes that the number of motor vehicles that will use the Motorway would increase from year to year. As the traffic density on the Motorway increases, risks on the safety of the traffic may also increase. Details about the minimum guaranteed traffic for the duration of operation, as outlined in the relevant terms of the BOT contract, will be available in the "Traffic Projections" section in Chapter-III in the ESIA “Project Description”.

Together with traffic safety, structural safety is essential for community health and safety issues during the operation phase. Pedestrian safety and emergency preparedness and response are other issues that need proper management to avoid/minimize risks on the Project. Additionally, air emissions, noise, and vibration may disrupt the populations along the motorway route. Further assessment of impacts during the operation phase is provided below.

Structural Safety

The Project involves several large and small engineering structures. Safety failure of these structures (i.e. culverts, viaducts, bridges, etc.) may pose significant risks on the health and safety of the community. The Project are located in second degree earthquake zone according to Earthquake Zoning Map of Türkiye, thus failures that may be triggered by earthquake events are among the most important design considerations for the Project.

On the other hand, since the Project will be designed in accordance with KGM’s technical specifications and international standards (including seismic), structural failure risks have already been minimized by design. Seismic and other geotechnical risks have been covered in Chapter 6 in the ESIA (“Topography, Soils and Geology”).

Traffic Safety

Traffic accidents, which have become one of the most significant causes of injuries and fatalities among public members, may be mainly related to the driver's behavior, the quality of the vehicles used, and/or the road's design, construction, and maintenance conditions. Accordingly, improved driving conditions provided by the new Motorway will likely prompt some drivers to speed up traffic, increasing the risk of accidents. On the other hand, this risk may be contra-balanced by the overall reduction of traffic accidents related to improved driving conditions for more fluent and safe traffic on motorways having high physical and geometrical standards (JASPERS, 2010). Also, snow and ice, if not properly and timely removed, may reduce or eliminate the vehicle's friction ability and road holding capacity, resulting in risks to traffic safety. Thus, snow and ice removal is a vital operation phase activity (IFC, 2012)

With the Antalya-Alanya Motorway Project, other motorways and divided roads in the country are anticipated to contribute to the improvements in the fatality rate reductions targeted to be achieved in the following decades despite the expected increase in vehicle ownership and vehicle kilometers. Since Turkish authorities publish no statistical information or analyses about the effect of Motorway on the number of accidents and fatality rates that would support this assessment, the study “Road Safety Statistics at Regional Level” published by Eurostat (the Directorate General of the European Commission responsible for providing statistical information to the institutions of the European Union-EU, road safety statistics in the EU, as well as the European Free Trade Association (EFTA) and candidate countries) have been reviewed1. Motorway density and risk based on the total number of fatalities in road traffic accidents have been a particular topic under this study.

Based on the analysis, regions with high traffic volumes have a lower rate of road accident fatalities. This is particularly true for many areas in western Germany, England, and most parts of the Netherlands, especially in major cities and around transport hubs. The congestion caused by high traffic volumes near major cities and transport hubs reduces average speeds and the likelihood of fatalities in case of

[1] *http://ec.europa.eu/eurostat*

accidents. Many of these regions with low fatalities have a high density of motorways in relation to their total territory. In general, motorways are safer than secondary roads. Additionally, transit traffic primarily uses the motorway network, further reducing road accidents despite high total traffic volumes[2].

In contrast, fatality rates are high in regions with a low motorway density, such as most regions in Romania, Hungary and the Czech Republic, except their capital regions, all Bulgarian and Polish regions, the Baltic Member States[3], and many rural areas in France and Spain. These data suggest that the high proportion of road traffic using motorways is an essential factor behind the low number of road fatalities in many regions.

In addition to the share of the total road network accounted for by motorways, the significant reductions in the number of road deaths are also due to a combination of high in-vehicle and out-of-vehicle safety standards, better-enforced speed limits and a general 'safety culture', including the quality of the emergency and healthcare systems.

Pedestrian Safety

Pedestrians and bicyclists are at the greatest risk of serious injury from collisions with moving vehicles. Children are generally the most vulnerable due to lack of experience and knowledge of traffic related hazards, their behavior while at play, and their small size making them less visible to motorists. In addition, collisions and accidents can involve a single or multiple vehicles, pedestrians or bicyclists, and animals.

Many factors contribute to traffic accidents. Some are associated with the behavior of the driver or the quality of the vehicle, while others are linked to the road design, or construction and maintenance issues. For example, risks that emerge during rainy weather conditions because of the wet road surface may be properly managed by drivers strictly obeying the traffic rules (IFC, January 2012).

Ensuring that drivers are aware of and prepared for such scenarios is essential for minimizing harm to both animals and pedestrians. Implementing measures such as reduced speed limits, increased driver training on wildlife awareness and the use of warning signs can significantly improve safety for all road users and help protect the local wildlife.

Chemicals And Fuels

During the operation phase of the motorway, various chemicals and fuels will be regularly used in connection with fuel stations, rest areas, maintenance and service facilities established along the road. These include gasoline, diesel, LPG, lubricants, antifreeze, cleaning agents, and maintenance/repair chemicals. In addition, road maintenance works will require asphalt repair materials, paints, and de-icing chemicals (e.g., salt and special solutions)

- Leaks and spills from fuel stations may infiltrate groundwater and agricultural lands, contaminating drinking water resources.
- Accidents during the storage and transportation of flammable and explosive fuels may cause severe fires and explosions.
- Vapors from fuels, solvents, and other volatile chemicals may result in respiratory problems and long-term health impacts for both facility workers and users.
- Improper storage or handling of chemicals in rest areas may directly endanger road users.
- Any chemical incident at fuel stations or rest areas may directly affect not only employees but also road users and nearby communities.

2http://ec.europa.eu/eurostat
3https://ec.europa.eu/eurostat/statistics-explained/index.php?title=Glossary:Baltic_countries

Gender-Based Violence and Harassment (GBVH)

It is anticipated that the risk of GBVH within the scope of the Project will continue during the operation phase. Some dynamics may lead to increased incidents of GBVH in both public and private domains, potentially compromising the physical safety, psychological well-being, and social inclusion of vulnerable groups, particularly women and children. Although employment dynamics will change during the operation phase, it will be important to maintain the same level of sensitivity in terms of measures and working conditions.

From a policy and technical perspective, inadequate integration of gender-responsive occupational health and safety (OHS) measures may restrict female workers' access to appropriately designed personal protective equipment (PPE) and safe facilities, thereby exacerbating workplace vulnerabilities.

Public Health and Welfare

The new Motorway route may be a source of dust and gaseous emissions and traffic noise that may cause disturbance of the local people living, conducting agricultural, grazing or other economic activities, etc. along the route.

Emergency Preparedness and Response

Emergency situations most commonly associated with road operations include accidents involving single or multiple vehicles, pedestrians, and/or the release of oil or hazardous materials. Thus, an Emergency Preparedness and Response Plan, covering the emergency situations (involving vehicles and pedestrians) that may occur during the Motorway's operation, has to be prepared and implemented by trained personnel (IFC, January 2012).

XV.4. Mitigation Measures

The design, construction and operation of the Motorway will be done in accordance with most recent project standards and technical specifications of KGM as well as robust engineering design criteria. KGM will control the works to be conducted by the Project Sponsor during the BOT contract.

An Emergency Preparedness and Response Plan, describing the targets and framework regarding the means for dealing with possible emergency situation during the construction and operation phases will be prepared for the Project. With effective implementation of this Plan, The Project Sponsor will aim to prevent emergencies and respond to unavoidable incidents that could not be prevented by taking relevant measures properly so that no significant risk is posed to health and/or safety of the public.

Throughout the project life-cycle, specialized engineers will be engaged to ensure the structural safety of the works. The safe construction of major engineering structures within the scope of the Project will be subject to regular inspections to continuously safeguard structural integrity.

A notification and reporting procedure will be established to address accidents and incidents. This procedure will serve as a key tool in lessons-learned and continuous improvement meetings. In addition, notifications made to the relevant state authorities will provide an additional mechanism for oversight and monitoring. The reporting of occupational accidents shall constitute a legal obligation pursuant to Turkish legislation. Pursuant to Law No. 6331 on Occupational Health and Safety and the relevant secondary regulations, employers shall be obliged to notify the Social Security Institution and the competent authorities of any occupational accidents.

Through the Grievance Mechanism to be implemented throughout the life-cycle of the Project, local communities and road users will be able to submit their complaints and suggestions. This mechanism, encompassing multiple communication channels, will serve as a key means of ensuring effective engagement with stakeholders. Complaint boxes to be placed in neighborhood mukhtars' offices and rest facilities, a toll-free hotline, a complaint/suggestion link on the Project website, and national

grievance channels (e.g., CİMER) will enable the submission of complaints anonymously; thereby safeguarding the principle of protection against retaliation, as emphasized in the IFC Good Practice Note for the Private Sector: Addressing the Risks of Retaliation Against Project Stakeholders (2021). In addition, Community Liaison Officers (CLOs) employed within the scope of the Project will conduct regular site visits to directly listen to the concerns and suggestions of local communities, and will ensure that the forms collected from complaint boxes are regularly reported. (see Annex-9 in the ESIA)

These measures will contribute to ensuring the safety of the public (including local communities and road users) and will also strengthen compliance with the IFC Performance Standards.

Specific measures to be taken during the land preparation and construction as well as operation phases of the Project are described in the following sub-sections.

XV.4.1. Land Preparation and Construction Phase

During the land preparation and construction phase, primarily, access to construction/work sites will be restricted by means of proper measures such as fencing, signage, etc. Other specific measures to be taken for particular risk subjects to ensure community health and safety and public welfare during the land preparation and construction phases of the Project are described below.

Vegetation Clearance and Excavation Activities

Due to the sensitive receptor designation of Hacıali neighborhood, an air quality monitoring point has been determined, monitoring will be carried out every three months and in case of complaints.

The Health & Safety (H&S) team member or CLO assigned within the Project will visit households and carry out community information activities and free mask distribution (including spares) before construction works approach within 1,000 meters of any residential area.

If dust levels reduce visibility, safety personnel will be stationed at pedestrian crossings to ensure safe passage for individuals.

Dust emissions will be controlled by water spraying. In cases where excavation trucks must pass close to residential areas, the loads will be covered to minimize dust spread during transport.

Heavy Machinery Operation

As one of the key avoidance and mitigation measures to protect community safety, truck movements should be determined based on the routes in a way that avoids residential areas and noise-sensitive zones as much as possible. Drivers will be informed about the haulage routes, and they will be regularly reminded of the rules to be followed within residential areas, and additional measures such as speed restrictions, regular vehicle maintenance, and safe driving practices will be implemented.

The professional competency certificates of operators and drivers will be checked during the recruitment process, and the validity of these certificates will be ensured by the relevant department in cooperation with the OHS Committee, OHS Department, and HR Department. The relevant documents will be archived in the personnel files.

Community Severance

As part of the project, a series of measures have been planned to mitigate the potential community severance impacts that may arise during road construction. In particular, in areas where the project route intersects with existing village roads, farm tracks, or rural connection routes, temporary access solutions such as gravel service roads, temporary bridges, and directional signage should be provided. Before any temporary closure is implemented, local residents should be informed at least 7 days in

advance through verbal channels (e.g., public announcements, village offices), and maps showing alternative routes should be posted on-site.

In locations where the project intersects with main roads, secondary roads, or internal access routes within settlements, construction activities should be phased to reduce disruption. Night-time construction should be limited, and temporary traffic signals or trained traffic marshals should be deployed where necessary. Especially near sensitive areas such as schools, health clinics, mosques, and marketplaces, safe pedestrian access must be maintained at all times. Where necessary, temporary pedestrian overpasses, protective barriers, and metal crossing structures should be installed, along with adequate lighting and traffic-calming measures.

Close coordination with tourism facility managers is essential to minimize disruptions to visitor movement and local economic activity. Additionally, in situations where children, patients, or other residents are unable to access schools, healthcare services, or public transport due to temporary construction closures, the Project Sponsor may provide shuttle services or temporary transport support as needed.

All construction teams should be explained with a site-specific access protocol, outlining key rules such as no road closures without prior notification, informing the Community Liaison Officer (CLO) before placing barriers, and taking into account the daily movement patterns of local residents. Furthermore, equity-based measures should be implemented to ensure safe and dignified access to essential services for women, the elderly, and persons with disabilities through inclusive design and targeted communication.

Finally, in order to ensure uninterrupted access to essential destinations such as schools, health centers, markets, and places of worship, permanent safe crossing structures (pedestrian overpasses, underpasses, or at-grade crossings) should be strategically constructed along the road corridor. These facilities must be accessible and inclusive, incorporating features such as ramps, handrails, and adequate lighting, particularly for women, children, elderly individuals, and people with disabilities. Throughout the construction phase, the access plan should remain flexible and adaptive, supported by a community grievance mechanism that enables timely and transparent resolution of access-related complaints.

Influx of a Large Male Workforce

The influx of a large male workforce as part of the project has the potential to alter local social dynamics, especially in rural and vulnerable communities, leading to various social risks. To manage these risks, a set of comprehensive social mitigation measures has been developed. All workers will receive orientation training on local cultural norms, community values, and national laws, and will be required to sign a binding Code of Conduct to ensure respectful and ethical behavior toward host communities.

To minimize direct contact with local populations, labor camps will be located away from residential areas, and public access to camp premises will be strictly limited. . The camp perimeter should be fenced, and entry/exit points should be controlled (without restricting individuals' freedom of movement). In order to deter potential criminal activities and facilitate the detection of any incidents, both the interior and perimeter of the camp area should be monitored through security cameras. To support these objectives, the perimeter of the camp should be illuminated to a level equivalent to that of the interior. These measures will contribute to ensuring the safety of local communities and temporary settlers (workers), while also ensuring compliance with the IFC Performance Standards.
To prevent GBVH, awareness campaigns should be carried out targeting both workers and local communities. Labor camps will be equipped with safe, well-lit, and gender-segregated accommodation, toilet and shower facilities. In addition, confidential and accessible grievance mechanisms should be established, including the assignment of specially trained gender liaison officers to support women and vulnerable individuals.

In order to ensure transparent and sustainable engagement, regular consultation meetings will be held with local people (especially women’s groups), local authorities and village heads (mukhtars), and community concerns will be carefully considered. To balance the social impacts of incoming labor, local hiring will be prioritized, and goods and services will be sourced from local businesses to support the

local economy. All these measures will be supported by ongoing social monitoring and reporting mechanisms to allow for early detection of social tensions or grievances. This holistic approach aims to safeguard community health and safety while maintaining a long-term relationship of trust between the project and local communities.

Complaint boxes will be placed in the headman's (mukhtar) offices of all villages within the Project's area of influence. These boxes will be checked at least once every 7 days, and all complaints will be formally recorded. Even if the complaint boxes are empty, their status (being empty) and the date of opening will be reported. This practice will allow for an evaluation of the number of complaints received within a given period. In addition, a toll-free grievance hotline will be established, a grievance section will be created on the project website.

All employees will be provided with training on the grievance mechanism and communication rules with the community. Participation will be mandatory. Trainings will be documented and reported by the Community Liaison Officer (CLO). For details of the training, which will be conducted one hour per month, refer to the table in Chapter-16 in the ESIA entitled 'Training Program to be Organized for Personnel'.

Increased Road Traffic and Heavy Vehicles

- Speed limits will be enforced in sensitive areas (e.g., near schools and health facilities).
- Traffic marshals or traffic lights will be deployed in necessary locations to ensure safe passage.
- Vehicles and machinery shall not deviate from the designated route.
- Local communities will be informed at least 7 days in advance of any road closures.
- Alternative routes will be provided during temporary road closures, and information about these routes will be shared verbal formats.
- CLO's employed under the Project will visit households and conduct awareness-raising activities before construction activities approach within 1000 meters of any settlement.
- All employees operating vehicles will receive safe driving training. Participation will be mandatory. Trainings will be documented and reported by the HR Department or H&S Department.
- Maximum vehicle speed in and around settlements should be limited to 30 km/h.

Temporary Labor Camps

Due to the large number of personnel, camps will be located at a safe distance from settlements to avoid interference with the daily lives of local communities and minimize complaints.

The implementation of hygiene measures will help prevent the spread of infectious diseases, thus alleviating potential strain on local healthcare services.

As one of the three worker camps is located in close proximity to a residential area, a range of measures will be implemented to prevent potential risks and minimize adverse impacts on community health and safety. A physical boundary (such as fencing or a green buffer zone) will be established between the camp and the settlement to ensure controlled access. Entry and exit points of the camp will be monitored by security personnel to prevent unauthorized access. Behavioral Codes of Conduct and GBVH (Gender-Based Violence and Harassment) awareness trainings will be mandatory for workers who may interact with the local community. Special supervision and guidance protocols will be applied for situations involving direct community engagement. Environmental impacts such as noise, waste, water use, and traffic will be regularly monitored and managed to avoid deterioration in the quality of life for nearby residents. The grievance mechanism will be made accessible to local communities, and all submissions will be addressed promptly. These measures aim to ensure a respectful and safe coexistence between the camp and the surrounding community.

The map showing the locations of the camps is provided in Figure XV.6

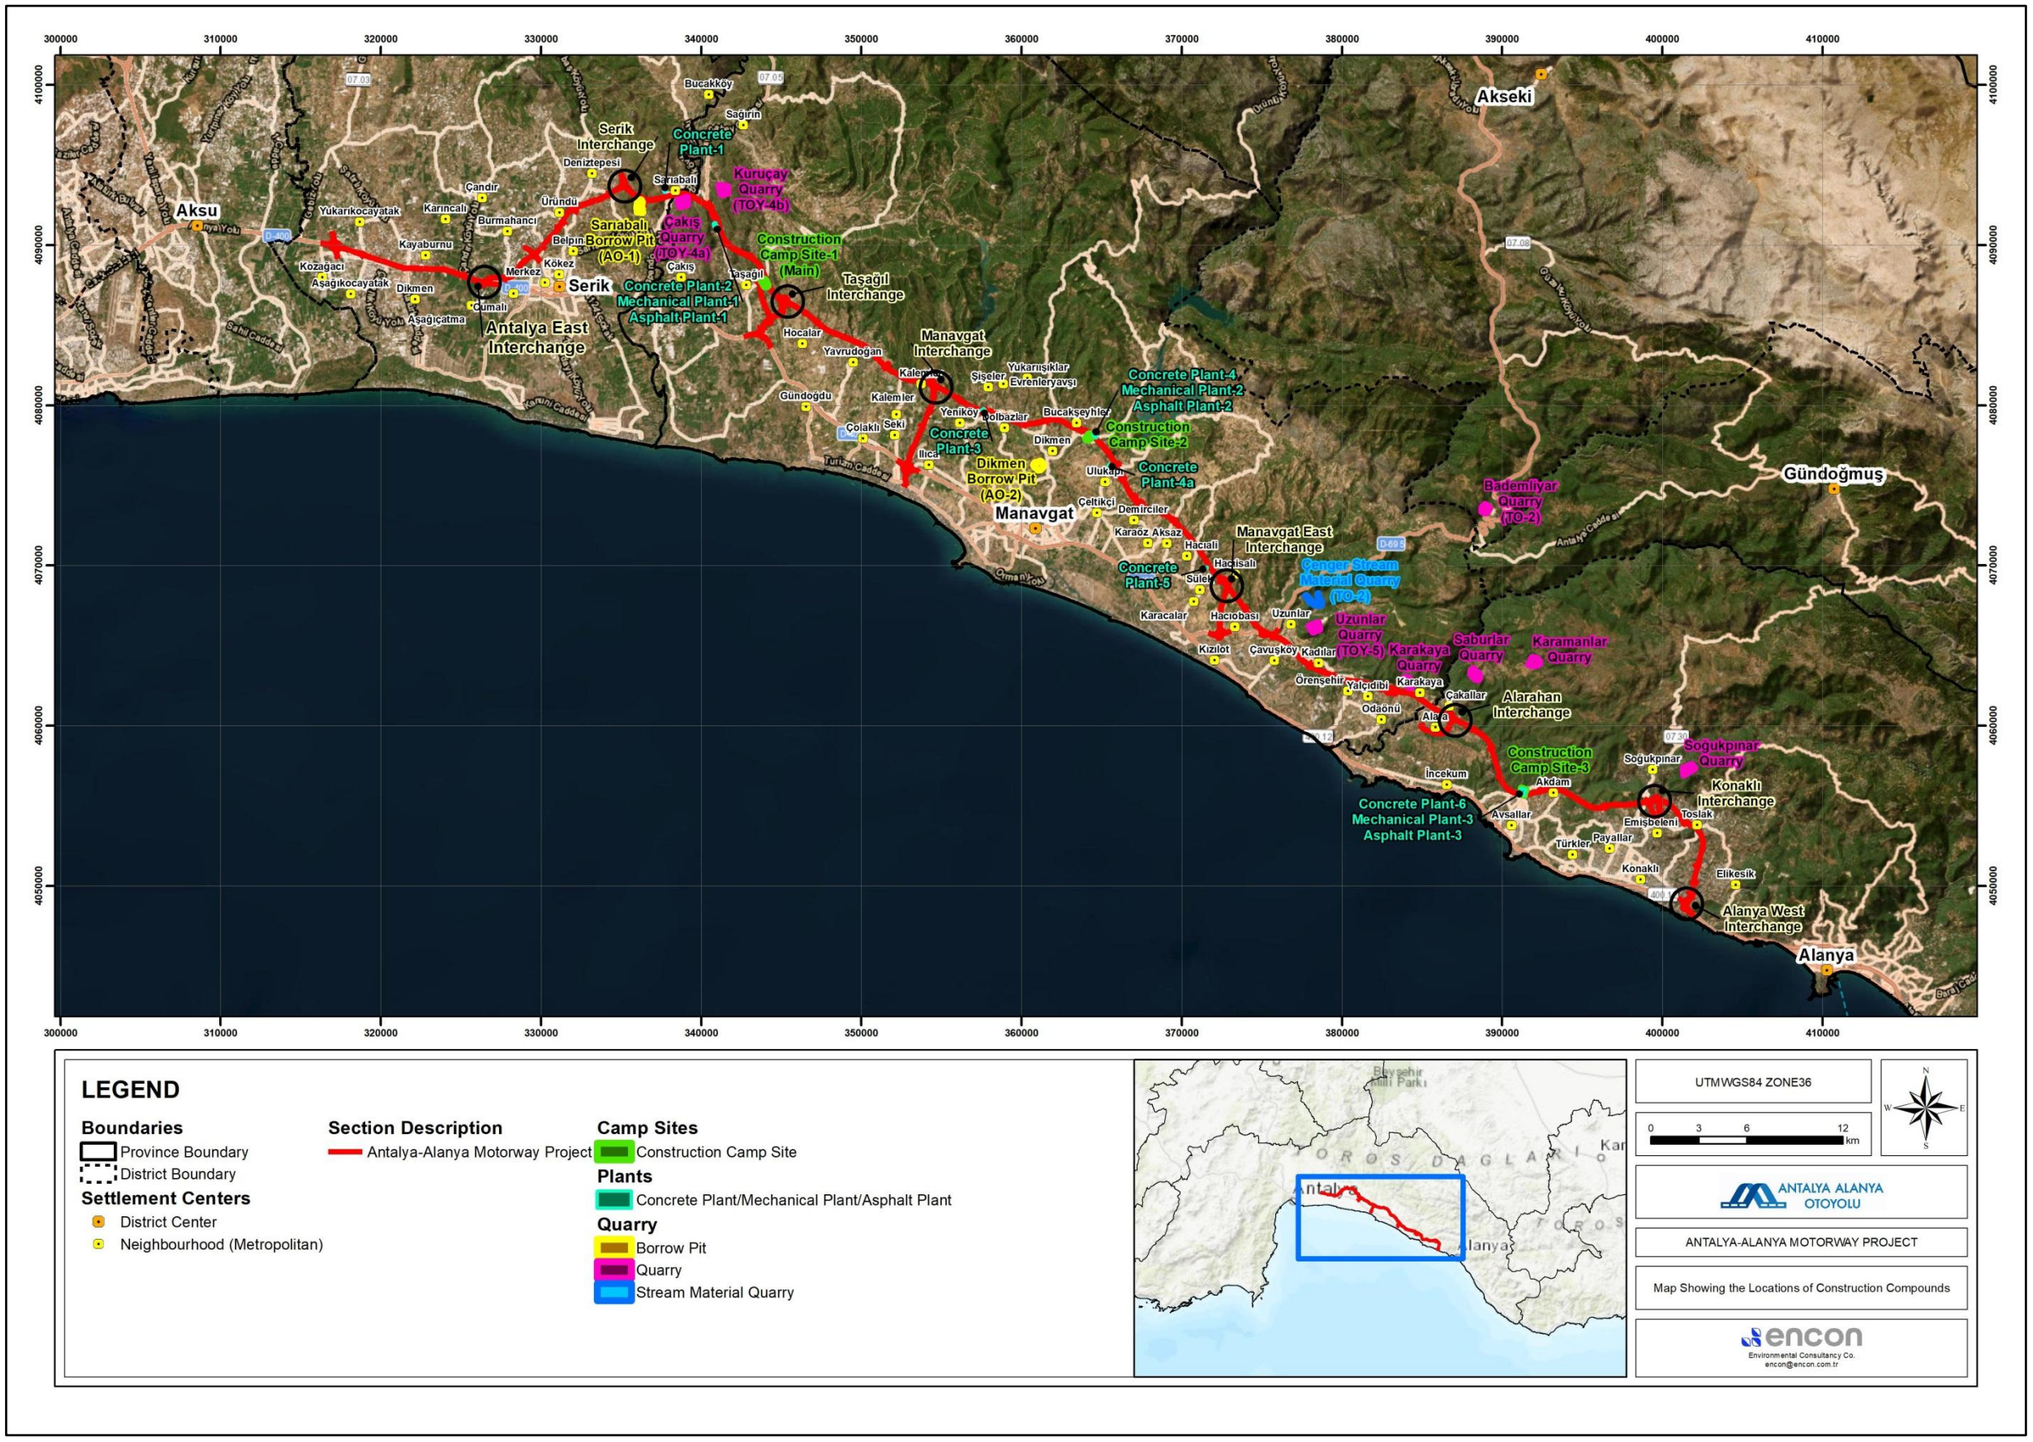

Figure XV.6 Map showing the camps

Construction Traffic Safety

In this regard, following measures will be taken in accordance with the KGM's Technical Specifications for Motorways and relevant international standards to ensure traffic safety at the construction sites and minimize the risk of accidents:

- Construction works on existing roads will not be started until relevant traffic safety measures (including traffic signing and placement of equipment) are taken on roads serving pedestrian and vehicle traffic. These measures will be designed to ensure the safety of life and property of the local people and the users of the roads.
- In the scope of the better working organization, construction traffic routes will be strictly defined, and road construction machinery will use only these routes.
- Passage of the routes through the settlements (i.e., neighborhoods) will be avoided where alternative routes are available. Dangerous routes that are to be avoided, if there is any, will be specified and drivers will be informed. In this scope, construction contractors will construct service roads in order to avoid effecting (such as by increasing the heavy traffic load) the natural flow on the existing roads and to avoid the passage of heavy vehicles through residential areas, whenever feasible. In addition, the traffic will be temporarily diverted where the service roads will be constructed. Furthermore, service roads will be used for the transportation of the construction machinery, equipment, and materials used for the Project.
- Pedestrian interaction with construction vehicles will be minimized by taking appropriate measures in and around the construction corridor.
- Valid licenses will be required for the drivers and operators.
- Drivers and operators will be provided with relevant training that emphasizes the safety aspects.
- Working hours of the day for the drivers/operators should be specified and informed to relevant personnel.
- Limits will be defined for the working/trip duration for the drivers and operators to avoid extreme fatigue.
- Speed control devices should be used on trucks.
- All the construction machinery and equipment will be operated in alignment with the direction of the traffic flow.
- Rigid objects will not be used for the purpose of traffic diversion.
- Unused construction materials, equipment, or machinery will not be left on the road in an uncontrolled way. They will be put in designated places.
- Road signing for night traffic will be provided with reflectors and flashing signals of sufficient number.
- Relevant dust control measures will be taken at the road construction sites to maintain safe sight distances on the existing roads under service.
- Upon the completion of works, signing equipment will be immediately removed, and standard signing will be provided.
- To reduce transportation distances, services and materials required for construction works will be aimed to be primarily supplied from local sources, wherever possible.
- The professional competency certificates of operators and drivers will be checked during the recruitment process, and the validity of these certificates will be checked by the cooperation with the OHS Committee, OHS Department, and HR Department. The relevant documents will be archived in the personnel files.

Disturbance due to Blasting Operations

- Relevant permits will be obtained from the security authorities for the delivery, transportation, and use of explosives in the scope of the blasting operations to be conducted on the Motorway route and the quarries.
- Blasting operations, including their transportation, storage, preparation, utilization, discharge of surplus explosives or unblasted materials, etc., will be carried out by competent, trained experts under the control of the technical supervisor.
- Explosives will be kept within permitted storage areas with isolated capsule divisions.
- Blasting operations will be carried out only after the necessary announcements are made to the local population (The blasting schedule should be shared with the neighborhood mukhtars, and blasting activities should be announced to the local population through the mukhtars.). Accordingly, a blasting schedule will be prepared and activities will be conducted in line with this schedule.
- Warning signs explaining the blasting schedule will be posted at proper locations within the construction sites and the nearby roads and passageways.
- The flagged signal person will be located at designated locations prior to each blasting activity in the risks locations.
- Blasting operations will be conducted daytime between 08:00-18:00. No blasting operation will be conducted on Sundays and holidays in the crowded settlements.
- Blasting calculations will be done, and a maximum number of holes to be blasted at one shot and total charge amounts per shot that would not cause significant environmental impacts (i.e. vibration, air shock, fly rock, etc.,) will be determined prior to execution of operations in consideration of the manufacturers' suggestions. Prior to blasting operations, calculations made to consider of the type of explosive and blasting method will be rechecked.
- Safety distances ensuring no hazard to Project personnel and local people will be determined and maintained during blasting operations. Where required, structures preventing the scattering of materials will be used.
- Locations of holes will be measured and marked before the execution of blasting operations to ensure that blasting energy will be effectively distributed.
- Blasting operations should not be performed during stormy weather conditions.
- Access by unauthorized persons to blasting sites will be prevented.
- If required, cooperation will be made with local authorities to ensure the safety of nearby roads by controlling traffic during blasting.
- Prior to the blasting operations, the sensitivity of nearby settlements/buildings against noise and vibration will be assessed. Buildings located within 100 meters of major vibration sources will be identified and assessed for vibration sensitivity prior to construction. Structural conditions of buildings located within 100 meters of the motorway alignment will be recorded before and after construction works to assess any possible vibration-induced damage. .
- During the entire construction phase, regular surveys will be carried out throughout blasting and drilling activities by the contractor, capturing photographic records of all structures adjacent to blasting areas to detect and evaluate any damage that may occur post-blasting.Explosive charges will be optimized accordingly. Detailed records of blasting operations will be kept and blasting related impacts will be closely monitored.
- Following the post-blasting vibration survey, if any receptor is found to have been adversely affected by the blasting activities, appropriate compensation will be provided.
- Modern blasting techniques will be employed to minimize vibration, including the use of millisecond delays with low charge weights, which will be determined based on geological formation and rock density.
- The number of blasted holes per shot and total charge amounts per shot will be optimized to comply with the regulatory limit values and minimize fly rock incidents. All blast vibrations will be monitored by using vibrometers to be placed at appropriate locations, with records kept on charge amounts, delays, distance to blast sites, and resulting vibration levels.
- Blasting activities will adhere to the limit values specified in the Regulation on Environmental Noise Control for ground vibrations. Records of air shock and vibration measurements will be maintained, and compliance with regulatory limit values will be monitored to minimize impacts on local residents.

Chemicals And Fuels

Chemicals and fuels used during the construction phase can pose serious threats to community health and safety if not properly managed. Incidents such as spills, leaks, fires, or explosions may directly affect not only the workers but also the health, safety, and quality of life of local communities within the Project's area of influence. In addition, environmental pollution may cause long-term adverse impacts, including damage to agricultural lands and contamination of water resources. Therefore, the implementation of strict management practices in line with national legislation and international standards is of critical importance to effectively control these risks.

- All fuels and chemicals will be stored in sealed, properly labeled, and licensed storage facilities. Separate storage arrangements will be ensured for flammable and explosive materials.
- Spill containment systems, secondary containment structures, and absorbent materials will be available at storage and use areas. Emergency spill kits will always be kept accessible.
- Vehicles, equipment, and storage tanks will undergo regular maintenance and inspections, and any equipment with leakage risks will be repaired immediately.
- All personnel handling chemicals will receive regular training on safe storage, transportation, usage, and emergency response. Participation will be mandatory, and trainings will be documented.
- Storage areas will be fire-resistant, and firefighting equipment will be available at all times. Explosives will only be handled by competent and authorized personnel.
- During the transportation of chemicals and fuels, vehicles compliant with national regulations will be used, and transport routes will be planned to avoid residential areas as much as possible
- Local communities will be informed about potential risks and the preventive measures taken, and they will be able to communicate their concerns through the grievance mechanism. (see Annex-9 in the ESIA)
- An Emergency Preparedness and Response Plan (EPRP) will be implemented for potential spill, fire, or explosion scenarios, and its effectiveness will be tested through regular drills. (see Annex-3 in the ESIA)
- Air, soil, and water quality will be regularly monitored, and rapid response will be ensured in case of detected contamination.
  An inventory of all chemicals and fuels used during the Project will be established and continuously updated to ensure proper tracking, management, and compliance with applicable regulations.

GBVH (Gender-Based Violence and Harassment)

Within the scope of the Project, a set of preventive and institutional measures has been developed to effectively manage the risk of Gender-Based Violence and Harassment (GBVH) during the construction phase. All project personnel - particularly subcontracted workers and security staff - will receive mandatory training on GBVH awareness and appropriate conduct. These trainings will begin prior to employment. Training content will cover gender equality, boundaries and consent, types of harassment, and procedures for reporting incidents.

To prevent any form of verbal, physical, or psychological harassment by male workers toward female tourists, local women, or temporary female populations residing near the construction corridor, specific mitigation measures will be implemented. Key areas of potential contact will be identified, and environmental precautions such as site lighting, surveillance, and safe-zone demarcation near camps and transit points will be put in place.

In addition, accessible and anonymous grievance mechanisms tailored to women will be established. These will include phone hotlines, complaint boxes, and in-person reporting options. Female CLOs will be appointed in Project area to provide a direct communication channel for women and to ensure that complaints can be submitted safely and confidentially.

All security personnel deployed in the project will be required to complete specialized training on human rights and gender sensitivity. Completion of this training will be a prerequisite for site assignment. Interactions between security personnel and the community will be closely monitored, and any inappropriate behavior will be addressed through strict disciplinary procedures.

For local women and female tourists, multilingual informational materials, emergency contact numbers, and visual awareness materials should be distributed in locations. These outreach activities should be implemented with the support of local women's organizations and community-based stakeholders to ensure cultural appropriateness and inclusion.

Institutional responsibilities for the implementation of these measures are clearly defined. The Project Sponsor and main contractor are responsible for establishing GBVH-related corporate policies, securing subcontractor commitments, and conducting overall compliance monitoring. The Social Chief will oversee the organization of trainings, tracking of grievances, and reporting of key performance indicators such as the number of complaints and response times. The Human Resources department will ensure ethical hiring practices and develop protection measures for female staff. Community Liaison Officers (CLOs) will manage direct engagement with local women, lead information campaigns, and promote grievance mechanisms. In addition, local NGOs and Women's Organizations should support outreach, monitoring, and referrals where needed.

Airborne / Communicable Diseases

Involving large numbers of workforce, large development projects are seen as a factor for health hazards among local communities due communicable and vector-borne diseases, especially if sanitation standards and living conditions at the campsites remain insufficient.

In the Project, campsites areas have been determined in sufficiently large areas. Most of the construction workforce will be accommodated in these campsites. The sanitation and living conditions provided at the campsites will be sufficient. Drinking water to be provided to the Project workforce will meet the Regulation on Water Intended for Human Consumption requirements so that diseases related to low-quality drinking water are not anticipated to emerge. Additionally, domestic wastewater and solid wastes will be managed in accordance with waste management procedures, meeting the requirements of the national waste management regulations and international standards so that hygienic problems related to insufficient management of wastewaters and solid waste are not anticipated.

- Health awareness training will be provided to all workers, including contractors and subcontractors. The training will include briefings on hygiene practices such as handwashing, prevention of communicable and infectious diseases, and key facts on transmission routes and symptoms of high-risk illnesses.
- Surveillance and active screening and treatment of workers will be provided.
- Immunization programs will be conducted for workers to improve health and guard against infection.
- Infirmaries and Health Team with competent personnel will be available at campsites.
- Measures will be taken for pest control whenever required.
- Infectious disease screening protocols will be implemented for all workers, including those of subcontractors, particularly at the time of initial recruitment. All protocols will comply with the most up-to-date national health guidelines issued by the relevant authorities.

Security Personnel Arrangements

In the scope of the Project, security services will be provided by the Project Sponsor. Unarmed security service will be provided within the scope of the Project Sponsor's support services unit.

In consideration of good international practices, training will be provided to these personnel covering the following subjects:

- Legal requirements regarding their acts under the applicable Turkish legislation
- Principles of proportionality
- Use of force
- Legitimate preventive and defensive purposes for the use of force (in proportion to the nature and extent of the threat),
- Code of Conduct related with Project workers and local people.

Security personnel will be required to act in accordance with the requirements of the applicable Turkish legislation through contractual agreements with the contracting companies.

The Grievance Mechanism established by the Project Sponsor (see Chapter 19, "Public Consultation") is a mechanism for the local communities to express their concerns about the security arrangements and acts of security personnel, if there are any. This mechanism will be kept operational throughout the entire BOT contract duration. In case of any grievance or allegations of unlawful or abusive acts of security personnel, Project Sponsor will take all the necessary measures to prevent recurrence and take action in accordance with legal requirements.

Emergency Preparedness and Response

During the construction phase of the Project, a comprehensive approach has been adopted to address potential emergencies such as fires, explosions, hazardous material spills, traffic accidents, natural disasters, infectious disease outbreaks, or occupational accidents. This approach is guided by the Project's Emergency Preparedness and Response Plan (EPRP), which has been prepared in full alignment with IFC Performance Standard 4 and relevant national legislation, covering all construction and campsite areas.

To ensure readiness, each work and camp site will be equipped with fire extinguishers, first aid kits, emergency exit signage, and designated assembly points. Dedicated emergency response teams will be assigned to each location and will regularly participate in drills based on predefined scenarios, including fire outbreaks, injuries, and explosive-related incidents. Region-specific risks-such as forest fires or earthquakes-have also been assessed and incorporated into localized prevention strategies.

Campsites will host on-site infirmaries staffed by trained health professionals to provide initial response in case of injuries or health incidents. In the event of an emergency, coordination with local authorities-including village headmen, municipalities, healthcare units, and law enforcement-will enable swift and organized action. Where necessary, evacuation, quarantine, or temporary access restrictions will be implemented, and directly affected communities will be informed promptly through written and verbal means.

All project personnel will receive mandatory training on emergency response procedures both before starting work and at regular intervals. These trainings will include information on evacuation routes, emergency contact numbers, and individual responsibilities. Awareness-raising materials and informational campaigns will also be provided for local communities, ensuring broad preparedness. Moreover, grievance and feedback mechanisms will remain accessible to report any concerns related to emergency response.

Public Health and Welfare

Following measures will be taken to minimize impacts of Project on public health and welfare:

- To minimize the impacts on community health and safety and local disturbances due to air emissions, noise, and vibration, new, highly efficient, and reliable road construction machinery, equipment and high quality fuels will be used in the scope of construction works.
- Only construction machinery and equipment having proper emission controls and certificates in the scope of relevant Turkish regulations will be used.
- Well-balanced measures will be developed to limit worker movements to minimize disruption of local people while providing the workers with the right of movement freedom.
- Vehicle/wheel wash basins will be constructed at suitable locations to minimize transportation of sediments/mud and pollution/dustiness of public roads.
- Throughout the road construction process, specialized engineers will be engaged to ensure the structural safety of the works.
- Compliance of drivers and operators with professional competency requirements will be ensured.
- Complaint boxes will be placed in all mukhtar offices within the area of influence, and the grievance mechanism will be introduced during the site visits conducted by the CLOs.

Measures to Mitigate Displacement Impacts

The measures taken in relation to displacement are provided in Table XV.18

Table XV.18 Measures related to displacement

Measures to Mitigate Displacement Impacts	Description
Avoidance through alternative project design	Repositioning project components to minimize impact on settlements and livelihoods.
Detailed socio-economic survey and impact assessment	Identifying all affected households, lands, and businesses; assessing the extent of physical and economic displacement.
Voluntary land acquisition and negotiated settlements	Preferring voluntary land transfer where possible; conducting documented, fair negotiations.
Provision of fair and adequate compensation	Timely payment of compensation at market value for assets and income loss, including for tenants and users.
Preparation of Resettlement Action Plan (RAP)	If physical displacement occurs, develop a plan including housing and livelihood support with attention to vulnerable groups.
Livelihood restoration support	Offering agricultural support, vocational training, or grants for small businesses to restore income.
Establishment of grievance mechanism	Accessible grievance mechanism for displaced persons to raise concerns and seek resolution.
Continued stakeholder engagement	Maintaining continuous communication and participation with affected persons throughout the process.
Monitoring and evaluation	Periodic evaluation of RAP implementation and livelihood outcomes by independent experts.

NOTE: For more detailed information, please refer to the Resettlement Action Plan (RAP) in the ESIA.

XV.4.2. Operation Phase

Traffic and pedestrian safety risks that may emerge during the operation of the Motorway can be reduced by proper Motorway design including safe crossing, fencing, installation of warning signs, etc. (IFC,2012). In the scope of the Antalya-Alanya Motorway Project, such measures will be taken in accordance with KGM's technical specifications and international standards, as detailed below.

In accordance with the terms of the BOT contract, the Project Sponsor will be responsible for taking necessary traffic safety measures under the relevant national legislation. In this respect, Project Sponsor will cooperate with the related government agencies and institutions where required. In case of situations that may emerge to violate traffic and environmental safety during the operation period, the Project Sponsor will be liable for taking immediate actions to ensure the safety of relevant aspects. The Project Sponsor will also take all the necessary measures to avoid damage to life and/or any private or legal property, structure, infrastructure, existing traffic, or environmental resources.

Measures to be taken to ensure community health and safety during the operation phase of the Motorway are described below.

Public Health and Welfare

Air emissions and noise to be sourced by the Motorway traffic should be monitored at selected/sensitive locations along the route (see Chapter 20 in the ESIA "Environmental and Social Management System"). Additionally, complaints related to air quality or noise impacts would be delivered to the Project Sponsor through the Project-specific grievance mechanism established (see Chapter 19 in the ESIA ("Public Consultation")). If the measurement results or the grievance mechanism indicate impacts on the public's health and welfare at certain locations, effective and feasible corrective measures will be planned and implemented by the Project Sponsor.

Field studies will be continuously conducted by CLOs, and impact, risk, and mitigation measures for identified vulnerable groups will be reorganized and documented within the scope of public health and safety, taking into account specific situations.

High-Speed Vehicle Traffic

- Warning signs will be placed in areas where animal crossings are known to occur.
- Physical safety measures such as speed bumps, pedestrian crossings, and traffic warning signs will be installed.
- Drivers will be monitored through warning signs and speed control measures, including radar enforcement where applicable.
- A grievance mechanism accessible to the community will be established to address complaints related to traffic issues.
- Targeted awareness efforts will be carried out to ensure cautious and low-speed driving in areas frequented by the local population.
- All personnel operating vehicles will receive safe driving training. Participation will be mandatory. All trainings will be documented and reported by the H&S Team.
- Uncontrolled wildlife crossings on highways pose a serious threat to both drivers and animals. Large mammals (such as wild boars, deer, cattle, etc.) suddenly entering the road can result in high-speed collisions, which often lead to fatal traffic accidents. These incidents not only endanger the lives of drivers and passengers but also create chain-reaction risks for other road users, causing significant property damage and loss of life. Therefore, controlling animal crossings and implementing appropriate measures (such as fencing and warning signs) is of critical importance for traffic safety and the protection of human life. Details of the precautions to be taken can be found in Chapter-9 in the ESIA.

Continuous Emissions and Noise from Vehicles

- .
- All vehicles and machinery used during construction and operation will be subject to regular maintenance and inspection programs to minimize emission and noise levels.
- Speed limits will be enforced in areas close to settlements to reduce both noise and emission levels.
- An effective and accessible grievance mechanism will be in place for complaints related to noise or emissions. Corrective measures will be implemented based on community feedback.
- Air quality will be monitored at regular intervals. The monitoring and management approaches related to air quality in the Project are detailed in the Air Quality Management Plan (Annexes-4 in the ESIA).

Fire Risk from Fuels, Equipment, and Vegetation

- Fire drills will be organized one a year (The number of drills may be increased if deemed necessary.), specifically for campsites, facilities, tunnels, and forest-adjacent areas, and these drills will be documented and reported by the H&S Team.
- All personnel should receive one-hour fire safety training sessions each semi-annually for a period of one year.
- An early warning system will be established through coordination with local headmen (mukhtars). In case of an emergency, the CLO will directly contact the mukhtars to initiate a localized response.
- Adequate firefighting equipment, such as extinguishers, hydrants, and water tanks, will be installed in campsites, storage areas, and construction sites, with regular maintenance checks to ensure functionality.
- Fuels and hazardous chemicals will be stored in designated, fireproof, and ventilated storage areas equipped with spill kits, fire suppression systems, and clear warning signs.
- Vegetation near camps, storage areas, and construction sites will be regularly cleared to minimize the risk of fire spread. Buffer zones will be established in forest-adjacent areas.
- Continuous collaboration will be maintained with local fire departments and emergency response authorities to ensure preparedness and effective coordination during potential fire incidents.

Structural Safety

The structural safety of the Project components will be ensured by design, engineering, and construction in accordance with the most recent project standards and international codes, as well as KGM's technical specifications. Following KGM's specifications, safety and durability have been the primary considerations in the design and engineering of the structures.

Static and dynamic stability analyses and cross-section calculations of the engineering structures have been done using internationally accepted computer programs approved by the KGM. In the design of the engineering structures, the Standard Specifications for Highway Bridges published by the American Association of State Highway and Transportation Officials (AASHTO) has been used. In the seismic calculations, the Standard Specifications used for the seismic design of the highway bridges have been taken as basis. Where required, Project-specific revisions have been done with the approval of KGM to adapt these specifications adequately to the Project.

In accordance with the KGM the technical specifications, design of the traffic safety measures including guardrails, wire fences, horizontal and vertical traffic signs, and markings and signalization implementations will also meet KGM standards. Guardrails will fulfill the internationally accepted standards. KGM will control the operation works during the BOT contract.

In case of natural disasters that may risk the structural safety of the Project structures, the operation personnel will conduct visual inspections, take immediate actions (e.g., communication with local people, restricting access to risky areas, etc.), and collaborate with local emergency response

authorities to prevent any adverse impact on the health and safety of the local people or users of the Motorway.

Traffic Safety

Traffic accidents directly related to the drivers' behavior and quality of the vehicles will not be under the control of the Motorway's operators. Additionally, legal speed limits for different types of vehicles driving on Motorways are defined in relevant Türkiye laws and regulations. Thus, all the Motorway drivers will be obliged to comply with the legal speed limitations.

On the other hand, design, construction, and maintenance measures can contribute to minimizing traffic safety risks to a certain extent. In particular, maintenance of the Motorway and the planning of traffic safety signings may be effective in preventing, minimizing and controlling risks to the community from traffic accidents and ensuring the safety of the traffic. Measures to be taken by the Project Sponsor in this context are provided below:

- Motorway's horizontal (i.e., shoulder lines, traffic lines, parking lines, etc.) and vertical signing (i.e., traffic signs, plates, etc.) will be following KGM's technical specifications.
- Rescue vehicles and tow trucks will be kept ready in adequate numbers to promptly respond to probable accidents and vehicles that may cause the closure of the road.
- The pavement structure of the Motorway will be subject to routine maintenance works in order to remove any impairment on the road surface that may risk traffic safety, reduce driving comfort and decrease the structural strength. Large-scale repair and reconstruction works will also be conducted as required to maintain the functionality of the road.
- Wire fences will be installed along the risk border of the Motorway to minimize the risk of collisions between animals and vehicles and direct the animals towards crossing structures (i.e., culverts) to be built.
- Wire fences, welded wires, and walls to be used to enclose the area to be allocated to the Motorway will be continuously checked to prevent any uncontrolled intrusion of wild animals to the Motorway corridor that may pose a risk to traffic safety and damage the landscape components. Any damaged enclosure component will be immediately repaired/maintained.
- Intelligent Traffic System (ITS) will be installed in the scope of the Project. Through the ITS, real-time warning systems with signage to warn drivers of congestion, accidents, adverse weather-road conditions, and other potential hazards ahead will be used.
- Snow and ice removal works will be conducted within the Motorway corridor when icing occurs to ensure safe and secure driving conditions for the vehicles and users of the road (including interchanges, access roads, and service areas) during severe winter conditions.
- If necessary, precautionary salt application will be done before the start of snowfall.
- Where required, road deicing will be done by application of a suitable agent in solid or solution forms such as salt (NaCl), calcium chloride ($CaCl^2$), magnesium chloride ($MgCl^2$), etc., directly or blended in proper ratios depending on road and weather temperature.
- In case of continuous snowfall periods, the effectiveness of the chemicals applied may become insufficient in removing snow and ice. In such situations, mechanical snow and ice removal works will be conducted using suitable and adequate vehicles and/or equipment.
- In the event of a spill of oil or other hazardous liquids, absorbent equipment will be used for the initial response, and the road surface will be cleaned with water until the spilled material is completely removed.
- Measures will be taken to prevent parking vehicles at the entrance and exit roads of the service areas.

Service areas that will serve as roadside rest areas for the drivers have been planned in by KGM's technical specifications and international standards. In this regard, to minimize driver fatigue and provide resting facilities to the users of the Motorway, service areas will be constructed along the motorway route.

Pedestrian Safety

To ensure pedestrians safely pass/cross the Motorway and avoid population disruption, culverts and underpasses/overpasses have been included in the design and will be constructed. Culverts and underpasses will be planned in each section and the settlements and roads connected by overpasses have been provided in Chapter-3 in the ESIA ("Project Description").

In this regard, to prevent a crossing of the Motorway by pedestrians and wildlife animals in an uncontrolled and unsafe way, wire fences will be installed along the expropriation border of the Motorway, except the designated crossing points, following the technical specifications of the KGM.

The structures constructed for pedestrian safety are provided in Table XV.19.

Table XV.19 Crossings Constructed Within the Scope of the Project

Engineering Structure	Number
Overpass	56
Underpass	43

The KGM requirements for pedestrian safety are provided in Table XV.20

Table XV.20 Specifications of the General Directorate of Highways

Category	Requirement
Pedestrian Crossings	Must be designed based on road width and traffic density. At-grade pedestrian crossings are not allowed on roads wider than 10 meters unless central refuge islands are provided.
Underpasses / Overpasses	Underpasses must be designed for pedestrian, animal, and tractor crossings. Dimensions vary by road type: Village roads: 9.00 m x 5.00 m Provincial roads: 10.00 m x 5.00 m State roads: 12.00 m x 5.00 m Rural tracks: 5.00 m x 5.00 m Pedestrian/animal crossings: 3.00 m x 3.00 m If vertical clearance is insufficient, overpasses with a minimum width of 8.00 m must be constructed.
Markings and Signage	All pedestrian crossings must include horizontal and vertical signage. Missing or non-compliant markings must be corrected. "Yield to Pedestrians" icons must be painted at all unsignalized pedestrian and school crossings.
Fencing	Wire fences must be installed along expropriation borders (except designated crossings) to prevent uncontrolled pedestrian and animal entry onto highways.
Lighting	Road work areas in residential zones must be properly lit during nighttime operations.
Monitoring & Enforcement	Regular inspections must be scheduled monthly for pedestrian crossings. Enforcement should be active, continuous, and effective.
Education & Awareness	Public awareness campaigns and training should be conducted to promote pedestrian safety.

Chemicals And Fuels

During the operation phase, the safe management of chemicals and fuels is of critical importance for community health and safety. Even minor leaks, spills, or improper storage practices at fuel stations, rest areas, or maintenance facilities may lead to severe environmental pollution, fire and explosion risks, and direct health impacts such as poisoning or respiratory problems. Such incidents may endanger not only workers but also road users and nearby communities. Therefore, the safe storage, transportation, monitoring, and preparedness for emergencies regarding chemicals are essential for the sustainability of the Project and for ensuring compliance with international standards, particularly the IFC Performance Standards.

- A detailed inventory of all fuels and chemicals will be established and regularly updated.
- Fuels and chemicals will be stored in sealed tanks and facilities in compliance with national and international standards.
- Secondary containment systems, spill basins, and emergency kits will be installed at fuel stations and storage facilities.
- Groundwater, surface water, and soil quality will be regularly monitored, with immediate response in case of contamination.
- Firefighting systems will be installed at fuel and chemical storage areas, and regular drills will be conducted.
- Used oils, filters, cleaning agents, and other hazardous wastes will be sent to licensed disposal facilities.
- Local communities and road users will be informed about emergency procedures and safety measures.
- The Emergency Preparedness and Response Plan (EPRP) will remain active during the operation phase and will be regularly updated.
- Spill kits and MSDSs (Material Safety Data Sheets) will be kept in the areas where chemicals are stored.

Emergency Preparedness and Response Plan

The Emergency Preparedness and Response Plan prepared for the Project is presented in Annex-3 in the ESIA. The main objective of this Plan is to establish strategies and procedures for managing all aspects of emergency situations associated with Project components.

- Prevention and preparation measures (actions to be taken before emergency).
- Response measures (actions to be taken during emergency).
- Damage assessment and recovery measures (actions to be taken after an emergency).

The Emergency Preparedness and Response Plan covers the actions to be implemented by the Project to ensure emergency preparedness. These actions are mainly associated with proper planning and design of the Project units, construction in accordance with specifications and operation and maintenance in line with project safety requirements, as well as the actions to be taken for preparing for an emergency such as installation of monitoring and warning systems, communication systems, and carrying out impact studies, training of staff for awareness, procedures for warning, communication, mobilization of emergency forces and equipment, responsibilities, and evacuation practices.

The general emergency response procedures that will be given in the Emergency Preparedness and Response Plan covers the whole Motorway including engineering structures for major hazards such as accidents, spills/leakages fires, and earthquakes.

Finally, the actions to be taken following emergency response and further actions to be taken for recovery management purposes is included in the Plan. An operation phase–specific Emergency Preparedness and Response Plan (EPRP) shall be prepared no later than three months prior to the commencement of the operation phase.

Gender-Based Violence and Harassment

GBVH constitutes a serious violation of human rights, threatening the safety, dignity, and equality of individuals. Implementing robust preventive mechanisms is not only a legal obligation, but also essential for ensuring an inclusive, respectful, and safe environment for both workers and community members. Preventive actions enhance overall well-being, safeguard the project's social license to operate, and support the proactive mitigation of reputational and social risks. Therefore, the Project will enforce a zero-tolerance policy on GBVH, implement targeted awareness-raising efforts, and ensure transparent and accessible grievance mechanisms are in place and effectively functioning.

A comprehensive GBVH program will be implemented to mitigate these risks. The details of this program are provided in Table XV.21

Table XV.21 GBVH Program within the Project Scope

Aspect	Description
Risk Assessment and Monitoring	Regular assessment of GBVH risks and continuous monitoring of worker behavior and community interactions to identify potential hotspots or incidents early. (CLO)
Community Engagement and Awareness	Active engagement with local communities and workers to raise awareness of GBVH, its impacts, and the importance of respectful, safe interactions through culturally sensitive outreach programs and education campaigns (CLO)
Worker Education and Training	Mandatory GBVH prevention training for all workers and contractors covering respectful workplace behavior, zero tolerance policies, and clear incident reporting channels.
Safe and Inclusive Environment	Provision of gender-sensitive facilities such as separate sanitation and rest areas. Adequate lighting of communal areas
Grievance and Support Mechanisms	Establishment of confidential, accessible grievance reporting systems and rapid response teams (CLO) to investigate and address GBVH complaints effectively. Implementation of the GBVH incident response procedure
Coordination with Local Authorities and NGOs	Collaboration with local law enforcement, healthcare providers, and NGOs to ensure victim support services and enforcement of legal and social protections.
Monitoring and Reporting	Regular reporting on GBVH incidents and community safety issues, with adaptive management to improve policies and interventions throughout the project lifecycle
Overall Objective	Protect community and workforce health and safety, foster a culture of respect, equality, and zero tolerance for GBVH throughout the project duration.

GBVH Incident Response Procedure for Community Members

The procedure to be followed in the event of a GBVH incident involving individuals is provided in Table XV.22

Table XV.22 GBVH Response Procedure for Community Members

GBVH Response Procedure for Community Members
Reporting
Community members can report GBVH (harassment/violence) incidents involving project workers through the following channels: • Female Community Liaison Officer (CLO) • Community grievance mechanisms (hotline, email, complaint boxes) • A trusted mediator (Trusted figures in the community may include the mukhtar/mukhtar's wife, a female teacher, or a female nurse or doctor.) • Community-based organizations or local NGOs • Directly to the security or social team at the project site Anonymous or named complaints are accepted and are handled with confidentiality and seriousness.
Immediate Response and Safety Measures
The CLO or the Social & Environmental Team shall: • Ensure the safety of the complainant and provide psychosocial support if needed • Assess the risk of retaliation and implement protective measures (e.g., no-contact order) • Cooperate with local authorities to facilitate medical or legal support if necessary
Internal Review and Investigation
The GBVH Response Committee (CLO) or an independent expert shall: • Review the complaint in confidentiality • Interview witnesses, employees, and the complainant (with consent) • Evaluate whether the incident violates the worker code of conduct Target resolution timeframe: within 14 working days
Disciplinary and Corrective Actions
If the involved worker is found responsible: • Disciplinary action will be applied (warning, suspension, termination) • The worker may be permanently removed from community-facing roles • If the incident constitutes a crime, legal authorities will be notified
Community Support and Communication
The Project Sponsor shall maintain respectful and transparent communication with the complainant and community representatives. Referrals for legal, psychological, and medical support will be provided. Informative sessions will be held for community members regarding grievance mechanisms and their rights.
Prevention and Awareness
All workers will receive training on the following topics: • Rules of respectful conduct toward community members • GBVH risks and consequences • Code of Conduct and responsibilities

Note: The specified GBVH Response Procedure will also remain in effect throughout the construction phase of the Project and will be fully implemented during this period.

XV.5. Summary of Assessment and Residual Impacts

While the expansion of road infrastructure in Türkiye brings significant benefits in terms of connectivity and economic growth, it is essential to address the associated negative impacts through careful planning and management. Sustainable development practices, environmental protection measures, and attention to social equity are crucial for ensuring that road infrastructure improvements meet the population's needs while minimizing adverse effects. Regular assessment and adjustment based on evolving needs and impacts are necessary to determine if the current level of infrastructure development is truly adequate.

Project-related risk would be minimized by taking relevant planning and design measures and implementation of the Emergency Preparedness and Response Plan, which will meet the international requirements. On the other hand, some of the traffic and pedestrian safety risks will be mostly related with the users of the road on which the Project Sponsor will only have limited control. Summary of the community health and safety assessments are provided in Table XV.23.

Table XV.23. Summary of the Community Health and Safety Assessments

Definition of Potential Impact	Affected Ecosystem Component	Type of Impact	Impact Magnitude						Sensitivity /Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts
			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
Land Preparation and Construction Phases												
Increased risk of accidents due to operation of heavy construction machinery or disturbance on the health, safety and welfare of local communities due to road closure, traffic passing through settlement centers, etc.	Local communities	Adverse	Restricted	Medium	Moderate (machinery will not be localized but distributed along the linear route)	Short term reversible	Continuous	Moderate (B)	High (3) Settlements within the expropriation corridor having affected population >500 habitants; Settlements within the study corridor having affected population>1.000;	High (B3)	• Construction works on existing roads will not be started until relevant traffic safety measures (including traffic signing and placement of equipment) are taken on roads serving pedestrian and vehicle traffic. These measures will be designed to ensure the safety of life and property of the local people and the users of the roads. • In the scope of better working organization, construction traffic routes will be strictly defined and road construction machinery will use only these routes. • Passage of the routes through the settlements (i.e. neighborhoods) will be avoided where alternative routes are available. Dangerous routes that are to be avoided, if there is any, will be specified and informed. In this scope, construction contractors will construct service roads in order not the affect (such as increasing the heavy traffic load) the natural flow on the existing roads and for avoiding the passage of heavy vehicles through residential areas to the extent possible. In addition service roads will be constructed where the traffic will be temporarily diverted. Furthermore, service roads will be used for transportation of the construction machinery, equipment and materials used for Project. • Pedestrian interaction with construction vehicles will be minimized by taking appropriate measures in and around the construction corridor. • Valid licenses will be required for the drivers and operators. • Drivers and operators will be provided with relevant trainings that emphasize the safety aspects. • Working hours of the day for the drivers/operators will be specified and informed to relevant personnel. • Limits will be defined for the working/trip duration for the drivers and operators to avoid overtiredness. • Speed control devices will be used on trucks. • All the construction machinery and equipment will be operated in alignment with the direction of the traffic flow. • Rigid objects will not be used for the purpose of traffic diversion. • Unused construction materials, equipment or machinery will not be left on the road in an uncontrolled way. They will be put in designated places. • Construction-related traffic delays will be minimized. Flow of traffic will be allowed periodically. • Road signing for night traffic will be provided with reflectors and flashing signals of sufficient number. • Relevant dust control measures will be taken at the road construction sites so that safe sight distances could be maintained on the existing roads under service. • Upon the completion of works, signing equipment will be immediately removed and standard signing will be provided. • To reduce transportation distances, services and materials required for construction works will be aimed to be primarily supplied from the local sources, wherever possible	Low
		Adverse	Restricted	Medium	Moderate (machinery will not be localized but distributed along the linear route)	Short term reversible	Continuous	Moderate (B)	Medium (2) Settlements within the study corridor (Inc. exp. corridor) having affected population 500-1.000;	Medium (B2)		Low
		Adverse	Restricted	Medium	Moderate (machinery will not be localized but distributed along the linear route)	Short term reversible	Continuous	Moderate (B)	Low (1) Settlements within the expropriation corridor having affected population<500 habitants.	Low (B1)		Low
Displacement.		Adverse	Local	Long	High	Long term reversible	Continuous	Major (A)	High (3) (Number of residential buildings within the expropriation corridor>20)	High (B3)	• Advance notification and scheduling of construction activities • Compensation for verified income losses • Maintaining alternative access to affected businesses • Support programs for re-establishing livelihoods (e.g., farming assistance, training) • Preparation of a detailed Resettlement Action Plan (RAP) • Provision of fair and timely compensation • Psychological and logistical support for affected households • Prioritization of vulnerable groups (e.g., women-headed households, elderly, persons with disabilities)	Medium
GBVH		Adverse	Restricted	Long	High	Long term reversible	Continuous	Major (A)	High (3) (women from the local community, seasonal female workers in agriculture and tourism, and female tourists)	High (B3)	• Regular assessment of GBVH risks and continuous monitoring of worker behavior and community interactions to identify potential hotspots or incidents early. (CLO) • Active engagement with local communities and workers to raise awareness of GBVH, its impacts, and the importance of respectful, safe interactions through culturally sensitive outreach programs and education campaigns (CLO • Mandatory GBVH prevention training for all workers and contractors covering respectful workplace behavior, zero tolerance policies, and clear incident reporting channels • Provision of gender-sensitive facilities such as separate sanitation and rest areas. Adequate lighting of communal areas. • Establishment of confidential, accessible grievance reporting systems and rapid response teams (CLO) to investigate and address GBVH complaints effectively. Implementation of the GBVH incident response procedure • Collaboration with local law enforcement, healthcare providers, and NGOs to ensure victim support services and enforcement of legal and social protections. • Protect community and workforce health and safety, foster a culture of respect, equality, and zero tolerance for GBVH throughout the project duration.	Low

			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
Land Preparation and Construction Phases												
											• Regular reporting on GBVH incidents and community safety issues, with adaptive management to improve policies and interventions throughout the project lifecycle	
Blasting operations to be conducted at road construction sites, quarries etc.		Adverse	Restricted	Medium	Medium	Short term reversible	Intermittent	Moderate (B)	High (3) (Number of residential buildings within the expropriation corridor>20)	High (B3)	• Blasting operations will be conducted in full compliance with the Occupational Health and Safety Law (Law No. 6331) to protect workers, and with the Regulation on the Assessment and Management of Environmental Noise to control noise and vibration impacts on nearby communities. • Unauthorized access will be prevented • Safety distances will be maintained; protective barriers will be used • Warning signs and flagmen will be placed in risky areas.	Low
		Adverse	Restricted	Medium	Medium	Short term reversible	Intermittent	Moderate (B)	Medium (2) (Number of residential buildings within the expropriation corridor between10-20)	High (A2)	• Blasting should only take place during daytime (08:00-18:00), excluding Sunday and holidays. • Photographs and vibration records taken after the explosion will be stored if there are nearby structures. • Blasting program will be prepared and announced to local communities and gendarmerie • Compensation will be provided if damage occurs	Low
		Adverse	Restricted	Medium	Medium	Short term reversible	Intermittent	Moderate (B)	Low (1) (Number of residential buildings within the expropriation corridor<10)	Medium (A1)	• Blasting operations will be conducted in full compliance with the Occupational Health and Safety Law (Law No. 6331) to protect workers, and with the Regulation on the Assessment and Management of Environmental Noise to control noise and vibration impacts on nearby communities. • Unauthorized access will be prevented • Compensation will be provided if damage occurs • Blasting program will be prepared and announced to local communities and gendarmerie	Low
Blasting operations to be conducted at quarries		Adverse	Restricted	Medium	High	Short term reversible	Intermittent	Major (A)	Low (1) (Number of residential buildings within the AoI<10)	Medium (A1)	• Blasting operations will be conducted in full compliance with the Occupational Health and Safety Law (Law No. 6331) to protect workers, and with the Regulation on the Assessment and Management of Environmental Noise to control noise and vibration impacts on nearby communities. • Blasting program will be prepared and announced to local communities and gendarmerie	Low
Water supply		Adverse	Local	Medium	High	Long term reversible	Continuous	Major (A)	Low (1)	Medium (A1)	• Collaboration with local law enforcement, healthcare providers, and NGOs to ensure victim support services and enforcement of legal and social protections.	Low
Health risks (spreading of airborne/ communicable diseases) due to population influx		Adverse	Wide	Medium	Low (Project will give priority to employment of local people, number of incoming workers is anticipated to be low)	Short term reversible	One-off	Minor (C)	Low (1) No existing health issues have been identified in the area.	Low (C1)	• Regular reporting on GBVH incidents and community safety issues, with adaptive management to improve policies and interventions throughout the project lifecycle. • All workers should undergo pre-employment and periodic health screenings; immunization programs should be implemented against communicable diseases. • Clean drinking water, sufficient toilet/shower facilities, and regular wastewater/solid waste management should be ensured at the campsites. • Workers and subcontractors should be regularly trained on handwashing, food hygiene, disease symptoms, and transmission routes. • Daily health records should be maintained through infirmaries; suspected cases should be promptly reported and isolated, and local health authorities should be informed when necessary. • Regular pest control should be carried out, and water stagnation around camps should be prevented to control mosquitoes, rodents, and other disease vectors	Low
Disturbance of local communities due to improper acts of security personnel		Adverse	Local	Medium	Low	Short term reversible	One-off	Minor (C)	Low (1) No particular sensitivity/past issues have been identified in the area	Low (C1)	• Protect community and workforce health and safety, foster a culture of respect, equality, and zero tolerance for GBVH throughout the project duration.	Low
Use Of Chemical And Fuels	Local Communities And workers	Adverse	Local	Medium	Medium	Short term reversible	Intermittent	Moderate (B)	Medium (2)	Medium (A1)	• Civilian access to the construction site will be restricted to the greatest extent possible. • Leakage or spills of fuels, oils, and solvents may lead to soil and groundwater pollution, potentially affecting agricultural lands, local water resources, and thereby public health. • Improper storage and handling of fuels and explosives can create fire and explosion risks, which may endanger both workers and nearby communities. • Direct or indirect exposure to hazardous chemicals (vapors, dust, or accidental contact) may result in respiratory issues, skin irritation, or other health problems for workers and local populations. • Improper handling of chemicals, such as paints and solvents, may create strong odors that disturb nearby settlements and affect quality of life.	Low

Definition of Potential Impact	Affected Ecosystem Component	Type of Impact	Impact Magnitude						Sensitivity /Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts
			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
Operation Phase												
GBVH		Adverse	Restricted	Long	High	Long term reversible	Continuous	Major (A)	High (3)	High (A3)	• Regular assessment of GBVH risks and continuous monitoring of worker behavior and community interactions to identify potential hotspots or incidents early. (CLO) • Active engagement with local communities and workers to raise awareness of GBVH, its impacts, and the importance of respectful, safe interactions through culturally sensitive outreach programs and education campaigns (CLO • Mandatory GBVH prevention training for all workers and contractors covering respectful workplace behavior, zero tolerance policies, and clear incident reporting channels • Provision of gender-sensitive facilities such as separate sanitation and rest areas. Adequate lighting of communal areas. • Establishment of confidential, accessible grievance reporting systems and rapid response teams (CLO) to investigate and address GBVH complaints effectively. Implementation of the GBVH incident response procedure • Collaboration with local law enforcement, healthcare providers, and NGOs to ensure victim support services and enforcement of legal and social protections. • Protect community and workforce health and safety, foster a culture of respect, equality, and zero tolerance for GBVH throughout the project duration. • Regular reporting on GBVH incidents and community safety issues, with adaptive management to improve policies and interventions throughout the project lifecycle	Low
Accident risks (involving vehicles or pedestrians) due to speedy traffic by some of the drivers on the new Motorway route	Local Communities	Adverse	Restricted	Long	High	Irreversible	One-off	Major (A)	High (3)	High (A3)	• To minimize driver fatigue and provide resting facilities to the users of the Motorway, Service areas that will serve as roadside rest areas for the drivers have been planned in accordance with KGM's technical specifications and international standards. In this regard, to minimize driver fatigue and provide resting facilities to the users of the Motorway, service areas (Type B and Type C) will be constructed along the motorway route. • Horizontal (i.e. shoulder lines, traffic lines, parking lines, etc.) and vertical signing (i.e. traffic signs, plates, etc.) of the Motorway will be in accordance with KGM's technical specifications. • Rescue vehicles and tow trucks will be kept ready in adequate numbers to promptly respond to probable accidents and slippery vehicles that may cause the closure of the road. • Pavement structure of the Motorway will be subject to routine maintenance works in order to remove any impairment on the road surface that may risk traffic safety, reduce driving comfort and decrease the structural strength. Large-scale repair and reconstruction works will also be conducted as required to maintain the functionality of the road. • Wire fences will be installed along the expropriation border of the Motorway to minimize the risk of collisions between animals and vehicles and direct the animals towards crossing structures (i.e. culverts) to be built. • Wire fences, welded wires, walls to be used to enclose the area to be allocated to the Motorway will be continuously checked to prevent any uncontrolled intrusion of wild animals to the Motorway corridor that may pose risk to traffic safety and damage the landscape components. Any damaged enclosure component will be immediately repaired/maintained. • Intelligent Traffic System (ITS) will be installed in the scope of the Project. By means of the ITS, real-time warning systems with signage to warn drivers of congestion, accidents, adverse weather road conditions, and other potential hazards ahead will be used. • Snow and ice removal works will be conducted within the Motorway corridor when the temperature is between 0^0C and -12^0C to ensure safe and secure driving conditions for the vehicles and users of the road (including interchanges, access roads, service areas) during severe winter conditions. • If necessary, precautionary salt application will be done before the start of snowfall. • Where required, road deicing will be done by application of a suitable agent in solid or solution forms such as salt (NaCl), calcium chloride (CaCl2), magnesium chloride (MgCl2), etc. directly or blended in proper ratios depending on road and weather temperature. • In case of continuous snowfall periods, effectiveness of the chemicals applied may become insufficient in removing snow and ice. In such situations, mechanical snow and ice removal works will be conducted by using suitable and adequate vehicles and/or equipment. • In case of oil spill or spill of other hazardous liquids, road surface will be washed with water until the spilled material is removed completely. • Measures will be taken to prevent parking vehicles at the entrance and exit roads of the services areas. • To ensure safe passage/crossing of the Motorway by the pedestrians and avoid population disruption, culverts and underpass/overpasses included in the design will be constructed. • To prevent crossing of the Motorway by pedestrian and wild life animals in an uncontrolled and unsafe way, wire fences will be installed along the expropriation border of the Motorway, except the designated crossing points, in accordance with the technical specifications of the KGM.	Medium
Traffic Safety	Local Communities, Road Users	Adverse	Local	Long	Medium	Long term reversible	Continuous	Moderate (B)	Medium (2)	Medium (A1)	• Motorway's horizontal (i.e., shoulder lines, traffic lines, parking lines, etc.) and vertical signing (i.e., traffic signs, plates, etc.) will be following KGM's technical specifications. • Rescue vehicles and tow trucks will be kept ready in adequate numbers to promptly respond to probable accidents and slippery vehicles that may cause the closure of the road.	Low

Definition of Potential Impact	Affected Ecosystem Component	Type of Impact	Impact Magnitude						Sensitivity /Value of Resource /Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts
			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
											• The pavement structure of the Motorway will be subject to routine maintenance works in order to remove any impairment on the road surface that may risk traffic safety, reduce driving comfort and decrease the structural strength. Large-scale repair and reconstruction works will also be conducted as required to maintain the functionality of the road. • Wire fences will be installed along the expropriation border of the Motorway to minimize the risk of collisions between animals and vehicles and direct the animals towards crossing structures (i.e., culverts) to be built. • Wire fences, welded wires, and walls to be used to enclose the area to be allocated to the Motorway will be continuously checked to prevent any uncontrolled intrusion of wild animals to the Motorway corridor that may pose a risk to traffic safety and damage the landscape components. Any damaged enclosure component will be immediately repaired/maintained. • Intelligent Traffic System (ITS) will be installed in the scope of the Project. Through the ITS, real-time warning systems with signage to warn drivers of congestion, accidents, adverse weather-road conditions, and other potential hazards ahead will be used. • Snow and ice removal works will be conducted within the Motorway corridor when the temperature is between 00C and -120C to ensure safe and secure driving conditions for the vehicles and users of the road (including interchanges, access roads, and service areas) during severe winter conditions. • If necessary, precautionary salt application will be done before the start of snowfall. • Where required, road deicing will be done by application of a suitable agent in solid or solution forms such as salt (NaCl), calcium chloride (CaCl2), magnesium chloride (MgCl2), etc., directly or blended in proper ratios depending on road and weather temperature. • In case of continuous snowfall periods, the effectiveness of the chemicals applied may become insufficient in removing snow and ice. In such situations, mechanical snow and ice removal works will be conducted using suitable and adequate vehicles and/or equipment. • In case of an oil spill or spill of other hazardous liquids, the road surface will be washed with water until the spilled material is removed completely. • Measures will be taken to prevent parking vehicles at the entrance and exit roads of the service areas.	
Public Health and Welfare (High-Speed Vehicle Traffic, Continuous Emissions and Noise from Vehicles, Fire Risk from Fuels, Equipment, Hazardous Materials and Vegetation, Structural Safety)	Local Communities, Road Users	Adverse	Local	Long	Medium	Long term reversible	Continuous	Moderate (B)	Medium (2)	Medium (A1)	• Warning signs will be placed in areas where animal crossings are known to occur. • Physical safety measures such as speed bumps, pedestrian crossings, and traffic warning signs will be installed. • Drivers will be monitored through warning signs and speed control measures, including radar enforcement where applicable. • A grievance mechanism accessible to the community will be established to address complaints related to traffic issues. • Targeted awareness efforts will be carried out to ensure cautious and low-speed driving in areas frequented by the local population. • All personnel operating vehicles will receive safe driving training. Participation will be mandatory. All trainings will be documented and reported by the H&S Team. • . • Air quality will be monitored at regular intervals • Fire drills will be organized twice a year, specifically for campsites, facilities, tunnels, and forest-adjacent areas, and these drills will be documented and reported by the H&S Team. • All personnel will receive one-hour fire safety training sessions each semi-annually for a period of one year. • Spill kits and MSDSs (Material Safety Data Sheets) will be kept in the areas where chemicals are stored. • Fuels and chemicals will be stored in sealed tanks and facilities in compliance with national and international standards. • Secondary containment systems, spill basins, and emergency kits will be installed at fuel stations and storage facilities.	Low

XVI. LABOR AND WORKING CONDITIONS

Throughout the construction and operation phases of the Antalya-Alanya Motorway Project, labor management, working conditions and occupational health and safety practices will be implemented in full compliance with both the Labor Law of the Republic of Türkiye and the International Finance Corporation (IFC) Performance Standards. In this context, IFC Performance Standard 2 and Performance Standard 4 serve as primary references. Given the employment of hundreds of direct and subcontracted personnel and the execution of large-scale earthworks involving heavy machinery, ensuring a safe and equitable working environment will be one of the core responsibilities of project management.

Fundamental labor rights, including fair remuneration, non-discrimination, contractual employment conditions, and the right to freedom of association, will be safeguarded. Subcontractor companies will be informed of the relevant requirements in accordance with national labor legislation and IFC standards, and will be contractually obligated to comply with them. Furthermore, an effective and transparent grievance mechanism will be established and actively operated to allow employees to safely report concerns and complaints.

From an occupational health and safety (OHS) perspective, preventive measures will be taken against physical and chemical risks during both construction and operation phases. Engineering controls, use of personal protective equipment (PPE), and regular site inspections will be implemented to mitigate risks such as noise, dust, working at height, falls, collisions, electric shock, and exposure to explosive or flammable substances. Material Safety Data Sheets (MSDS) will be maintained for all chemicals used and stored on site, and personnel will be trained in their safe handling. Workplace hygiene, ventilation, fire safety, safe access routes, lighting, and cleanliness will also be integral elements of the OHS management system.

In addition, a comprehensive Emergency Preparedness and Response Plan (EPRP) has been developed to address potential emergency situations. This plan will be regularly reviewed and tested through drills and simulations. Emergency Response Teams (ERT) will be established to respond to incidents such as fires, explosions, collapses, chemical spills, and traffic accidents. Ambulances, fire suppression systems, and first aid equipment will be maintained in a state of readiness at all times for rapid intervention. During the operation phase, specific risk assessments will be carried out for maintenance and repair activities, and appropriate control measures will be implemented prior to commencement.

These measures aim not only to fulfil legal obligations comprehensively, but also to enhance employee well-being and ensure the alignment of the project with international principles of social sustainability.

XVI.1. Assessment Methodology and Data Sources

The labor and occupational health and safety dimensions of the Project have been analyzed based on qualitative assessment approaches, taking into account the typical risks associated with large-scale infrastructure projects. The activities planned within the scope of the Project and their potential impacts have been evaluated by subject-matter experts. The project area was visited by technical teams, and the most suitable alignment for the motorway under the scope of the Project was identified. Considering the geographical and environmental characteristics of the route, the proposed structures were finalized and submitted to the relevant ministries for approval. Subsequently, the Project's Area of Influence was determined, and the process was transparently shared with stakeholders.

As part of stakeholder engagement, household surveys and focus group discussions were conducted with local communities and village headmen (mukhtars) within the Project's Area of Influence. In addition, a Public Participation Meeting was organized to provide information and address community concerns. The Project Sponsor is committed not only to engagement during the Environmental and Social Impact Assessment (ESIA) process but also to maintaining ongoing communication with stakeholders throughout the entire Project lifecycle through continued field studies and consultations.

In this context, conducting a project-specific risk assessment and managing the process in collaboration with stakeholders ensures the identification of key risks, development of appropriate mitigation measures, establishment of an efficient work program, and protection of worker and community health.

The main national legislation, international standards, and guidance documents considered within the scope of this assessment are listed below:

- Turkish Labor Law
- Turkish Occupational Health and Safety Law and related regulations
- IFC's Performance Standard 2: Labor and Working Conditions (2012)
- Guidance Note by IFC/EBRD on Worker's Accommodation: Processes and Standards (2009)
- The World Bank ESS2: Labor and Working Conditions
- TurkStat. Statistics on Child Labor (2012 and 2019) and Work Accidents (2020)
- Focus Group Interview will be conducted with employees in the scope of Social Field Study
- Structured survey interviews conducted with local village headmen (mukhtars) within the Project's Area of Influence

Significance Criteria

The significance of impacts on labor will be assessed as high, medium, or low based on the magnitude of the impact and the sensitivity and value of the affected receptors, in accordance with IFC Performance Standard 2. The methodology described in Chapter IV ("ESIA Methodology") will be applied for determining impact magnitude, taking into account aspects such as working conditions, labor rights, occupational health and safety, and the nature of employment.

Sensitivity/value criteria will reflect factors such as health and safety risks, access to freedom of association, reliance on income from employment, availability of social protection, and the ability of workers to be re-employed. Impacts affecting basic rights or worker health and safety will be considered of high sensitivity. In cases of retrenchment, sensitivity will be evaluated based on the affected workers' vulnerability, access to alternative livelihoods, and the strength of existing support mechanisms. In line with IFC guidance, any retrenchment process must include timely notification, consultation, adequate compensation, and assistance in securing alternative employment.

In the context of Türkiye, gender-related disparities in workforce participation, risks of gender-based discrimination, unequal pay, and limited access to maternity protections are particularly relevant. As per IFC PS2 and its commitment to gender equality and non-discrimination, impacts affecting female workers will be treated with high sensitivity. Risks such as workplace harassment,

underrepresentation, and inequity will be specifically assessed, and mitigation measures will be developed accordingly.

Child labor is strictly prohibited under IFC Performance Standard 2, Türkiye's Labor Law, and international conventions such as ILO Conventions No. 138 and 182. Any risk of child labor will be classified as a high significance negative impact. The project will not engage any individuals below the legal minimum working age. Where permitted by law, young workers may be employed under controlled and non-hazardous conditions, with strict supervision to ensure their physical and psychological well-being.

Other vulnerable groups-including persons with disabilities, older workers, seasonal agricultural laborers, and migrant or refugee workers will be assessed in line with IFC's principles of inclusivity and non-discrimination. Their access to fair working conditions, safety, and legal protection will be carefully evaluated, and inclusive employment practices will be promoted throughout the project.

Detailed information on the sensitivity of each impact type is provided in the following section titled "Baseline Conditions", while the corresponding mitigation measures and monitoring mechanisms are elaborated in the Environmental and Social Management Plan (ESMP).

The sensitivity assessment will be carried out based on the information provided in Table XVI.1.

Table XVI.1 Sensitivity/Value Criteria for Labor Impact Receptors

Topic	High (3)	Moderate (2)	Low (1)
Physical Hazards	Workers exposed to high-risk tasks (e.g., lifting, working at heights, heavy equipment, subcontractors)	Support workers with limited safety controls	Administrative staff working in low-risk, indoor environments
Chemical Hazards	Workers handling hazardous substances directly (e.g., solvents, jet grout, paints)	Occasional contact with chemicals (e.g., support staff near storage areas)	Staff with no exposure to chemicals (e.g., clerical workers)
Retrenchment	Informal workers, short-term contractors, older workers, sole earners with no alternative income	Contracted workers with social security but limited employment alternatives	Long-term, skilled employees with full legal protections
Workers' Accommodation Conditions	Workers in overcrowded, mixed-gender, or remote accommodation camps	Shared facilities with some oversight and basic hygiene standards	Separate, well-equipped facilities with regular inspections
Child Labor	Children under legal working age employed in hazardous or heavy work (prohibited)	Young workers (aged 16–18) employed in light, legal duties under supervision	Youth employed under legal and controlled, non-hazardous conditions
GBVH (Gender-Based Violence and Harassment)	Female workers in informal roles, housed in male-dominated camps, with no complaint mechanisms	Workers with limited access to reporting systems and basic awareness training	Workers in safe housing with access to female CLOs and effective GBVH protocols
Human Rights	Undocumented migrant workers, ethnic minorities, or persons with disabilities lacking protections	Vulnerable groups with limited voice or legal support	Workers with access to unionization, legal recourse, and formal protections

XVI.2. Baseline Conditions

The International Labor Organization (ILO) is a specialized agency of the United Nations[1] for the world of work. It sets international labor standards, promotes rights at work, and encourages decent employment opportunities, the enhancement of social protection and the strengthening of dialogue on work-related issues. Türkiye became a member state of the ILO in 1932 and ratified 59 ILO Conventions (4 of them have been denounced) including the ones related with occupational health and safety, minimum age, forced labor, weekly rest, equality treatment.

In 1992 Türkiye was one of the initial six countries to undertake direct action to combat child labor. On the other hand, the problem of child labor is one that Türkiye, as every country in transition, needs to address. The problem needs to be viewed in terms of demography, educational levels, economics and social development. Similar to global statistics for child labor, agriculture is by the most important sector where child laborers can be found.

Türkiye has ratified relevant ILO Conventions on improvement of gender equality and women employment. On the other hand low women's labor force participation and employment rates are among the most important issues in the field of employment in Türkiye. Compared to EU, Türkiye's female employment rates are extremely low.

Within the scope of the ESIA studies, focus group meetings will be held with the workers in the scope of the socio-economic field study. These meetings will be held at three different planned construction site campsites. Participants will be selected through random sampling for these three focus group discussions. In these meetings, which will be held on subjects such as working, housing, OHS and other related issues at the construction sites, it is aimed to get a general idea about the work and working conditions of the personnel.

In addition, a grievance mechanism based on anonymity will be established for all personnel employed under the Project, including subcontracted workers. This mechanism will consist of complaint boxes, a dedicated phone line and others (see Annex-9 in the ESIA). Through these channels, employees will be able to submit their requests and complaints directly to the Project Sponsor. The Project Sponsor will be responsible for formally documenting the grievance process and taking appropriate action for all complaints submitted-even in cases where a complaint is found to be unsubstantiated, the process followed will still be recorded and archived. The grievance mechanism will also serve as an effective tool for managing complaints submitted by female workers.

Accordingly, Turkish labor law and related regulations covers the basic principles of international labor standards and the IFC PS 2 in the issues of equal treatment of employees, restrictions on the working age and employment of children, avoidance of forced labor and ensuring occupational health and safety at the workplaces. On the other hand, monitoring of the implementation is essential to ensure full compliance of the activities with the relevant legislation. Figure XVI.1 presents a comparison of child labor in different sector in year 2012 and 2019. While 68.5% of children between the ages of 5-14 worked in the agricultural sector in 2012, this rate decreased to 64% in 2019. While the rate of working in the service sector for children of the same age group was around 18% in 2012, it increased to over 24% in 2019. In 2012, 37.4% of children aged 15-17 took part in the service sector. This rate increased to 51% in 2019. Also, Table XVI.2 presents Child Labor statistics in comparative perspective between 2012 and 2019.

1 *https://www.un.org/*

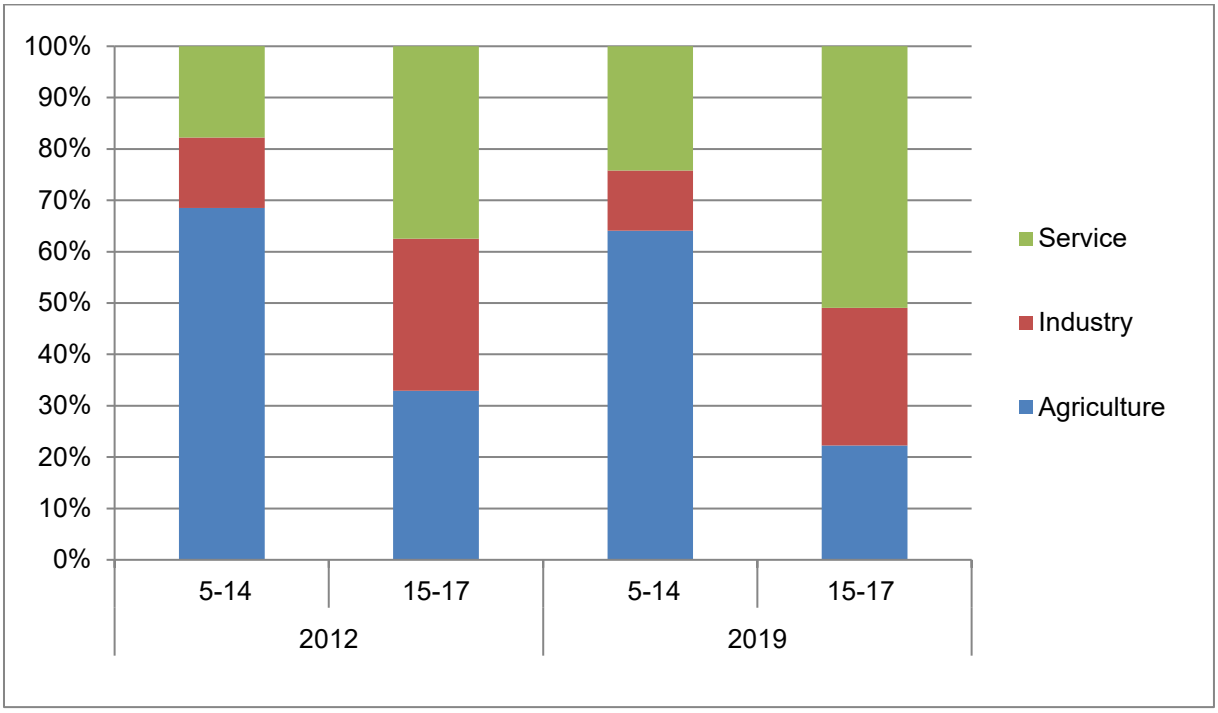

Figure XVI.1 Comparison of the Ratio of Children Working in Different Economic Sectors in Years 2012 and 2019

Table XVI.2 Child Labor Statistics for Türkiye (years 2012 and 2019)

Years	2012		2019	
Age Group	**5-14**	**15-17**	**5-14**	**15-17**
Agriculture	68.5%	32.9%	64.1%	22.3%
Industry	13.7%	29.6%	11.7%	26.8%
Service	17.8%	37.4%	24.2%	51%

Source: TurkStat, 2019[2]

In 2015, Türkiye made moderate progress in efforts to eliminate the worst forms of child labor. The government, in cooperation with the ILO, implemented a project providing services to more than 1,000 children working in commercial hazelnut production and amended the Labor Code to provide protection for children working in the arts and commercial advertising.

Also in 2020, within the scope of the National Programme to End Child Labor (2017-2023), the "Project to End the Worst Forms of Child Labor in Seasonal Agriculture in Hazelnut Harvesting" and the second phase (2024-2027) is being launched in cooperation with ILO tripartite partners (government, workers' and employers' organizations) within the framework of a public-private partnership, with the aim of sharing experiences in combating child labor, particularly in the hazelnut supply chain.

However, children in Türkiye are still being employed in street labor and mobile seasonal work in agriculture. The government does not have laws protecting children working in agricultural enterprises employing less than 50 workers. While the government has taken important steps to increase Syrian refugee children's access to education and other services across the country, many Syrian refugee children in urban areas of Türkiye have little or no access to education and other social services, leaving significant numbers at risk of exploitation in the worst forms of child labor.

It is estimated that the increase in the number of Syrian refugees in the country in the recent years had led to a rise in child labor rates. Table XVI.3 provides an overview of child work by sector and activity.

Table XVI.3 Overview of Children's Work by Sector and Activity

Sector/Industry	Activity
Agriculture	Production of cotton, hazelnuts, citrus fruits, sugar beets, cumin, peanuts, pulses, apricots, melons, and cherries
Industry	Production of furniture, bricks, shoes, leather goods, and textiles; auto repair; mining
Services	Street work, including vending small items, carrying bundles in market areas, cleaning car windshields, collecting recyclable materials, and begging ; working in restaurants and small shops

Source: US Department of Labor, 2018.

In the examination by gender, it is observed that of the working children, 70.6% are identified as male, and 29.4% as female. Education is attended by 65.7% of these children, with attendance rates being 65.6% for males and 66.1% for females. The motivation for children's engagement in economic activities primarily includes helping in the household's economic activities, and followed by learning a profession or skills for a job. In relation to the sectors of employment, working children are found in agriculture (30.8%), industry (23.7%), and the service sector (45.5%) in Türkiye. By age, those in the 5-14 age groups are predominantly found in agriculture (64.1%), whereas the 15-17 age group is more significantly represented in the service sector (51%) (ILO, 2021;TurkStat, 2019).

Statistics on work accidents for the insured personnel working in different industries are published by TurkStat. Statistics kept for the insured personnel (under Article 4-1/a of the Law on Social Security and General Health Insurance Law) working in road and motorway construction sector works are provided in Table XVI.4.

Table XVI.4 Statistics on Work Accidents and Occupational Diseases for Road and Motorway Construction

Activity Classification	Number of Insured Persons Having Work Accident by Incapacity Days in 2020		
	Male	Female	Total
Construction of roads and motorways	1,769	10	1,779

		Private Alanya Şifa Medical Centre

XVI.3. Potential Impacts

In projects involving large numbers of personnel, such as the Project, effective management of working relationships and employment terms is essential. The provision of adequate accommodation and working conditions is also critical. Ensuring non-discrimination, equal opportunity, and promoting employee satisfaction are key factors. Additionally, establishing feedback mechanisms is crucial for fostering a strong worker-management relationship. This relationship would ensure efficiency and productivity of the activities/operations and avoid any reputational risk that may jeopardize the Project/Project Sponsor. Accordingly, issues related with labor and working conditions, including safety and security of the workers, will have to be properly managed during the construction and operation phases of the Project.

Occupational health and safety impacts are another important aspect of the construction and operation of large infrastructure projects, especially during the construction phase of the project when large number of direct and contracted personnel is involved to perform large-scale earthwork and construction activities. Key labor and occupational health and safety issues associated with the construction of motorways primarily include the following:

- Labor issues and working conditions
- Workers' accommodation conditions and general occupational health and safety issues
- Physical and chemical hazards
- Emergency preparedness and response

Detailed staffing information for the Project is presented in Table XVI.6.

Table XVI.6 Information Regarding Staff To Be Hired Under The Project

INFORMATION REGARDING STAFF TO BE HIRED UNDER THE PROJECT	
Construction Phase	**Operation Phase**
The construction phase of the Project is expected to last approximately three years and will involve extensive civil works, infrastructure development, and workforce mobilization across the Antalya-Alanya Motorway corridor. Up to 3,300 personnel - including both direct employees and subcontracted workers - will be employed during peak periods. The workforce, comprising white-collar and blue-collar workers such as engineers, drivers, and unskilled laborers, will be deployed across construction sites and administrative offices. In line with the recruitment strategy, priority will be given to hiring from the project's area of influence-particularly from Serik, Alanya, and Manavgat districts and nearby neighborhoods along the corridor. If needed, recruitment will be expanded to the wider Antalya region, the Mediterranean Region, and then nationally.	The operation phase will begin immediately after construction is completed and will continue for 12 years under the 15-year Build-Operate-Transfer (BOT) contract. Approximately 250 personnel will be employed during this phase to manage toll collection, traffic control, routine maintenance, and service area operations. The recruitment strategy will prioritize hiring from the project's area of influence - particularly from Serik, Alanya, and Manavgat districts and nearby neighborhoods along the corridor. If suitable candidates are not available locally, recruitment will expand to the wider Antalya region, the Mediterranean Region, and then nationally. Staff will be stationed at toll plazas, control centers, and maintenance facilities to support 24/7 operations, including snow removal, road repairs, and system monitoring. Additional indirect employment will be generated through local service areas along the motorway, which will include restaurants, fuel stations, cafés, and small retail outlets.

XVI.3.1. Land Preparation and Construction Phase

Large-scale employment of workforce will occur during the land preparation and construction phase of the Project. Activities of the site personnel will involve typical construction risks observed at construction sites such as risks due to moving equipment, elevated work, chemical hazards, exposure to noise and dust emissions (*IFC, April 2007*). The rate of accidents will be highly dependent on the consciousness and cautiousness of the personnel regarding the specific hazards of the construction work they are involved in. These risks together with labor issues and working conditions have to be managed in accordance with the good management approaches and international construction site practices to avoid problems with the worker-employer relations and significant occupational health and safety risks.

Since the construction activities will be completed in 3 years, retrenchment will be an issue at the end of the construction phase that needs proper management. Additionally, resolving the complaints of the workers within the Project through an effective grievance mechanism would be very important to protect the reputation of the Project/Project Sponsor.

The number of workers planned to be hired for the construction phase is 3300. Workers are planned to work 10 hours a day in two shifts.

Although the daily working time of the workers within the scope of the project is specified as 10 hours by the company, this practice is only possible within the scope of overtime with the consent of the workers in accordance with the Labor Law No. 4857, published in the Official Gazette No. 25425 in April 2004. The employer is required not to exceed this period, to pay the necessary wages for overtime work and to provide workers with adequate rest periods. The Project is obliged to observe compliance with ILO standards and national legislation in this regard.

Accommodation will be provided for the personnel to be employed during the construction phase of the Project. Details of the campsite locations and facilities are presented in Table XVI.7

Table XVI.7 Proposed Construction Camp Site Locations

Location (Km)	Province	District	Nearest Neighborhood	Description
Km 64+500	Antalya	Manavgat	Taşağıl	Construction Camp Site-1 (Main)
Km 87+800	Antalya	Manavgat	Bucakşeyhler	Construction Camp Site-2
Km 123+000	Antalya	Alanya	İncekum	Construction Camp Site-3

Gender Based Violence, Harassment and Inequalities

The construction of the roadway will result in changes in local communities, including worker influx and changes in households' dynamics which can exacerbate the risk of Gender Based Violence and Harassment (GBVH) in both public and private spaces.

Women and men have different economic opportunities in Turkey. Traditionally, males tend to dominate leadership positions and women are marginalized in the decision-making process, therefore making them vulnerable.

Women may also be at risk of being discriminated against, as they are often not offered the same opportunities to get paid employment or are limited to taking on certain roles such as cooking food or providing laundry services at the camps. During recruitment, women could be suffering discrimination and may not be provided with the same working conditions as men once recruited.

Lastly, when performing the work, OHS decisions may not use a gender-responsive approach resulting in women not having access to PPE specifically designed for them. Wearing overalls designed for men or outsized safety shoes, gloves or coats could lead to additional health and safety hazards. The impact of Gender Based Violence, Harassment and Inequalities is considered high.

Supply Chain

The Project will require extensive sourcing of construction materials such as aggregate, sand, asphalt, concrete, and steel, as well as chemical substances to be used during various construction processes. These materials will be procured from quarries and construction material production facilities such as concrete and asphalt plants, which are integral components of the Project. As such, the Project's supply chain may involve indirect labor through third-party contractors and suppliers.

In line with IFC PS2, the Project acknowledges the potential labor and human rights risks associated with its supply chain, especially in relation to material suppliers such as quarry operators, concrete and asphalt producers, and chemical suppliers. Key risks include child labor, forced labor, and poor working conditions, particularly among subcontracted or informal workers.

Given the increasing incidence of child labor among refugee and migrant communities in Türkiye, the Project recognizes the elevated risk of such practices occurring within its indirect workforce. Based on the nature of these sectors and the regional context, the following potential labor-related risks have been identified in relation to the Project's supply chain:

- Workers engaged in the Project's construction activities may be subject to long working hours, inadequate rest periods, and inadequate access to protective equipment (PPE), especially in non-unionized or subcontracted facilities.
- Handling and transport of hazardous substances (e.g., asphalt binders, chemical admixtures, diesel fuels) involve risks such as chemical burns, respiratory issues, and fire hazards. Inadequate training or enforcement of safety protocols among supply chain workers can increase the likelihood of incidents.
- Limited traceability in sourcing (e.g., the origin of aggregates or cement) may result in materials being procured from suppliers with poor human rights records or who operate in environmentally or socially sensitive areas, thereby indirectly exposing the Project to reputational and compliance risks.

The impact of Supply Chain is considered High.

Child Labor and Forced Labor in the Supply Chain

Under IFC Performance Standard 2, the risk of child labor and the involvement of youth aged 16-18 in hazardous work within the supply chain should be significantly mitigated through the implementation of effective measures.. Managing these risks within the supply chain is a critical component of social responsibility requirements and international standards compliance for projects. Strengthening knowledge and practices for preventing and managing child labor within contracted and supplier companies, in accordance with IFC standards, holds potential for positive and lasting legacy effects.

The proposed mitigation measures are expected to substantially reduce the use of forced labor, rendering such incidents non-routine events. However, should such incidents occur, the impacts on affected individuals may remain unchanged, underscoring the need for effective support mechanisms. The impact of Child Labor is considered High.

Workers Accommodation Conditions

Ensuring good standards in accommodation facilities is important in order to avoid safety hazards and to protect workers from diseases and/or illness resulting from humidity, bad/stagnant water (or lack of water), cold, spread of fungus, proliferation of insects or rodents, as well as to maintain a good level of morale. In this scope, the standards of the rooms or dormitory facilities are important to allow workers to rest properly and to maintain good standards of hygiene.

Conditions that ensure a high standard of personal hygiene and clean cafeterias must be maintained to prevent contamination and the spread of diseases. Such diseases, often resulting from inadequate sanitary facilities, can also impact community health and safety. Medical facilities (first-aid facilities, additional medical facilities) are also important to maintain workers' health and to provide adequate responses in case of health emergency situations.

Additionally, basic leisure, social and telecommunication facilities are important for workers to rest and also to socialize during their free time (*IFC/EBRD, 2009*). Since accommodation will be provided at campsites in the scope of the Project, all these requirements at the facilities will need to be optimized to minimize potential impacts on the workers' welfare and risk of work-related accidents and maximize the overall productivity.

Retrenchment

Upon completion of the construction phase, during which approximately 3,300 workers were employed, the Project will transition into the operation phase with a significantly reduced workforce of around 250 employees. This shift represents a substantial retrenchment process. Although the workforce was employed under fixed-term, project-based contracts, the social and economic impacts of job loss-particularly for local workers-are considered noteworthy.

The retrenchment may result in sudden decreases in household income, local employment imbalance, psychological stress, reduced livelihood opportunities, and disruption of social dynamics within communities. These impacts may be more pronounced in rural or semi-rural areas where alternative employment opportunities are limited. Moreover, the uncertainty faced by workers after short-term employment may contribute to increased social vulnerability and challenges in reintegration into the labor market.

In this context, the termination of employment following the construction phase is assessed as having a high level of potential adverse socioeconomic impact.

Physical Hazards

Physical hazards represent potential for accident or injury or illness due to repetitive exposure to mechanical action or work activity. Road construction personnel may be exposed to physical hazards during the land preparation and construction phase of the Project. These hazards may be due to the operation of heavy construction vehicles during the earthworks, working at height for the construction of bridges, overpasses, viaducts, exposure to severe weather conditions, exposure to high noise levels caused by construction machinery and equipment.

Poorly trained or inexperienced drivers would increase risk of accident with other vehicles, pedestrians, and equipment. Additionally, heavy equipment operators have limited fields of view close to their equipment and may not see pedestrians close to the vehicle. These risks would be similar to any large scale infrastructure project and can be managed effectively with good management and implementation of occupational health and safety measures (*IFC, 2007*).

Chemical Hazards

Significant volumes of earthworks and paving activities will be conducted within the long construction corridor of the Project. The exhaust emissions from large number construction machinery, hazardous materials used for painting and paving operations are among main sources of chemical hazards for construction workforce (*IFC, April 2007*).

The chemicals used in the Project are presented in the Table XVI.8

Table XVI.8 Chemical List

Unit	Chemicals in Use
Machinery Unit	Diesel, AdBlue, Hydraulic Oils, Engine Oils
Construction Unit	Concrete Admixture, Mould Release Oil
R&D Unit	Methylene Blue Powder, Magnesium Sulfate Solution, Trichloroethylene

Emergency Preparedness and Response

As discussed in details in Chapter 15 and Emergency Preparedness and Response Plan (EPRP) (see Annex-3 in the ESIA), emergencies such as accidents, fire, natural hazards, etc. may occur during the land preparation and construction phase of the Project and if not properly managed, associated risks may occur on the health and safety of the Project personnel. The ineffective implementation of the EPRP may result in the inability to manage risks effectively and could lead to adverse impacts on health and safety.

XVI.3.2. Operation Phase

In the operation phase, maintenance personnel (i.e. road maintenance and landscaping workers), especially workers on foot, may be subject to occupational health and safety risks if not properly mitigated. Road repairs have to be managed within a structured plan to ensure safety zone and minimize relevant risks. In addition to the maintenance, personnel will be employed at toll plazas and control centers. Sub-contractors may also be involved in the operation of service areas.

During the operational phase, it is anticipated that labor and occupational health and safety issues may be neglected, as the number of personnel involved in activities will be significantly reduced compared to the land preparation and construction phases.

Gender Based Violence, Harassment and Inequalities

During the operation phase of the motorway project, although the workforce will be significantly reduced compared to the construction phase, certain risks related to Gender Based Violence, Harassment, and Gender Inequalities may still persist, particularly in relation to toll booth operators, maintenance personnel, subcontracted workers, and public interactions at service areas.

In Türkiye, women and men continue to face unequal access to economic opportunities. Leadership roles are predominantly held by men, and women may experience exclusion from decision-making processes, making them more vulnerable to gender-based risks, even during the operation phase.

Women employed during operation may still face risks of discrimination, particularly in terms of unequal access to employment opportunities or being confined to specific roles such as clerical or service-based work. Ensuring equal treatment during hiring, assignment of duties, and provision of working conditions remains essential.

Moreover, gender-responsive occupational health and safety practices must continue during the operation phase. Personal Protective Equipment (PPE) and uniforms should be available in appropriate sizes and designs for both women and men to avoid discomfort or additional safety risks.

Although accommodation camps are not expected during the operation phase, facilities such as rest areas, toll stations, and administrative units should include adequate and safe sanitation infrastructure, well-lit areas, and privacy measures for female employees, in line with the Project's Gender Action Plan (GAP).

Due to its tourism-driven and export-oriented economy, the province of Antalya is a highly frequented region with significant population mobility. This dynamic leads to frequent and diverse interactions among different social groups, which may increase the risks of gender-based violence, harassment, and inequality.

In this context, the risk level of gender-based violence, harassment, and inequality during the operation phase of the Project is assessed as high.

Supply Chain

During the operation phase of the highway project, supply chain-related risks are expected to be lower compared to the construction phase but still require ongoing monitoring. Key risks are primarily associated with outsourced services such as routine road maintenance, toll operations, security, cleaning, and landscaping. These activities may involve informal or short-term employment arrangements, especially among low-skilled or migrant workers, creating potential risks related to underpayment, lack of social security, excessive working hours, or poor occupational health and safety conditions.

In addition, procurement of consumables and spare parts (e.g., paints, lubricants, road marking materials, and electronic equipment) may involve supply chain transparency risks, including unethical sourcing, or limited oversight on labor conditions in the supply chain. The risk of non-compliance with

labor standards can increase over time if supplier and contractor performance is not regularly reviewed.

Child Labor and Forced Labor

During the operation phase of the motorway project, although the intensity of procurement and subcontracting activities is lower compared to the construction phase, certain risks related to child labor and forced labor within the supply chain may still exist, particularly in relation to service providers such as cleaning, maintenance, toll operations, security, and facility management companies.

In line with IFC Performance Standard 2, the presence of child labor and the involvement of youth aged 16-18 in hazardous work must continue to be proactively mitigated through the implementation of appropriate contractual provisions, supplier assessments, and ongoing monitoring efforts. Although the likelihood of such incidents may be reduced through these measures, their potential impact on affected individuals would remain significant if they occur.

Managing these risks throughout the operational supply chain is a critical element of the Project's social responsibility commitments and international compliance requirements. Promoting awareness and capacity building among subcontractors and service providers on the prevention of child and forced labor will contribute to long-term positive outcomes and reputational sustainability.

The implementation of effective mitigation measures is expected to substantially reduce the risk of forced labor, making such cases rare. Nevertheless, if such cases do arise, the adverse effects on individuals highlight the continued need for effective redress and support mechanisms.

For the operation phase, the overall risk related to child labor and forced labor is assessed as moderate, depending on the strength of supply chain oversight and contractor performance monitoring.

Workers' Welfare and Facility Conditions

During the operation phase of the motorway project, the need for large-scale worker accommodation (e.g., campsites) will significantly decrease; however, the welfare and working conditions of the personnel responsible for toll operations, routine maintenance, emergency response, cleaning, and security must still be carefully managed. Ensuring that these workers have access to basic and safe facilities - such as clean restrooms, break rooms, and shelter from adverse weather - is essential to protect their health, safety, and overall morale.

Although full dormitory facilities may no longer be required, staff working in shifts or in remote locations (e.g., toll booths, maintenance depots, or roadside service areas) should be provided with clean and adequately ventilated rest areas. These facilities must comply with national hygiene regulations and be equipped to prevent health issues that may arise from poor sanitation, insufficient water supply, or inadequate temperature control.

Additionally, maintaining basic first-aid services, communication systems, and secure storage areas for personal belongings or work equipment is necessary to support worker safety and comfort. Even during the operation phase, the risk of fatigue, accidents, and health issues can remain if rest and hygiene needs are not properly addressed - especially for shift workers performing repetitive or prolonged tasks.

Ensuring that workplace facilities support personal hygiene, provide privacy, and allow workers to take breaks under appropriate conditions will contribute to both compliance with international standards (e.g., IFC/EBRD) and the long-term operational efficiency of the Project.

Physical and Chemical Hazards

Road maintenance personnel, as the workers on foot, may be exposed to physical hazards during the operation phase of the Project. Similar to the construction phase, operation, maintenance and landscaping personnel working on the Motorway may be subject to the chemical hazards due to exhaust emissions of the vehicles driving on the road or passing through the toll plazas or due to hazardous dust or asphalt fumes generated during activities such as pavement, painting, vegetation removal.

The ineffective implementation of the Emergency Preparedness and Response Plan (EPRP) prepared within the scope of the Project may lead to various hazards and risks. Failure to implement occupational health and safety (OHS) measures may lead to adverse impacts on employees' health and safety.

Emergency Preparedness and Response

The ineffective implementation of the Emergency Preparedness and Response Plan (EPRP) prepared within the scope of the Project may lead to various hazards and risks. Failure to implement occupational health and safety (OHS) measures may lead to adverse impacts on employees' health and safety.

The exclusion of OHS rules, emergency preparedness measures, and response procedures from trainings may lead to the occurrence of accidents and the escalation of minor emergencies. This situation may endanger the health and safety of employees, nearby settlements, and road users.

XVI.4. Mitigation Measures

Project Sponsor will strictly comply with the requirements of the Turkish Labor Law and Occupational Health and Safety Regulation regarding the management of occupational health and safety risks and protection of the health and safety of Project workers including the direct and contracted personnel. Additionally, Project's policy on Labor, Employment and Occupational Health and Safety are described in the Environmental and Social Management System (see Chapter 20 in the ESIA), which will be implemented during the land preparation, construction and operation phases of the Project to ensure compliance with international standards on labor and working conditions. Contracted workers and Project Sponsor will also be required to comply with the Project policy on Labor, Employment and Occupational Health and Safety through contractual requirements.

Project Sponsor will ensure that the sub-contractors have the technical capability to manage the occupational health and safety issues of their employees. Accordingly, all the sub-contractors who will be involved in the Project will be required to be subject to the same contractual conditions with the Project Sponsor in the issue of occupational health and safety and will be required to implement Project's occupational health and safety policies.

Regarding the labor conditions, sub-contractors will be subject to the same contractual conditions with the Project Sponsor. Duration of the contracts to be made with the sub-contractors will not exceed the duration of BOT Contract.

In the management of occupational health and safety hazards, preventive and protective measures will be taken in the following order of priority in accordance with the following approach as recommended by IFC both during the construction and operation phases of the Project:

- The activity causing the hazard will be eliminated from the work process;
- Hazard will be controlled at its source through use of engineering controls.
- Hazard will be minimized through design of safe work systems and administrative or institutional control measures.
- Appropriate personal protective equipment (PPE) will be provided in conjunction with training, use, and maintenance of the PPE.

With effective implementation of occupational health and safety measures including compliance with the requirements of the relevant regulations, implementation of safe practices and procedures when conducting assignments, provision of occupational health and safety trainings, proper use of PPE and monitoring of occupational health and safety impacts, number of accidents/incidents would be effectively reduced and associated risks with significant consequences are likely to be well managed throughout the construction and operation phases of the Project.

A comprehensive grievance mechanism has been established to enable Project workers to submit their complaints and suggestions (see Annex-9 in the ESIA). Under this mechanism, all workers (including contractor and supply chain workers) will be able to raise their grievances through a dedicated phone hotline, the Project website, complaint boxes located at the Project site, or through national-level channels (e.g., GİMER, YİMER, and the Social Security Institution). The grievance mechanism includes an anonymous option to safeguard against retaliation. In addition, complaint boxes will be placed in areas without cameras (e.g., changing rooms) to prevent the identification of complainants.

Sensitive grievances will be addressed under a specific procedure (see Table XVI.11). A confidentiality-based approach will be adopted for the complainant, case-specific remedial actions will be developed, and additional preventive measures will be implemented to avoid recurrence.

XVI.4.1. Land Preparation and Construction Phases

Land preparation and construction phases will involve a significant number of workforces, including both direct and contracted workers. Accommodation will be provided at campsites in the scope of the Project. Thus, promotion of safe and healthy working conditions and provision of good labor and accommodation conditions will be important during this phase of the Project. Good management of the potential issues would positively affect not only the quality, efficiency and productivity but also the reputation of the Project and its Sponsor.

Retrenchment of the construction workforce following the completion of construction activities will be done in compliance with all legal and contractual requirements.

Gender Based Violence, Harassment and Inequalities

Table XVI.9 presents comprehensive and systematic measures that need to be implemented to prevent and manage risks related to gender-based violence, harassment, and inequalities that may arise within the scope of the project. These measures aim not only to ensure occupational health and safety but also to establish social justice and equality, thereby guaranteeing that the project is conducted in accordance with principles of social responsibility and sustainability.

Separate accommodation will be organized for female employees based on the requirements of the Gender Action Plan (GAP) developed for the Project which will include lockable doors and windows, well maintained lighting throughout the facilities and measures to avoid overcrowding and lack of privacy (for example: enough women-only bathrooms and changing rooms).

Table XVI.9 Measures taken under GBVH

Risk Area	Detailed Measures to be Taken
Community and Workforce Management	Regularly monitor the volume and demographic profile of the workforce and analyses social impacts (CLO). Enhance security measures in worker camps and surrounding areas; establish social cohesion and support mechanisms. Cooperate with local authorities and NGOs.
Awareness and Training	Implement culturally and gender-sensitive training programs on GBVH for workers and local communities. Trainings should cover definitions of violence and harassment, prevention methods, and reporting mechanisms. Prepare training materials in accessible formats.
Policies to Combat Violence and Harassment	Establish and enforce clear zero-tolerance GBVH policies throughout the project. Create safe, confidential, and accessible complaint mechanisms. Ensure rigorous follow-up and response to reported incidents. Assign trained personnel to handle cases sensitively and effectively.
Equal Employment and Non-Discrimination	Ensure women are assessed fairly and equally during recruitment. Prevent limiting women to traditional roles; support their access to diverse job positions. Guarantee equal pay, working hours, and social benefits. Promote a culture of equality in the workplace.
Gender-Appropriate OHS Equipment	Provide personal protective equipment (PPE) specifically designed for women. Prevent women from using equipment designed for men. Ensure PPE is ergonomic and comfortable. Provide separate rest and hygiene facilities for women.
Separate Accommodation for Women	Provide separate, secure, and private accommodation for female workers per the Gender Action Plan (GAP) requirements. Ensure lockable doors and windows, adequate lighting, and ventilation. Provide sufficient women-only toilets, showers, and changing rooms. Implement measures to avoid overcrowding and protect privacy.

Occupational Training Measures to Prevent Gender-Based Violence, Harassment and Inequalities

All workers engaged in the project will be required to attend mandatory training sessions on gender-based violence, sexual exploitation and abuse (SEA), and workplace harassment. The training will be delivered by qualified professionals prior to site mobilization and repeated at regular intervals. Attendance will be monitored, and understanding will be assessed. The training program will be supported by a worker Code of Conduct (see Annex-15 in the ESIA) and a confidential grievance mechanism.

To prevent the occurrence of gender-based violence and harassment (GBVH), including sexual exploitation and abuse (SEA) and sexual harassment (SH), all project-related workers (including contractors, subcontractors, and third-party service providers) will receive mandatory awareness and behavioral training aligned with the requirements of IFC PS2, EBRD PR2, and national labor law.

The training details are provided in Table XVI.10.

Table XVI.10 Training Details

Scope of Training	
Mandatory for	**Training will cover**
All site workers (construction, security, transport) Contractor and subcontractor staff Community Liaison Officers and site managers	Definitions and examples of GBVH, SEA, and SH Acceptable and unacceptable workplace behavior Protection against infectious and non-infectious disease risks Power dynamics and gender sensitivity. Reporting channels and protections for whistleblowers. Sanctions and zero-tolerance policy
Timing and Frequency	
Initial onboarding (before starting work on-site) Refresher training every 6 months during construction phase Ad-hoc sessions in case of reported incidents or high-risk observations	
Trainer and Method	
Delivered by	**Method**
A certified gender and GBVH specialist (external consultant or NGO) Or by in-house E&S staff trained in GBVH prevention	Separate sessions for workers and supervisors Gender-segregated sessions where culturally appropriate Role-playing, visuals, and storytelling-based learning for low-literacy participants o Language support (e.g., interpretation for migrant workers)
Monitoring and Compliance	
Training attendance logs and feedback forms collected Random post-training assessments for understanding Monitoring included in contractor performance reviews Non-compliance may result in removal from site	
Integration into Code of Conduct (see Annex-15 in the ESIA)	
All workers must sign a Code of Conduct that includes: Zero tolerance for GBVH Clear disciplinary measures Commitment to report witnessed abuse	

Under the Antalya-Alanya Motorway Project, GBVH training is mandatory for all personnel and aims to raise awareness on key issues such as gender equality, power dynamics, and sexual exploitation and abuse (SEA/SH). The training targets all site workers-including contractors, subcontractors, security, and transportation staff-as well as Community Liaison Officers and site managers.

The curriculum covers definitions and examples of GBVH, acceptable and unacceptable workplace behavior, protection against infectious and non-infectious diseases, grievance mechanisms and whistleblower protections, and sanctions under a strict zero-tolerance policy.

Training sessions will be conducted during the onboarding process, before workers begin duties on site, and will be repeated every six months throughout the construction phase. In addition, ad-hoc sessions will be arranged in response to any reported incidents or increased risk levels. Training will be delivered by certified GBVH specialists (either external consultants or NGOs) or by in-house environmental and social (E&S) staff trained in GBVH prevention. Where culturally appropriate,

separate sessions will be organized for male and female participants. Interactive methods such as role-playing, visual materials, and storytelling will be used to support participants with limited literacy. Language interpretation will be provided for migrant or non-native-speaking workers.

To ensure traceability and effectiveness, attendance logs will be maintained, knowledge assessments will be conducted post-training, and participant satisfaction will be monitored. Training compliance will be integrated into contractor performance reviews, and failure to participate may result in removal from the site. All workers will be required to sign a Code of Conduct that outlines the Project's zero-tolerance approach to GBVH, specifies disciplinary consequences, and emphasizes the duty to report any witnessed abuse or misconduct.

Gender-Based Violence and Harassment (GBVH) Incident Response Procedure

The procedure to be followed in the event of a workplace incident is provided in Table XVI.11

Table XVI.11 GBVH Response Procedure

GBVH Response Procedure
Reporting
The employee can report a harassment incident through one of the following channels: - Female Community Liaison Officer (CLO) and Social Chief - A trusted mediator (colleague, female manager, female security guard, female CLO) - Anonymous complaint boxes - Human Resources Department (with confidentiality guaranteed) Complaints can be made anonymously or by name; both types are taken seriously and handled with care.
Initial Response and Safety
The CLO or relevant unit shall: - Immediately assess the physical and psychological safety of the complainant. - If necessary, arrange for the temporary reassignment of the complainant to another unit. - Apply temporary suspension or separation measures for the alleged perpetrator if appropriate.
Investigation
- An impartial internal audit team or external expert shall carry out the investigation. - All parties involved will be interviewed, and witnesses (if any) will be heard. - The process will be conducted confidentially; only directly involved individuals will be informed. - The investigation is targeted to be completed within a maximum of 14 working days.
Resolution
Based on the outcome of the investigation, the following actions may be taken: - Disciplinary sanctions (warning, reprimand, suspension, dismissal) - Reassignment of either or both parties - Referral for psychological support - Cooperation with local authorities (if the case involves criminal behavior)
Follow-up & Monitoring
- After the incident, periodic check-ins will be conducted to monitor the complainant's safety and psychological condition. - A satisfaction survey regarding the complaint process may be conducted. - Preventive training sessions will be implemented in the relevant units to avoid recurrence
Prevention and Training
Regular training will be provided to all employees on the following topics: - GBVH awareness and rights - Information on the reporting and response process - Guidelines for respectful communication and behavior - Empathy and inclusive behavior training for all employees

Child Labor and Forced Labor

- Within the scope of the project, clear and binding policies will be established to prevent child labor and forced labor throughout all stages of the supply chain, especially in high-risk areas.
- Age verification and identity checks will be mandatory in recruitment and procurement processes, with rigorous field and management inspections to enforce compliance.
- Contracts with suppliers and subcontractors will explicitly prohibit child labor and forced labor, and sanctions will be applied in cases of violation.
- The obligations under IFC Performance Standards, ILO conventions, and Turkey's national labor legislation will be fully adopted and implemented.
- All project stakeholders will be recognized as socially responsible parties in preventing child labor and forced labor, and this commitment will be integrated into the project culture.
- Field managers and relevant personnel (Community Liaison Officers - CLOs) will be equipped and tasked with identifying and reporting potential violations.
- Special audit and support units focused on this issue (CLOs) will be established within the project to effectively manage risks in the supply chain.
- Employees' identity information, working conditions, and wage rights will be transparently and reliably recorded.
- All personnel will be ensured to receive a copy of the Code of Conduct document and their employment contract.
- Overtime will be carried out on a voluntary basis, and the annual legal limit of 270 hours will be strictly observed.

Supply Chain

To address supply chain risks, the Contractor Management Plan includes a specific section on supply chain management, which outlines procedures for:

- Screening and selecting suppliers based on their compliance with national labor laws and international labor standards,
- Requiring suppliers to sign a code of conduct or contract clauses committing to the prohibition of child and forced labor,
- Monitoring supplier performance through audits, inspections, or grievance mechanisms, where applicable,
- Taking corrective actions or terminating contracts with suppliers found in breach of labor requirements.

In addition, the Project will ensure that:

- Procurement contracts contain clauses aligned with the core principles of IFC PS2;
- Tenders and procurement documents emphasize the requirement for ethical labor practices;
- Workers employed by suppliers have access to grievance mechanisms either directly through their employer or, where possible, through the Project's established grievance channels. (Confidentiality and anonymity will be fully maintained.)

Child Labor and Forced Labor in the Supply Chain

- The Project Sponsor will oversee whether suppliers comply with all applicable child labor laws and will only permit the employment of workers who meet the applicable minimum legal age requirements; this practice will be in accordance with international standards.
- Contractor agreements will specify the contractor's right to monitor and audit all main contractors and subcontractors under the project, and the consequences they face if found to be in violation of national legal requirements, international standards, policies, or contractual clauses related to forced labor. Furthermore, the main contractor agreements will explicitly state that their subcontractors and suppliers must also comply with the same standards.
- All contractor agreements will clearly state the requirement to comply with Turkish legislation and international standards related to child labor for the project.

Practices such as identity checks at project site entrances and the complete recording of personal identification details in the visitor logbook will be utilized to enable the early detection of child labor and forced labor cases. Security personnel will be specifically informed and sensitized on this critical issue. A worker's ability to present their own identification is an indication that their ID has not been confiscated by a third party for the purpose of forced labor. Additionally, verifying the date of birth on the identification document serves as an effective measure for the early detection of child labor.

General Workers Accommodation Measures

The campsites will include facilities such as cafeteria, medical room, showers and toilets, wastewater treatment plants/septic tanks, water supply facilities (i.e. water well). Concrete plants will be located at the campsites; asphalt and mechanical plants will be sited at campsites and close to the quarries to the extent feasible (see Chapter 3 in the ESIA for the description of campsites). General measures to be taken at the workers accommodation facilities will be as follows:

- The accommodation to be provided will be clean and safe and meet the basic needs of workers, providing minimum amounts of space for each worker; sanitary, laundry and cooking facilities. Overcrowding will be avoided.
- Heating, air-conditioning and ventilation will be appropriate for the climatic conditions and provide workers with a comfortable and healthy environment to rest and spend their spare time.
- Drinking water to be provided to Project workforce and water to be supplied to food preparation, washing and bathing areas will meet the requirements of the Regulation on Water Intended for Human Consumption.
- Adequate lavatory facilities (toilets, urinals, washbasins and showers) will be provided for the number of people expected to work in the facility and allowances will made for indicating whether the toilet facility is "In Use" or "Vacant". Toilet facilities will also be provided with adequate supplies of hot and cold running water, soap, and hand drying devices.
- Domestic wastewater and waste to be produced at campsites will be properly managed and disposed of in line with the requirements of relevant Turkish regulations as well as good site practices described in this ESIA Report (see Chapter 8 for the management of wastes; see Chapter 7 for the management of wastewater).
- First aid and medical facilities as well as provisions for safety against potential hazards (fire, etc.) will be provided at the campsites.
- Residents of the campsites will be made aware of any rules governing the accommodation.
- Project's Grievance Mechanism to be established will provide means to the Project personnel to express their complaints. Project Sponsor will ensure that the workers are informed of the grievance mechanism at the time of recruitment and make it easily accessible to them.
- Camp-related waste will be managed in accordance with relevant Waste Management Plans (e.g., solid waste, wastewater, hazardous waste, zero waste).

- Emergency response equipment will be available on-site in compliance with legal requirements to respond to fire, medical, and environmental emergencies.
- Access to and from the camp site will be controlled in accordance with the provisions outlined in the Security Management Plan.
- Hygienic and legally compliant meal service areas will be established within the camp to meet workers' nutritional and health needs.
- Adequate quantities of safe and hygienic drinking water will be supplied and maintained at all times in compliance with national health regulations.
- Toilet, shower, laundry, changing, and dressing areas will be provided in sufficient quantity, in hygienic conditions, and in accordance with legal requirements.
- Comfort conditions (ventilation, lighting, heating, etc.) in on-site office buildings will be ensured in line with applicable occupational health and safety regulations.
- A drainage system will be installed across the camp site to prevent water accumulation and runoff, in accordance with relevant legislation.
- Legally compliant medical units and first-aid equipment will be established within the camp site and made readily accessible to all personnel.
- Workshop areas (such as those used for equipment maintenance and repair) within the camp will be managed to prevent adverse impacts on the environment, community, and worker health.
- Waste and hazardous materials generated in these areas will be stored separately in sealed, leak-proof containers and in designated enclosed areas, in line with related management plans.
- Measures will be taken to prevent the release of contaminants into soil and water, including the implementation of spill containment protocols and secondary containment systems.
- Building materials used in worker accommodation will comply with applicable fire safety and hygiene regulations.
- Accommodation units will be positioned at a reasonable distance from active construction zones to ensure worker safety and comfort.
- Legally compliant drainage and wastewater collection systems will be installed to prevent contamination risks within worker living areas.
- Safe, clean, and adequate drinking water will be provided in all worker accommodation areas in line with national hygiene standards.
- Comfort conditions-such as ventilation, lighting, and heating-will be ensured in worker housing to meet seasonal needs and legal requirements.
- Systems for the organized collection and disposal of domestic and operational waste will be established, including clearly designated bins and regular collection services.
- Routine pest control will be implemented to maintain sanitary conditions in worker accommodation facilities.
- Each worker will be assigned a personal bed, and all rooms will be equipped with operable windows, secure door locks, and pest prevention measures.
- Separate storage areas for personal protective equipment, including boots and other gear, will be provided to avoid cross-contamination and ensure organization.
- Regular cleaning of sleeping quarters and bedding will be carried out to maintain hygiene and prevent health issues.
- Toilets and sleeping quarters will be located within the same building to enhance accessibility, safety, and convenience for workers.

Worker accommodation areas, where large numbers of people live in close proximity for extended periods, pose a high risk for the transmission of infectious diseases. In the event of an outbreak during the site preparation and construction phases of the Project, the Project Sponsor will implement the following measures to ensure appropriate accommodation conditions:

- Entry of infected individuals into worker accommodation will be strictly prohibited, and where necessary, such individuals will be quarantined in accordance with the applicable national health regulations.

- Common surfaces, including the interiors of worker transport vehicles, workbenches, floors, walls, and shared areas, will be considered potentially contaminated and will be disinfected regularly.

Retrenchment

To minimize the adverse socioeconomic impacts of workforce downsizing following the completion of the construction phase, a Retrenchment Plan will be prepared in line with IFC Performance Standard 2. This plan will be developed through consultation with affected workers and shared transparently with all personnel at least three months prior to the transition to the operation phase. Regular information sessions will be held in coordination with labor representatives and local authorities. All employment terminations will follow fair, lawful, and non-discriminatory procedures, and workers will receive all legally due severance payments, entitlements, and benefits in a timely and complete manner.

Support will be provided to affected personnel through re-employment assistance programs. In cooperation with public employment agencies, vocational training centers, or local institutions, job placement support, resume writing and interview workshops, and short-term skill-building trainings will be offered. Additional support mechanisms will be designed for vulnerable groups such as women, persons with disabilities, elderly workers, or migrant laborers. Furthermore, access to counseling services should be provided to help workers manage psychological stress and uncertainty caused by sudden job loss.

The Project's existing Grievance Mechanism (GM) will be updated to include retrenchment-related issues during the retrenchment process. A designated person within the Community Liaison Team will ensure safe, confidential, and timely handling of complaints. To monitor the long-term impacts of retrenchment, a post-employment tracking system should be established to follow up on livelihood conditions of a representative sample of retrenched workers over time, and to evaluate the effectiveness of support mechanisms. This comprehensive approach aims to protect labor rights, ensure social responsibility, and maintain the Project's long-term social sustainability.

Measures against Physical Hazards

- Safe work zone will be established to separate workers on foot from the traffic.
- For the construction works to be conducted at location where traffic exists, safe work zones will be established by taking relevant measures (closure of roads, diversion of traffic, use of protective barriers, cones, warning lights, etc.)
- The area around which elevated work is taking place will be barricaded to prevent unauthorized access and working under personnel on elevated structures will be avoided.
- Hoisting and lifting equipment will be rated and properly maintained, and operators trained in their use. Elevating platforms will be maintained and operated according to established safety procedures including use of fall protection measures (e.g. railings), equipment movement protocols (e.g. movement only when the lift is in a retracted position), repair by qualified individuals, and installation of locks to avoid unauthorized use by untrained individuals.
- Ladders will be used according to pre-established safety procedures for proper placement, climbing, standing, as well as the use of extensions.
- When working at height, proper fall protection measures will be implemented. Fixtures will be installed on bridge components. Safety belts with proper thickness and of suitable materials ensuring sufficient strength will be used. Rope safety belts will be replaced before signs of aging or fraying of fibers become evident. When operating power tools at height, workers will use a second (backup) safety strap.
- Personnel exposed to high levels of noise will be required to use personal hearing protection devices/equipment that will be provided by the Project Sponsor at no cost. Where required for specific works, work rotation programs will be implemented to reduce cumulative exposure.

- Weather forecasts will be monitored for outdoor work to provide advance warning of extreme weather and schedule the work accordingly. Protective clothing will be used where required.

Measures against Chemical Hazards

- Properly maintained construction machinery, equipment and vehicles will be used to minimize exhaust emissions.
- Engine idling time will be reduced in construction sites.
- Direct diesel exhaust will be properly redirected to minimize exposure of the operators.
- Indoor working areas where vehicles or engines are operated will be ventilated or the exhaust gases will be properly diverted.
- Lead-containing paint will be avoided and appropriate respiratory protection will be used when cutting galvanized steel.
- Hazardous materials will be replaced with a less hazardous substitute whenever feasible.
- Engineering and administrative control measures will be performed in order to prevent or reduce the release of hazardous materials into the work site. Level of exposure will be kept below internationally established or recognized limits.
- The number of workers to be exposed will be kept in minimum.
- Hazardous materials will be labeled and marked properly considering national and international regulations and guidelines. Materials Safety Data Sheets (MSDS) will be prepared. All written communication will be readable and available to workers to be exposed and first-aid personnel.
- Workers will be trained in use of information related to hazardous materials (MSDSs etc.), safe work practices and appropriate use of PPE.
- Spill kits must be available, placed in easily accessible locations, and regularly inspected.
- Emergency showers and eyewash stations must be installed to provide workers with rapid response capability against chemical splashes and spills.
- Incompatible chemicals (e.g., acids and bases, oxidizers and flammables) must be stored in separate compartments or containers.
- Chemicals must be stored in sealed, capped containers made of appropriate materials.
- Storage areas must be ventilated, well-lit, and protected from direct sunlight.
- Secondary containment systems (e.g., leak-proof pallets, collection basins) must be in place in storage areas.
- Fire extinguishers of the appropriate type (e.g., ABC or CO_2 extinguishers for chemical fires) must be provided and kept in easily accessible locations.
- Warning and safety signs (flammable, toxic, corrosive, etc.) must be posted at the entrance of storage areas and on shelves.
- Only authorized personnel must be allowed to enter the storage area.
- Evacuation procedures must be visibly posted in the storage area.

The details of the chemicals to be used in the project are provided in Table XVI.12.

Table XVI.12 The details of the chemicals to be used in the Project

Chemicals	
Hydraulic Oil	Hydraulic oil is considered low-risk; however, prolonged or repeated skin contact may lead to irritation and eye discomfort. During handling, chemical-resistant gloves, protective goggles, and long-sleeved clothing should be used. In cases where vapor concentration may occur, respiratory protection is advised. Spills should be contained using absorbent materials such as dry sand or vermiculite and must not be allowed to enter soil or sewage systems.
AdBlue	AdBlue has low toxicity but may cause mild skin and eye irritation. At high temperatures, it may release ammonia gas, requiring caution in enclosed spaces. In the event of a spill, the product should be contained using absorbent materials like sand or soil to prevent environmental contamination. Recommended PPE includes nitrile gloves, protective goggles, chemical-resistant clothing, and ammonia/NOx-compatible respirators.
Mould Release Oil	This product poses a significant health hazard if swallowed or inhaled due to its aspiration toxicity. It may also irritate the skin and eyes. Spills should be cleaned with sawdust or absorbent materials and kept away from drains or soil. Personal protective measures should include nitrile or neoprene gloves, face shields, and masks suitable for hydrocarbon vapors.
Magnesium Sulfate	Generally considered non-hazardous, magnesium sulfate may cause mild irritation if inhaled as dust. Contact with skin and eyes may result in mechanical irritation. Spilled material should be collected with a shovel and disposed of properly, followed by thorough washing with water. Dust masks, safety gloves, goggles, and protective clothing are advised.
Methylene Blue Solution	This chemical is toxic and flammable. It can cause organ damage if swallowed, inhaled, or absorbed through the skin. In case of a spill, absorbent materials should be used and disposed of as hazardous waste. PPE must include full safety goggles, chemical-resistant gloves, antistatic protective clothing, and an ABEK-type respirator for vapors.
Diesel Fuel	Diesel fuel poses significant health hazards, including suspected carcinogenicity, and may cause toxicity through inhalation and skin contact. Symptoms include dermatitis, dizziness, nausea, and CNS depression. Spills should be isolated, absorbed with inert materials, and handled by trained personnel. Appropriate PPE includes a vapor-resistant mask (type A), hydrocarbon-resistant gloves and clothing, and face shields.
Sika Sigunit L-25 (Shotcrete Additive)	Due to its high alkalinity, this shotcrete accelerator may cause skin and eye irritation. It should be applied in closed systems where possible, and any contact surfaces should be washed thoroughly with water. Protective goggles, gloves, and long-sleeved clothing are required during application to prevent splashes.
Trichloroethylene	Trichloroethylene is a highly hazardous chemical classified as carcinogenic and potentially mutagenic. It may cause eye and skin irritation and central nervous system effects if inhaled. Use is restricted to trained personnel under strict controls. PPE includes chemical-resistant suits, gloves, sealed goggles, and A-type respirators or SCBA units. Spills must be absorbed with suitable materials and disposed of as hazardous waste.

General Occupational Health and Safety Measures

Following additional measures will be taken in accordance with the KGM's Technical Specifications for Motorways to avoid and/or minimize risks due to moving equipment and vehicles or works to be conducted at height or elevated/overhead works:

- Project Sponsor will ensure that qualified first-aid can be provided at all times at the working/construction sites.
- Adequate lightning (that would not distract drivers' sight) will be provided for works to be conducted at night-time. Lightning system will be moved forward in parallel to the progress of works.
- All the vehicles that will operate at night will have yellow colored overhead flashlights that will be activated during the time of works.
- Good cooperation with the local medical services will be ensured.
- A system will be established for the reporting and recording of occupational accidents and dangerous occurrences/incidents.
- Personal protective equipment/devices (PPE/PPD) and seasonal working outfits, meeting the requirements of the relevant Turkish regulations and good site practices, will be provided to all construction personnel by the Project Sponsor at no cost. Effective use of the PPEs/PPDs by the construction personnel will be monitored and ensured by the Project Sponsor.
- Sub-contractor workers will also be strictly required to use necessary PPEs/PPDs by means of contractual stipulations to be done with the sub-contracting companies.

- In the selection of personal protective equipment (PPE), suitability to the individual as well as compatibility with the nature of the work and specific working conditions (e.g., location, time, and environmental factors) will be ensured.
- In addition to having first aid equipment and H&S Committe in theProject Area, it is recommended to cooperates with private hospitals in the surrounding area, as these measures may not be enough in possible situations.

The risks related to the project site and the measures taken against these risks are presented in Table XVI.13.

Table XVI.13 Site Risks and Occupational Health and Safety (OHS) Measures

Risk Area	OHS Measures
Traffic and Equipment Safety	Use of cameras, alarms, and flagmen for mobile equipment. Temporary traffic management plans implemented.
Working at Heights	Double-hook harnesses, safety nets, scaffold checks, and health clearance for workers.
Excavation and Tunneling	Slope stability analysis, shoring systems, tunnel ventilation, and gas monitoring.
Material Transport and Blasting	Dust control during transport, secure loading, and explosive handling by certified personnel only.
Fire and Chemical Safety	Fire stations, controlled storage of flammables, PPE use for hot asphalt and chemicals.
Dust and Noise Exposure	Use of respirators, hearing protection, regular environmental monitoring.
Emergency Preparedness	EPRP, mobile medical unit, evacuation routes and drills.
Worker Camps	Safe accommodation, hygiene control, clean water, waste management, and grievance mechanisms.

Occupational Health and Safety Trainings

Training of the Project workers and other personnel including the management, supervisors, and even occasional visitors is a key measure in reducing the number of accidents during the land preparation and construction phases. Basic occupational health and safety orientation trainings will be provided to all new personnel including direct and contracted workers, management, supervisors and occasional visitors. These trainings will include specific occupational health and safety subjects that include, but not limited to the following:

- Basic site rules and hazard awareness
- Hygiene requirements
- Potential risks to health
- Site-specific hazards
- Safe work practices
- Knowledge of materials, equipment and tools
- Wearing and use of protective equipment and clothing
- Hazards of working on foot around equipment and vehicles;
- Preventing injury to fellow workers
- Safe practice for work at night and in other low-visibility conditions (e.g. use of high-visibility safety apparel and proper illumination for the work space while controlling glare)
- Emergency procedures (e.g. during fires, natural disasters, etc.)

In addition to orientation trainings, all the direct and contracted workers will be provided with relevant trainings prior to commencement of new assignments (change of workplace/task, change of working machinery and equipment, introduction of new technologies, etc.). Workers with rescue and first-aid duties will be provided with dedicated training. Through appropriate contract specifications and monitoring, Project Sponsor will ensure that service providers, as well as contracted and subcontracted labor, are trained adequately before assignments begin.

A visitor orientation and control program will be established to ensure visitors do not enter hazard areas unescorted. In this respect, relevant checkpoints and record keeping practices will be used for ensuring both safety of the works and the visitors.

The training program to be organized by the project sponsor for its personnel is presented in Table XVI.14

Table XVI.14 Training program to be organized for personnel

Name of the Training	Subject of the Training	Participants	Training Document	Training Duration	Training Continuity	Training Location	Goal and Objective
1.Orientation Training / Induction Training							
Orientation Training	1-Introduction of the Project 2-Project OHS and Environmental Rules 3-Duties, Authorities, and Responsibilities 4-Emergencies, Emergency Response Methods, and Actions to Take in Emergencies 5-Hazards and Risks in the Work Area, Precautions Against These Hazards and Risks, Safe Working Methods, and Establishing Safe Working Environments	All Newly Recruited Employees	Visual Training Presentation (Before each new worker starts working on site)	2 Hours	Every Month	Training Room	Until the Basic OHS trainings are provided, employees are informed about the Project, made aware of the OHS and Environmental rules and instructions that must be implemented in the Project, and are aimed to gain knowledge about the hazards and risks in the work areas, the precautions to be taken against these hazards and risks, and the necessary actions in case of emergencies.
2.Basic Occupational Health and Safety Trainings							
General Topics	a) Information on labor legislation b) Legal rights and responsibilities of employees c) Workplace cleanliness and order d) Legal consequences of occupational accidents and diseases e) Use of Personal Protective Equipment (PPE) f) General Occupational Health and Safety rules and safety culture	All Newly Recruited Employees	Relevant Legal Requirements and Procedures	2 Hours	Every Month	Training Room, Worksite	At the time of recruitment (in-person/remote) and at one-year intervals, the trainings specified under General Occupational Health and Safety topics are provided to employees and documented. Following the training, it is expected that employees will demonstrate changes in behavior regarding occupational health and safety knowledge and safe working methods, and they will be subject to supervision.
		All Employees	Toolbox Talks				
Health Topics	a) Causes of occupational diseases b) Principles of disease prevention and implementation of protection techniques c) Biological and psychological risk factors d) First aid e) Harmful effects of tobacco products and passive exposure	All Newly Recruited Employees	Special Training Documents			Training Room, Worksite	
		All Employees	Toolbox Talks				
Technical Topics	a) Chemical, physical, and ergonomic risk factors b) Flammability, explosion, fire, and fire prevention c) Working with display screen equipment d) Safety and health signs e) General occupational health and safety rules, safety culture, and behavior-based OHS	All Newly Recruited Employees	Special Training Documents			Training Room, Worksite	
		All Employees	Toolbox Talks				
	Safe Manual Lifting and Handling	Newly Recruited Employees and All Employees	Special Training Documents	30 Minutes	Every Month	Training Room, Worksite	Employees are informed about the hazards and risks involved in manual lifting and handling activities, the necessary OHS precautions to be taken against these hazards and risks, and safe working methods for manual lifting and handling. A change in behavior is expected following the training.
			Toolbox Talks	15 Minutes			
	Safe Use of Work Equipment	Newly Recruited Employees and All Employees	Special Training Documents	30 Minutes	Every Month	Training Room, Worksite	Users of work equipment are informed about the potential hazards and risks that may arise during the use of such equipment, the necessary OHS precautions to be taken against these hazards and risks, and safe working methods based on the equipment's user manual. It is expected that the equipment will be used safely following the training.
			Toolbox Talks	15 Minutes			
	Electrical hazards, risks, precautions, electrical hand tools, and cable management	Newly Recruited Employees and All Employees	Special Training Documents	30 Minutes	Every Month	Training Room, Worksite	Users of electrical hand tools are informed about electrical hazards and risks in the work areas, as well as the safe use of electrical hand tools.
			Toolbox Talks	15 Minutes			
	Causes of Occupational Accidents, Legal Responsibilities, and Reporting	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees are informed about the causes of occupational accidents, the legal responsibilities of managers and workers, and the legislation related to the reporting of occupational accidents.
			Toolbox Talks	15 Minutes			
	Evacuation and Rescue	Newly Recruited Employees and All Employees	Specialized Training Documents	30 Minutes	Every Month	Training Room, Worksite	In situations requiring evacuation, employees are informed about the necessary actions to quickly reach the assembly point from the work areas.
			Toolbox Talks	15 Minutes			
Other Topics	Safe Working at Heights	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees are informed about the existing hazards and risks associated with working at heights, the necessary OHS precautions to be taken against these hazards and risks, and safe working methods at heights. Compliance with rules and instructions is expected.
			Toolbox Talks	15 Minutes			
	Safe Working in Confined/Restricted Spaces/Environments	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees are informed about the existing hazards and risks in confined/restricted spaces, the necessary OHS precautions to be taken against these hazards and risks, and safe working methods for tasks performed in confined/restricted spaces. Compliance with instructions is expected.
			Toolbox Talks	15 Minutes			
	Safe Working During Hot Work (Welding, Grinding, Cutting, etc.)	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees are informed about the existing hazards and risks during hot work (welding, grinding, cutting), the necessary OHS precautions to be taken against these hazards and risks, and safe working methods for hot work activities.
			Toolbox Talks	15 Minutes			
	Safe Working with Chemical Substances	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees are informed about the hazards and risks of the chemicals used according to their SDS (Safety Data Sheets) forms, as well as the necessary OHS precautions to be taken against these hazards and risks. Compliance with instructions is expected.
			Toolbox Talks	15 Minutes			
	Safe Working in Areas with Radiation Risk	Newly Recruited Employees and All Employees	Specialized Training Documents	30 Minutes	Every Month	Training Room, Worksite	Employees are informed about radiation-related hazards and risks, the necessary OHS precautions to be taken against these hazards and risks, and safe working methods in radiation areas.
			Toolbox Talks	15 Minutes			

Name of the Training	Subject of the Training	Participants	Training Document	Training Duration	Training Continuity	Training Location	Goal and Objective
	Safe Working in Lifting Operations	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees are informed about the hazards and risks related to lifting machines and equipment or lifting operations, the necessary OHS precautions to be taken against these hazards and risks, and safe working methods during lifting operations.
			Toolbox Talks	15 Minutes			
	Working with Special Risk Equipment	Newly Recruited Employees and All Employees	Specialized Training Documents	30 Minutes	Once every 2 months	Training Room, Worksite	Users of special risk or specific work equipment are informed about the safe use of the machine/equipment they will operate before starting work.
			Toolbox Talks	15 Minutes			
	Potential Health Risks Caused by Carcinogenic Substances	Newly Recruited Employees and All Employees	Specialized Training Documents	30 Minutes	Every Month	Training Room, Worksite	Lists of materials with carcinogenic effects are prepared, their SDS (Safety Data Sheets) are obtained, and employees are provided with training on safe working methods related to these materials.
			Toolbox Talks	15 Minutes			
	Safe Working at Night/In the Dark	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Once every 2 months	Training Room, Worksite	Employees are informed about the hazards and risks that may occur in environments without daylight or in darkness, the necessary OHS precautions to be taken against these hazards and risks, and safe working methods for working at night or in the dark.
			Toolbox Talks	15 Minutes			
	Safe Working in Excavation Operations	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees are informed about the hazards and risks involved in all excavation works, as well as the measures to be taken to eliminate or reduce these hazards and risks to an acceptable level. They are expected to apply this knowledge in practice
			Toolbox Talks	15 Minutes			
	Safe Working in Tunnel Operations	Newly Recruited Employees and All Employees	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees are informed about the existing hazards and risks in energized areas (mechanical, electrical), the precautions to be taken against these hazards and risks, and safe working methods.
			Toolbox Talks	15 Minutes			
	Return-to-Work Training for Employees Who Have Experienced a Work Accident or Occupational Disease	Employees Who Have Experienced a Work Accident or Contracted an Occupational Disease	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Employees who have experienced a work accident or contracted an occupational disease are informed about the root causes of the accident or disease, and all employees are educated to prevent similar incidents from occurring in the future.
			Toolbox Talks	15 Minutes			
3.Emergency Training							
General Emergency Training	Emergency Response Plan Training of Emergency Teams Training on Emergency Response Methods Testing of Response Plans (Drills) and Subsequent Performance Evaluation	All Employees, Emergency Teams	Specialized Training Documents	1 Hour	Every Month	Training Room, Worksite	Emergency teams are informed about their duties, authorities, and responsibilities in potential emergency situations according to the emergency response plan. Practical field drills are conducted to reinforce the training.
			Toolbox Talks	15 Minutes			
First Aid	First Aid Training (Certified)	First Aiders	Legal Requirements	3 Days	Once every 3 months	Training Room	First aid personnel are provided with information about their duties, authorities, and responsibilities, and their qualifications are documented.
Fire Safety	Fire Formation, Types of Fire Extinguishers, and Their Use	All Employees	Specialized Training Documents	1 Hour	Once a month for 4 months	Training Room, Worksite	Employees are informed about fire formation, combustible materials, fire prevention methods, types of fire extinguishers, and fire-fighting techniques. They are expected to know how to respond in the event of a fire.
			Toolbox Talks	15 Minutes			
4.Risk Assessment Trainings							
Risk Assessment	Concept of hazard and risk Identification of hazards in the workplace Evaluation of risks arising from hazards Risk assessment Elimination of risks or reduction to an acceptable risk level	Risk Assessment Team and All Employees	Specialized Training Documents	1 Hour	Once a month for 6 months	Training Room, Worksite	The risk assessment team and employees are informed about the identification, analysis, and evaluation of hazards and risks that may arise in all ongoing project activities, as well as the implementation of OHS measures. A change in OHS awareness is expected.
			Toolbox Talks	15 Minutes			
5.Specialized Trainings							
Visitor Training	Hazards and risks that guests and visitors may encounter in the work area, the precautions to be taken to protect against these hazards and risks, safe working practices, and safe working environments.	Guests and Visitors	Special Training Documents	1 Hour	Every Month	Training Room	Personnel who come to the work area as visitors, guests, etc. are informed about the hazards and risks in the work area, the precautions to be taken to protect against these hazards and risks, and safe working environments.
Training of Apprentices, Interns, and Individuals Requiring Special Policies	Apprentices, interns, and individuals requiring special policies are informed about the project, the rules to be followed within the project, their specific rules and instructions, working conditions, and hazards and risks in the work areas.	Apprentices and Interns	Special Training Documents	2 Hour	Every Month	Training Room	Hazards and risks in the work area, the OHS measures to be implemented against these hazards and risks, and safe working methods are communicated to apprentices, interns, and individuals requiring special policies by the relevant personnel when they start working.
Hygiene Training	Training and information for personnel involved in cleaning and food handling on prevention of infectious diseases and skin conditions.	Kitchen and Cleaning Staff	Authorized Organization/Person	8 Hour	Once	Training Room	Canteen, tea kitchen, and cleaning staff are expected to comply with hygiene rules.
Employee Representative / Support Staff	Duties, Authorities, and Responsibilities of Employee Representatives and Support Staff	Employee Representatives, Support Staff	Special Training Documents	1 Hour	Twice	Training Room	Designated employee representatives and support staff are informed about their duties, authorities, and responsibilities.
Occupational Health and Safety (OHS) Committee Training	Duties and authorities of the committee National legislation and standards on OHS Common occupational accidents and their causes Basic principles of occupational hygiene Communication techniques Emergency measures Occupational diseases Specific risks related to workplaces Risk assessment	OHS Committee Members	Relevant Legal Requirements and Special Training Documents	2 Hours	Once	Training Room	Occupational Health and Safety committee members are informed about their duties, authorities, and responsibilities as defined in the relevant legislation. They are expected to perform and implement their roles accordingly throughout the committee's term.
Safe Driving Training	Project-specific rules and instructions regarding the safe use of company vehicles	All Personnel Who Drive Vehicles	Relevant Legal Requirements and Special Training Documents	1 Hour	First 3 months, then twice	Training Room, Worksite	All personnel driving vehicles on the project are informed about the driving rules they must follow, and compliance with the specified

Name of the Training	Subject of the Training	Participants	Training Document	Training Duration	Training Continuity	Training Location	Goal and Objective
							rules and instructions is expected.
6.Environmental Trainings							
Environmental Cleanliness and Waste Management	Legal legislation and project plans and procedures related to environmental cleanliness and waste management	All Employees	Documents specially prepared for the training content: ● Solid Waste Management Plan and Hazardous Materials Management Plan ● Relevant legal legislation ● Project's EIA (Environmental Impact Assessment) and ESIA (Environmental and Social Impact Assessment) Reports	1 Hour	Every Month	Training Room	Employees are informed about the disposal of waste in the work area, housekeeping and waste management procedures in the work areas, and the existing procedures are explained to them. A change in behavior is expected.
Environmental Emergency Management	What are environmental emergencies? Which procedures should be followed? What actions need to be taken? What are the duties, authorities, and responsibilities of employees?	All Employees	Documents specially prepared for the training content: ● Emergency Management Plan ● Relevant legal legislation ● Project's EIA (Environmental Impact Assessment) and ESIA (Environmental and Social Impact Assessment) Reports	1 Hour	Every Month	Training Room	Communication and response methods during environmental emergencies are explained.
Biodiversity Awareness and Code of Conduct	What are the sensitive areas and species that may be encountered within the project sites? What should the rules be for working in natural environments? What actions should be taken when encountering fauna species within the site or during transportation? What are the endemic species in and around the project area? What measures should be taken to protect wildlife?	All Employees	Documents specially prepared for the training content: ● Biodiversity Action Plan ● Relevant legal legislation ● Project's EIA (Environmental Impact Assessment) and ESIA (Environmental and Social Impact Assessment) Reports	1 Hour	Every Month	Training Room	The precautions to be taken in field operations are explained according to the Biodiversity Management Plan prepared for the project.
Water and Energy Efficiency	What is efficiency in water consumption? What is efficiency in energy consumption? What is the importance of saving water and energy for the project, the country, and the world? How can individuals contribute to water and energy efficiency?	All Employees	Documents specially prepared for the training content: ● Water, Wastewater, and Surface Water Management Plan ● Relevant legal legislation ● Project's EIA (Environmental Impact Assessment) and ESIA (Environmental and Social Impact Assessment) Reports	1 Hour	Every Month	Training Room	During the project, both on-site and in camp areas, the necessary actions to be taken regarding water and energy efficiency are explained.
Rules for Communication with the Community	What are the general characteristics of the local population in the area? What should be considered when establishing communication with the community? Are there any local communities specific to the project area and its surroundings? If so, what are the important points to consider when communicating with these communities? What are the correct communication methods within the construction site?	All Employees	Documents specially prepared for the training content: ● Stakeholder Engagement Plan ● Public Health and Safety Management Plan ● Human Resources and Employee Management Plan ● Relevant legal legislation ● Project's EIA (Environmental Impact Assessment) and ESIA (Environmental and Social Impact Assessment) Reports	1 Hour	Every Month	Training Room	The rules for communication with the community are explained throughout the duration of the project.
Grievance Mechanism	What is a grievance mechanism? What is the purpose of the grievance mechanism? Who are the persons responsible for the grievance mechanism? Explanation of how employees can submit all their requests, demands, and complaints, including their personal rights and living standards, to the company.	All Employees	Documents specially prepared for the training content: ● Stakeholder Engagement Plan ● Relevant legal legislation ● Project's EIA (Environmental Impact Assessment) and ESIA (Environmental and Social Impact Assessment) Reports	1 Hour	Every Month	Training Room	Both project employees and stakeholders affected by the project are informed about how to submit complaints related to the project and how to follow up on the outcomes.

**This program has been prepared for the year 2025 and will be updated accordingly.*

Use of Personal Protective Equipment's (PPEs)

Within the scope of the Project, Personal Protective Equipment (PPE) will be considered as an additional protection measure for workers, complementing all technical and administrative measures taken to prevent and reduce potential risks on the construction site. Appropriate PPE will be identified based on the type of work performed and the potential hazards to which workers may be exposed, and it will be provided to all personnel in need. In order to ensure the correct and effective use of PPE, a training program will be organized, with mandatory participation for all relevant personnel. This training will be compulsory for all new personnel prior to starting work and should be organized once within the first three months of the project and then repeated at least twice per year. The training will include topics such as the correct selection, wearing, removal, cleaning, and storage of PPE.

The Project will be carried out in compliance with the Turkish Law on Occupational Health and Safety and the Regulation on the Use of Personal Protective Equipment in Workplaces, which is aligned with relevant European Union Directives. All PPE will bear CE certification and meet EU standards. The use of PPE will be tailored to different work areas and job types across the site. For example, workers on high structures such as bridges and viaducts will use double-hook safety harnesses and fall arrest systems; those working with hot asphalt or welding will wear heat-resistant gloves, welding masks, and fireproof aprons. Tunnel workers will be equipped with gas masks and headlamps, while reflective vests and proper lighting systems will be used for night shifts. Personal protective equipment (PPE) appropriate to the risks associated with electrical works will be provided to personnel engaged in such tasks. In work situations that require special safety precautions -such as working alone or near water- supervisors will be required to exercise due diligence and ensure that all relevant safety measures are fully implemented.

In areas where heavy machinery is operated, visible safety measures will be implemented to reduce risks of collision or crushing. These include placing warning signs and safety barriers around active machinery zones and assigning flaggers to guide operations. Additionally, all machinery operating in reverse will be equipped with audible warning systems, and spotters will be deployed in low-visibility areas. Records related to PPE use, safety briefings, and trainings will be kept up to date and monitored regularly. Any nonconformities identified will be promptly corrected, and occupational health and safety practices will be continuously improved.

Emergency Preparedness and Response

In response to potential emergency situations that may occur at construction and campsite areas (e.g., fire, explosion, natural disasters, chemical spills, occupational accidents), the necessary preparedness and response measures will be implemented in line with:

- Law No. 6331 on Occupational Health and Safety (Türkiye)
- The Regulation on Emergency Situations in Workplaces (Official Gazette No. 28681, dated 18.06.2013)
- IFC Performance Standard 1 (Assessment and Management of Environmental and Social Risks and Impacts)
- ILO Convention No. 155 on Occupational Safety and Health

In this context, emergency scenarios specific to site-related risks have been developed, and the corresponding Emergency Preparedness and Response Plan has been prepared and is presented in Annex-3 in this ESIA. The plan outlines procedures for protecting the safety of workers, contractors, and visitors, minimizing environmental damage, and ensuring timely and effective response and recovery actions.

All employees will receive training on emergency procedures, and regular practical drills will be conducted. In addition, the plan will be reviewed and updated periodically to ensure its continued effectiveness. Physical emergency preparedness measures - including fire suppression systems, first aid stations, evacuation routes, and designated assembly points - will be installed across all active sites. Responsibilities of relevant emergency personnel will be clearly defined and communicated.

XVI.4.2. Operation Phase

Some of the occupational health and safety measures described for the land preparation and construction phases for the mitigation of physical and chemical hazards, provision of occupational health and safety trainings, use of PPE and etc. would also be applicable for the management of operation phase risks and thus be implemented during the operation phase. Specific measures for the operation phase risks and impacts are described below. Regarding the management of emergencies, measures specified in the Emergency Preparedness and Response Plan will be implemented.

In accordance with the related terms of the BOT contract, Project Sponsor will ensure that the operation and maintenance personnel are properly trained in their specialty and successfully completed the necessary security investigations. Operation and Maintenance Plan will be submitted to the KGM according to the time set in BOT contract. In accordance with the related terms of the BOT contract, 1 year ahead of the end of the contract duration, personnel designated by the KGM will be trained by the Project Sponsor on the aspects related with the operation and maintenance works of the Motorway.

Sub-contractors to be involved in the operation of service areas will be subject to the same contractual conditions with the Project Sponsor, sub-contractors will be required to comply with occupational health and safety measures that are set by the Project Sponsor.

Gender Based Violence, Harassment and Inequalities

All employees and contractors are required to acknowledge and comply with the Project Sponsor's environmental and social work practices; additionally, they must report safety hazards, unsafe working conditions, unacceptable situations, and environmental and social issues in accordance with the Code of Conduct and Zero Tolerance Policy. Furthermore, the Project Sponsor will appoint a suitable CLO to ensure gender-responsive practices across different policies.

All contractor agreements will explicitly state the requirement to comply with Turkish legislation and the Project Sponsor's health and safety standards and policies. Contracts must also include clauses requiring contractors to adhere to the Project Sponsor's GBVH policies; these clauses should clearly specify the specific GBVH risks and agreed measures to address them, emphasizing the Project Sponsor's zero-tolerance approach toward GBVH.

Training and orientation programs focused on respecting local communities and vulnerable populations will be organized. These programs will place special emphasis on gender, human rights, and GBVH awareness, providing clear guidelines to create a safe environment for women and children.

Monitoring systems will be established to ensure regular reporting on GBVH. These systems will include confidential and anonymous grievance mechanisms, complaint referral processes, and support provisions for workers. Personnel responsible for handling complaints will receive specialized training on conducting GBVH-related investigations and providing appropriate responses.

In addition to the Code of Conduct and Zero Tolerance Policy, the project has tools such as the Security Management Plan, Gender Action Plan, and Labor Management Plan to ensure the prevention of GBVH. These plans also include grievance mechanisms to facilitate communication regarding any potential incidents throughout the construction and operation phases of the project.

The Gender-Based Violence and Harassment (GBVH) procedures and related measures implemented during the construction phase will remain applicable throughout the operation phase. The Project Sponsor has adopted a formal policy to reflect its commitment and sensitivity on this matter. This policy aims to ensure that employees' opinions and complaints are taken seriously, that complaint processes are conducted transparently with strict confidentiality for the complainant, and that appropriate measures are in place to prevent any form of retaliation against individuals who submit complaints. In this context, the policy seeks to maintain a safe, inclusive, and accessible working environment for all personnel.

Supply Chain

During highway operations, most supply-chain exposure arises from outsourced services (road maintenance, toll-booth operation, cleaning/landscaping, security) and the periodic purchase of consumables and spare parts. To manage these risks, the Project Sponsor will:

- Extend PS2 clauses and the Project Code of Conduct to all long-term maintenance and service agreements, including sub-tiers.
- Carry out an annual E&S audit of high-risk service providers, focusing on working hours, wage payment, social security registration, migrant-worker protection and occupational health & safety.
- Require suppliers of paints, lubricants, electronics and road-marking materials to provide traceability and compliance declarations.
- Keep grievance channels open to subcontracted workers and track any supply-chain-related complaints through to resolution, reporting trends in the annual ESG report.
- Provide refresher training to procurement and contract-management staff on supply-chain due-diligence procedures and red-flag indicators of child or forced labor.

These measures collectively ensure that labor and working-condition risks in the supply chain remain controlled and that the Project continues to comply with IFC PS2 throughout the asset's life-cycle.

Child Labor and Forced Labor

In order to eliminate the risks of child labor and forced labor during the operation phase, the Project Sponsor will implement a comprehensive set of measures. The zero-tolerance policy against child and forced labor will remain in effect throughout the operation period and will be clearly reflected in binding contractual provisions with all service providers. These contracts will explicitly state requirements such as minimum working age, prohibition of employing young workers in hazardous activities, the principle of voluntary employment, and appropriate working conditions.

Regular social compliance audits will be conducted for service providers operating in areas such as cleaning, security, toll operations, maintenance, and facility management. Identity verification and age control procedures will be strictly enforced. In the event of any violations, corrective action plans will be implemented, and repeated non-compliance may result in contractual termination.

In addition, awareness-raising training sessions on the prevention of child labor and forced labor will be organized for managers and HR personnel of contractors and subcontractors. These trainings will cover national legislation, IFC Performance Standard 2, and the ethical principles of the Project Sponsor in detail.

Confidential, accessible, and, if necessary, anonymous grievance mechanisms will be maintained throughout the operation phase, ensuring a safe and non-retaliatory process for raising concerns. An independent monitoring system will also be established to ensure timely and impartial handling of complaints.

Finally, at least once a year, a risk assessment related to child and forced labor will be conducted for all active contractors during the operation phase. The results of these assessments will be documented by the Project Sponsor and used in internal audits and stakeholder reporting. This integrated approach aims to ensure compliance with international standards and uphold the long-term social responsibility commitments of the Project.

Workers' Welfare and Facility Conditions

During the operation phase of the motorway project, the need for large-scale worker accommodation (e.g., campsites) will significantly decrease; however, the welfare and working conditions of the personnel responsible for toll operations, routine maintenance, emergency response, cleaning, and security must still be carefully managed. Ensuring that these workers have access to basic and safe facilities -such as clean restrooms, break rooms, and shelter from adverse weather- is essential to protect their health, safety, and overall morale.

Although full dormitory facilities may no longer be required, staff working in shifts or in remote locations (e.g., toll booths, maintenance depots, or roadside service areas) should be provided with clean and adequately ventilated rest areas. These facilities must comply with national hygiene regulations and be equipped to prevent health issues that may arise from poor sanitation, insufficient water supply, or inadequate temperature control.

Additionally, maintaining basic first-aid services, communication systems, and secure storage areas for personal belongings or work equipment is necessary to support worker safety and comfort. Even during the operation phase, the risk of fatigue, accidents, and health issues can remain if rest and hygiene needs are not properly addressed -especially for shift workers performing repetitive or prolonged tasks.

Ensuring that workplace facilities support personal hygiene, provide privacy, and allow workers to take breaks under appropriate conditions will contribute to both compliance with international standards (e.g., IFC/EBRD) and the long-term operational efficiency of the Project.

General Occupational Health and Safety Measures

Occupational health and safety (OHS) measures implemented during the operation phase are critically important not only for protecting the workforce but also for ensuring the safety of road users. As toll booth personnel, maintenance crews, and control center operators are continuously exposed to specific operational risks, adequate ventilation, ergonomic workstations, carbon monoxide monitoring, high-visibility equipment, and effective traffic management are essential. Maintaining strong emergency response capacity and safe working conditions enhances service quality and helps prevent accidents that could result in injury, loss of life, or reputational damage to the operator. Therefore, sustaining a robust safety culture throughout the operation phase is fundamental to the long-term success of the project.

Operational Phase OHS Measures are given in Table XVI.15.

Table XVI.15 Operational Phase OHS Measures

Risk Area	OHS Measures
Routine Road Maintenance	Temporary lane closures, traffic signs, lighting for night work, and visibility clothing for workers.
Toll Booth Safety	Ventilation and air filtration systems in toll cabins, carbon monoxide exposure monitoring.
Control Center Operations	Ergonomic furniture, screen time management, and indoor air quality controls.
Emergency Response on Road	Deployment of rapid intervention teams, satellite communications, and portable traffic signs.
Worker Comfort	Ventilation, heating, lighting systems in operational buildings and rest areas.

Measures against Physical Hazards

Following measures will be taken to ensure safety during the road maintenance or landscaping works:

- Safe work zones will be established to separate workers on foot from the traffic by using proper methods/devices (e.g. use of protective barriers, traffic cones, barrels)
- When possible, traffic will be rerouted to alternative roads.
- Proper land closure or traffic diversion measures will be taken, in consideration of the width of the road.
- Protective barriers will be used to shield workers where required.
- Traffic flow will be primarily regulated by warning lights and use of flaggers will be avoided where possible.
- Maximum speed limits will be reduced in the work zones.
- Blind spots will be avoided to the maximum extent possible by means of proper design of the work space.

Measures against Chemical Hazards

- Machines with ventilation systems should be used to protect workers from dust and asphalt fumes, and these systems should be regularly maintainedCorrect asphalt product will be used for each specific application and application at the correct temperature will be ensured to reduce the fuming of bitumen during normal handling.
- Adequate ventilation will be provided in necessary areas with limited natural air circulation.
- Tollbooths will be equipped with proper ventilation and air filtration systems.
- Protective clothing will be used when working with cutbacks (a mixture of asphalt and solvents for the repair of pavement), diesel fuel, or other solvents.
- Appropriate respiratory protection will be used when removing paints.

Emergency Preparedness and Response

While the current Emergency Preparedness and Response Plan (EPRP) has been developed specifically to address emergency scenarios associated with construction and campsite activities, it is acknowledged that the risks and emergency contexts during the operation phase of the motorway differ significantly. Therefore, a separate and dedicated Emergency Preparedness and Response Plan will be developed for the operation phase. This plan will consider risks such as road traffic accidents, vehicle fires, hazardous material spills during transport, medical emergencies at toll booths or rest areas, and security incidents.

The operational phase EPRP will be prepared in line with national legislation, IFC Performance Standards, and best international practices, ensuring the protection of road users, operation and maintenance personnel, and surrounding communities. It will include clearly defined emergency scenarios, response protocols, roles and responsibilities, communication strategies, and coordination mechanisms with local emergency services. Regular training and emergency drills will also be implemented for relevant operational personnel to ensure preparedness and rapid response capacity throughout the operational period of the motorway.

The EPRP will be finalized at least three months prior to the commencement of the operation phase.

XVI.5. Summary of Assessment and Residual Impacts

Project-related occupational health and safety risks would be minimized by taking relevant design, operational and administrative measures and implementation of an Emergency Preparedness and Response Plan, which meet the international requirements. Control of risks caused by third parties is more challenging, but they can also be properly mitigated by means of good management, contractual obligations and effective monitoring. Summary of the labor and working conditions risk assessments are presented in Table XVI.16.

Table XVI.16. Summary of the Assessments on Labor and Working Conditions

Definition of Potential Impact	Affected Ecosystem Component	Type of Impact	Impact Magnitude						Sensitivity/Value of Resource/Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts
			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
Land Preparation and Construction Phase												
Poor accommodation conditions resulting on safety hazards, spread of disesases and reduced level of morale	Project Personnel	Adverse	Restricted	Medium	Medium (personnel will not be localized but distributed along the linear route and campsites, quarries, etc.)	Short-term reversible	Continous	Moderate (B)	High (3)	High (B3)	• The accommodation to be provided will be clean and safe and meet the basic needs of workers, providing minimum amounts of space for each worker; sanitary, laundry and cooking facilities. Overcrowding will be avoided. • Heating, air-conditioning and ventilation will be appropriate for the climatic conditions and provide workers with a comfortable and healthy environment to rest and spend their spare time. • Drinking water to be provided to Project workforce and water to be supplied to food preparation, washing and bathing areas will meet the requirements of the Turkish Regulation on Water Intended for Human Consumption. • Adequate lavatory facilities (toilets, urinals, washbasins and showers) will be provided for the number of people expected to work in the facility and allowances will made for indicating whether the toilet facility is “In Use” or “Vacant”. Toilet facilities will also be provided with adequate supplies of hot and cold running water, soap, and hand drying devices. • Domestic wastewater and waste to be produced at campsites will be properly managed and disposed of in line with the requirements of relevant Turkish regulations as well as good site practices described in this ESIA (see Chapter 7 for the management of wastes; see Chapter 8 for the management of wastewater). • First aid and medical facilities as well as provisions for safety against potential hazards (fire, etc.) will be provided at the campsites. • Residents of the campsites will be made aware of any rules governing the accommodation. • Project’s Grievance Mechanism to be established will provide means to the Project personnel to express their complaints. Project Sponsor will ensure that the workers are informed of the grievance mechanism at the time of recruitment and make it easily accessible to them. • Project Sponsor prevents infected persons from entering workers’ accommodations areas, and if applicable or necessary, quarantine these persons per local regulations and/or recommendations from relevant international organizations. • Common surfaces, including ones in vehicles transporting workers from their accommodations to the workplace, counters, floors, and walls, should be treated as potentially contaminated and be cleaned regularly.	Low
Supply Chain	Project Personnel	Adverse	Restricted	Long	High	Long-term reversible	Continous	Restricted (C)	High (3)	High (B3)	• The Contractor Management Plan will be followed during the land preparation and construction phase of the project. • Procurement contracts contain clauses aligned with the core principles of IFC PS2; • Tenders and procurement documents emphasize the requirement for ethical labor practices; • Workers employed by suppliers have access to grievance mechanisms either directly through their employer or, where possible, through the Project’s established grievance channels.	Low
Child Labor	Project Personnel	Adverse	Restricted	Long	High	Long-term reversible	Continous	Restricted (C)	High (3)	High (B3)	• Within the scope of the project, clear and binding policies will be established to prevent child labour and forced labour throughout all stages of the supply chain, especially in high-risk areas. • Age verification and identity checks will be mandatory in recruitment and procurement processes, with rigorous field and management inspections to enforce compliance. • Contracts with suppliers and subcontractors will explicitly prohibit child labour and forced labour, and sanctions will be applied in cases of violation. • The obligations under IFC Performance Standards, ILO conventions, and Turkey’s national labor legislation will be fully adopted and implemented. • Field managers and relevant personnel (Community Liaison Officers - CLOs) will be equipped and tasked with identifying and reporting potential violations. • Special audit and support units focused on this issue (CLOs) will be established within the project to effectively manage risks in the supply chain. • Employees’ identity information, working conditions, and wage rights will be transparently and reliably recorded.	Low
Gender Based Violence and Harassment	Local communities, Project Personnel	Adverse	Restricted	Long	High	Long-term reversible	Continous	Moderate (B)	High (3)	High (B3))	• Develop and enforce zero-tolerance GBVH policies; provide training and support services • Ensure equal employment opportunities and non-discriminatory practices; monitor recruitment and working conditions • Provide gender-specific PPE; organize separate accommodation complying with GAP standards • Strengthen social safeguards; community awareness and monitoring	Low
Phsyical and chemical hazards due to operation of	Project Personnel	Adverse	Restricted	Medium	Medium (machinery /	Short term reversible	Intermittent	Moderate (B)	High (3)	High (B3)	• Emergency Preparedness and Response Plan will be implemented.	Low

Definition of Potential Impact	Affected Ecosystem Component	Type of Impact	Impact Magnitude						Sensitivity/Value of Resource/Receptor	Impact Significance (Before Mitigation)	Measures to be Taken	Significance of Residual Impacts
			Geographic Extent	Duration	Magnitude	Reversibility	Frequency	Overall Magnitude				
heavy vehicles, earthworks, exposure to noise, emissions					activities will not be localized but distributed along the linear route, use of chemicals will be limited)						• Hazardous materials will be replaced with a less hazardous substitute whenever feasible. • Engineering and administrative control measures will be performed in order to prevent or reduce the release of hazardous materials into the work site. Level of exposure will be kept below internationally established or recognized limits. • The number of workers to be exposed will be kept in minimum. • Hazardous materials will be labeled and marked properly considering national and international regulations and guidelines. Materials Safety Data Sheets (MSDS) will be prepared. All written communication will be readable and available to workers to be exposed and first-aid personnel. • Workers will be trained in use of information related to hazardous materials (MSDSs etc.), safe work practices and appropriate use of PPE. • Safe work zone will be established to separate workers on foot from the traffic. • For the construction works to be conducted at location where traffic exists, safe work zones will be established by taking relevant measures (closure of roads, diversion of traffic, use of protective barriers, cones, warning lights, etc.) • The area around which elevated work is taking place will be barricaded to prevent unauthorized access and working under personnel on elevated structures will be avoided. • Hoisting and lifting equipment will be rated and properly maintained, and operators trained in their use. Elevating platforms will be maintained and operated according to established safety procedures including use of fall protection measures (e.g. railings), equipment movement protocols (e.g. movement only when the lift is in a retracted position), repair by qualified individuals, and installation of locks to avoid unauthorized use by untrained individuals. • Ladders will be used according to pre-established safety procedures for proper placement, climbing, standing, as well as the use of extensions. • When working at height, proper fall protection measures will be implemented. Fixtures will be installed on bridge components. Safety belts with proper thickness and of suitable materials ensuring sufficient strength will be used. Rope safety belts will be replaced before signs of aging or fraying of fibers become evident. When operating power tools at height, workers will use a second (backup) safety strap. • Personnel exposed to high levels of noise will be required to use personal hearing Protection devices/equipment that will be provided by the Project Sponsor at no cost. Where required for specific works, work rotation programs will be implemented to reduce cumulative exposure. • Weather forecasts will be monitored for outdoor work to provide advance warning of extreme weather and schedule the work accordingly. Protective clothing will be used where required. • Properly maintained construction machinery, equipment and vehicles will be used to minimize exhaust emissions. • Engine idling time will be reduced in construction sites. • Direct diesel exhaust will be properly redirected to minimize exposure of the operators. • Indoor working areas where vehicles or engines are operated will be ventilated or the exhaust gases will be properly diverted. • Lead-containing paint will be avoided and appropriate respiratory protection will be used when cutting galvanized steel. • At work sites where dust levels are excessive, dust masks will be used by relevant personnel.	
Emergencies such as accidents, fires, natural hazards, etc.	Project Personnel	Adverse	Restricted	Medium	Medium	Short-Term Reversible	One-off	Moderate (B)	High (3)	High (B3)		Low
Emergencies such as accidents, fires, natural hazards, etc.	Project Personnel	Adverse	Restricted	Medium	High	Irreversible	One-off	Moderate (B)	High (3)	High (B3)		Low
Retrenchment of construction workforce at the end of construction phase	Project Personnel	Adverse	Restricted	Short	High	Short-term reversible	One-off	Moderate (B)	Medium (2) (Since the Project will not cause retrenchment of personnel from an existing workplace but from a Project construction with predefined limited duration sensitivity of personnel is asummed as medium instead of high)	Medium (B2)	• Retrenchment of the construction workforce following the completion of construction activities will be done in compliance with all legal and contractual requirements. • A Retrenchment Plan in compliance with IFC PS2 will be prepared and implemented during the retrenchment process.	Low
Operation Phase												
Phsyical and chemical hazards during road maintenace and landscaping works.	Project personnel and/or subcontractor personnel	Adverse	Restricted	Long	Medium (stationary personnel, road maintenance personnel and workers on foot)	Long-term reversible	Continous	Restricted (C)	Low (1)	Low (C1)	• In accordance with the related terms of the BOT contract, Project Sponsor will ensure that the operation and maintenance personnel are properly trained in their specialty and successfully completed the necessary security investigations. Operation and Maintenance Plan will be submitted to the KGM 4 months ahead of the start of Motorway's operation. In accordance with the related terms of the BOT contract, 1 year ahead of the end of the contract duration, personnel designated by the KGM will be trained by the Project Sponsor on the aspects related with the operation and	Negiligible

Supply Chain	Project personnel and/or subcontractor personnel	Adverse	Restricted	Long	High	Long-term reversible	Continous	Restricted (C)	High (3)	High (B3)	• Extend PS2 clauses and the Project Code of Conduct to all long-term maintenance and service agreements, including sub-tiers. • Carry out an annual E&S audit of high-risk service providers, focusing on working hours, wage payment, social security registration, migrant-worker protection and occupational health & safety. • Require suppliers of paints, lubricants, electronics and road-marking materials to provide traceability and compliance declarations. • Maintain a live supplier risk register to capture changes in ownership, workforce profile or geographic risk (e.g., influx of migrant labour, conflict-affected sourcing). • Keep grievance channels open to subcontracted workers and track any supply-chain-related complaints through to resolution, reporting trends in the annual ESG report. • Provide refresher training to procurement and contract-management staff on supply-chain due-diligence procedures and red-flag indicators of child or forced labour.	Low

XVII. CUMULATIVE IMPACT ASSESSMENT

Project-level environmental and social impacts of the project have been evaluated in the previous sections of this ESIA Report. This Section aims to assess the potential cumulative impacts that may arise from incremental impacts from other past, current or future (reasonably foreseeable) developments/activities implemented or planned in the region.

XVII.1. Definitions, Methodology Assessment and Data Sources

XVII.1.1. Definitions

Cumulative Impact

The Cumulative Impact Assessment (CIA) study to be undertaken under this ESIA will follow the core principles of the International Finance Corporation's (IFC, August 2013) Good Practice Handbook (IFC, August 2013) that is one of the most recent and up-to-date work on the Cumulative Impact Assessment and Management Guidelines. It compiles the most comprehensive document available to CIA practitioners and key approaches to the assessment of cumulative impacts from key reference documents. Additional key references to be used in the assessment will include:

- Sample Guidelines: Cumulative Environmental Impact Assessment for Hydropower Projects in Turkey (ESMAP, 2012) published under the World Bank's Energy Sector Management Assistance Programme,
- Cumulative Impact Assessment and Management Guidelines published by the International Association for Impact Assessment (IAIA) (Canter L. and William R., 2009; http://www.iaia.org/),
- European Commission's (EC) Guidelines for the Assessment of Indirect and Cumulative Impacts as well as Impact Interactions (May, 1999),
- Canadian Environmental Assessment Agency (Hegmann, GC Cockling, R. Creasey, S. Dupuis, Kennedy, L. Kingsley, W. Rodd, H. Spaling and D. Stalker; February, 1999).

The International Finance Corporation (IFC) defines cumulative impacts as “Cumulative impacts are those that result from the successive, incremental, and/or combined effects of an action, project, or activity (collectively referred to in this document as “developments”) when added to other existing, planned, and/or reasonably anticipated future ones.” (IFC, August 2013).

Cumulative impacts occur in the form of interaction. This interaction can be between actions and/or between actions and environmental components. The magnitude of the cumulative impacts may equal the sum of the individual effects (aggregate effect) or result in an incremental effect (synergistic effect) (World Bank, June 2012). Several independent activities/projects/developments with insignificant effects on their own can together cause a cumulative impact that can be significant (EC, May 1999; see Figure XVII.1).

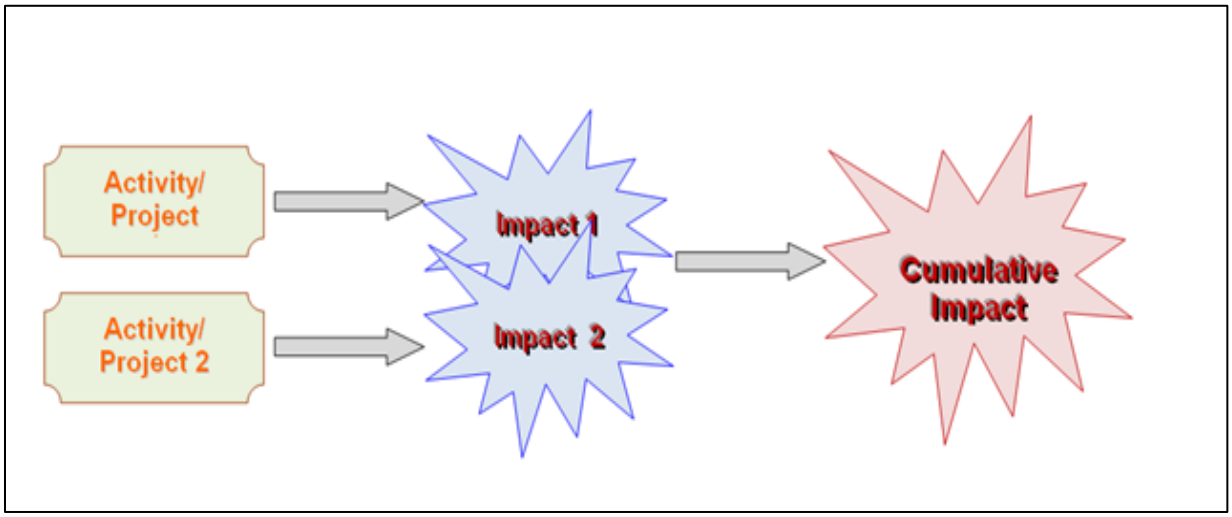

Figure XVII.1 Illustration of Cumulative Impacts (adapted from EC, May 1999)

Valued Ecosystem Components (VECs)

Valued Ecosystem Components that is one of the main components of cumulative impact assessment processes are defined as “Any part of the environment that is considered important by the proponent, public, scientists or government involved in the assessment process.” (Hegmann et al., 1999).

In the cumulative impact assessment, the environmental and social impacts and risks of a project or activity are determined through VECs. VECs may include the following environmental and social elements. (IFC, August):

- Physical features, habitats, wildlife populations (e.g., biodiversity),
- Ecosystem services,
- Natural processes (e.g., water and nutrient cycles, microclimate),
- Social conditions (e.g., health, economics), or
- Cultural aspects (e.g., traditional spiritual ceremonies).

Area of Impact

The concept of “Area of Impact” in the CIA process (named CIA in this report) describes the boundaries of the spatial area where the assessment will be made, as in an EIA study. Area of impact is defined as the minimum study area where EIA and/or CIA for a project will be carried out (World Bank, June 2012; World Bank ESMAP, December 2012).

Identifying spatial boundaries is one of the key and most challenging stages of the CIA process. Spatial boundaries should be determined by striking an appropriate balance, taking into account the budget, available data, practical constraints, and the geographic and temporal dimensions of complex environmental interactions (World Bank, June 2012; World Bank ESMAP, December 2012).

Limits of Acceptable Change and Limit Values

Since thresholds play a key role in determining the severity of impacts, setting thresholds is an important process for both assessing and managing cumulative impacts. Thresholds are limits where cumulative change becomes a concern when exceeded, and can also be expressed as a target, standard, carrying capacity, or limits of acceptable change (World Bank, June 2012; World Bank ESMAP, December 2012).

A threshold value may be the maximum intensity at which a given pollutant will adversely affect health if exceeded, or the maximum amount at which the natural state of an area will change unacceptably (e.g., reduction of forest or agricultural land). To reach a conclusion about the significance of the cumulative impacts, a certain limit of variation is required that can be used to compare the effects. Theoretically, if the cumulative impacts of all combined actions in a region do not exceed a limit or threshold, that action may be considered acceptable. However, in practice, the absence of such thresholds is a constraint on the assessment of cumulative impacts. This is especially true for the terrestrial components of ecosystems. Pollutants affecting human health and components in air and water are generally subjected to legal regulations. Therefore, the necessary threshold values for the assessment of the effects on these components are defined in the regulations or included in the guidelines (World Bank, June 2012; World Bank ESMAP, December 2012).

The concept of “Limits of Acceptable Change” is based on describing the acceptable level of environmental conditions rather than determining appropriate use levels (World Bank, June 2012). In this approach, after the acceptable conditions are identified, the necessary practices are determined in order to maintain these conditions.

Cumulative Impact Assessment (CIA)

Cumulative Impact Assessment (CIA), assessment of the possible impacts and risks of planned actions, projects or activities (development), together with other human activities and natural environmental and social external factors, on selected VECs and reducing or mitigating the identified cumulative impacts and risks of the process that involves proposing concrete measures as far as possible.

In this context, the two main components that form the basis of CIA are (IFC, August 2013):

- The contribution of the activity subject to the assessment to the cumulative impacts;.
- Expected future conditions after the aggregate impact of other past, present and reasonably foreseeable future activities and natural, external environmental and social factors.

In the region where the Project route passes, there are projects in different sectors within the scope of EIA Regulation Annex-I and Annex-II lists. In accordance with good practices of CIA, the possible cumulative impacts of the projects in and around the Motorway on VECs will be evaluated within the scope of this study.

XVII.1.2. Cumulative Impact Assessment Methodology

Cumulative Impact Assessment (CIA) aims to determine how the potential impacts of a project will cumulatively combine with the potential impacts of other human activities and natural factors (e.g. floods or extreme climatic events) (IFC, August 2013).

Identifying the cumulative environmental impacts of a project requires a much broader and regional perspective beyond the direct and immediate impacts of the project. CIA requires a broader scope for impact assessment and a more complex consideration of the interaction between human activities and VECs compared to a general EIA study. In this context, in a general EIA study, the evaluation focuses on the project that caused the impact, while the CIA study keeps the affected VECs at its center.

CIA studies basically have the same logical framework and analytical process as EIA studies. Within this scope, as generally the case with EIA studies, CIA studies consist of the basic stages of scoping, existing situation determination, impact assessment and management, which follow each other.

IFC describes the CIA process in six steps in its Good Practice Handbook on Cumulative Impact Assessment and Management:

Step 1:	Scoping Phase I – VECs, Spatial and Temporal Boundaries
Step 2:	Scoping Phase II – Other Activities and Environmental Drivers
Step 3:	Establish Information on Baseline Status of VECs
Step 4:	Assess Cumulative Impacts on VECs
Step 5:	Assess Significance of Predicted Cumulative Impacts
Step 6:	Management of Cumulative Impacts – Design and Implementation

This six-step process generally coincides with the process (Canter L., and William, R., 2009. IAIA Wiki: Cumulative Impact Assessment and Management) described by the International Association for Impact Assessment (IAIA), which gathers similar principles adopted in EU countries, Australia, New Zealand and other countries where implementation is carried out, in six steps and the cumulative impact assessment and management frameworks published in the USA and Canada. Similarly, the cumulative impact assessment process described in the Cumulative Environmental Impact Assessment for Hydropower Projects in Turkey Sample Guideline developed by the World Bank within the scope of the Energy Sector Management Support Program also basically adopts the principles of this processes proposed by IFC.

Cumulative impacts are considered separately for the physical, biological and socio-economic environment while evaluating the construction and operation phases. In each case, after the projects are classified under the following three groups, a cumulative impact assessment can be made under different scenarios consisting of combinations of these groups (World Bank, June 2012; World Bank ESMAP, December 2012):

- Project subject to evaluation (source project).
- Other existing projects (secondary projects) that have an impact on VECs.
- Future projects (confirmed, reasonably foreseeable and probable).

Antalya-Alanya Motorway Project Cumulative Impact Assessment

In the CIA study conducted for the Antalya-Alanya Motorway Project, the six-step process presented above was followed.

For the project, a CIA study was conducted to achieve the following outputs in accordance with international standards. These are;

- Identification of VECs that are likely to be affected by the activities under evaluation in the project in question.
- Identification of all other existing, certain, reasonably foreseeable and/or likely to be triggered developments and natural environmental and external social factors likely to affect the selected VECs.
- Evaluation of the future status of VECs by comparing them with current or foreseeable limit/reference values.
- Preventing or mitigating potential impacts on VECs during the life of the activity or during the lifetime of the activity, in accordance with the mitigation hierarchy.
- Monitoring and managing risks to the existence or sustainability of VECs throughout the life of the operation or the duration of the operation's effects, whichever is longer.

Within the scope of the Cumulative Impact Assessment, Antalya-Alanya Motorway Project will be considered as a resource Project that may cause cumulative impacts together with other projects/activity/developments affecting the same VECs.

Step 1: Scoping Phase I – VECs, Spatial and Temporal Boundaries

Valued Ecosystem Components (VECs)

Valued Ecosystem Components (VECs), which are one of the main elements of the cumulative impact assessment process, are defined as “parts of the environment that are considered important by the organization that proposes the project, the public, scientists or the public administration involved in the evaluation process”, and the selection criteria in international standards are explained under the title of “Valued Ecosystem Components”.

Identifying the cumulative environmental impacts of a project requires a much broader and regional perspective beyond the direct and immediate impacts of the project. CIA requires broader scope for impact assessment and more complex consideration of the interaction between human activities and VECs compared to general EIA study. In this context, in a general EIA study, the evaluation focuses on the project causing the impact, while the CIA study keeps the affected VECs in its center. The project-centered approach of a general EIA process and the VEC-centered approach of the CIA process are represented in Figure XVII.2 and Figure XVII.3, respectively.

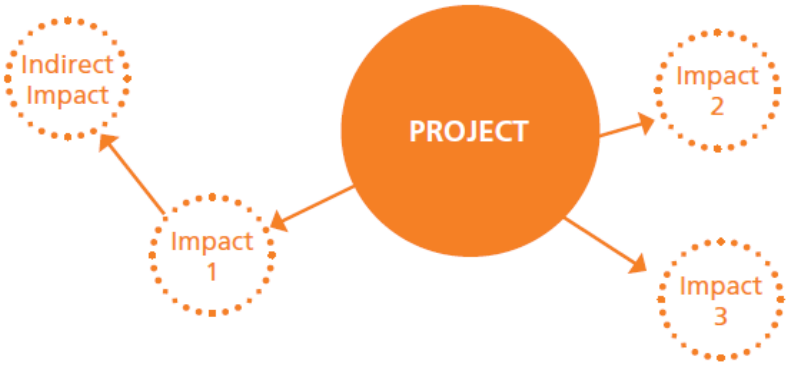

Figure XVII.2 EIA Approach

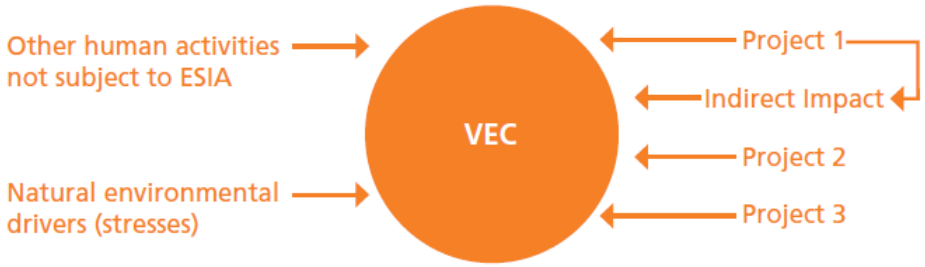

Figure XVII.3 CIA Approach

With CIA study, it is aimed to understand the situation of VECs as a result of the effects of one or more actions, projects or activities and/or natural factors. A good CIA study focuses on understanding whether the cumulative impacts of planned developments have a significant impact on the existence and sustainability of VECs. Evaluation of expected conditions after potential impacts of VECs forms the basis of this approach (IFC August 2013).

International good practice on impact assessment recommends focusing on the evaluation and method of "VECs" in CIA studies, since it would not be realistic to reasonably include every environmental and social component that would be exposed to cumulative impacts in a Project within the CIA process. The Figure XVII.4 below represents the VEC-driven impact assessment approach.

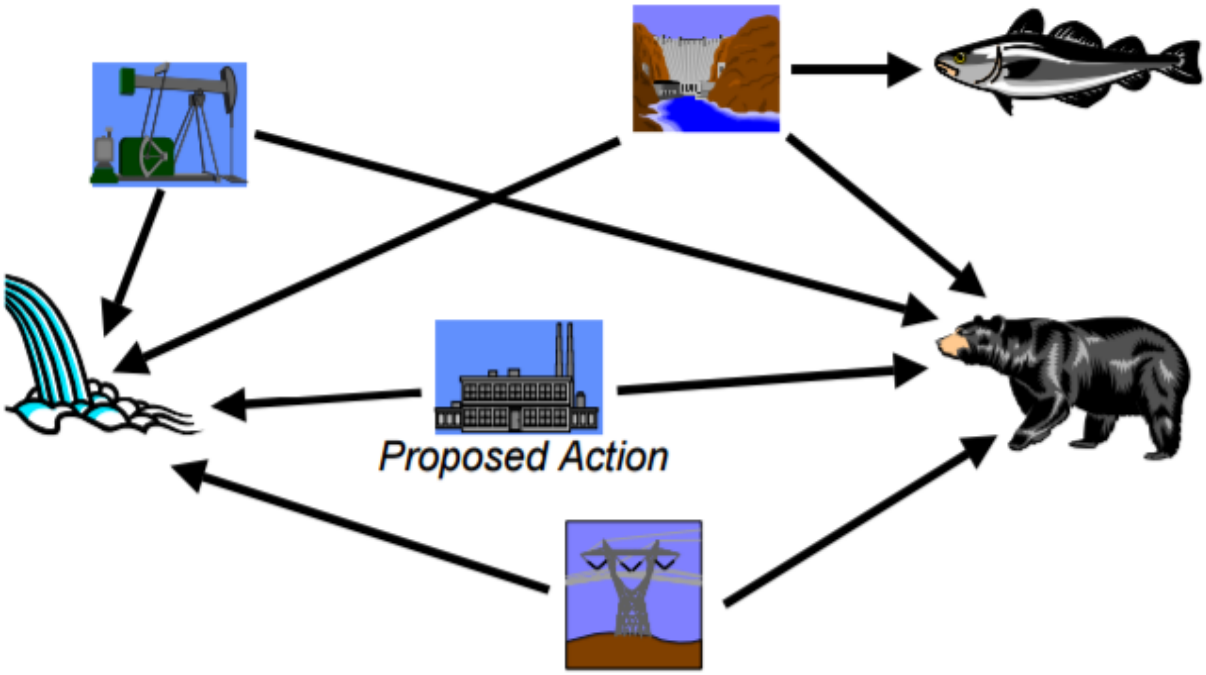

Figure XVII.4 Focusing on Impacts on VECs

For example, fish affected by one of the other projects as shown according to the VEC focused approach should not be considered as VEC in the CIA process of the proposed project, as they are not affected by the proposed project. In this direction, since the selection of VECs will affect the entire CIA process, the first step of the scoping phase is the identification of VECs (IFC, August 2013).

In the cumulative impact assessment to be made within the scope of the Antalya-Alanya Motorway Project, only VECs that will be affected by the Antalya-Alanya Motorway Project will be considered. In other words, any VEC that is not affected by the Antalya-Alanya Motorway Project but will be affected by other developments (e.g. protected areas, sensitive habitats, water resources, etc.) will not be taken into account in the assessment.

Determination of Temporal and Spatial Boundaries

In the first scoping phase of CIA, it is an important step to determine the temporal and spatial (geographical) boundaries on which impact assessment will be made. This step provides an understanding of the temporal and geographic dimensions of potential impacts on VECs during the duration of project impacts. Geographical boundaries within the scope of CIA are likely to exceed the direct impact area of the project (IFC, August 2013).

International good practices provide some suggestions for basic steps to be followed in determining geographical boundaries within the scope of CIA (IFC, August 2013):

i. The area that will be directly affected by the project or activity is determined (The area where direct impacts will be seen in a generally in EIA report - the direct impact area);
ii. VECs within the direct impact area are identified;

iii. Examined whether the boundaries of the determined VECs extend beyond the direct impact area;
iv. Geographical boundaries are set taking into account the distance that possible cumulative impacts can reach and affect VECs; Activities that do not affect VECs outside the geographic boundary and that do not make it technically or scientifically reasonable to participate in the evaluation are eliminated.

Similarly, recommended steps for determining the temporal limits of evaluation are also included in international standards:

i. The estimated life of the project subject to evaluation (source project) is taken into account;
ii. It is determined whether the potential impacts of the source project will continue after the project life is completed;
iii. The most conservative time interval between (i) and (ii) is chosen;
iv. In line with the evaluation of the experts who make the cumulative impact assessment, a balance is established for the time limit that will not be too long or too short.

Step 2: Scoping Phase II – Other Activities and Environmental Drivers

In the second scoping phase of the CIA process (Step 2), studies are carried out to determine whether there is an existing or planned activity ("secondary activities") or natural external factor affecting the same VECs within the analytical framework determined in the previous step.

Other (Secondary) Activities

The aim of the studies to be carried out in this step is to determine the activities (secondary activities) that can affect the status of VECs evaluated within the scope of CIA, in addition to the source project. Secondary activities may include existing and future activities (IFC, August 2013). Future activities, on the other hand, can be grouped into certain activities, reasonably foreseeable activities and hypothetical activities.

Within these three groups, certain activities represent activities that are certain to occur or are expected to occur with a very high probability. Reasonably foreseeable activities include activities that are likely to occur but involve uncertainty. Hypothetical activities include activities for which there is a serious uncertainty about their realization. The criteria for how future activities can be classified under these three groups are summarized in the graph presented in the Figure XVII.5 below.

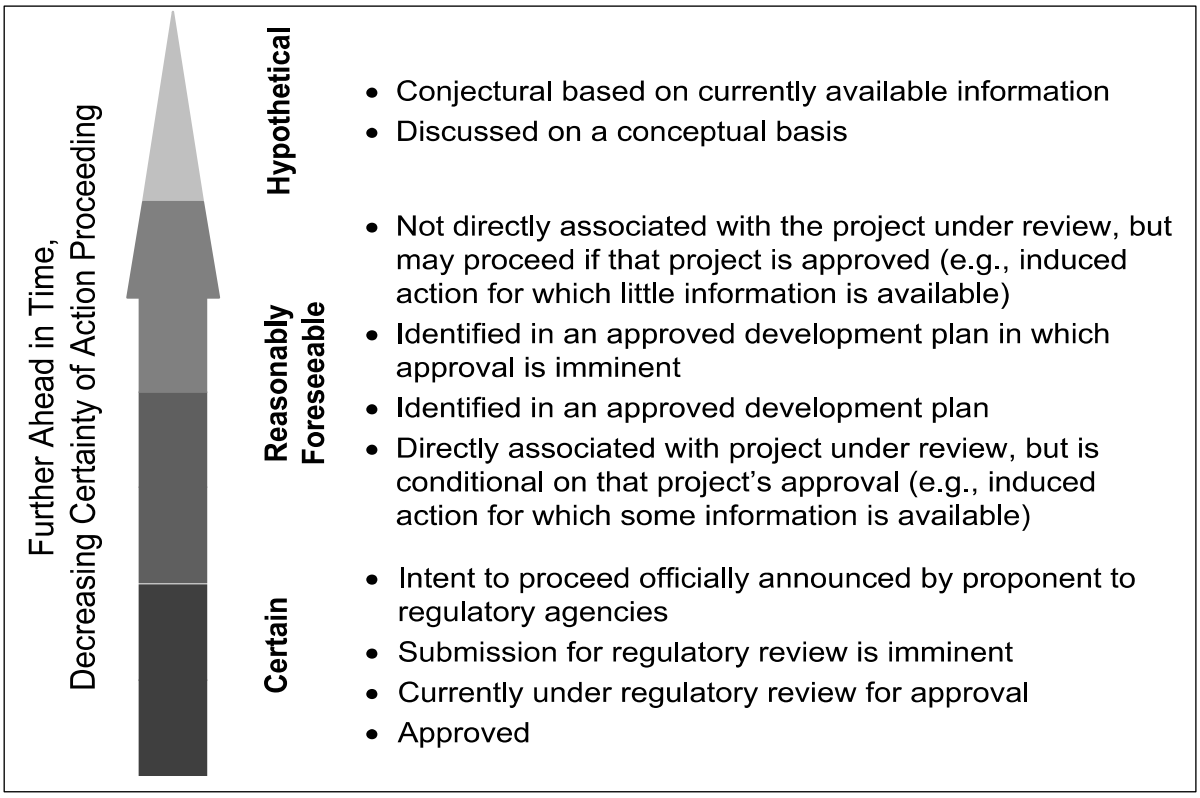

Figure XVII.5. Classification of Future Actions

In the classification described in the Figure XVII.5 above, it will create difficulties in practice if the certain and reasonably foreseeable projects can be clearly differentiated according to certain criteria. Therefore, within the scope of the CIA study of the Antalya-Alanya Motorway Project, all of the projects that are certain and reasonably foreseeable will be named as “reasonably foreseeable” projects.

In determining reasonably foreseeable projects, it is recommended to refer primarily to local, regional and national plans, and to consider a generally not very long time frame due to uncertainties in long-term investment plans. This period is accepted as 3-4 years in the European Union. Good practice recommends that where local, regional and national plans are not available, activities that are in the planning stage and whose official permit processes are in progress (e.g. EIA Report has been prepared, permit application has been made, etc.) should be considered. However, it is not possible for this approach to reveal a certainty about which activity will take place. It will always be possible that some of the activities in the planning phase will not be realized within the stipulated time, or that an unforeseen project will be developed and implemented. At this point, it is important that the time limits taken into account in the evaluation and all the developments and factors included in the evaluation are clearly explained in the CIA report (IFC, August 2013).

While the evaluation of past and current projects within the scope of CIA can be mostly based on tangible data, the existence of different possibilities regarding the realization status of the projects included in the evaluation with the definition of "Reasonably Foreseeable" may cause uncertainties within the scope of CIA. International good practices suggest that “scenario analyzes” be included in the evaluation to eliminate such uncertainties. The purpose of scenario analysis is not to identify the most probable scenario, but to enable assessment based on the consequences of uncertainties and, if necessary, the development of measures for cumulative impact management (IFC, August 2013).

After the Cumulative Impact Assessment area is determined in the assessment to be made within the scope of the Antalya-Alanya Motorway Project, other activities and environmental factors that will affect the status of VECs selected for the Cumulative Impact Assessment within this geographical boundary, available resources (e.g. Master Plans, EIA Positive Decisions for Projects etc.) and the infrastructure databases of the Ministry of Transport and Infrastructure, which are made available to Project Sponsor, will primarily focus on transportation infrastructure projects.

Step 3: Establish Information on Baseline Status of VECs

In the third step of the CIA process, the current status of VECs is determined. The main purpose of this step is to understand the response of a VEC to the impact, its resilience and the time it will need to recover, and to determine the trend of change in the conditions of VECs (IFC, August 2013). In this step, first of all, the scope and adequacy of the available data should be evaluated. It is important to anticipate the need for data at this early stage of the scoping process. If the available data provide sufficient information to fully assess the cumulative impacts, no additional data collection process will be needed (IFC, August 2013).

In a typical CIA study, since a larger area is studied compared to a typical EIA study, it is generally not possible to create a database as comprehensive as an EIA. In this respect, data focusing on especially on important VECs are taken into account within the scope of the CIA study. The need for new baseline data collection is often limited and, if needed, these efforts focus on indicators to assess changes in the state of VECs (IFC, August 2013; World Bank ESMAP, December 2012).

Historical information on the status of VECs is important in determining trends in conditions, thereby assessing important issues within the scope of cumulative impacts. For example, if there is a prolonged/significant deterioration in the conditions of a particular VEC, this may be an indication that the threshold (limit) values are approaching at which change is no longer acceptable (IFC, August 2013). For this reason, the development of the required database on the current status of the selected VECs by utilizing the current sources constitutes an important part of the CIA process.

For the Antalya-Alanya Motorway Project, the basic conditions for VECs to be evaluated within the scope of this study will be based on the information collected for each environmental and social issue under the ESIA process. Relevant information on VECs is provided in the relevant sections of this ESIA Report.

Step 4: Assess Cumulative Impacts on VECs

Cumulative impacts on VECs will be analyzed by estimating the future state of VECs under the collective influence of past, present and future (reasonably foreseeable activities/projects/developments). The purpose of this step is to make an assessment of what conditions VECs will have as a result of the combined impact of all relevant resources.

The assessment made in this context should reveal the possible impacts and risks that may threaten the long-term existence and sustainability of VECs. Also, in this step, the total impact on VECs and the contribution of the source project to this impact (World Bank ESMAP, December 2012) should also be revealed, as well as the known or predictable cause-effect relationships and whether impacts and risks will interact with each other (IFC, August 2013).

The assessment will be based on a qualitative approach and will focus on the final state of the relevant VEC under the influence of all impact factors.

Potential cumulative impacts will be estimated with a holistic approach, considering the possible impacts (project impacts) of the activities carried out within the scope of the Antalya-Alanya Motorway Project and the possible impacts of external factors, if any. If the source project does not have any impact on a VEC, the possible cumulative impacts on that VEC (cumulative impacts on the VEC of other projects other than the source project) will not be considered within the scope of this study.

The cumulative impacts of the project, which are estimated using the results of the EIA study, will show what kind of mitigation measures will be required for the project. On the other hand, the cumulative impact assessment, taking into account all sources of impact on a VEC, will provide a description of the measures that will need to be implemented by all parties/project owners contributing to the total impact (IFC, August 2013).

Step 5: Assess Significance of Predicted Cumulative Impacts

Potential cumulative impacts will be estimated with a holistic approach, considering the possible impacts (project impacts) of the activities carried out within the scope of the Antalya-Alanya Motorway Project and the possible impacts of external factors, if any (see Table XVII.1). If the source project does not have any impact on a VEC, the possible cumulative impacts on that VEC (cumulative impacts on the VEC of other projects other than the source project) will not be considered within the scope of this study.

Table XVII.1. Criteria for Determining the Significance of Cumulative Impacts

Significance	Impacts
Severe	Impacts that the decision maker should consider when the Recipient/Source is irreversibly compromised.
Major	Impacts that may become key decision-making issue.
Moderate	Impacts that are unlikely to become issues on whether the project design should be selected, but where future study may be needed to improve on current performance.
Minor	Impacts those are locally significant.
Not Significant	Impacts that are beyond the current forecasting ability or are within the ability of the resource to absorb such change.

Source: UK Highways Agency 205/08: Design Manual for Roads and Bridges; http://www.standardsforhighways.co.uk/ha/standards/dmrb/

Current practice shows that setting thresholds is an important part of the process, not only for assessing cumulative impacts, but also for developing management strategies. In order to assess the significance of cumulative impacts, it is necessary to define the limits at which change in the conditions of VECs is acceptable. These limits will allow comparison of incremental effects. In practice, the activity will be considered acceptable if the cumulative impact of all relevant actions, projects and activities on a VEC does not exceed a certain threshold (IFC, August 2013).

Step 6: Management of Cumulative Impacts - Design and Implementation

The last step of the CIA process describes how the cumulative impacts identified in the previous steps will be managed. Management practices required to prevent anticipated cumulative impacts are shaped by both how the impacts arise (e.g. through other projects and natural factors affecting VECs)

and the characteristics of impacts. At the end of this step, after taking preventive and mitigation measures, the importance of residual effects is evaluated (e.g. by matrix method), and if there is a residual effect, measures for their management are recommended (IFC, August 2013).

Although the management of impacts at the project level and the reduction of the contribution to cumulative impacts are the responsibility of the contributing projects, the highest level of responsibility in cumulative impact management rests with the relevant government authorities. In this context, government authorities should establish a framework for the identification of interested/contributory parties within the scope of CIA, selection of VECs and impact management processes (IFC, August 2013).

XVII.2. Potential Impacts

The cumulative impact assessment will be carried out step by step below in accordance with the methodology described in the previous section.

Step 1: Scoping Phase I - Valued Ecosystem Components (VECs), Spatial and Temporal Boundaries

For the initial determination of VECs, environmental and social issues within the scope of the impact assessment conducted for the Antalya-Alanya Motorway Project in the previous sections of this ESIA report will be taken into account. VECs to focus on in the Cumulative Impact Assessment were selected as follows:

- Land use
  - Forests
  - Agricultural Lands
- Water Bodies
  - Dam Lake
- Key Biodiversity Areas (KBAs)
  - Antalya Plains
  - Kızılot
- Protected areas
  - Nature parks
  - Specially Protected Environment Area (Belek SEPA)
- Local communities
  - Belpınar, Hocalar, Ilıca, Kalemler, Yeniköy, Hacıisalı, Hacıali, Hacıobası, Uzunlar, Kadılar, Örenşehir, Yalçındibi, Alara, Akdam, Üründü, Merkez Neighbourhoods where secondary projects intersect with the Motorway Project.

With regard to the temporal dimension of impacts, the assessment covers, to the maximum extent possible, the impacts of past, present and reasonably foreseeable future developments over the economic life of the Project.

The cumulative impact assessment area for the motorway project was defined by considering the spatial extent of potential overlapping impacts from similar linear infrastructure developments, particularly road and utility corridors, on shared Valued Environmental and Social Components (VECs). The area was delineated using GIS-based analysis and a desk-based review of regional planning data and project locations.

Although the irrigation projects—Serik–Deniztepesi Irrigation, Manavgat–Naras Irrigation, Manavgat Irrigation, Oymapınar Dam Access Road, Köprüçay Irrigation, Yavrudoğan Dam Irrigation, Alanya–Yeniköy–Yerköprü Dam Irrigation, and Yeniköy Dam Irrigation—have been identified within the broader region, their implementation timelines do not coincide with the construction or operation phases of the motorway project. As such, no temporal overlap is expected, and these projects are not anticipated to contribute to cumulative impacts during the project's lifecycle.

As mentioned in Chapter 4 ("ESIA Methodology"), The Area of Influence (AoI) for the Antalya-Alanya Motorway Project has been determined separately for each different environmental and social component. Study areas and AoI's for each environmental and social component are listed in Table XVII.2. Accordingly, the Area of Influence (AoI) has been determined by considering the direct impact area of the Project activities. In this respect, the motorway width (35.5 m) and the minimum width of the expropriation corridor (55 m) had been considered. It should be noted that the expropriation corridor will extend up to maximum 450 m at the locations of interchanges, large embankment and cut sites, service areas, etc. In addition, some of the quarries and disposal areas are located out of the expropriation corridor. Thus, in consideration of such components, study area had to be expanded exceptionally as needed. The study area determined for Land Use and Property, Topography, Soil and Geology, Ecology and Biodiversity, Landscape and Visual Environment, Protected Areas and Cultural Heritage is 400 m.

The overall study area covering all sub study areas has been determined as 4,000 m corridor (2,000 m from each side of the Motorway axis) on the basis of the air quality and socio-economic environment components.

Table XVII.2. Proposed Study Area for the Motorway

Environmental and Social Component	Study Area (m)*	Possible AoI / SAoI (m)
Air Quality	4,000	2,000
Topography, Soils, and Geology	400	100
Water Resources	1,000	500
Noise and Vibration	2,000	1,000
Landscape and Visual Environment	400	400
Ecology and Biodiversity***	400	100
Protected Areas	400	100
Cultural Heritage	400	100
Land Use and Property	400	100
Socio-economic Environment **	4,000	2,000
Community Health and Safety	2,000	1,000
Cumulative Impact Assessment ****	10,000	10,000

** Represents the total width. For example; a 400 m study area is composed of 2 x 200 m corridors (200 m located in the left side and 200 m located in the right side of the Motorway's axis, making a total of 400 m in total).*

*** It should be noted socio-economic environment, due to its nature, propound a distinction in the ESIA approach; thus the study area specified in the table for socio-economic environment should be considered as the minimum study area. Settlements, whose lands extend beyond the proposed study area, have also been included in the scoping assessments and will be included in the scope of ESIA assessments as well, wherever necessary.*

**** For biodiversity, the area of influence was initially defined based on the project's direct impacts. Nevertheless, the impact assessment and field surveys extended beyond the 400 m study area, and wider components of the project footprint were incorporated into the evaluation.*

***** Within the scope of cumulative impact assessment studies, an area of 5 km north and 5 km south from the Project area was determined.*

The area where the cumulative impacts are evaluated, apart from the study areas within the scope of the project, is defined as the area where the activities to be carried out in the project are likely to cause changes on the environmental and social components together with the activities within the scope of other nearby projects. This area is much wider than the direct impact area of the project and has been chosen to include impacts on different environmental and social components (air, water, socio-economics, etc.).

However, as a result of the preliminary evaluations made, considering the prevailing wind direction of the secondary projects around the project area, climatic characteristics, the distribution of the effects on air quality, the spread of the noise effect, the dimensions of the change to be observed on the flora and fauna, the project route should be 5 km in the north and south directions as a total of 10 km corridor cumulative impact assessment area has been selected. It is clear that this area is wide enough to allow appropriate assessment of the cumulative impacts that may be on VECs.

The study areas and cumulative impact assessment area determined within the scope of the Antalya-Alanya Motorway Project are presented in Figure XVII.6.

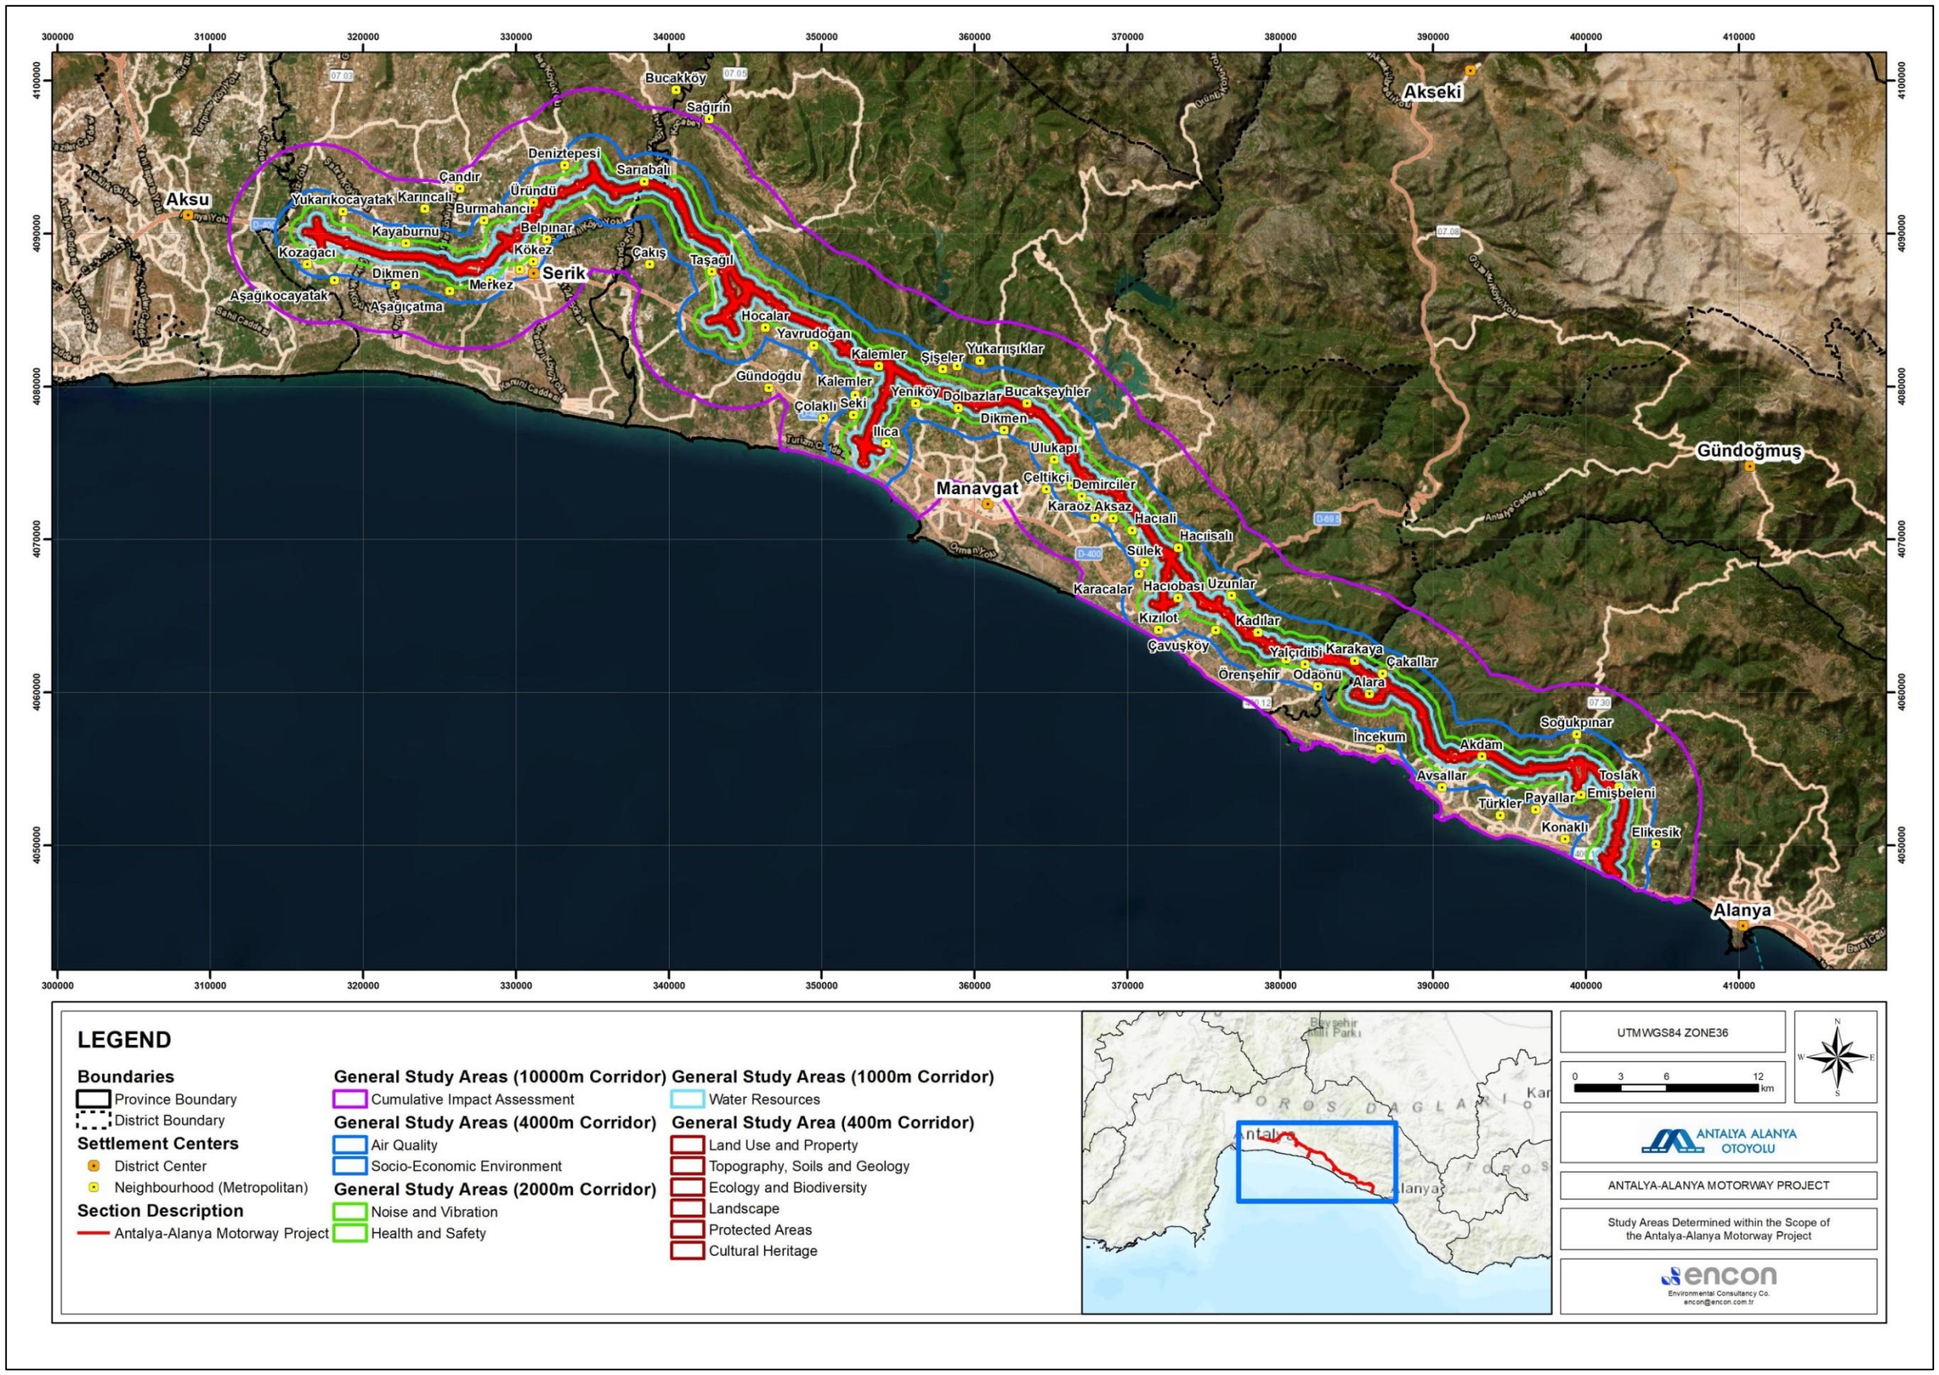

Figure XVII.6 Study Areas Determined within the Scope of the Antalya-Alanya Motorway Project

Step 2: Scoping Phase II – Other Activities and Environmental Drivers

Within the scope of the project, other past, ongoing, and reasonably foreseeable transportation-related infrastructure projects (such as railway constructions and natural gas pipelines, energy transmission lines) located in Antalya Province were considered in the second stage of the CIA. These projects were evaluated through a desk-based review of relevant databases to assess their potential cumulative effects on the selected VECs.

Ministry of Transport and Infrastructure and other available resources (e.g. Environmental Master Plans, EIA Positive Decisions for Projects, etc.) are as listed in Table XVII.3.

It should be noted that the list given in Table XVII.3 is a comprehensive list covering all other projects in the region. The last column of the table describes the potential of other projects/activities/developments to influence selected VECs. In the scope of the cumulative impact assessment, the Railway Line, two Energy Transmission Lines (ETL) and the Natural Gas Pipeline project were included due to their linear nature and spatial relevance to the motorway route. Given the linear nature of the motorway project, point-source projects were not included, as they are not expected to generate overlapping or synergistic effects on the selected VECs within the defined assessment area.

The projects in Table XVII.3 are the projects selected within the scope of the CIA study in the first place. Secondary projects within the CIA Area are given in
Figure XVII.7**Error! Reference source not found.**

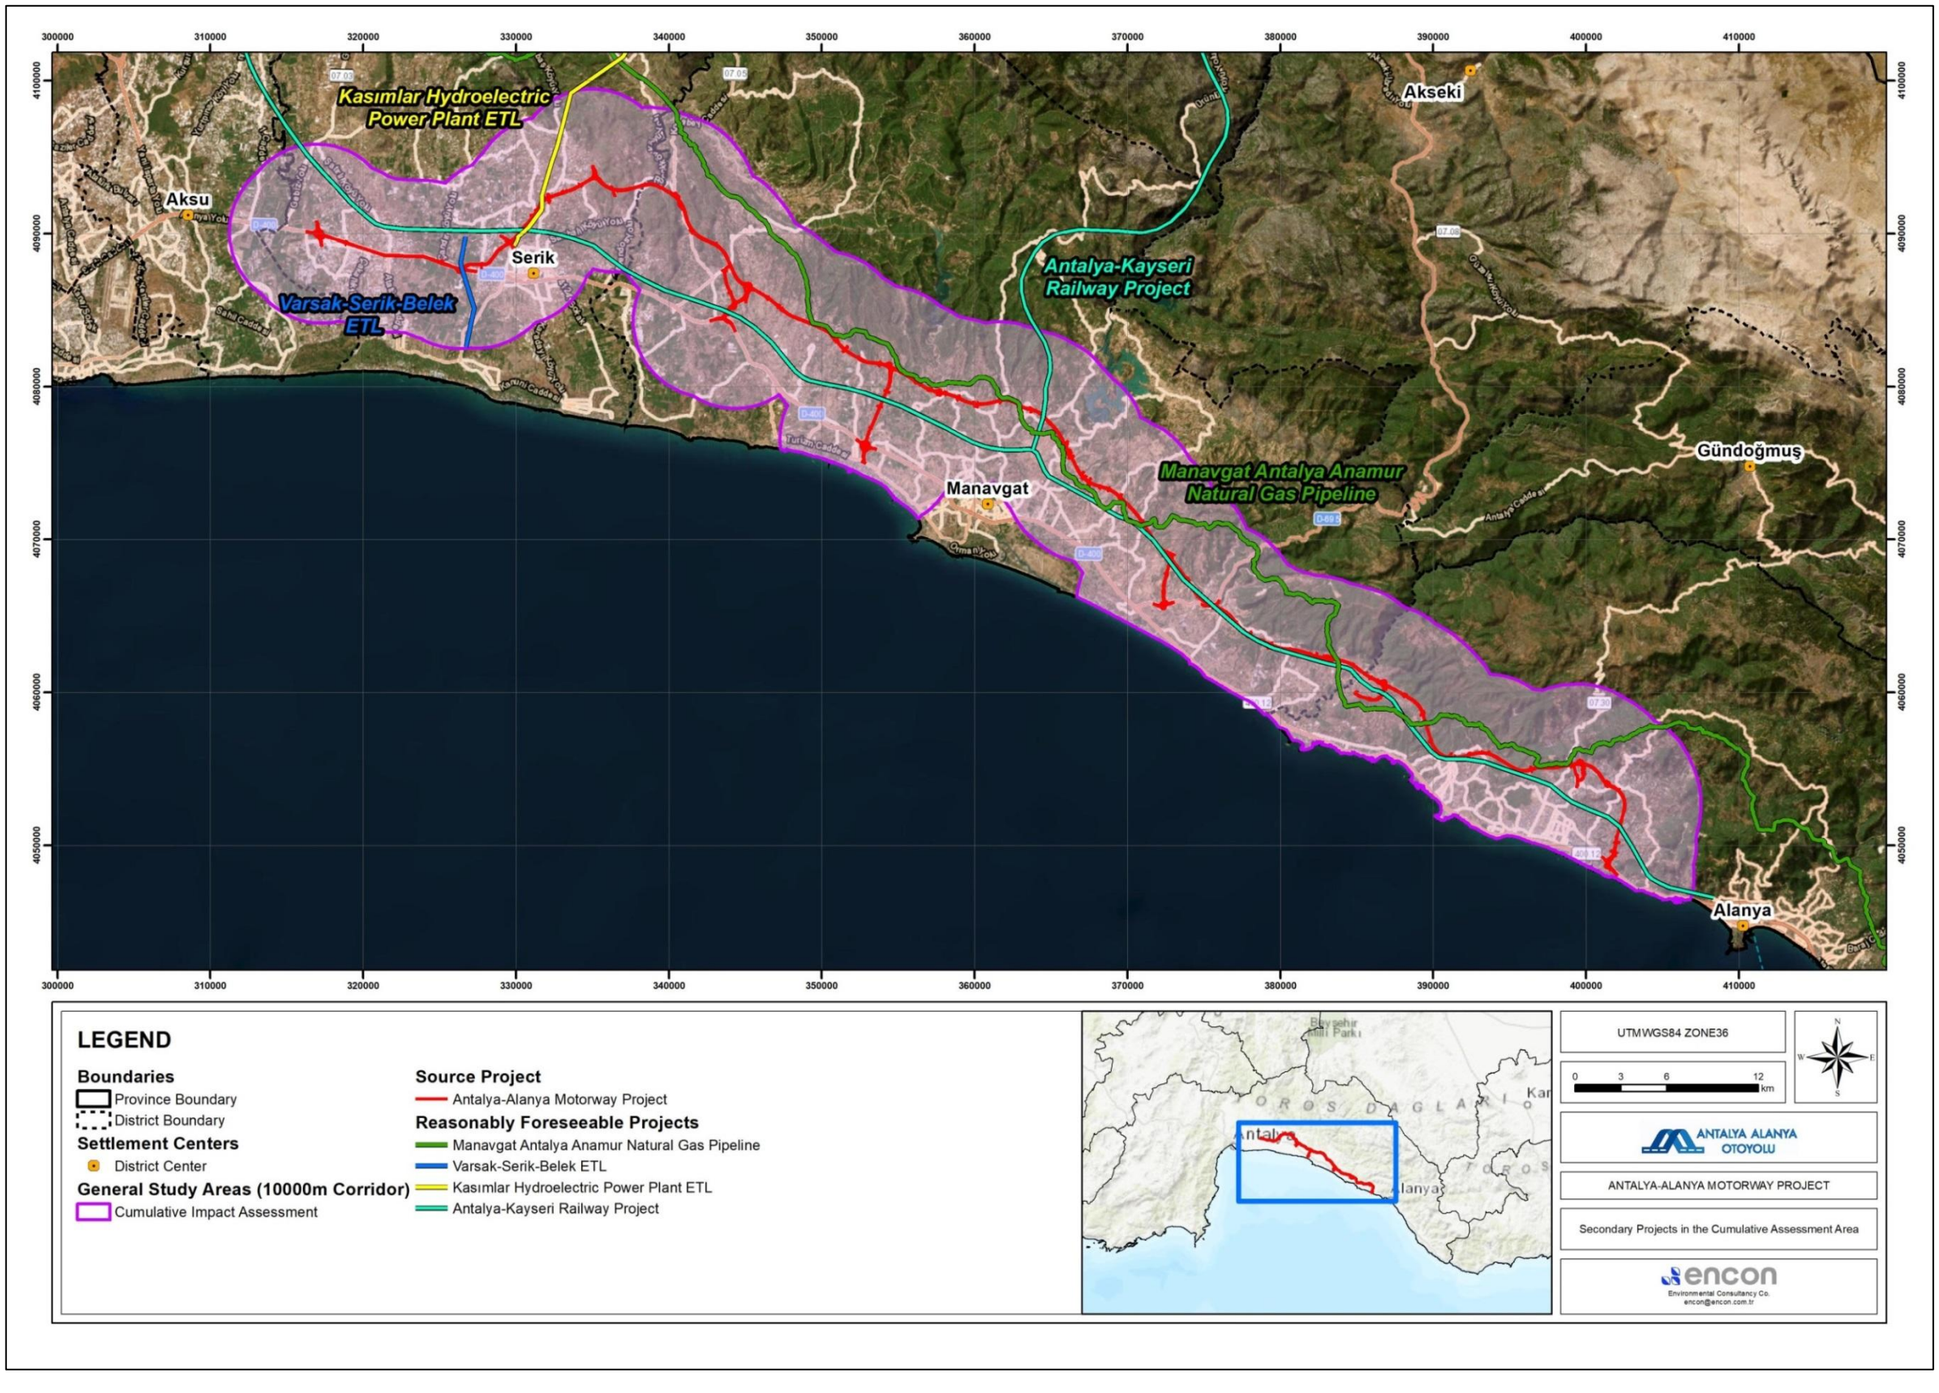

Figure XVII.7 Secondary Projects in the Cumulative Assessment Area

As mentioned before, in the Cumulative Impact Assessment for the Antalya-Alanya Motorway Project, only the projects/activities/developments that have the potential to affect selected VECs are marked as "Yes" in the last column of Table XVII.3. Cumulative Impact Assessment practices will be considered in accordance with the VEC-centered perspective. Projects in operation will be considered as existing projects within the scope of evaluation.

Table XVII.3 Other Projects/Activities/Developments in Antalya Province

Industry Sector	Other Project/Development	Status	Construction		Project Cost	Potential for Affecting the Selected VECs	
			Start	End		Yes	No
Infrastructure-Railway	Antalya- Kayseri Railway Project	Project Design	Not known at this stage		-		
Infrastructure – Natural Gas	Manavgat Antalya Anamur Natural Gas Pipeline	Project-Design	Not known at this stage but Construction period will take 3 years		458,000,000 TL		
Infrastructure – Energy Transmission Line (ETL)	Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	Operation	Operation Phase		16,000,000 TL		
	Varsak-Serik-Belek ETL	Operation	Operation Phase		2,700,000 TL		

The cumulative impact assessment considers the spatial and temporal overlaps between the Antalya–Alanya Motorway Project and other relevant developments in the region. Both the railway project and the natural gas pipeline are currently under design phase, and their construction timelines are expected to overlap with that of the motorway, particularly between 2025 and 2028. Although the two energy transmission lines are in the operational phase, their spatial proximity to the motorway corridor may contribute to long-term residual impacts, particularly in terms of land use and ecological fragmentation.

Step 3: Establish Information on Baseline Status of VECs

The baseline conditions for VECs to be assessed in this study are based on information collected for each environmental and social issue under the ESIA process. Relevant information on VECs is provided in the relevant sections of this ESIA Report.

Step 4: Assess Cumulative Impacts on VECs

The results of the evaluation of the cumulative impacts of the Antalya-Alanya Motorway Project on the selected VECs along with other projects/activities/developments identified in the region are summarized in
Figure XVII.8.

Within the scope of the assessment, the cumulative impact potential on the VECs was evaluated by considering the "***Infrastructure Projects***" affecting the Antalya-Alanya Motorway Project.

In this context, the potential for cumulative impacts on each VEC has been classified as none, low, moderate or high depending on the criteria described below.

- None; if the VEC will only be affected by the Antalya-Alanya Motorway Project.
- Low; if VEC will be affected by only 1 other project in addition to the Antalya-Alanya Motorway Project.
- Moderate; if VEC will be affected by 2 more projects in addition to the Antalya-Alanya Motorway Project.
- High; if the VEC will only be affected by 3 or more projects in addition to the Antalya-Alanya Motorway Project.

As can be seen from the assessment, there are three projects interacting with the Antalya-Alanya Motorway Project and there is a VEC that causes two “High” cumulative impact potential.

It should be noted that the assessment is limited to the level of technical knowledge currently available to practitioners of this Cumulative Impact Assessment. In addition, the assessment is based on currently known routes, so any changes to projects' route could change the impact status of VECs. A table summarizing the Interaction of Projects with Selected VECs is presented in Table XVII.4.

Table XVII.4 Interaction of Projects with Selected VECs

VECs	Source Project	Other Projects				Cumulative Impact Potential
	Antalya Alanya Motorway Project	*Manavgat-Antalya-Anamur Natural Gas Pipeline*	*Varsak-Serik-Belek Energy Transmission Line*	*Kasımlar Hydroelectric Power Plant Energy Transmission Line*	Antalya-Kayseri Railway Project	
Protected Areas						
Nature Park						Low
Specially Protected Environment Area						Moderate
Water Bodies						
Dam Lake						Low
Land Use						
Forests						High
Agricultural Lands						High
Key Biodiversity Areas (KBAs)						
Antalya Plains						Low
Kızılot						None
Local communities						
Belpınar						None
Hocalar						Moderate
Ilıca						None
Kalemler						Moderate
Yeniköy						Moderate
Hacıisalı						Moderate
Hacıali						Moderate
Hacıobası						Low
Uzunlar						Moderate
Kadılar						Moderate
Örenşehir						Low
Yalçıdibi						Moderate
Alara						Moderate
Akdam						Moderate
Üründü						Moderate
Merkez						Moderate

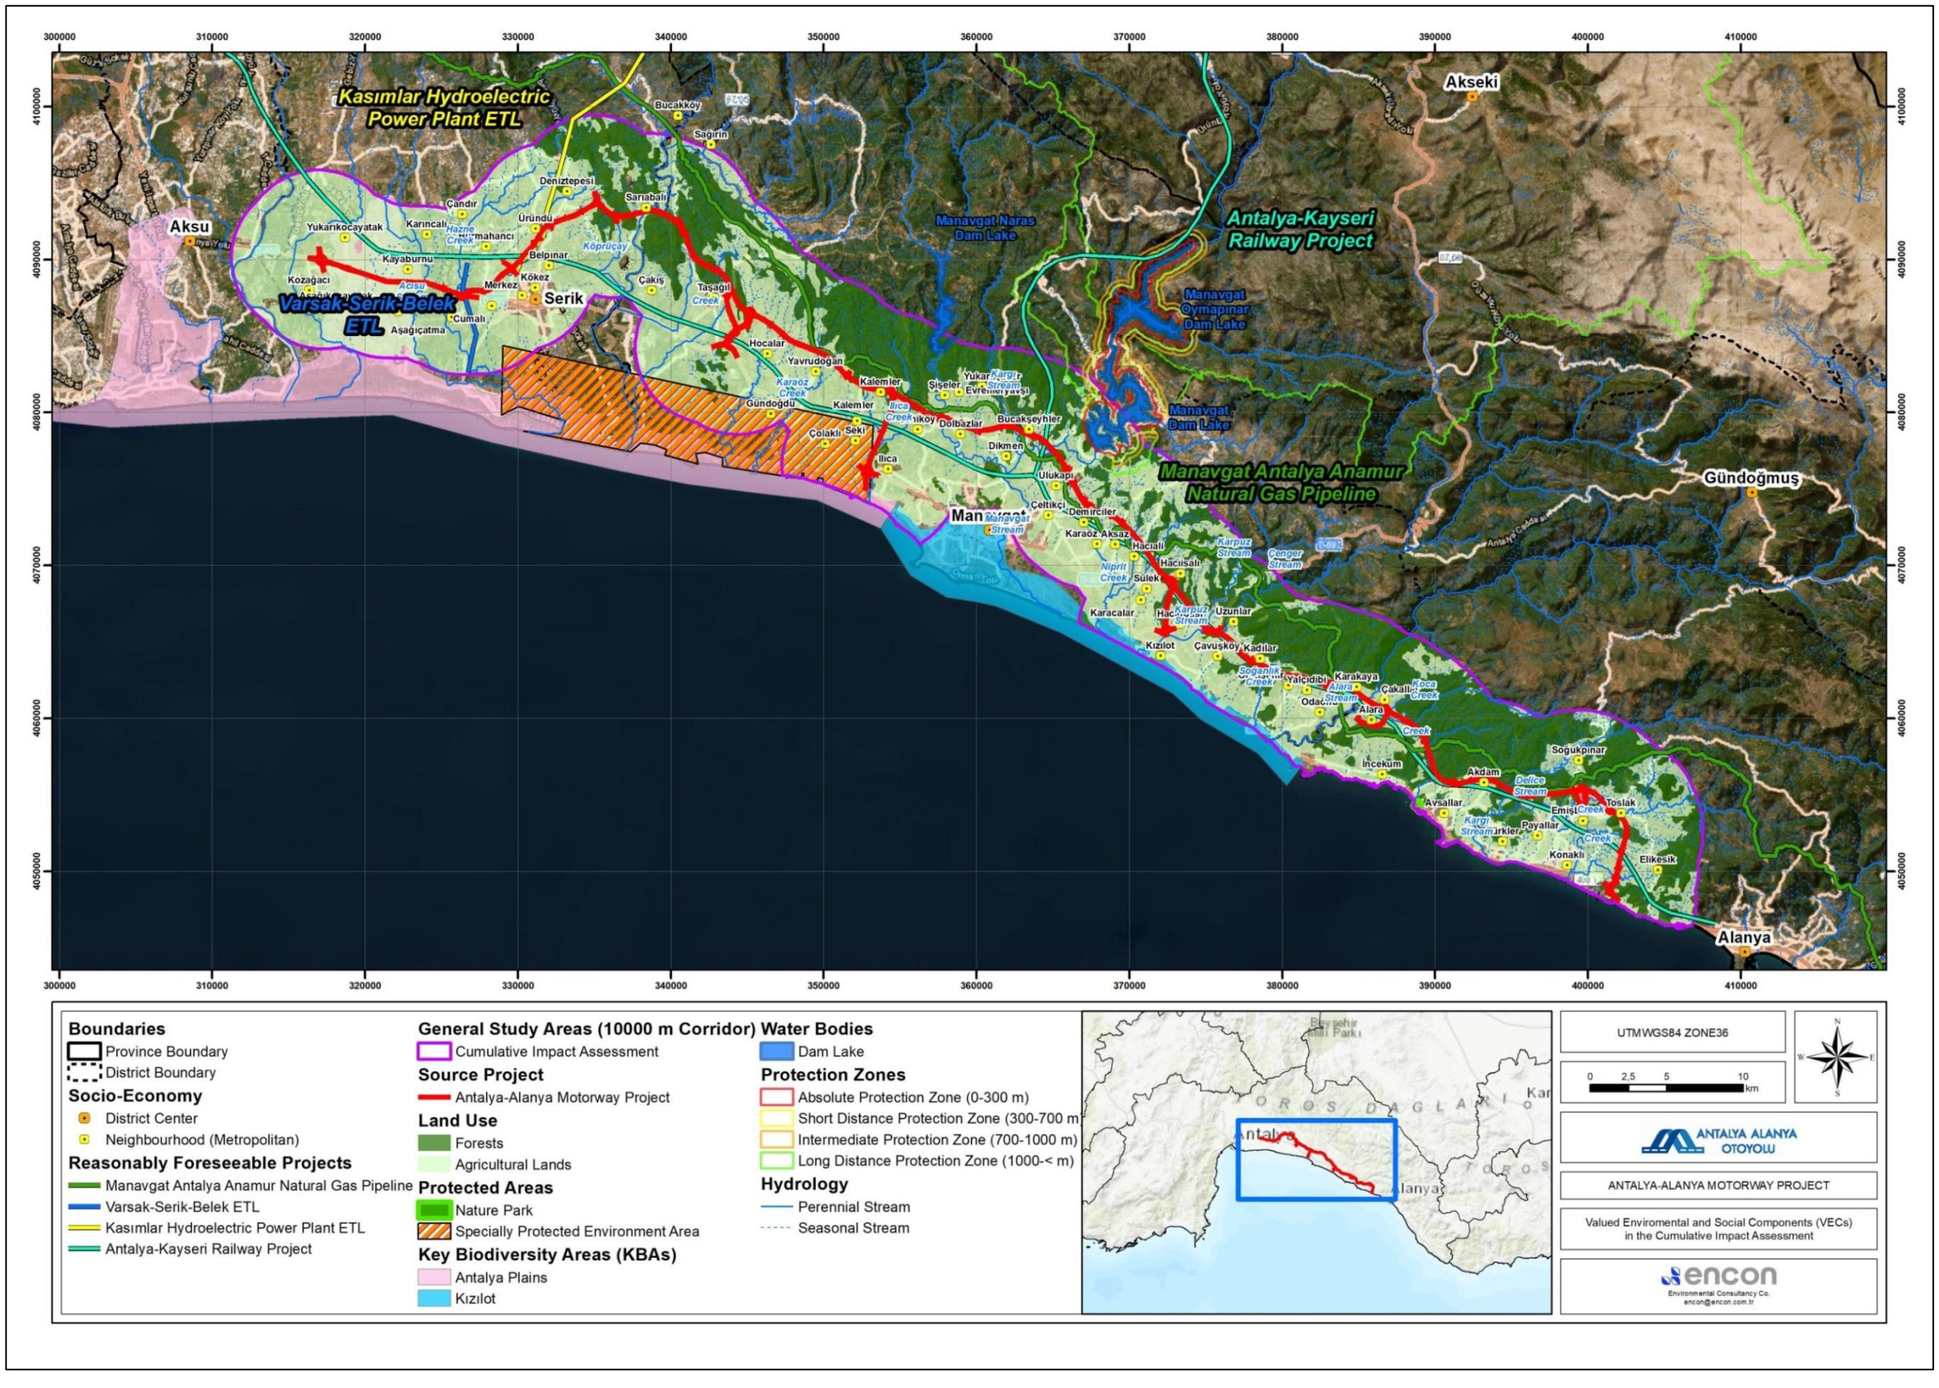

Figure XVII.8 Valued Enviromental and Social Components (VECs) in the Cumulative Impact Assessment

Step 5 and Step 6: Assess Significance of Predicted Cumulative Impacts and Management of Cumulative Impacts – Design and Implementation

Table XVII.5 lists VECs with low, moderate, or high cumulative impact potential (as assessed in Step 4). The significance of the cumulative impacts was then determined according to the criteria given section of assessment methodology.

Table XVII.5 Significance of Potential Cumulative Impacts

VECs	Cumulative Impact Potential	Significance of Cumulative Impact
Protected Areas		
Nature Park	None	-
Specially Protected Environment Area	Moderate	Moderate
Water Bodies		
Dam Lake	None	-
Land Use		
Forests	High	High
Agricultural Lands	High	High
Key Biodiversity Areas (KBAs)		
Antalya Plains	Low	Low
Kızılot	None	-

The purpose of this section is to identify and assess the cumulative impacts that may arise from the Antalya–Alanya Motorway Project in combination with other existing or planned infrastructure developments in the region. These include the railway project and the natural gas pipeline, both currently under design phase and with potential spatial and temporal overlap with the motorway. Additionally, two energy transmission lines (ETLs), while already operational, have been considered due to their spatial proximity and potential contribution to residual environmental and social impacts.

The cumulative impact assessment focuses on a range of Environmental and Social Components, including but not limited to air quality, noise and vibration, water resources, land use, biodiversity, cultural heritage, socio-economic environment, and community health and safety. The assessment evaluates how overlapping project activities may interact and collectively affect these components.

In addition, the assessment also identifies the VECs that are most affected by the cumulative impacts. The “Affected VECs” column in the table highlights the specific components of concern, providing a clearer link between the identified impacts and the environmental and social values at risk. This ensures that the evaluation not only considers impacts on environmental and social components in general but also explicitly addresses how these impacts influence key VECs shared across multiple projects.

The table below summarizes the identified cumulative impacts, their assessed significance (categorized as High, Medium, Low, or Negligible), proposed mitigation measures, and the expected level of residual impact after mitigation. The assessment aims to inform impact management planning

and ensure that cumulative effects are adequately addressed through coordinated and proportionate mitigation strategies.

Since cumulative impacts result from the actions of more than one stakeholder, responsibility for the management of these impacts encompasses all stakeholders. It is important that individual development requires individual actions to eliminate or minimize their contribution.

The identified cumulative impacts, along with their significance levels, proposed mitigation measures, and expected residual impacts, are summarized in Table XVII.6.

The mitigation measures outlined in Table XVII.6 are indicative and conditional in nature, developed solely for the purpose of addressing potential cumulative impacts that may arise if and when nearby or associated projects become active during overlapping timeframes and within shared zones of influence.

These measures do not represent firm commitments or obligations either by this Project or by any third-party entities referenced. They are based on current publicly available information, and in most cases, the implementation timelines, design details, and exact footprints of the other projects are unknown or remain unconfirmed. As such, these measures are to be regarded as considerations to be further evaluated in the event that the relevant external projects proceed to execution.

Where such potential overlaps may materialize and where technical feasibility and jurisdictional authority allow, good-faith engagement with the relevant third parties may be pursued. However, the success of any collaborative mitigation effort remains outside the direct control of this Project and will depend on future developments.

Table XVII.6 Table including Suggested Mitigation to be Considered

Other Projects	Affected VECs	Assessment of Cumulative Impact with the Antalya-Alanya Motorway Project	Mitigation Measures	Residual Cumulative Impact
Air Quality				
Antalya- Kayseri Railway Project	➢ Nature Park ➢ Specially Protected Environment Area ➢ Forests ➢ Agricultural Lands ➢ Local communities (Hocalar, Kalemler, Yeniköy,Hacıali, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Alara, Akdam Neighbourhoods)	➢ Increase in dust emission levels due to simultaneous construction activities with the motorway project. ➢ Cumulative dust generation and emissions in shared air basins, especially near settlements and agricultural areas. ➢ Risk of exceeding local air quality thresholds. The expected cumulative impact of these projects will be ***Medium***.	➢ If possible coordinated scheduling, dust suppression (e.g. watering), covering trucks, low-emission equipment, air quality monitoring in overlapping zones, buffer zones near communities.	**Low**
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Forest ➢ Agricultural Land ➢ Local communities(Hocalar, Kalemler, Yeniköy, Hacıisalı, Hacıali, Uzunlar, Kadılar, Yalçındibi, Alara, Akdam Neighbourhoods)	➢ The Manavgat–Antalya–Anamur Natural Gas Pipeline is currently in the construction phase; construction may coincide with the motorway project. ➢ If construction phases overlap, emissions from excavation, pipe-laying, and heavy machinery use could add to the overall air quality burden. ➢ Combined activities may result in increased levels of particulate matter (PM10) and nitrogen oxides (NO_x) in the project region. ➢ The cumulative impact could be particularly critical in environmentally sensitive areas and residential zones located near both projects. ➢ Without coordinated planning, temporary exceedances of air quality standards may occur during the peak construction period. The expected cumulative impact of these projects will be ***Medium***.	➢ Early inter-project coordination, permitting-stage CIA requirements, shared dust suppression, real-time monitoring if overlap occurs.	**Low**
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Specially Protected Environment Area ➢ Forest ➢ Agricultural Land ➢ Local communities (Belpınar, Üründü Neighbourhoods)	➢ No direct emissions; minor indirect impacts may occur due to permanent vegetation clearance and maintenance-related dust or vehicle emissions. The expected cumulative impact of these projects will be ***Negligible.***	➢ Best practices will be implemented during ETL maintenance. ➢ Simultaneous maintenance and highway works will be avoided in shared corridors.	**Negligible**
Varsak-Serik-Belek ETL	➢ Agricultural Lands ➢ Antalya Plains ➢ Local communities (Cumalı, Merkez Neighbourhoods)			
Topography, Soils, and Geology				
Antalya- Kayseri Railway Project	➢ Forests ➢ Agricultural Lands	➢ Significant earthworks may overlap with motorway construction, increasing erosion and topsoil loss. The expected cumulative impact of these projects will be ***High*** (due to simultaneous, large-scale excavation).	➢ If possible coordinated excavation, erosion control, topsoil reuse, slope stabilization	**Low-Medium**
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Forest ➢ Agricultural Land	➢ Potential future trenching could compound soil disturbance in shared zones. The expected cumulative impact of these projects will be ***Medium***.	➢ Make reccomendation to the gas pipeline project to include a cumulative impact assessment at the permitting stage, with specific attention to avoiding simultaneous trenching in areas with high erosion risk.	**Low**
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Agricultal Lands	➢ Minor indirect effects from vegetation clearance and access road erosion, especially on steep terrain. The expected cumulative impact of these projects will be ***Low.***	➢ If possible coordinate with ETL operators to share erosion-related observations during routine motorway inspections.	**Negligible**
Varsak-Serik-Belek ETL	➢ Agricultural Lands			
Water Resources				
Antalya- Kayseri Railway Project	➢ Nature Park ➢ Specially Protected Environment Area ➢ Dam Lake ➢ Forests	➢ The railway construction involves extensive excavation and use of machinery, which may coincide with similar activities in the motorway project. This can lead to increased surface runoff, sedimentation in nearby water bodies, and temporary degradation of water quality.	➢ If possible coordinate water extraction planning to avoid overuse of local sources, especially in dry periods or in hydrologically sensitive basins. ➢ Limit construction activities near water bodies during heavy rainfall	**Low-Medium**

Other Projects	Affected VECs	Assessment of Cumulative Impact with the Antalya-Alanya Motorway Project	Mitigation Measures	Residual Cumulative Impact
	➢ Agricultural Lands ➢ Local communities (Hocalar, Yeniköy,Hacıali, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Alara, Akdam Neighbourhoods)	The expected cumulative impact of these projects will be ***High***.	periods to reduce sediment transport risk	
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Forest ➢ Agricultural Land ➢ Local communities(Hocalar, Kalemler, Yeniköy, Hacıisalı, Hacıali, Uzunlar, Kadılar, Yalçındibi, Alara, Akdam Neighbourhoods)	➢ If constructed during motorway works, trenching and hydrotesting could increase water use and contamination risk near surface waters. The expected cumulative impact of these projects will be ***Medium***.	➢ If possible avoid construction in shared watershed zones at the same time.	**Negligible**
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Agricultural Land ➢ Local communities (Belpınar, Üründü Neighbourhoods)	➢ Minimal ongoing impact; however, historic land clearance and road access in hydrologically sensitive zones may contribute to runoff and erosion. The expected cumulative impact of these projects will be ***Low.***	➢ Observe ETL access routes during rainfall; include water-sensitive areas in visual site inspections.	**Negligible**
Varsak-Serik-Belek ETL	➢ Agricultural Lands ➢ Local communities (Cumalı, Merkez Neighbourhoods)			
Noise and Vibration				
Antalya- Kayseri Railway Project	➢ Nature Park ➢ Specially Protected Environment Area ➢ Forests ➢ Agricultural Lands ➢ Local communities (Hocalar, Yeniköy,Hacıali, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Alara, Akdam Neighbourhoods)	➢ Simultaneous construction may increase daytime and possibly night-time noise levels in nearby settlements. Overlapping activities may amplify vibrations. The expected cumulative impact of these projects will be ***High***.	➢ If possible coordinate working hours; restrict night works near sensitive receptors; use low-vibration equipment; install noise barriers.	**Medium**
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Forest ➢ Agricultural Land ➢ Local communities(Hocalar, Kalemler, Yeniköy, Hacıisalı, Hacıali, Uzunlar, Kadılar, Yalçındibi, Alara, Akdam Neighbourhoods)	➢ If constructed concurrently, overlapping truck movements and excavation may increase local noise levels. The expected cumulative impact of these projects will be ***Medium.***	➢ If possible and not inconvenient avoid simultaneous heavy machinery use near communities; If possible coordinate haul routes and work shifts.	**Low**
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Specially Protected Environment Area ➢ Forest ➢ Agricultural Land ➢ Local communities (Belpınar, Üründü Neighbourhoods)	➢ No significant operational noise, but occasional maintenance may add minor disturbance in rural areas. The expected cumulative impact of these projects will be ***Low.***	➢ If possible align maintenance timing with low-impact periods; notify communities in advance.	**Negligible**
Varsak-Serik-Belek ETL	➢ Agricultural Lands ➢ Antalya Plains ➢ Local communities (Cumalı, Merkez Neighbourhoods)			
Landscape and Visual Environment				
Antalya- Kayseri Railway Project	➢ Nature Park ➢ Specially Protected Environment Area ➢ Forests ➢ Agricultural Lands ➢ Local communities (Hocalar, Kalemler, Yeniköy,Hacıali, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Alara, Akdam Neighbourhoods)	➢ Railway and motorway may result in significant visual alterations, especially in natural landscapes or touristic zones. The expected cumulative impact of these projects will be ***High***.	➢ If possible align design to existing topography; use vegetative screening; prioritize underpasses or tunnels in scenic areas.	**Medium**
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Forest ➢ Agricultural Land ➢ Local communities(Hocalar, Kalemler, Yeniköy, Hacıisalı, Hacıali, Uzunlar, Kadılar, Yalçındibi,	➢ If constructed above ground in parts, additional linear infrastructure could increase visual fragmentation. The expected cumulative impact of these projects will be ***Medium.***	➢ Avoid visible components in scenic areas; co-locate with existing corridors where possible.	**Low**

Other Projects	Affected VECs	Assessment of Cumulative Impact with the Antalya-Alanya Motorway Project	Mitigation Measures	Residual Cumulative Impact
	Alara, Akdam Neighbourhoods)			
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Specially Protected Environment Area ➢ Forest ➢ Agricultural Land ➢ Local communities (Belpınar, Üründü Neighbourhoods)	➢ Existing ETLs already contribute to visual impact; their presence combined with new infrastructure may degrade landscape quality. The expected cumulative impact of these projects will be ***Low.***	➢ No new impact; visual integration of new elements should consider existing visual clutter; consult local land use planning.	**Negligible**
Varsak-Serik-Belek ETL	➢ Agricultural Lands ➢ Antalya Plains ➢ Local communities (Cumalı, Merkez Neighbourhoods)			
Ecology and Biodiversity				
Antalya- Kayseri Railway Project	➢ Nature Park ➢ Specially Protected Environment Area ➢ Dam Lake ➢ Forests ➢ Agricultural Lands	➢ Habitat fragmentation, noise disturbance, and fauna displacement may combine with motorway works in ecologically sensitive areas or near KBAs. The expected cumulative impact of these projects will be ***Medium.***	➢ Coordinate vegetation clearance timing; avoid breeding seasons; implement ecological monitoring	**Low**
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Forest ➢ Agricultural Land	➢ Temporary vegetation removal and disturbance may overlap with motorway works. Impacts are limited if construction avoids sensitive timing. The expected cumulative impact of these projects will be ***Medium.***	➢ Implement basic habitat restoration post-construction.	**Low**
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Specially Protected Environment Area ➢ Forest ➢ Agricultural Land	➢ As the ETLs are already operational and no new land clearance is expected. The expected cumulative impact of these projects will be ***Negligible.***	➢ No mitigation is required beyond routine vegetation maintenance within existing right-of-way boundaries.	**Negligible**
Varsak-Serik-Belek ETL	➢ Agricultural Lands ➢ Antalya Plains			
Land Use and Property				
Antalya- Kayseri Railway Project	➢ Forests ➢ Agricultural Lands ➢ Local communities (Hocalar, Yeniköy,Hacıali, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Alara, Akdam Neighbourhoods)	➢ Railway and motorway may both require land acquisition in the same regions, increasing land pressure and causing more extensive fragmentation of farmland. The expected cumulative impact of these projects will be ***High.***	➢ If possible coordinate land acquisition planning; inform landowners early; provide fair and timely compensation.	**Medium**
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Forest ➢ Agricultural Land ➢ Local communities(Hocalar, Kalemler, Yeniköy, Hacıisalı, Hacıali, Uzunlar, Kadılar, Yalçındibi, Alara, Akdam Neighbourhoods)	➢ Pipeline construction may temporarily restrict access to agricultural land, especially if aligned parallel to the motorway route. The expected cumulative impact of these projects will be ***Medium.***	➢ If possible limit construction footprint; maintain access routes.	**Low**
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Forest ➢ Agricultural Land ➢ Local communities (Belpınar, Üründü Neighbourhoods)	➢ No new land use change expected; existing ETLs already define the current land pattern. The expected cumulative impact of these projects will be ***Negligible.***	➢ No additional mitigation required.	**Negligible**
Varsak-Serik-Belek ETL	➢ Agricultural Lands ➢ Antalya Plains ➢ Local communities (Cumalı, Merkez Neighbourhoods)			

Other Projects	Affected VECs	Assessment of Cumulative Impact with the Antalya-Alanya Motorway Project	Mitigation Measures	Residual Cumulative Impact
Socio-economic Environment				
Antalya- Kayseri Railway Project	➢ Local communities (Hocalar, Yeniköy,Hacıali, Kalemler, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Alara, Akdam Neighbourhoods)	➢ Combined with the motorway, the railway project may increase competition over local employment, housing, and services, and cause pressure on local infrastructure. The expected cumulative impact of these projects will be ***High.***	➢ Prioritize local hiring; coordinate with municipalities on service planning; monitor social dynamics.	**Medium**
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Local communities(Hocalar, Kalemler, Yeniköy, Hacıisalı, Hacıali, Uzunlar, Kadılar, Yalçındibi, Alara, Akdam Neighbourhoods)	➢ Short-term increase in workforce and vehicle traffic may affect rural livelihoods and create temporary disruptions in agricultural areas. The expected cumulative impact of these projects will be ***Medium.***	➢ Use local suppliers/workers; maintain access to agricultural fields; if possible avoid peak harvest times.	**Low**
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Local communities (Belpınar, Üründü Neighbourhoods)	➢ No direct ongoing socio-economic impact expected; previous land acquisition and employment phase completed. The expected cumulative impact of these projects will be ***Negligible.***	➢ No additional mitigation required.	**Negligible**
Varsak-Serik-Belek ETL	➢ Local communities (Cumalı, Merkez Neighbourhoods)			
Community Health and Safety				
Antalya- Kayseri Railway Project	➢ Local communities (Hocalar, Yeniköy,Hacıali, Kalemler, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Alara, Akdam)	➢ Increased heavy vehicle traffic, noise, and dust may collectively elevate accident risks and public health concerns in overlapping communities. ➢ Combined workforce and equipment mobilization may raise safety concerns in rural communities and increase risks of social tension. ➢ Lack of coordination between projects may overwhelm local health or emergency services if an incident occurs. The expected cumulative impact of these projects will be ***High.***	➢ If possible coordinate construction schedules to avoid simultaneous peak traffic in shared access routes, especially near settlements. ➢ Place clear signage and speed control measures near community areas affected by construction traffic. ➢ Inform local communities in advance about construction activities and expected disturbances through local channels (e.g. muhtars, notice boards). ➢ Coordinate with local emergency and health services to align response protocols in case of incidents involving multiple projects. ➢ Provide SEA/SH (Sexual Exploitation, Abuse, and Harassment) awareness training to all site workers.	**Medium**
Manavgat – Antalya- Anamur Natural Gas Pipeline	➢ Local communities(Hocalar, Kalemler, Yeniköy, Hacıisalı, Hacıali, Uzunlar, Kadılar, Yalçındibi, Alara, Akdam)	➢ Combined workforce and equipment mobilization may raise safety concerns in rural communities and increase risks of social tension. ➢ Community members may unintentionally enter construction zones, increasing the risk of injury in the absence of proper fencing and signage. The expected cumulative impact of these projects will be ***Medium***.	➢ Prioritize local workforce recruitment and clearly communicate hiring criteria to avoid perception of unfairness. ➢ Ensure proper fencing and signage around active construction zones to prevent unauthorized access. ➢ Provide SEA/SH (Sexual Exploitation, Abuse, and Harassment) awareness training to all site workers.	**Low**
Kasimlar Hydroelectric Power Plant Energy Transmission Line (ETL)	➢ Local communities (Belpınar, Üründü Neighbourhoods)	➢ No new physical activities; minimal residual risk related to periodic maintenance access in rural zones. The expected cumulative impact of these projects will be ***Negligible.***	➢ No additional mitigation required.	**Negligible**
Varsak-Serik-Belek ETL	➢ Local communities (Cumalı, Merkez Neighbourhoods)			

The impacts of the projects on VECs are shown in Table XVII.4. Local communities within the AoI (e.g., Hocalar, Kalemler, Yeniköy, Hacıali, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Alara, Akdam) are expected to experience cumulative impacts from simultaneous motorway, railway, and pipeline construction activities. Increased traffic volumes, dust, and noise emissions may heighten health and safety risks, while competition for local employment and housing could generate socio-economic pressures. The overlapping presence of multiple workforces may also raise risks related to community relations and SEA/SH concerns. Effective mitigation requires inter-project coordination on construction schedules, health and safety measures, and proactive stakeholder engagement to reduce social tension and safeguard public well-being.

Forests and agricultural lands are highly sensitive VECs due to their ecological, economic, and livelihood functions. Simultaneous land clearance, trenching, and excavation for the motorway, railway, and pipeline projects could lead to cumulative soil erosion, habitat fragmentation, and reduced agricultural productivity. These pressures may result in long-term landscape degradation if not managed collectively. Coordinated land acquisition planning, erosion control measures, and restoration of temporarily disturbed lands will be critical to minimize residual impacts on these VECs.

Protected areas located within or adjacent to the AoI face heightened risks of cumulative disturbance, particularly from noise, vibration, and dust generated by overlapping construction phases of large-scale infrastructure projects. These disturbances can adversely affect biodiversity, visitor experience, and the ecological integrity of protected sites.

Water resources may face cumulative risks of contamination and over-extraction due to multiple projects operating concurrently in the same hydrological basins. Activities such as trenching and large-scale excavation could intensify sedimentation, increase surface runoff, and reduce water quality in nearby lakes and rivers. The risk is particularly critical in dry seasons or during heavy rainfall events. Coordinated water use planning, seasonal construction scheduling, and shared monitoring of water quality will be essential to manage these cumulative impacts.

Socio-economic pressures are expected to intensify as multiple projects operate simultaneously in the region. Local labor demand, migration of non-local workers, and increased competition for services such as housing, healthcare, and transportation may create stress on municipal capacities. These cumulative pressures can affect community cohesion and overall quality of life. Mitigation should focus on prioritizing local hiring, coordinating with municipalities to expand social services, and monitoring socio-economic dynamics to ensure that cumulative impacts remain within manageable levels.

Ecological receptors, particularly Natural Habitats (e.g. Mediterranean maquis, garrigue and coniferous forests) and Key Biodiversity Areas and nationally protected (Antalya Plains and Belek SEPA, which partially intersects with the Project Area) areas within and near the Project Area, are at risk of cumulative habitat fragmentation and disturbance. Concurrent vegetation clearance, noise, and human activity may reduce species abundance and disrupt breeding or migration patterns. The residual impacts could be significant if projects are not harmonized. Coordinated ecological surveys, biodiversity minimization and offset strategies, and alignment of construction schedules with seasonal ecological sensitivities are necessary to limit cumulative impacts on biodiversity.

The cumulative impact assessment has been undertaken based on a worst-case scenario, considering the potential overlap of the identified projects, most of which are still in the planning stage. The assessment does not imply that all impacts will occur simultaneously or at their maximum intensity, but rather provides a precautionary evaluation in line with IFC good practice. Furthermore, cumulative impacts are the result of multiple projects implemented by different stakeholders; therefore, they cannot be addressed solely by the Project Sponsor. Effective management of these impacts will require coordination among all project proponents, regulatory authorities, and local stakeholders to

ensure that risks to valued environmental and social components (VECs) are minimized and managed proportionately.

XVIII. ANALYSIS OF ALTERNATIVES

As already mentioned in previous chapters, the Project is one of the two sub-projects that constitute the Afyonkarahisar-Alanya Motorway Project and is designed to connect Serik and Alanya districts through Manavgat district of Antalya province. The EIA Report for the Project has been prepared and submitted to the MoEUCC and an "EIA Positive Decision" issued on August 17, 2018. Ministry of Transport, and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), General Directorate of Highways, as the owner of the Antalya-Alanya Motorway Project, has tendered for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). As a result of the tendering process, KGM has awarded AAOİAŞ (the Project Sponsor) with a BOT contract for the implementation of the Project. Following the signing of the BOT Contract, Project Sponsor has continued route, and Project optimization and design work in cooperation with KGM and other related state authorities. Throughout the Project history, alternative routes were evaluated from a technical, economic and social point of view. These alternatives were generated to address the challenges that emerged during the feasibility and tender stages and requests of the KGM, and then studied and screened out with the KGM authorities. In the following paragraphs, the criteria that affected the route selection during the feasibility and tender stages and optimization of the route in the scope BOT Contract are explained.

XVIII.1. Route Selection Alternatives

Route selection for the Project has been made in two stages. The first stage included the selection of the route by the KGM during the feasibility and tender stages. Following the BOT tender and appointment of the relevant company, Project Sponsor has conducted further work to optimize the route and the locations, numbers, and/or lengths of the road structures such as viaducts, interchanges, overpasses, underpasses, culverts, etc. to achieve the most suitable design in terms of technical, environmental and economic considerations. The third and final stage of the alternative route selection commenced during the post-design phase and continued until the beginning of the construction phase. During this stage, revisions to the route were made based on findings from field studies and/or insights provided by assigned expert(s). In particular, detailed site investigations carried out during the pre-construction phase necessitated changes in certain sections of the route. The primary reason for these revisions was the identification of cultural heritage sites during field activities. A comprehensive field study was conducted along the Project route to detect and assess cultural heritage assets. Following this process, additional studies will be carried out during the construction phase under the supervision of a cultural heritage expert to be employed by the Project Sponsor. It should be noted that all route revisions proposed by the Project Sponsor are subject to the approval of the General Directorate of Highways (KGM).

In the selection of the route by KGM at the feasibility and tendering stages, the following environmental, social, and economic criteria were taken into consideration to the extent the specified physical and geometric standards of the Motorway specifications allowed:

- Avoidance of impacts on legally protected areas, including cultural heritage sites;
- Avoidance and/or minimization of impacts on ecologically sensitive forests;
- Avoidance and/or minimization of the crossing of residential and industrial areas;
- Keeping sufficient distance to the borders of the residential areas to the extent possible;
- Avoidance and/or minimization of the impacts on essential water resources (rivers, lakes, reservoirs, ponds, etc.) and their protection of these areas where applicable;

- Integration with existing transportation infrastructure so that the existing traffic loads/problems can be mitigated and potential needs of future industrial and residential developments;
- Geotechnical/geological conditions/risks (i.e., landslide sites, hills, seismicity);
- Minimization of the expropriation costs;
- Minimization of construction costs (i.e., need for soil works, optimized number and length of viaduct etc. requirements, costs for access roads);
- Operation costs (i.e., fuel, amortization, workforce losses, etc.);
- Interaction potential with existing infrastructure (e.g., energy transmission lines, water supply/distribution, sewerage system, oil and natural gas pipelines, water channels, telecommunication lines, railways, etc.);
- Local climate conditions that may affect maintenance and operation of the Motorway;
- Existing and planned zoning plans within the municipality borders.

The details of the alternative route generation and selection processes, driven by various considerations at each stage, are provided in the subsequent subsections.

XVIII.1.1. Alternative Route Selection during Feasibility and Tender Stages

The main reasons that cause changes in route selection at feasibility and tender stages are:

- Intersection of the Motorway route with legally protected or Cultural Heritage Sites or Protected Areas;
- Intersection of the Motorway route with settlements and/or their components (e.g., cemetery, power lines);
- Intersection of the Motorway route with existing master plans and/or land use licenses (e.g., mining license);
- Technical feasibility and/or restrictions due to geographical conditions;
- Land use characteristics;
- Economic feasibility.

To detail these considerations, a summary table containing information on the position and reasons for the significant route changes is provided in Table XVIII.1:

Table XVIII.1. Summary of Alternative Route Selection during Feasibility and Tender Stages

Position	Explanation
Km: 0+000	Due to the presence of residential areas and the area licensed for mining operations situated to the west of this location, the Project's starting point is shifted approximately 450 meters south of the initial planned starting point.
Km: 3+700 – 7+000	Due to the presence of mining licenses and to optimize land use, the route was shifted approximately 600 meters south.
Km: 8+000 – 10+500	During a field trip conducted with the relevant state institutions, a 1st Degree Cultural Heritage Site was identified. In the following process, this area was registered in the cultural heritage inventory. The route was shifted in line with the opinions received from the institution.
Km: 24+250 – 25+270	Planned filling application at the Aksu Valley crossing was changed to a viaduct pass due to the presence of agricultural areas, the route's intersection with the existing highway and irrigation channels, and the proximity of a cemetery.
Km: 25+900	Based on findings obtained during fieldworks, location of the planned motorway service building was anticipated to be negatively affected by potential flooding of the Aksu Stream. Additionally, placing the building on agricultural land would complicate the process of obtaining the necessary permits. Consequently, the location of the building was shifted forward to Km: 32+550.
Km: 51+892	In response to feedback from KGM officials, a bridge and junction that were not initially present/visible in the provided Project documents were added to the digital documentation of the Project. As a result, the route was shortened by approximately 35 kilometers.
Km: 66+024	As a result of the opening of Taşağıl-Beydiğin-Derebucak State Road (D-687) to traffic, Taşağıl junction and the access road are required to be revised. After the revision the motorway and D-687 junction will be shortened, motorway access from Taşağıl will be easier, thus reducing the time and fuel consumption.
Km: 82+744	Manavgat Access Route is mostly located on areas planned for zoning and as a result expropriation costs become quite high. If the access route is to be passed through the unhabited areas to the west the costs would be lower.
Km: 85.000	To avoid dividing the Boynuzlubelen neighborhood and to minimize the demolition and compensation of multiple properties, the route was shifted further north at the given location.
Km: 101+527	Since the Project route runs parallel to the railway route for an extended stretch, the planned junction was relocated approximately 130 meters to the east to avoid potential interactions.
Km: 146+111 – 146+120	The tunnel exits at the specified locations have been realigned to conform with the existing zoning plan. Additionally, four viaducts have been added to the route to prevent the division of residential areas resulting from the tunnel exit.

Source: Approved EIA of the Project (Afyonkarahisar-Antalya-Alanya Motorway Project (Antalya-Alanya Section) Environmental Impact Assessment Report).

As a result of the alternative route selection process outlined above, the final route, determined at the conclusion of the feasibility and tender stages, is presented in the Figure XVIII.1 below.

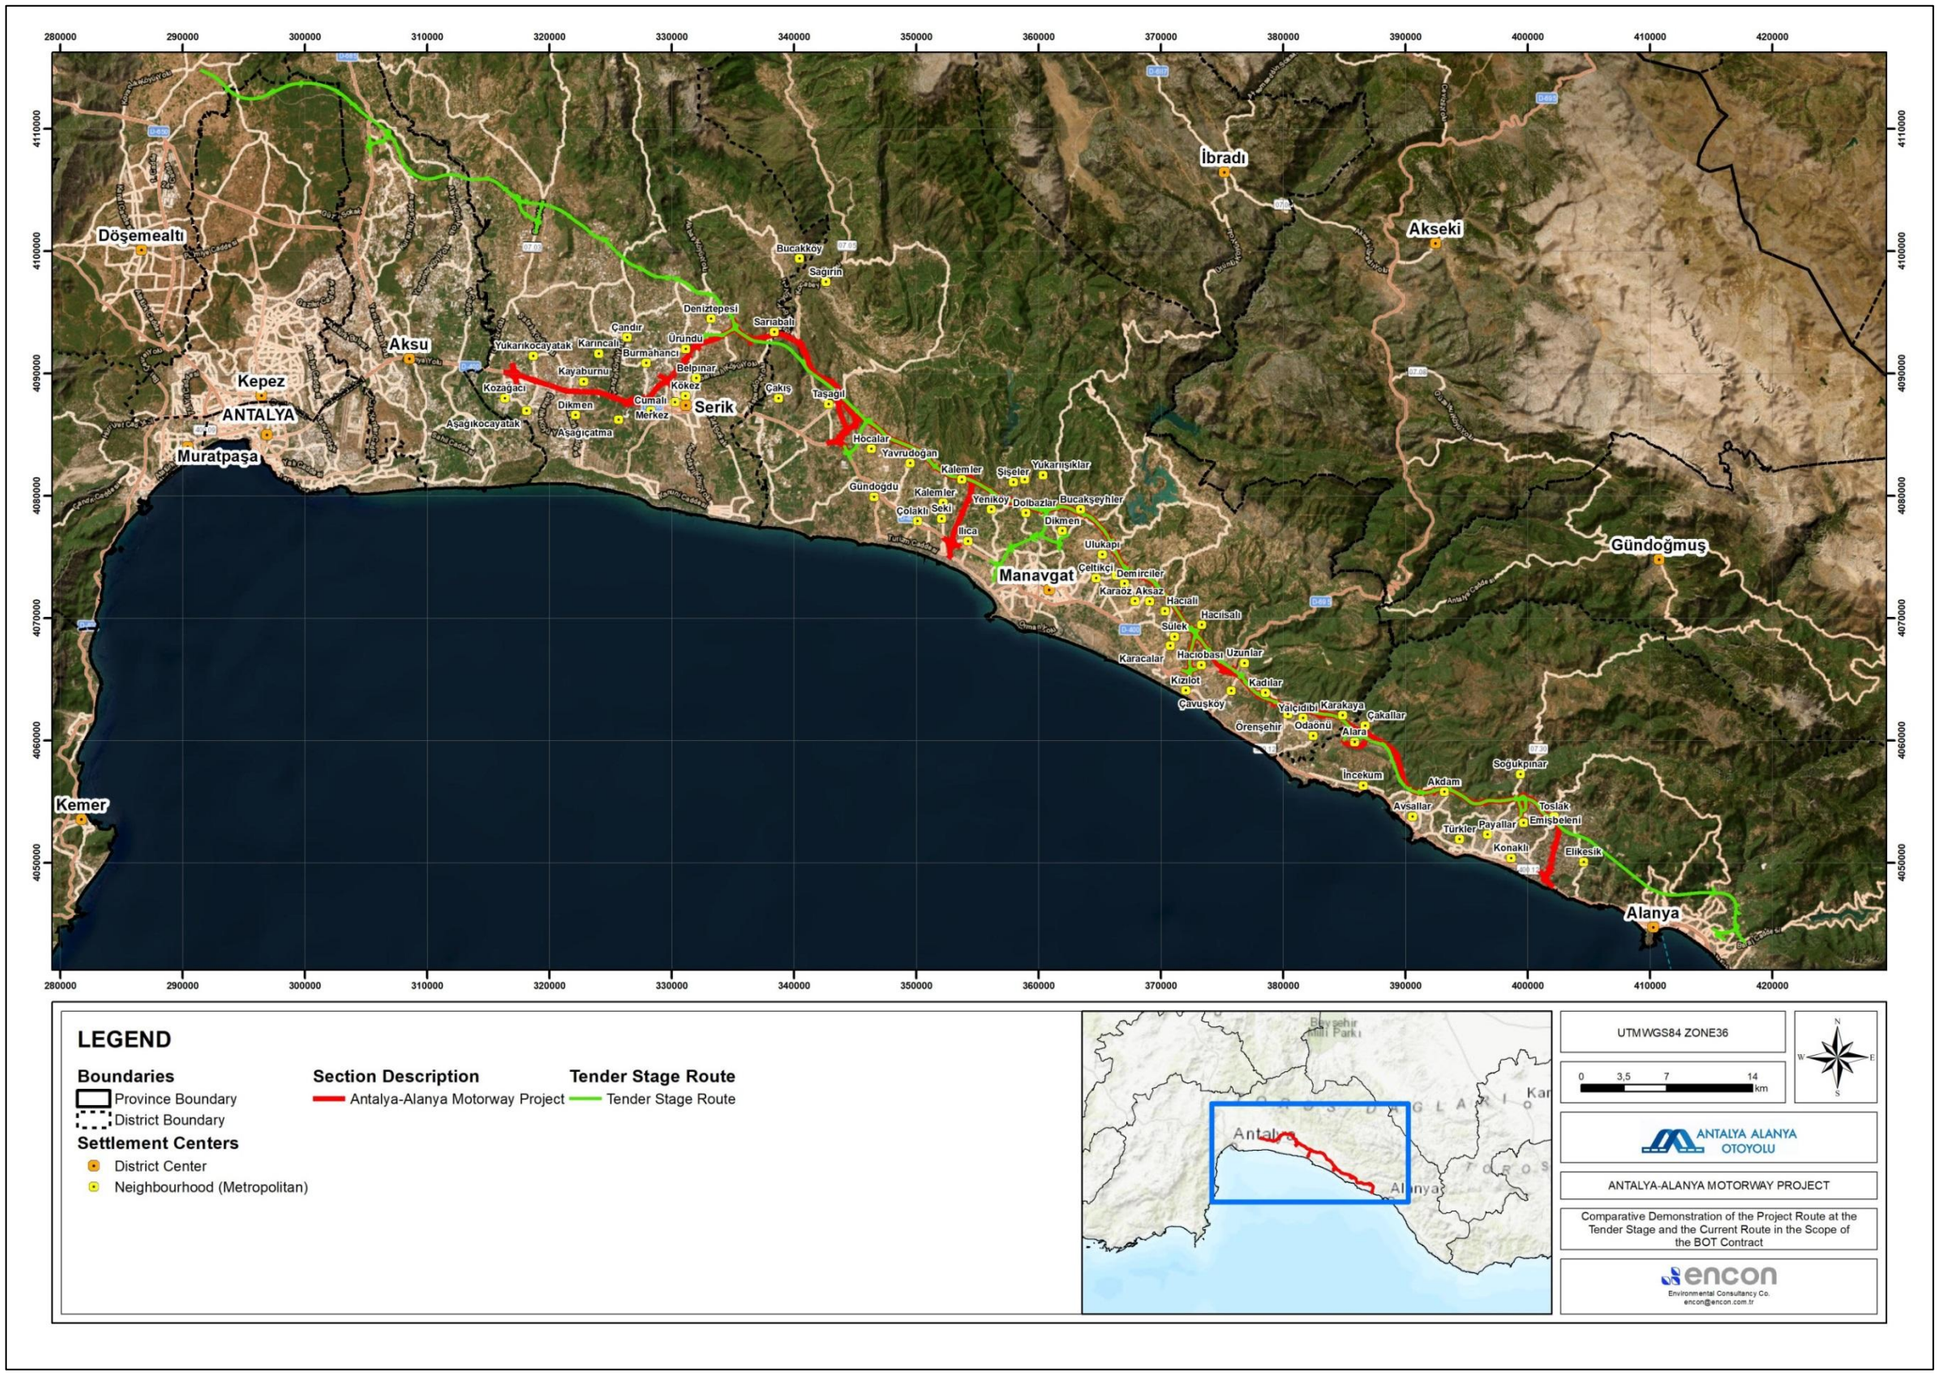

Figure XVIII.1. Comparative Demonstration of the Project Route at the Tender Stage and the Current Route in the Scope of the BOT Contract

XVIII.1.2. Alternative Route Selection during Design Stage

This stage begins after the completion of the feasibility and tender stages and establishment of BOT contract with the relevant contractor (Project Sponsor, in this case), concluding at the design freeze phase before the initiation of the construction works. The primary factors causing changes in route selection at this stage are generally similar with those in previous stages. Additionally, some of the alternative route generation and selection process result from alterations in tender conditions, laws, regulation, masterplans, infrastructure services that made between the feasibility stage and design stage. To outline these considerations, a summary table containing details for the significant changes requiring alternative route generation is provided in Table XVIII.2:

Table XVIII.2. Summary of Alternative Route Selection during Design Stage

Alternative Route Generation Reason*	Explanation
Necessary project revisions will be carried out by taking into account the existing and planned infrastructure projects intersecting with the approved route and changes in land conditions (BOTAŞ, DSİ, SİT, TEİAŞ, TEDAŞ, TELEKOM etc.).	Possible alternative route generation due to changes in infrastructure (water supply, and natural gas pipelines; power, internet and phone lines.) service coverage areas.
In accordance with the legislation and circulars on "Streambeds and Floods", the project will be designed and constructed in a way that the minimum culvert size is 2.00x2.00 m and all culverts are single-tab (as explained in Article 9.3).	Possible alternative route generation due to changes in legislations to enhance overall safety of the users.
Although the project design speed for motorways is stated as 120 km/h in the project criteria report, in line with the developments in the country, the motorway project design speed will be taken as 140 km/h for the main body of the motorway and 110 km/h for the connecting roads, and the necessary project design and construction works will be carried out according to these design speed values.	Possible alternative route generation due to changes in tender specifications. Maximum speed limits directly affect curve angles, curve approach angles, and road slope designs.
The steering arm of the Serik trumpet junction located on the main body of the motorway is in the direction of Antalya, but the said steering arm is altered to be constructed in the direction of Alanya.	Possible alternative route generation due to changes in tender specifications. This change may cause expropriation of new parcels.
The 10 km section of the D400 State Road, between the end of the Antalya Northern Ring Road and the Serik Junction, which serves as a divided road, was designed as 2x2. However it will be redesigned and constructed as 2x3.	Possible alternative route generation to enhance the overall safety and comfort of the users. This change may necessitate expropriation of additional parcels.
The Highway T-4 Tunnel around Km: 61+200, passes approximately 11.8 m below the Seydişehir-Antalya Railway Project route, redesigning and construction will be carried out in a way that will ensure tunnel safety in this section.	Possible alternative route generation due to other infrastructure projects (railway) to enhance overall safety of the users.
In the earthquake design of large engineering structures, the earthquake spectrum with a 50-year exceedance probability of 2% (2475-year return period) will be used. Details on the subject will be taken into consideration in the “Seismic Design Requirements for Bridges” section of the 3rd Section titled “Project-Related Information”.	Possible alternative route generation due to changes in binding documents to enhance overall safety of the users.

Source: Technical Requirements Document of the Project.

As a result of the alternative route selection process outlined above, an interim route and the final design stage route are presented in the

Figure XVIII.2 below to emphasize the evolution of the Motorway route. It should be noted that, the final design stage route provided in

Figure XVIII.2 is not definitive, since the Route may change in future due to cultural heritage finds and other safety, legal, economic and/or social reasons.

Figure XVIII.2. The Interim Routes and the Final Design Stage Route Map of the Project

XVIII.1.3. Alternative Route Selection after Design Stage

The third and final stage of alternative route selection will commence from the post-design phase and continue until the end of the construction phase. Changes in the route during this stage may occur due to findings obtained from the field studies and/or insights provided by employed expert(s). The most probable reason for such changes will be the discovery of cultural heritage sites during field studies and/or construction works. A comprehensive field study will be conducted along the route to detect, define, and assess cultural heritage assets. Upon completion of this field study, further cultural heritage studies will be continued by a cultural heritage expert employed by the Project Sponsor throughout the construction phase. Following field studies, in order to preserve and protect the cultural heritage assests, changes are going to be made on the locations of two intersections of the highway. The respective changes are shown on Figure XVIII.2.

XVIII.2. Motorway Design Parameters

Motorways are access-controlled highways with two or more traffic lanes in each direction and provide an uninterrupted flow. A median and collection of tolls that separate opposing traffic are performed at designated points. Some of the ideal design conditions for the motorways are specified in the Highway Capacity Manual 2000 (HCM 2000) as follows (KGM, August 2010):

- The maximum capacity for each traffic lane will be 2,400 passenger vehicles/hour;
- The minimum width of each traffic lane will be 3.6 m;
- Clearance of 1.8 m between the edge of the travel lanes and the nearest obstructions or objects at the roadside and in the median;
- Speed of the free flow will be 100 km/hour or more;
- Distance between interchanges will be 3 km or more;
- Terrain will be completely flat.

The Project has been designed in accordance with the KGM's technical specifications for motorways. The design speed for the Motorway has been determined as 140 km/hour along the main carriageway, while the design speed for the access roads will be 110 km/hour. In the current design, the width of the lanes is 3.75 m, whereas the lane width drops to 3.50 m on the access roads. The number of the traffic lanes will be 2x3 (dual carriageway with 3 lanes) in all sections along the main carriageway while access roads/connecting roads will be 2x2 (dual carriageway with 2 lanes).

In the Project, constructing the route on flat terrain has been the priority to the extent that it is feasible, however, where the environmental and/or social (i.e., topography, geology, geotechnics, ecological sensitivities, important water bodies, protected areas, cultural heritage sites, etc.) conditions do not allow, road structures such as viaducts, bridges, overpasses, underpasses, etc. have been added to the design to cross non-flat terrains.

XVIII.3. No Project Alternative

Motorway investments play an important role in the infrastructure development strategies of nations. This role is especially critical in Türkiye's transportation sector, where 95% of passenger transportation and 91% of freight transportation rely on road networks. Motorways offer efficient, safe, and rapid travel services, essential for overcoming the topographic and geological challenges present in Türkiye's terrain.

The Akdeniz (Mediterranean) Region of Türkiye holds a particular role in the tourism and agriculture sectors. The proposed Project aims to significantly enhance the region's capacity to fulfill this role in the most efficient and effective manner possible. This Project is an essential component of a broader motorway network initiative that seeks to improve the existing road infrastructure, thereby enhancing accessibility and coverage throughout the region. The region's geographical positioning, rich cultural heritage, historical landmarks, and favorable climate make it a key center for both tourism and agriculture in Türkiye.

Additionally, the urbanization rate of the region is high. As a result of rapid population growth, coupled with an increase in vehicle ownership, traffic problems (i.e., chronic congestion, frequent traffic jams) occur during peak hours, especially in the large cities. Therefore, there is always a significant demand for transportation both throughout and to the region.

In addition to these considerations, each year, over 4,000 lives are tragically lost in traffic accidents on Türkiye's roads, resulting in an annual economic loss of approximately 5 billion dollars, with an additional 180,000 individuals suffering permanent disabilities[1][2]. The Project is anticipated to reduce traffic accidents (assumed up to by 20% reduction), thereby safeguarding the valuable lives of people. This aligns with the fundamental responsibilities of all states, including Türkiye, as outlined in the Constitution of the Republic of Türkiye (Article 5, and 17) as well as international declarations, covenants, conventions (International Covenant on Civil and Political Rights, 1966, Article 6; United Nations Universal Declaration of Human Rights, 1948, Article 3; European Convention on Human Rights, 1950, Article 2), to uphold the most basic human right, the right to life.

The Project's benefits include enhancing the efficiency of transporting high-value agricultural commodities rapidly to both domestic and international markets, ensuring faster delivery, and consequently improving product freshness and quality by providing a safer and efficient transit corridor. Furthermore, the improved motorway infrastructure will provide essential services, education, and healthcare access for residents in remote locations, bridging the gap between rural and urban areas. It will also facilitate faster travel times for passengers and faster response times for emergency vehicles/services, ensuring a safer transportation network due to the reduction in traffic congestion.

As a result of the anticipated reduction in current traffic density due to the shift of a particular portion of vehicles to the new Motorway route, vehicle speeds on existing arteries are expected to increase, leading to reduced fuel consumption rates, air and noise emissions, and time and workforce losses. While the vehicles moving to the new Motorway will contribute to fuel consumption, air and noise emissions, and road accidents, there will be an economically and environmentally positive difference considering the design speed, geometric, and technical standards of the Motorway compared to the existing roads.

A "no project alternative analysis" for a motorway project is inherently challenging due to the lack of viable substitutes for the infrastructure projects. However, it is clear that the proposed Motorway is essential for the socio-economic development of the region. Improvements in transportation infrastructure will foster economic growth by stimulating trade and investment, enhancing safety, reducing congestion, and contributing to environmental sustainability. Thus, assuming the Project has conducted the appropriate studies, and documentation to secure final financial and technical approval from relevant authorities, the Project is a step toward to ensure the development and prosperity of the region, providing long-term benefits that far outweigh its potential drawbacks.

XIX. PUBLIC CONSULTATION

XIX.1. INTRODUCTION

According to the current design, total length of the Antalya-Alanya Motorway Project, including the main carriageway and the access roads, is 117.8 km according to the current design. The Project starts at Serik Interchange (Km: 52+000) and then proceeds eastward, following the corridor at the foothills of the Taurus Mountains within the boundaries of Serik and Manavgat districts, ending at north of Konaklı neighborhood of Alanya District (Km: 136+000).

The current Project design comprises 84 kilometers of main road (motorway) and 33.8 kilometers of access roads. The motorway will be constructed as a dual carriageway with three lanes in each direction (3x2) along the main route and two lanes (2x2) on the access roads. Table XIX.1 provides the approximate lengths of each road.

Table XIX.1. Antalya-Alanya Project's Current Road

Project	Start and End Locations of the Section (Km)		Length of the Road (Km)		
	Start Location	End Location	Main Road (Motorway)	Access Roads	Total
Antalya-Alanya Motorway	Km 52+000	Km 136+000	84+000	33+800	117+800

Ministry of Transport, and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project, has tendered for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). As a result of the tendering process, KGM has awarded AAOİAŞ as a Project Sponsor with a Build, Operate and Transfer (BOT) contract for the implementation of the Project.

In accordance with the terms of the BOT contract signed between the KGM and the Project Sponsor, the Project includes financing, planning/design, building/construction, operation, full range of maintenance and repair works during the operation period and transfer of the Motorway to the KGM at the end of the contract duration free from any debt or commitment and in a well-maintained, operating, in-service condition, without any charge. The rights of the Project Sponsor to operate maintain and repair the Motorway will expire at the end of the contract duration.

Public consultations must be ongoing activities to maximize the Project's positive impacts and mitigate the negative impacts. Therefore, Stakeholder Engagement Plan (SEP) is a crucial document that outlines the Project's environmental and social impact assessment and management strategies. It is a living document, meaning it must be continuously monitored, reviewed, and updated throughout process of the Project implementation. This method ensures that the social management strategies are appropriate and effective at addressing any potential impacts that may arise during the Project's lifecycle.

As part of the Environmental and Social Impact Assessment (ESIA) process for the Antalya–Alanya Motorway Project (AAMP), a series of public consultations were held to ensure that potentially affected communities and stakeholders were informed, engaged, and able to express concerns or preferences related to the project. These consultations aimed to promote transparency, identify context-specific social and environmental risks, and support the design of appropriate mitigation measures.

Considering national and international principles, ENCON provides the consultation services that the Project could remain environmentally and socially sustainable, and the natural resources are used in a responsible and effective manner.

XIX.1.2. Objectives

The objectives of the public consultation process were to:

- Inform stakeholders about the proposed project design, route alternatives, and anticipated impacts;
- Understand local priorities, social dynamics, and vulnerable groups;
- Gather input for shaping the Environmental and Social Management Plan (ESMP) and Stakeholder Engagement Plan (SEP);
- Establish trust and communication pathways for future engagement during construction and operation.

XIX.2. Regulatory Requirements

The Project is intended to meet applicable national and international standards (Equator Principles 4: Principle 5, and IFC Performance Standard 1 and 5).

A detailed description of the national and international legal framework for the Project is provided in subheadings of this section. Based on a detailed review and evaluation of a number of screening criteria is defined in Turkish EIA Regulation as well as IFCs policies and guidelines, and Equator Principles 4 guidelines.

XIX.2.1. National Requirements

Environmental Law, which was ratified in August 1983, is one of the principal legislation related to the Project. Several by-laws and decrees are enforced under the Environmental Law. The Environmental Impact Assessment Regulation (Official Gazette date: November 25, 2014, Number: 29186) defines the administrative and technical procedures and principles to be followed throughout the Environmental Impact Assessment (EIA) process. When an activity (a Project) is planned, the Project developer is responsible for preparing an EIA report along with many other permits required to realize the Project. However, facilities are subject to the preparation of an EIA Report depending on the type of the facility, its capacity, or the location of the activity. The activities that are subject to the provisions of the Environmental Impact Assessment Regulation are listed in Annex 1 and Annex 2 of the Regulation. For Annex 1 activities, a full EIA report is required, and those Projects go through the entire EIA process. Since the Project is included in the Annex 1 list of the Turkish EIA legislation, the required EIA report was completed in January 2017 and approved by the Ministry of Environment, Urbanization and Climate Change (MoEUCC) on August 17th, 2018 (EIA positive decision number 5180).

The main Turkish Regulation requiring public consultation and stakeholder engagement for development/investment/infrastructure projects is the Environmental Impact Assessment Regulation. The 1st Clause of the 9th Article of the Turkish EIA Regulation defines the stakeholder participation process. In accordance with the related article, a project owner's legal responsibility is to organize an official Public Participation Meeting for the Projects that are included in Annex 1 of the Regulation (as the case in the EU EIA Directive).

Turkish national policy on the protection of the environment, cultural heritage, and conservation of biological resources has been constituted based on relevant international agreements that Türkiye has signed or ratified.

XIX.2.2. International Requirements and Standards

The Project specifically identified physical conditions, aspects, and facilities that are likely to generate potentially significant adverse environmental and social risks and impacts. As a result, it has been proposed as a “Category A” project. For “Category A” projects, a comprehensive full-scale ESIA is required to be conducted. Therefore, the SEP (Stakeholder Engagement Plan) has been prepared according to national standards and EP4, Principle 5, and IFC Performance Standard (PS) 1 and 5, considering relevant parts of other performance standards. The requirements and contents of the standards that are used as guidelines are explained in the following subsections.

XIX.2.2.1. Related Equator Principles 4

According to Equator Principles 4 (latest version, also known as EP4) Principle 5: Stakeholder Engagement, for all Category A and Category B Projects, the Equator Principles Financial Institutions (EFPIs) requires the client to demonstrate effective stakeholder engagement, as an ongoing process in a structured and culturally appropriate manner, with affected communities, workers and, where relevant, other stakeholders. In the context of EP4, to engage stakeholders, the client provides relevant assessment documents to affected communities and interested other stakeholders based on the project's risks and impacts. The client considers and documents the results of the stakeholder engagement process, including any actions agreed upon resulting from such process.

Principle 5: Stakeholder Engagement

For Projects with potentially significant adverse impacts on affected communities, the client will conduct an informed consultation and participation process. The client will tailor its consultation process to: the risks and impacts of the Project; the Project’s phase of development; the language preferences of the affected communities; their decision-making processes; and the needs of disadvantaged and vulnerable groups. This process should be free from external manipulation, interference, coercion and intimidation.

Principle 6: Grievance Mechanism

For all Categories A and, as appropriate, Category B Projects, the EPFI will require the client, as part of the Environmental and Social Management System, to establish a grievance mechanism designed to receive and facilitate resolution of concerns and grievances about the Project’s environmental and social performance. The grievance mechanism is required to be scaled to the risks and impacts of the Project and have affected communities as its primary user.

The proposed Project is intended to meet applicable international standards. This document and SEP has been prepared in accordance with the guidance of the applicable IFC Performance Standards. In accordance with Equator Principles 4, Principle 5, and IFC Performance Standard 1, a process will be established by which people who deem that they have been adversely affected by the Project during planning, construction, or operation can bring grievances to the Project for consideration and, if required, resolution.

Where a project and a Project Owner receives project financing from IFC, or another financial institution adopting IFC requirements, IFC Performance Standards must be applied for the duration of that project finance. As of 2012, the following eight IFC Performance Standards are applicable to the Project as a whole:

XIX.2.2.2. IFC’s Standards and Guidelines

Performance Standard 1: Social and Environmental Assessment and Management System
Performance Standard 2: Labor and Working Conditions
Performance Standard 3: Pollution Prevention and Abatement
Performance Standard 4: Community Health, Safety and Security
Performance Standard 5: Land Acquisition and Involuntary Resettlement

Performance Standard 6: Biodiversity Conservation and Sustainable Natural Resource Management
Performance Standard 7: Indigenous Peoples
Performance Standard 8: Cultural Heritage

Performance Standard 1[1] specifically relates to stakeholder engagement on the basis that it establishes the importance of: (i) integrated assessment to identify the social and environmental impacts, risks, and opportunities of projects; (ii) effective community engagement through disclosure of project-related information and consultation with local communities on matters that directly affect them; and (iii) management of social and environmental performance throughout the life of the Project. The objectives of this standard are as follows[2]:

- To identify and assess social and environment impacts, both adverse and beneficial, in the Project's Area of Influence;
- To avoid, or where avoidance is not possible, minimize, mitigate, or compensate for adverse impacts on workers, affected communities, and the environment;
- To ensure that affected communities are appropriately engaged on issues that could potentially affect them; and
- To promote improved social and environment performance of companies through the effective use of management systems.

IFC PS2 (Labor and Working Conditions) specifically addresses harassment, intimidation, and/or exploitation. According to IFC PS 2, the client has to take measures and design the mechanisms to prevent and address harassment, intimidation, and/or exploitation, particularly concerning women and minority groups.

The mechanism should be designed to receive and facilitate the resolution of grievances about the Projects' environmental and social impacts. It should aim to resolve concerns quickly and fairly through a transparent process that is easily accessible, free of charge, and without any retaliatory measures against the party that raised the issue or concern. The comprehensiveness of this mechanism is essential. Therefore, ensuring affected people of all genders, minorities, or ethnic groups have easy and fair access is necessary

To meet these objectives, a SEP is designed to guide stakeholder consultations leading up to and during the period of the ESIA studies, as well as during the further stages of project implementation, i.e. excavation, construction and operation (see Annex 2 - Stakeholder Engagement Plan).

Retaliation Risk Prevention and Safe Stakeholder Participation

The Project is committed to ensuring that all stakeholders can freely express their concerns without fear of retaliation. In alignment with *the IFC Good Practice Note for the Private Sector: Addressing the Risks of Retaliation Against Project Stakeholders (2021)*, a series of practical measures have been integrated into the Stakeholder Engagement Plan (SEP) to safeguard stakeholder participation.

As part of the stakeholder identification and mapping process, the Project conducts a risk assessment to identify potential threats of retaliation, particularly toward vulnerable or marginalized groups. This assessment is used to design safe and inclusive engagement approaches tailored to local sensitivities. To further support this, the Grievance Mechanism (GRM) offers multiple anonymous reporting options -such as locked suggestion boxes and secure hotlines -ensuring that all personal data is managed with strict confidentiality in line with national data protection laws and IFC Performance Standard 1.

Sensitive issues, especially those related to gender-based violence and harassment (GBVH), are handled by trained female Community Liaison Officers (CLOs), who adopt a survivor-centered approach and ensure privacy and trust throughout the reporting process. In addition, project staff and

[1] *PS1 is specifically relevant, because it contains clear requirements for community engagement, disclosure of information and consultation. These requirements are the main concerns of this Chapter.*
[2] *IFC Performance Standards, 2012.*

grievance handlers receive specific training to recognize and respond to signs of intimidation or retaliation, using appropriate internal protocols to ensure timely and secure handling of such cases.

Allegations or risks of retaliation are closely monitored and promptly escalated to senior management, where necessary. The Project has adopted a zero-tolerance policy for retaliation in any form -whether by project personnel, contractors, or third parties -reinforcing a culture of safety, respect, and open dialogue for all stakeholders involved.

XIX.3. STAKEHOLDER ENGAGEMENT ACTIVITIES

Within the scope of the EIA studies, public consultation meetings were held alongside the route. The aim of the public participation meeting is to inform people who may be potentially affected about the Project and to understand their concerns, opinions and suggestions about the project. Also, it aims including people into decision making process in terms of the project. This process is the only formal requirement for stakeholder engagement according to Turkish legislation.

As part of the Stakeholder Engagement Activities, Serik and Alanya districts were visited in addition to Antalya to conduct interviews with key stakeholders such as Antalya Governorship and KGM Regional Directorates. Several Project Affected Persons (PAPs) were interviewed in addition to two muhtars of the affected settlements and a representative of Sera-Bir, a local NGO.

XIX.3.1. Stakeholder Engagement Methods

Table XIX.2 The consultations were conducted using a range of methods adapted to local contexts

Method	Description
Community meetings	Open gatherings in central village locations for general awareness and feedback
Focus group discussions	Small group meetings with women, elders, agricultural workers, and other vulnerable groups
Key informant interviews	Individual interviews with mukhtars, religious leaders, and local institution representatives
Household visits	Informal conversations with residents in affected neighborhoods, especially where digital access was limited
Meetings with institutions	Consultations with municipalities, provincial directorates, cooperatives, and relevant NGOs

XIX.3.2. Previous Stakeholder Engagement

The stakeholder engagement activities specific to the Project started at the time of the national EIA process. In this context, Antalya Provincial Directorate of Environment and Urbanization, relevant district Municipalities, District Governorships and Neighborhood/Village mukhtars were contacted in March 2016 to organize the stakeholder engagement activities. The formal stakeholder engagement meetings (public participation meeting), a requirement of the Turkish EIA Regulation, were held on April 7th, 2016, at Ekşili Village Coffeehouse, Alanya Municipality Çıplaklı Wedding Hall, and Manavgat Chamber of Commerce and Industry Assembly Meeting Hall. Therefore, a total of three consultation meetings were held at three different districts of the Project route (according to the Project's EIA Report, 2018): Döşemealtı, Alanya, and Manavgat districts of Antalya Province. The meetings were announced in one local and one national newspaper as per the regulatory requirements. The meetings included a presentation of the Project details, such as construction and operation activities, and recorded the comments and suggestions by participants.

Table XIX.3 Information of PCMs in EIA Process

PCMs	Districts	Date	Time	Location
1	Döşemealtı	07.04.2016	09:30	Ekşili Village Coffeehouse

PCMs	Districts	Date	Time	Location
2	Alanya	07.04.2016	11:00	Alanya Municipality Çıplaklı Wedding Hall
3	Manavgat	07.04.2016	15:00	Manavgat Chamber of Commerce and Industry Assembly Meeting Hall

Table XIX.4 Questions, Opinions, and Suggestions Submitted During the Public Consultation Meeting

Location – Date – Time	Question, Comment, or Suggestion	Response	Main Discussion Points & Feedback Summary
Ekşili Village Coffeehouse /07.04.2016 – 09:30	A specific location along the project route was mentioned, and concerns were raised regarding the expropriation of houses and pastures. A question was asked about the possibility of changing the route.	It was explained that due to elevation differences and geometric conditions at the connection point, the current route had been selected.	Local concern over property loss and desire for route revision; project constraints due to topography. This issue explained in the Institutional and Legal Framework Chapter.
	A question was raised about whether there is a railway project along the route.	The presence of a railway project was acknowledged, and it was explained that it is a separate and unrelated project.	Clarification requested regarding interaction with other infrastructure projects. This issue explained in the Cumulative Impact Assessment Chapter.
	Questions were asked regarding the expropriation process (e.g., number of affected properties, areas involved, and procedures).	It was stated that the entire process would be carried out in accordance with the Expropriation Law.	Community members requested clarification regarding the legal procedures and scope of land acquisition. This matter is addressed in detail within the Institutional and Legal Framework section and throughout the RAP.
Çıplaklı Wedding Hall / 07.04.2016 – 11:00	Concerns were raised about the environmental pollution that may occur during construction and operation phases, and its potential impact on nearby settlements and agricultural products. A request was made to change the route.	The route was shown on a map, and it was emphasized that expropriation is necessary to complete the road. Despite the increased cost, alternative solutions such as tunnels were considered in order to safeguard the well-being of the local community.	Participants raised concerns about environmental and agricultural risks and acknowledged the consideration of alternatives such as tunnels. These aspects are addressed in the Land Use and Property section and the Project Description chapter.
	It was stated that the road would divide the village by passing through its center, and a request was made to shift the route 200–300 meters northward (towards the forest).	It was explained that the requested area falls within a wildlife conservation zone and therefore cannot be used.	Route modification options are addressed in the Analysis of Alternatives section, with conservation considerations further discussed in the Protected Areas and Cultural Heritage chapters.
	Participants cited tunnels used in other villages and requested a similar tunnel for their own. They also expressed concerns about an inappropriate route selection for expropriation purposes.	Three participants submitted written statements (recorded in the minutes). No response was provided.	Tunnel requests were raised by the community. Relevant design adjustments are considered in the Project Description and Analysis of Alternatives sections.
Manavgat Chamber of Commerce and Industry – Assembly Hall / 07.04.2016 – 15.00	Negative environmental, agricultural, and tourism impacts were expressed.	It was stated that mitigation measures would be taken during construction, and that during the operation phase, the project would contribute positively to the transportation of agricultural products and increase tourism circulation.	The ESIA comprehensively assesses potential impacts during both construction and operation phases. Specific mitigation measures have been developed accordingly. Additionally, the potential benefits of the Project are also evaluated within the ESIA.

Location – Date – Time	Question, Comment, or Suggestion	Response	Main Discussion Points & Feedback Summary
	Negative feedback regarding the project route was shared (e.g., adverse impacts, expropriation issues).	Responses were provided, and it was mentioned that the route could be revised in coordination with relevant authorities, depending on stakeholder feedback.	Route modifications are considered in the Analysis of Alternatives section, based on stakeholder requests and in coordination with relevant authorities.
	Questions were raised regarding potential negative impacts on settlements and the mitigation measures to be taken.	It was explained that measures such as road watering to prevent dust, covering truck trailers, and installing noise barriers would be implemented.	Project routes are defined in the Project Description section of the ESIA, and potential impacts during construction and operation in these locations are addressed in detail throughout the report. Specific mitigation measures are developed in Chapter 15: Community Health and Safety.

During the Public Consultation Meetings (PCMs), the majority of questions, comments, and complaints were related to the proposed route of the Project. Local stakeholders expressed concerns about the potential impacts of land acquisition activities along the route, particularly regarding their effects on the agriculture and tourism sectors. Accordingly, a significant portion of the complaints received from local residents focused on the loss of agricultural lands and restricted access to tourism facilities.

In the meetings held in and around Manavgat, tourism-related questions predominated, as the proposed Project route passes near touristic areas. Participants frequently requested revisions to the route and raised concerns about the expropriation process. In response, representatives of the relevant authorities emphasized that all procedures will be carried out in compliance with the Expropriation Law No. 2942, ensuring full adherence to national legal frameworks.

Topics such as archaeological sites and protected cultural heritage areas were mentioned less frequently. However, for the questions raised on these matters, project officials clarified that appropriate mitigation measures will be implemented, and coordination with relevant heritage protection authorities will be ensured throughout the project lifecycle.

In June 2024, ENCON conducted a comprehensive four-day field study aimed at gathering qualitative data from a wide range of stakeholders across various regions in Antalya province. The study included interviews and focus group discussions with academics, local authorities, and community members, targeting diverse demographic and occupational groups. The detailed breakdown of the activities conducted during the field study is presented in Table XIX.5. The feedback received during the interviews and how they were responded to is presented in Table XIX.6.

Table XIX.5 Summary of Field Study Activities Conducted by Encon in June 2024

Table XIX.6 Summary of Field Study Interview Conducted by Encon in June

Interview Type and Location	Summary of the Interview	Main Discussion Topics and Responses
Akdeniz University / Faculty of Agriculture – Academic Interview	Emphasis was placed on the protection of agricultural lands, prevention of zoning pressure, and continued support for small-scale producers. Protection of underground water resources was also requested.	Agricultural lands will be preserved, and monitoring and preventive measures for water resources will be implemented to support farmers' activities.
Akdeniz University / Faculty of Tourism and Biology – Academic Interview	Recommendations included preventing fragmentation of natural habitats, using local plant species (olive, carob) in medians, and declaring the Alarahan area a nature park.	The route was planned to avoid habitat fragmentation. Local species will be used in landscaping, and coordination with relevant institutions will be ensured.
Serik District Governorate – Official Institution Interview	The project is viewed positively; however, it was requested that construction not coincide with tourism and agricultural seasons.	Efforts will be made to ensure that construction activities do not overlap with peak tourism and harvest periods.
Serik Chamber of Tradesmen and Craftsmen – NGO Interview	The road is expected to benefit tradespeople and farmers; it was requested that rest areas be designed to support commercial activities.	Rest facilities will be made accessible to local producers and tradespeople to support commercial activities.
Serik / Merkez Neighborhood – Mukhtar	Requests included ensuring road access to	Noise and air quality control measures will

Interview Type and Location	Summary of the Interview	Main Discussion Topics and Responses
Interview and Focus Group	villages, controlling dust/noise, and increasing information dissemination.	be implemented and monitored. Village access will be maintained with planned connection roads. An inclusive grievance mechanism has also been developed.
Manavgat / Taşağıl Neighborhood – Focus Group and Elderly Group	Elderly individuals face challenges accessing information; it was suggested to use audio announcements.	Information access for the elderly will be provided through public announcements in spaces such as mosques and mukhtar offices.
Manavgat / Kalemler Neighborhood – Focus Group and Women Group	The road's positive contribution to health and agricultural access was noted; women expressed social support needs.	Social support requests specific to women will be considered.
Manavgat / Ulukapı Neighborhood – Focus Group, Women Group, Mukhtar	Requested the preservation of field roads and uninterrupted access during construction.	Field roads and connections between settlements will be maintained with underpasses and overpasses ensuring uninterrupted access.
Manavgat Chamber of Agriculture – NGO Interview	Support for producers and participation in decision-making processes were requested.	Regular coordination and information meetings will be held with producer unions.
Manavgat Directorate of Technical Affairs – Official Institution Interview	Requested compatibility with urban planning and integration with public infrastructure.	Planning will be coordinated with municipalities, and infrastructure transitions will be integrated into the project.
Manavgat / Hacıisalı Neighborhood – Focus Group and Elderly Group	Requested reduction of social isolation and safe crossings.	Safe pedestrian crossings and transport services will be provided.
Manavgat / Karakaya Neighborhood – Mukhtar and Focus Group Interview	Suggested preventing the village from being divided and constructing tunnels/underpasses.	Underpasses and bridges will be evaluated for critical crossing areas.
Alanya / Akdam, Toslak, Konaklı, Alara - Focus Group and Mukhtars	Requested support for loss of agricultural land, routing away from residential areas, and eco-tourism-oriented rest areas.	Support will be provided to affected producers and alternative route scenarios have been evaluated. Eco-tourism-focused designs will be considered for rest areas.

The EIA Review and Evaluation Commission set up by the MoEUCC; General Directorate of EIA, Permit and Inspection at the scoping stage of the national EIA processes included the governmental stakeholders listed in Table XIX.7

Table XIX.7 Governmental Stakeholders Involved in the Scoping, Review and Evaluation of the National EIA Process

Organization	Directorate/ Administration
General Directorate of Highways	General Directorate of Highways 13th Regional Directorate
Governorship of Antalya	Investment Monitoring And Coordination Department Antalya Governorship Repealed Provincial Directorate of Agriculture Antalya Governorship Provincial Directorate of National Education
Antalya Metropolitan Municipality	Department of Housing and Urbanization Department of Real Estate and Expropriation
Ministry of Transport and Infrastructure	Antalya Airport Chief Directorate
General Directorate of Mineral and Research and Exploration	General Directorate of Mining Affairs, Exploration Department
Ministry Of Agriculture And Forestry	General Directorate of State Hydraulic Works Department of Survey, Planning and Allocations Directorate General of Agricultural Reform General Directorate of Nature Conservation and National Parks General Directorate of Forestry Department of Permits and Easements

Organization	Directorate/ Administration
Ministry of Forestry And Water Affairs	Repealed Ministry of Forestry and Water Affairs 6th Regional Directorate Antalya Branch Directorate
Turkish Electricity Transmission Corporation (TEIAŞ)	General Directorate of Electricity Generation Corporation
Ministry of Culture and Tourism	Directorate General of Investments and Enterprises Regional Board of Protection of Cultural Heritage
Ministry of Environment, Urbanization and Climate Change	General Directorate of Conservation of Natural Assets Provincial Directorate of Environment, Urbanization and Climate Change
Ministry of Interior	Provincial Directorate of Disaster and Emergency
Ministry of National Defense	General Directorate of Machinery and Chemical Industry Corporation
Ministry Of Industry And Technology	Directorate General for Industrial Zones

The EIA Application File was prepared on behalf of General Directorate of Highways and submitted to the Ministry of Environment and Urbanization by the e-EIA system on March 4th, 2016, and the EIA process was initiated. During the preparation of the Project's EIA Report, the comments and opinions expressed by the local communities during the Public Participation Meeting, and the official views of the governmental stakeholders that formed the EIA Review and Evaluation Commission, were incorporated. Following the finalization of the report, the EIA was disclosed to the public via the MoEUCC and the Provincial Directorate of the Environment, Urbanization and Climate Change as per the requirements of the national EIA Regulation.

XIX.3.3. Stakeholder Engagement as part of the ESIA Process

The expert team in Encon held two separate field studies as part of the ESIA study, as summarized in Table XIX.8. The first one was a reconnaissance study carried out on May 2024 with the main objective of identifying the environmental and social features and sensitivities of the Project. This included planned art structures along the motorway route, campsites, quarries, and facilities such as the concrete plant, asphalt, and mechanical plan.

The second field study, conducted on June 2024, focused on key informant, focus group, vulnerable groups, and other stakeholders (NGOs, Academicians, Communities, etc., in the region) interviews. During the social field study, key informative interviews were conducted with the mukhtars of four (4) settlements previously determined. Focus group interviews were held in eight (8) settlements, including mukhtars and households of 12 neighborhoods in the impact areas. Focus group interviews in Serik Merkez, Taşağıl, Kalemler, Ulukapı, Hacıisalı, Karakaya-Çakallar-Alara, Akdam, and Toslak-Konaklı-Alara neighborhoods; and vulnerable group interviews were conducted in those areas. Additionally, other stakeholders such as academics, local officials, and local communities were interviewed to gather expert opinions on the socio-economic impacts of the Project.

Table XIX.8 Summary of the Social Field Studies Conducted as part of the ESIA

Tasks	Date of the Field Study	Scope of the Field Study
Site visit	May 2024	• The reconnaissance study started at Km: 52+000, and ended at Km: 135+000 • Visiting the license area: planned tunnel, viaduct, quarry, facility area, and construction site and storage area.

Tasks	Date of the Field Study	Scope of the Field Study
Key Informant Interviews Focus Group Interviews, Other Stakeholder Meetings	June 2024	• Four (4) key informant interviews in Serik/Merkez, Manavgat/Ulukapı, Manavgat/Karakaya, and Alanya/Toslak neighborhoods • Eight (8) Focus group interviews in Serik Merkez, Taşağıl, Kalemler, Ulukapı, Hacıisalı, Karakaya-Çakallar-Alara, Akdam, and Toslak-Konaklı-Alara • Interviews with Academics, local officials, and local communities
Road Trip Study Public Consultation Meetings (PCMs)*	August 2025	• Informing the local community about the Project and collecting feedback from stakeholders, including complaints, suggestions, and opinions.

**Shuttle vehicles were arranged for appropriate residential areas in order to facilitate access to the Public Participation Meetings and to increase attendance rates.*

In parallel to the ESIA studies, the Company has started to establish close relationships. In this scope, Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş participate the reconnaissance study in the project area May, 2024.

A Stakeholder/Public Consultation Meeting (PCM) had been organized after the finalization of the expropriation plan by the General Directorate of Highways (KGM). During the meeting, details about the project, its potential environmental and social impacts/risks, mitigation measures to be taken, and implementation/ monitoring/reporting responsibilities of different parties had been shared with the stakeholders; and then their opinions and suggestions received during the question-answer (Q&A) session are recorded and included in Table XIX.12.

XIX.3.4. Road Trip

In December 2024, Public Consultation Meetings (PCMs) was planned to be held in the four most affected locations related to the "Road Trip" study. However, due to delays in the completion of expropriation procedures, these meetings have been postponed and will be organized once sufficient progress has been made. These meetings aim to disclose Project impacts and planned mitigation measures, while creating a space for meaningful public feedback prior to the commencement of construction.

For the Project, four Public Consultation Meetings (PCMs) were held in selected locations Orta (Serik, Antalya), Yukarıpazarcı (Manavgat, Antalya), Avsallar (Alanya, Antalya), and Konaklı (Alanya, Antalya). Venues within local neighborhoods, which possess adequate capacity and appropriate physical conditions, were used for these meetings. This preference was based on the observation that participation levels are generally higher in such local venues, according to past experiences. Moreover, selecting the exact place/location were considered to create a more inclusive environment that enables women and vulnerable groups to participate. Figure XIX.2 and Figure XIX.1 shows the locations of the planned PCMs. and those that social field study was conducted.

To ensure broad awareness and community participation, announcements regarding the PCMs were made through multiple channels, including: public bulletin boards in central neighborhood locations, local mukhtars' offices, municipality websites, and local radio broadcasts where feasible. Additionally, printed invitations and visual materials such as posters and leaflets will be distributed, and mobile messaging applications (e.g., WhatsApp groups commonly used in local communities) may also be utilized to reach wider audiences. In addition to those the announcement at the national newspaper will also be done. All announcements will be made at least two weeks prior to the meetings and will be provided in Turkish, with Arabic translations where needed to ensure inclusivity for refugee or migrant populations.

PCMs took place along the entire Motorway route from the Serik district to the Alanya district of Antalya province. Table XIX.10 displays details about the planning of PCMs. The meeting locations were selected based on findings from key informant and focus group interviews conducted in the region by a social expert employed in ENCON. The overall motorway route spans 117.8 km, including

the main carriageway and the access roads. Since it would not be possible to organize a meeting in every settlement that is located within the study area, in the selection of the settlements at which the public consultation meetings are planned, it was aimed that a meeting location is determined every 30 (plus minus) km along the Motorway route to ensure to the extent possible that the meeting location was accessible for the local people from the surrounding settlements and in order to acquire a more inclusive Road Trip for all different stakeholders.

The meetings were held with the participation of representatives of Limak as Project Sponsors (senior officials and technical Project team members including design and expropriation), authorities from the 13th Regional Directorate of KGM, and the Environmental and Social Impact Assessment (ESIA) Consultant (ENCON Environmental Consultancy).

The ESIA Consultant moderated the meetings. The meetings commenced with an introduction and an explanation of the meeting's purpose and scope. This was followed by a presentation from the ESIA consultant and a final discussion session to address any questions, concerns, and suggestions. The main topics covered in the presentations were as follows:

- What is the Antalya-Alanya Motorway Project?
- Who are the project sponsor and ESIA Consultant?
- What are roles of the Project Sponsor and ESIA Consultant?
- What are the Anticipated Benefits of the Project?
- What is the Environmental and Social Impact Assessment Process?
- Stakeholder Engagement: How to Participate in the Process?
- Discussion (Questions and Answers) Session

Large-scale (in A0 format) maps showing the relevant part of the route in each meeting were posted on the walls of the meeting venue. In addition, project information brochures (including guide for land acquisition and compensation) was shared the participants. As a result of the information efforts, the attendance levels at meetings, particularly those that might be held in local neighborhood tea houses, will be adjusted to reach the expected number of participants. Different parties participated, including government officials or (significantly) from adjacent neighborhoods.

Table XIX.9 shows the expected local representatives of participant profile in planned PCMs. A list of participants will be maintained at the meeting.

Table XIX.9 Summary of Participants Profiles

PCM No	Meeting Location	Adjacent Neighborhoods from which Representatives (Mukhtar or Local People) will Participated in the Meeting
1	Serik / Merkez	Cumalı, Burmahancı, Deniztepesi, Kayaburnu, Çandır, Üründü, Aşağıkocayatak, Yukarıkocayatak, Sarıabalı, Aşağıçatma, Belpınarı and Abdurrahmanlar neighbourhoods
2	Manavgat / Merkezı	Çakış, Taşağıl, Gündoğdu, Hocalar, Yavrudoğan, Çolaklı, Seki, Kalemler, Evren, Ilıca, Yeniköy, Şişeler, Evrenleryahşi, Dolbazlar, Yukarıışıklar, Dikmen, Bucakşeyhler, Ulukapı, Aşağıışıklar, Demirciler, Karaöz, Aksaz, Hacıali, Cevizler, Sülek, Hacıisalı, Hacıobası, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Odaönü, Karakaya neighborhoods
3	Alanya / Avsallar	Avsallar, Akdam, İncekum, Alara, and Çakallar neighbourhoods
4	Alanya / Konaklı	Türkler, Emişbeleni, Toslak, Konaklı, Elikesik, Payallar neighbourhoods

Table XIX.10 Organizational Details of the Planning Public Consultation Meetings in Antalya*

PCM No	Province	District	Neighborhood	Km Chain age	Population (TURKSTAT, 2024)	Date of the Meeting	Time of the Meeting	Meeting Venue	Number of Participants
1	Antalya	Serik	Merkez	Km 52+000 (Access Road)	17,969	27.08.2025	09.00 - 12.00	Serik Multipurpose Cultural Hall	80-
2	Antalya	Manavgat	Merkez	Km 87+000	6,374	27.08.2025	15.00 - 18.00	Manavgat İbrahim Sözen Youth Center	187-
3	Antalya	Alanya	Avsallar	Km 125+000	16,118	26.08.2025	09.00 - 12.00	Avsallar Kör Ali Baysal Wedding Hall	200-
4	Antalya	Alanya	Konaklı	Km 141+000	17,927	26.08.2025	15.00 - 18.00	Alanya Municipality Konaklı Cultural Center	300-

**To facilitate access to the Public Participation Meetings and to increase attendance rates, shuttle vehicles were arranged for the eligible residential areas specified in Table XIX.9*

Figure XIX.1 Locations of Conducted Social Field Study

Figure XIX.2 Map of PCMs Locations

XIX.3.5. Field Study with Women

As part of the Project, Community Liaison Officers (CLOs) conducted a series of focus group discussions specifically with women in different districts and villages located along the Project corridor. These meetings were held between late July and late August 2025, covering Serik, Manavgat, and Alanya districts. The purpose of the discussions was to collect women's perspectives, identify their specific concerns, and ensure that their voices are incorporated into the Project's social assessment and engagement process. The record list of the meetings is presented in Table XIX.11

Table XIX.11 Focus Interviews Conducted by CLOs

No	Date	District	Village / Neighborhood	Facilitator	Meeting Status
1	7/28/2025	Serik	Sarıabalı	CLOs	Held
2	8/23/2025	Serik	Cumalı	CLOs CLOs	Held
3	8/24/2025	Serik	Üründü	CLOs	Held
5	8/24/2025	Manavgat	Taşağıl	CLOs	Held
6	8/22/2025	Manavgat	Yukarıışıklar	CLOs	Held
7	8/23/2025	Manavgat	Bucakşeyhler	CLOs	Held
8	8/24/2025	Manavgat	Ulukapı (Araplar Street)	CLOs CLOs CLOs	Held
			Ulukapı (Isparta Street)		
			Ulukapı (Alibazlı Street)		
9	8/23/2025	Alanya	Konaklı	CLOs CLOs	Held
10	8/23/2025	Alanya	Türkler	CLOs	Held
11	8/24/2025	Alanya	Avsallar	CLOs	Held

Each session was facilitated by a designated CLOs and provided an opportunity for women community members to share their expectations, highlight potential gender-related impacts, and discuss measures to address them. The outcomes of these meetings will serve as an important input for shaping the Project's Stakeholder Engagement Plan and informing mitigation strategies that are responsive to women's needs and priorities.

XIX.3.6. Public Consultation Meetings Summary

A detailed review of the PCMs held on August 26-27 as part of the project's ESIA process is presented below.
Figure XIX.3 shows the shuttle vehicle arranged to facilitate access to the PCM and used participation list form. The neighborhoods designated as shuttle points are listed under the meeting locations with transportation demand.

Figure XIX.3 Shuttle for PCM

Avsallar

The Public Consultation meeting was held on August 26, between 9 and 11 a.m, at the Kör Ali Baysal Avsallar Wedding Hall. To facilitate access to the PCM and to increase attendance rates, shuttle vehicles were arranged for the Alara, Akdam, Çakallar and Türkler. A total of 200 people attended the meeting, 34 of whom were women. It was observed that the majority of participants were between the ages of 35 and 64. It was also noted that 4-5 participants were aged 75+, and one physically disabled individual was present at the meeting. Before the meeting began, conversations were held with participants who had contacted, and their concerns were listened to. The project presentation began at 10 a.m. after which complaints, questions, and opinions were received. While the village heads and participants expressed their complaints, tensions arose among the participants from time to time. While a group of questions were being answered by project officials, the participants expressed their reactions by protesting the meeting, and as a result, the meeting could not be completed.

Figure XIX.4 shows the venue where the meeting took place, the layout of the meeting room, the project route maps hung on the walls for informational purposes, and the presentation made during the meeting. Figure XIX.5 shows the informational brochures. These include the Project information brochures distributed during the meetings and the informational brochures created regarding expropriation.

At the Avsallar - Kör Ali Baysal Wedding Hall, during part of the meeting and in the pre-meeting discussions, the main requests included shifting the route over the Alara River or constructing a tunnel through the forest corridor. Participants also emphasized the need to protect agricultural lands and to avoid adverse impacts on parks, greenhouses, irrigation canals, and residential houses. In addition, greater transparency was requested regarding information on quarries and their permitting processes.

On the other hand, the main concerns expressed were the increase in the number of houses affected due to the route change, grievances caused by the quarries, inappropriate working hours, and the risk posed to drinking water sources resulting from drillings. Concerns were also raised that expropriation compensation amounts would be too low. Prior to the meeting, the Expropriation Director provided information about the legal procedures, while ENCON Environmental Consultancy explained the compensation mechanisms foreseen within the RAP framework. The participants' Q&A table is presented in Table XIX.12.

Figure XIX.4 PCM in Avsallar

Figure XIX.5 The Informational Brochures in PCM

Konaklı

The Public Consultation meeting was held on August 26, between 3 and 6 p.m., at the Alanya Municipality Konaklı Cultural Center. The local headmen and residents stated that they would arrange their own transportation for the meeting held here. A total of 300 people attended the meeting, 26 of whom were women. Since the meeting in Avsallar could not be completed, some participants attended the meeting in Konaklı.

Figure XIX.6shows the venue where the meeting took place, the layout of the meeting room, the project route maps hung on the walls for informational purposes, and the presentation made during the meeting. Figure XIX.7 shows the informational brochures.

At the meeting held at the Alanya Municipality Konaklı Culture Center, the main requests included ensuring the continuity of the Konaklı–Alanya road, extending the road to Gazipaşa, and improving the design of the Konaklı junction. Tunnel and alternative crossing options were also suggested in order to prevent damage to agricultural lands. Complaints were mainly focused on the Konaklı junction dividing the neighborhood into two, the connection road design increasing traffic load, uncertainties regarding expropriation compensations and procedures, and concerns about 2B lands. In addition, the negative impacts of the Project on agricultural production and livelihoods were emphasized. Questions from participants regarding parcel and compensation information were answered by the AAOİAŞ Expropriation Director, while social impacts and measures under the RAP were explained by ENCON Environmental Consultancy and the AAOİAŞ Environment and Social Manager. CLOs conducted interview with local stakeholders prior to the session and also collected the contact information of participants who raised sensitivities during the meeting. The participants' Q&A Table is presented in Table XIX.12.

Figure XIX.6 PCM in Konaklı

Figure XIX.7 The Informational Brochures in PCM

Serik / Orta Neighborhood

The Public Consultation meeting was held on August 27, between 9 and 12 a.m., at the Antalya Metropolitan Municipality Multi-purpose Cultural Hall. The mukhtars and residents stated that they would arrange their own transportation for the meeting held here. A total of 80 people attended the meeting, 15 of whom were women.

At the meeting held at the Serik Multipurpose Cultural Center, the most frequently raised requests included a route change to protect the cemetery, the widening of the culvert under the D400 road, and ensuring access to greenhouses and houses through underpasses and connection roads.

The main complaints focused on the low level of expropriation compensations, the loss of value of payments due to inflation, the loss of fertile agricultural lands, and the risks faced by greenhouses built through loans. In addition, the absence of representatives from the General Directorate of Highways (KGM) was criticized. Questions related to the cemetery were addressed by AAOİAŞ representatives, who provided explanations on technical reasons and the inspections to be carried out. Details regarding expropriation compensations and legal procedures were provided by the Expropriation Director, while social impacts and livelihood losses were evaluated by the AAOİAŞ Environment and Social Manager. CLOs collected the addresses and contact numbers of households they had engaged with prior to the meeting as well as those who expressed sensitivities during the session.

The participants' Q&A Table is presented in Table XIX.12, while the meeting photos are presented in Figure XIX.8

Figure XIX.8 PCM in Serik / Orta Neighborhood

Manavgat / Yukarı Pazarcı Neighborhood

The Public Consultation meeting was held on August 27, between 3 and 6 p.m., at the Ibrahim Sözen Youth Center. To facilitate access to the PCM and to increase attendance rates, shuttle vehicles were arranged for the Yavrudoğan, Yeniköy, Dolbazlar, Karaöz, Hacıobası and Karakaya. A total of 187 people attended the meeting, 39 of whom were women.

At the meeting held at the Manavgat İbrahim Sözen Youth Center, the main complaints included uncertainties regarding expropriation negotiations and the payment schedule, issues related to fragmented parcels, risks of dust and asbestos as well as negative impacts from blasting, the risk of yield loss in olive trees, and the absence of representatives from the General Directorate of Highways (KGM). Questions concerning parcels and inherited properties were addressed by the AAOİAŞ Expropriation Director, while issues related to livelihood losses and vulnerable groups were answered by ENCON Environmental Consultancy and the AAOİAŞ Environment and Social Manager. Prior to the meeting, CLOs carried out information activities, and during the meeting, the addresses and contact details of participants who expressed sensitivities were collected in order to plan further engagements. The participants' Q&A Table is presented in Table XIX.12, while the meeting photos are presented in Figure XIX.9.

Figure XIX.9 PCM in Manavgat / Yukarı Pazarcı Neighborhood

Table XIX.12 Questions, Opinions, and Suggestions Submitted During the Public Consultation Meeting

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
Avsallar Kör Ali Baysal Wedding Hall / 26.08.2025 09:00-11.00	Headman of Akdam Neighborhood	It was emphasized that the Project would have negative impacts on agriculture and that both the local community and individuals would suffer losses.	A few questions, requests, and opinions were received first. Afterwards, while a representative from the General Directorate of Highways (KGM) was responding on behalf of the Project Officials, the meeting was interrupted and ended prematurely.	
	Resident	It was noted that the number of houses affected by the route change increased from 5 to 40, and a request was made to shift the route over the Alara River. It was also stated that parks, greenhouses, irrigation canals, and houses would be affected by the route.		
	Headman of Çakallar Neighborhood	It was stated that no prior notification had been provided regarding construction works, and that permission would not be granted once construction reached the village. A request was made for the Project		

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		route to pass through the forest instead of the settlement, including the construction of a tunnel if necessary. Objections to the quarries and the current route were reiterated, which were supported by applause from the community. Concerns were also expressed that the Project would not create employment, that people whose livelihoods depend on agriculture would lose their income sources, and that they would only be employed as cleaning staff.		
	Resident	It was stated that the local community did not want expropriations to be carried out. The procedures and legal processes related to expropriation were shared. It was also expressed that participants believed the compensation amounts for expropriation would be low.		
	Headman of Saburlar Neighborhood	It was stated that the motorway and quarries caused serious grievances and that the working hours were inappropriate. Questions were raised about whether EIA reports had been obtained for the quarries and who had granted the approvals. Concerns were expressed about the muddy water resulting from the drillings, noting that the Saburlar Quarry is located 200 meters upstream of the water source. It was further stated that a complaint petition had been submitted to the General Directorate of Highways (KGM) regarding this issue, but no action had been taken.		
Alanya Municipality Konaklı Culture Center / 26.08.2025 15:00-18.00	Resident	It was stated that there is a need for a road and that no alternative route exists, which causes heavy traffic. A request was made for the continuation of the Konaklı–Alanya road,		

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		noting that there is no entrance to Alanya after Konaklı.		
	Resident in Toslak Neighborhood	It was asked why the Project route had recently been changed and what the justification for this change was.	Representative of AAOİAŞ	Minor changes were made at the D-400 connection section in order to ease traffic.
	CHP District Chairman	It was stated that while the road is needed, it should not be constructed in its current form. The route passes through agricultural lands in Alarahan and Toslak, which constitute the livelihood of local people. It was requested that the complaints be taken into consideration, emphasizing that the destruction of agricultural lands would have significant impacts on climate and water scarcity. It was also noted that it currently takes one hour to travel 15 km, but congestion will still occur with the proposed connection roads.	Representative of ENCON	It was explained that in line with international standards, different solutions for expropriation activities and the associated costs are also being taken into account.
	Mayor of Konaklı (2014–2019)	It was stated that if the road is planned to be extended up to Gazipaşa, then the connection road in Konaklı (behind the New Hospital) should be cancelled. A concern was raised about whether it would first be constructed and then cancelled, emphasizing that people are already being adversely affected by the Konaklı connection road.	Representative of ENCON and AAOİAŞ	Reference was made to the Erdemli–Kızkalesi Project, where an extension was carried out as described. It was further explained that in addition to the motorway, certain connections are also included in the General Directorate of Highways' plans and will likely be expanded.
	Resident	Questions were raised regarding when the construction will take place and when it will be completed. Concerns were expressed about ongoing agricultural activities and related expenses (e.g., irrigation costs of 11,000 TL) as well as newly built structures (houses and buildings), and whether they would be demolished and compensated if affected.	Representative of AAOİAŞ	It was explained that initial assessments are being carried out, with inspections conducted by the General Directorate of Highways (KGM). The value of the land is determined based on the 2019 Expropriation Plan, taking into account unit costs and tax calculations. If any errors are identified during the assessments, these will be corrected. Notifications will be issued starting from March. Those seeking earlier information were

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
				advised to contact KGM directly. It was also stated that prices offered do not have to be accepted, and that lawsuits can be filed under Articles 27 and 10. Article 27 corresponds to an approximately two-month process, while Article 10 (Action for Price Determination and Registration) may take longer.
	Young Farmer Mustafa	A request was made for the service to be carried out properly, rejecting the route passing through fertile lands. It was stated that this is a wrong decision in the midst of a food crisis. It was further noted that ending the route in Konaklı would not solve the traffic problem, and that if the road is constructed in its current form, outward migration and unemployment will increase.	Representative of ENCON	It was stated that the concerns will be duly considered.
	Resident	It was stated that the area is not well known, and that traffic congestion occurs between Okurcular and Alanya. It was suggested that the Emişbeleni–Gazipaşa Tunnel Project should be implemented.	Representative of AAOİAŞ	It was stated that the concerns will be duly considered.
	Farmer, Resident	It was questioned whether this meeting would have been more effective if it had been held before the route was determined, and whether complaints would be taken seriously after the route has already been set.	Representative of ENCON	Complaints and requests will be taken into consideration to improve mitigation measures and the RAP. The necessary revisions and updates will continue to be implemented.
	Lawyer, Resident of Emişbeleni	It was stated that the Konaklı junction passes through the neighborhood, leading to the loss of greenhouses and damaging the efforts invested. It was questioned whether there is any land of equal value, emphasizing that the Project harms farmers.	Representative of ENCON	A RAP is being prepared within the scope of the Project, and losses will be compensated in line with international practices.
	Headman of Konaklı Neighborhood	It was stated that the approved Project route, particularly the junction on the Konaklı side, would negatively affect	Representative of AAOİAŞ	The settlement pattern is taken into account in the Project design, and necessary adjustments will be reviewed to

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		community life and divide the settlement into two.		minimize potential social impacts of the route.
		Concerns were raised that vehicles coming from the Alanya direction would increase the existing traffic load when connecting to the main route through the connection road due to the current design.	Representative of AAOİAŞ	Traffic impact analyses are being carried out, and measures to reduce traffic congestion will be considered in the junction designs.
		A request was made for the improvement of the junction design for these reasons.	Representative of AAOİAŞ	The matter will be re-evaluated with the relevant engineering design team, and appropriate technical solutions will be explored.
		An objection was expressed to the approved design, and an alternative route was requested.	Representative of AAOİAŞ	The approved route has been determined in line with national plans. However, the requests communicated will be recorded and forwarded to the relevant authorities.
		Questions were raised regarding the recent change in the Project route and the justification for this change.	Representative of AAOİAŞ	Route changes have been made by considering technical requirements and issues such as traffic safety.
		The possibility of further changes to the approved route was brought up.	Representative of AAOİAŞ	The Project route has been approved by the relevant authorities, and no substantial changes are foreseen.
		It was noted that the previous markings were more functional compared to the current design, and that the subsequent changes were negatively received.	Representative of ENCON	All markings and signages are implemented in compliance with national standards, and feedback received during implementation will be taken into account.
		It was emphasized that if improvements are made to the route, the community would show satisfaction, otherwise the reactions would continue.	Representative of ENCON	Stakeholder views will be regularly collected, and possible improvements will be made. The aim is to ensure community satisfaction.
		Participants expressed their discontent regarding the absence of representatives from the General Directorate of Highways (KGM) at the meeting.	Representative of AAOİAŞ	Participants' views in this regard have been recorded, and necessary steps will be taken to ensure the participation of the relevant authority representatives in future meetings.
	Resident in Emişbeleni	The local community stated that they did not want expropriations to be carried out.	Representative of AAOİAŞ	Expropriation will be carried out in accordance with the relevant national legislation and legal

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
				procedures, and the necessary information is being provided.
	Resident in Emişbeleni	Participants expressed their concern that the compensation amounts for expropriation would be low.	Representative of AAOİAŞ	Compensation amounts are determined through independent valuation studies, and participants were informed about the available legal appeal mechanisms.
	Resident in Akdam	The local community requested the implementation of the initial project design.	Representative of AAOİAŞ	The Project route has been updated considering technical requirements and traffic safety; however, the requests have been recorded and will be conveyed to the relevant authorities.
	Resident in Emişbeleni	Participants expressed concern about the potential loss of fertile agricultural lands.	Representative of AAOİAŞ	While determining the route, efforts were made to preserve fertile agricultural lands as much as possible; potential losses will be addressed through compensation mechanisms under the RAP.
	Resident	Participants mentioned that there are 2B lands in the area and stated that they did not know how to claim their rights.	Representative of AAOİAŞ	Processes related to 2B lands are carried out in line with the existing national legislation, and the rights holders have been provided with the necessary information.
	Resident	It was asked whether a new EIA Report would be required for route changes, noting that the road is shifted by 2 meters after the EIA Report is obtained.	Representative of AAOİAŞ	It was explained that before the tender, limited drilling works are carried out for design purposes. However, once the contractor takes over after the tender, the design cannot be finalized. Further drilling works are then conducted, and if the ground conditions are found unsuitable, route changes may occur.
	Resident in Akdam	Concerns were raised that the operating authorities did not act with due consideration and that construction works continued despite the complaints.	Representative of AAOİAŞ	Before construction, the headmen are informed and the CLOs provide relevant information. The address has been obtained and will be communicated to the CLOs.
	Resident in Emişbeleni	A question was raised regarding the possibility of reaching a settlement for the expropriation of the remaining portion of the land, as 73% has already been acquired.	Representative of AAOİAŞ	It was explained that a petition should be submitted for the expropriation of the remaining part. Depending on the assessment of the situation, the remaining

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
				portion may also be expropriated. For example, if access to the land is restricted, the petition would likely result in a favorable outcome.
	Resident in Konaklı	It was stated that the Konaklı junction has no benefit, and a request was made to return to the previous route. In addition, a request was made for the road to be extended to Gazipaşa. It was also suggested that Aksu should be connected to the Isparta road.	Representative of AAOİAŞ	The Konaklı junction and route designs have been prepared by taking into account traffic safety and transportation needs. Returning to the previous route is not technically feasible. The requests for extending the road to Gazipaşa and for connecting Aksu to the Isparta road have been noted and will be considered within the planning framework of the relevant authorities.
Serik Multipurpose Cultural Center / 27.08.2025 09.00-12.00	Headman of Yukarıkocayatak	A request was made for a route change due to the Mektebirli Cemetery located on parcel no. 1101. It was stated that 14–15 graves would be affected under the current route.	Representative of AAOİAŞ	It was explained that cancellation of the route is not possible. Following the meeting, a site inspection will be carried out to clarify the exact number of affected graves, as the figure was initially thought to be lower. It was further explained that the proposed route change does not comply with motorway standards; therefore, the current design must be maintained. A separate meeting will be organized with the headman and the concerned parties to share technical details, including why a change cannot be made and how the existing procedures will be followed. Further contact with the headman will be established at the beginning of the week.
	Headman of Kayaburnu	It was stated that the existing culvert under the D400 road is insufficient and needs to be widened. It was noted that the culvert is used by three neighborhoods, currently barely meets the demand, and may pose an overflow risk during sudden rainfall. It was asked whether the culvert could be widened	Representative of AAOİAŞ	It was noted that the issue will be reviewed with the relevant technical teams.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		during the D400 road expansion works. It was also stated that a petition had been submitted to KGM regarding this issue.		
	Headman of Deniztepesi	Concerns were raised that expropriation payments are too low and will lose value due to inflation by the time they are paid. A request was also made for land consolidation.	Representative of AAOİAŞ	It was clarified that there is a misunderstanding, as prices will be updated in the new year and payments will be made based on 2026 rates. It was also explained that land consolidation will not be possible after this stage of the process.
	Resident	It was asked whether compensation would be paid for greenhouses and structures.	Representative of AAOİAŞ	It was explained that compensation will be paid for structures. In the case of jointly owned lands, agreements may be reached through negotiation, or the matter can proceed to court.
	Resident	The public requested a clear timeline for the payment of expropriation compensations.	Representative of AAOİAŞ	It was stated that compensation amounts will be determined and paid according to the applicable legal schedule, and affected landowners will be informed individually.
	Resident	Information was requested regarding the size of the parcels to be expropriated.	Representative of AAOİAŞ	It was explained that the total area along the route has been calculated and that landowners of the affected parcels will be provided with specific information.
	Resident	Participants expressed that the offered expropriation compensations are significantly below market value.	Representative of AAOİAŞ	It was clarified that the compensations are determined through independent valuation studies, and landowners retain the right to appeal through legal mechanisms.
	Resident	Concerns were raised about the absence of representatives from the General Directorate of Highways (KGM) at the meeting.	Representative of AAOİAŞ	It was noted that this feedback has been recorded and will be conveyed to the relevant authority to ensure future participation.
	Resident	It was asked how payments would be made in parcels with multiple heirs.	Representative of AAOİAŞ	It was explained that payments will be made in accordance with inheritance shares, as determined under applicable legislation.
	Resident	Citizens requested adequate underpasses, culverts, and connection roads to ensure access to houses and greenhouses.	Representative of AAOİAŞ	It was stated that existing culverts will be extended and widened where necessary to maintain access.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
	Resident	Concerns were raised that cemeteries should not be affected by the Project.	Representative of AAOİAŞ	It was noted that measures will be taken to avoid impacts on cemeteries as far as possible, and any unavoidable cases will follow due procedures.
	Resident	It was stated that some parcels, houses, and greenhouses will be adversely affected by expropriation.	Representative of AAOİAŞ	It was explained that these impacts are recognized, and compensations will be provided in line with national legislation and the RAP framework.
	Resident	Concerns were expressed that expropriation payments would be insufficient to purchase new land.	Representative of AAOİAŞ	It was explained that compensations are based on independent valuations and legal requirements; however, concerns have been noted for further consideration in the RAP.
	Resident	It was noted that some greenhouses were built through loans, leading to additional grievances.	Representative of AAOİAŞ	It was explained that such cases will be reviewed on an individual basis, and compensation procedures will take account of legally recognized investments.
	Resident	Concerns were raised that certain routes may damage cemeteries and drinking water resources.	Representative of AAOİAŞ	It was stated that the Project design aims to avoid such sensitive areas; in cases where impacts are unavoidable, mitigation measures will be implemented in line with environmental and social standards.
	Resident in Kayaburnu (Parcel: 39 / 102)	Owns a single land plot of 11.5 decares with no other property. Stated that citrus trees planted in 2013 (12–13 years old) will be entirely affected, estimating a loss of 600–700 trees. Highlighted that the land is adjacent to a zoned area, making it highly valuable, and that acquiring new land under these conditions is impossible. Mentioned an annual income of 1,500–2,000 TL and stated that the road will not provide any benefit to him.	Representative of AAOİAŞ	The valuation of trees and land will be carried out through independent expert assessments. The proximity of the land to zoned areas, its current use, and agricultural productivity will be taken into account. Lost income and livelihoods will be addressed under the RAP.
	Resident in Burmahancı (Parcel: 102 / 88)	Raised concern that the KMZ is outdated at the location of the DSİ canal and needs to be checked. Noted that in the Ministry of Environment's e-Plan, the zoning plan attached	Representative of AAOİAŞ	The DSİ canal and existing roads will be reviewed by the technical teams. Discrepancies between the KMZ and the EIA plans will be checked, and the request

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		to the EIA report is updated, and the problem stems from the outdated report. Stated that there is already a DSİ road where lands are being taken, and that the additional T-junction road is unnecessary. Referred to the DSİ irrigation canal built in the 1970s.		regarding the additional connection road will be conveyed to the relevant authorities.
	Resident in Üründü	sked about the Project's start date. Stated that his greenhouse was divided and asked how water and electricity will be provided. Asked when he should stop agricultural activities, noting: "Should I plant or not?" Asked whether underpasses or culverts would be built since the route cuts through greenhouses and orange orchards. Asked how long before construction notification would be given.	Representative of AAOİAŞ	Notification will be given at least three months before construction begins.
		Asked whether there would be support for dismantling and transporting his greenhouse.	Representative of AAOİAŞ	Dismantling and transportation will be the responsibility of the landowner, but labor support may be provided.
	Resident in Cumalı (Parcel: 102 / 41)	Asked when the payments will be made and when construction will begin in their neighborhood.	Representative of AAOİAŞ	Expropriation payments and construction start dates will be determined in line with the official schedule, and landowners will be informed accordingly.
	Resident in Sarıbalı (Parcel: 249 / 5)	Stated that 10 households in the neighborhood are affected, 8 of which are in economic difficulty. Reported that 5 decares of his land will be lost, affecting his house and trees. Noted the presence of a tunnel passage on the route and asked whether there is a viaduct project to save his house.	Representative of AAOİAŞ	Yes, such a study is underway. Although the land is occupied, additional solutions are being explored.
	Resident in Üründü (Parcel: 135 / 6-4)	Noted that they are 5 co-heirs and the land originally belonged to their grandfather. Stated that the house, greenhouse, and orange orchard (approx. 300 trees, 20 years old) will be affected. Explained that this orchard is his livelihood, generating 2	Representative of AAOİAŞ	Üründü is not included in this year's construction plan.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		million TL annually, and that selling for 1 million TL is unacceptable. Emphasized that in 3 meetings held within 6 months, no clear information was provided about construction start dates or expropriation payments.		
	Resident in Burmahancı (Parcel: 102 / 40)	Reported that their 15-decare greenhouse will be completely lost and that they are 3 co-owners. Stated that their house and sources of income will disappear and that they had not been directly consulted before.	Representative of AAOİAŞ	Valuations will be carried out for greenhouses and houses affected by expropriation, and individual consultations will be held with the landowners. Loss of income will be considered under the RAP.
	Resident in Burmahancı	Asked why fertile agricultural lands are not being preserved as in countries like Germany. Stated that the Project design was made without consulting the local people and emphasized that fertile soils should not be lost. Noted that the local people are not involved in tourism but rely entirely on agriculture.	Representative of AAOİAŞ	Efforts have been made to avoid fertile agricultural lands as much as possible when determining the route. Public consultation meetings are being held to collect stakeholder opinions, and feedback from these meetings will be communicated to the relevant authorities.
	Resident in Üründü (Parcel: 117 / 5)	Reported that the 130-meter greenhouse is cut in half by the route, leaving unusable land on both sides. Noted that they took a 7-year loan from Ziraat Bank in 2021 and payments are still ongoing. Stated that the land represents years of labor, and despite health challenges (platinum in arm), agricultural production continues, but the Project disregards their efforts.	Representative of AAOİAŞ	Investments made with loans and agricultural facilities will be taken into account during expropriation valuation. Compensation mechanisms under the RAP will be evaluated to prevent grievances for landowners.
	Resident in Cumalı	Noted that apart from their 5-decare land on the route (Cumalı neighborhood, Antalya side), they have no other property. Previously, 10 decares had been requested for a hospital project (5 decares from a relative, 5 from themselves), but this project was later canceled due to the motorway. Requested that expropriation	Representative of AAOİAŞ	Expropriation compensation will be determined through independent expert assessments. Although losses arising from the cancellation of the hospital project cannot be considered under the official process, existing grievances will be assessed within the RAP framework. Social sensitivities have been conveyed to the project

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		compensation reflect not only the land value but also the economic losses from the canceled hospital project. Ali Bey added that his wife is a cancer patient who has undergone chemotherapy.		team.
Manavgat İbrahim Sözen Youth Center/ 27.08.2025 15.00-18.00	Resident	It was noted that there is no liaison office in Manavgat, and the Serik liaison office is not accessible for local citizens.	Representative of AAOİAŞ	Different communication channels (phone, email, CLO) will be used to facilitate citizens' access. Requests regarding office accessibility will be evaluated.
	Resident	Two lawyers attended the meeting and asked questions about expropriation processes.	Representative of AAOİAŞ	Answered questions regarding expropriation processes by Expropriation Director.
	Resident	The public requested a clear timeline for when expropriation negotiations and payments would be made.	Representative of AAOİAŞ	Expropriation payments and construction start dates will be determined in line with the official schedule, and landowners will be informed accordingly.
	Resident	Information was requested about the parcel sizes to be expropriated.	Representative of AAOİAŞ	It was explained that the total area along the route has been calculated and specific information will be provided to affected landowners.
	Resident	Participants stated that the offered expropriation compensations are far below market value.	Representative of AAOİAŞ	It was explained that landowners retain the right to appeal.
	Resident	Participants criticized the absence of representatives from KGM at the meeting.	Representative of AAOİAŞ	This feedback has been recorded; the necessary steps will be taken to ensure the participation of institutional representatives in future meetings.
	Resident in Örenşehir	Raised concerns about 15 years of income loss, asking who would cover this. Asked why shifting the road north is not possible, noting there are technical solutions. Asked what people will do for their livelihood after construction, emphasizing that they will not benefit from the motorway.	Representative of AAOİAŞ	Income losses and impacts on livelihoods will be assessed within the scope of the RAP. The road route has been determined based on technical requirements, and alternative requests will be recorded and forwarded to the relevant institutions.
	Resident in Hacıobası	Their house and business are affected. Asked why expropriation compensation is divided among all co-owners and	Representative of AAOİAŞ	Explained that consent must be obtained from other co-owners; if not, proof of ownership (e.g., bills) can be used. If

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		how they can ensure that only they receive payment.		necessary, a lawsuit can be filed to prove ownership.
	Resident in Taşağıl	Asked whether a study was carried out on dust and asbestos risks due to construction. Reported being close to the tunnel entrance and affected by blasting, leading to repeated complaints to the gendarmerie. Highlighted the presence of four elderly people (80+) and vulnerable individuals (Alzheimer's, visually impaired, broken arm), emphasizing negative impacts.	Representative of AAOİAŞ	Measures are being taken for dust control and blasting safety during the construction process, and regular measurements and inspections are being carried out. Vulnerable groups (the elderly, disadvantaged individuals) will be specifically assessed under the RAP and EIA.
	Headman of Taşağıl	Stated that the Taşağıl headman did not provide sufficient information about the meeting, and that they had difficulty learning about it.	Representative of AAOİAŞ	Meeting announcements were made through various channels (village council, public notice, website, newspaper). Feedback in this regard has been recorded. More frequent updates will be provided at subsequent meetings.
	Resident	Reported that her house and workplace at the Akseki road junction are affected by expropriation and that she has no other source of income. Asked how expropriation would be handled for inherited property. Expressed concern about losing her livelihood from running a roadside greengrocery.	Representative of AAOİAŞ	Payments for inherited land will be made in accordance with legal procedures. Loss of livelihood and damages will be addressed under the RAP.
	Headman of Gündoğdu	Reported that an electricity pole was placed on his land without official notification or expropriation information. Suggested that the route should pass 300–500 meters above the settlement to reduce impacts. Mentioned that high-voltage towers were initially placed in the middle of the road but later shifted to the side after consultations. Requested the installation of a low-voltage line. Another citizen reported that only 2 decares of land remained after	Representative of AAOİAŞ	The expropriation processes for power lines and poles will be carried out in coordination with the relevant institutions, and official notifications will be made to the rightful owners. The route has been determined in accordance with current design engineering and safety standards. Requests for low-voltage lines will be forwarded to the relevant institutions and evaluated based on technical suitability.

Location - Date - Time	Participants	Question, Comment, or Suggestion	Responser	Feedback Summary
		expropriation and asked how the process would proceed. Criticized the absence of KGM at the meeting. Raised concerns that construction dust would prevent olive trees from yielding crops and asked how this would be compensated.		Dust control measures are being taken for trees, and compensation mechanisms will be activated under the RAP in case of damage.
	Resident in Çolaklı	Reported having olive groves on land with 42 inheritance division agreements, where his mother is a co-owner. Requested that compensation for his mother's share be paid directly to her.	Representative of AAOİAŞ	Provided an explanation regarding the process.
	Lawyer	Stated that her clients learned about the expropriation by chance rather than through official notification. Requested information specifically about parcel 138/1530.	Representative of AAOİAŞ	Provided an explanation regarding the parcel.
	Headman of Aksaz	Reported that he had given consent for the service road route and was promised a stabilized road in return. Requested a dedicated information meeting for Aksaz. Reiterated demand for route changes, suggesting the route should pass 20 meters above the settlement to reduce impacts.	Representative of AAOİAŞ	The request for a stabilized road has been recorded, and coordination with the relevant institutions will be ensured. Holding a special information meeting for Aksaz will be evaluated. The route has been determined according to engineering criteria; requests will be recorded and forwarded to the relevant institutions.
	Headman of Ulukapı	Noted that sociologists, engineers, and foremen were assigned for community information, but there is a lack of legal support. Suggested that lawyers should also be involved in the process to ensure that both community and company rights are properly understood.	Representative of AAOİAŞ	The necessary legal information will be provided so that stakeholders understand the process correctly. A proposal to include lawyers in the fieldwork has been recorded.

Across the four meetings, the most frequently raised issue was the demand for route changes. In particular, participants consistently emphasized the need to protect agricultural lands, cemeteries, and water resources. The view that the Konaklı junction would affect community life was also expressed. Concerns about level of expropriation payments and of the process were among the asked questions. On the other hand, some participants stressed the clear need for the road and the necessity of a new arrangement to reduce the heavy traffic load in the region. In addition, repeated requests were made

to ensure adequate underpasses, culverts, and connection roads to maintain access to houses, greenhouses, and agricultural lands.

During the meetings, questions regarding parcel information, payment schedules, and compensation mechanisms were answered by the Expropriation Director and the Environment & Social Manager. Furthermore, CLOs engaged in one-on-one communication with vulnerable groups both prior to and during the meetings. This approach ensured that the meetings were conducted in line with the principle of participation.

XIX.3.7. Internal Stakeholder Engagement Activities

Employee Satisfaction Survey

The internal stakeholders of a project are crucial for its healthy progress. The largest group of internal stakeholders in terms of quantity is the employees. Employees of the project sponsor and subcontractors are involved in all stages of the Project's life cycle. Therefore, engaging with internal stakeholders through stakeholder engagement activities is an essential and crucial key performance indicator criterion. The project sponsor is expected to conduct various stakeholder engagement activities with internal stakeholders.

As part of internal stakeholder engagement activities, the Project Sponsor may conduct an employee survey to gather feedback on the overall operation of the Project. This survey aims to identify areas for improvement in management and the workplace and emphasize the importance of gender equality. By doing so, the Project aspires to promote inclusivity and create a better working environment for all employees, ensuring that everyone's views are valued and considered in the quest to enhance workplace dynamics and fairness.

The suggested employee questionnaire is prepared with at least a 5-point Likert scale. The survey study is set up to analyze the answers given by the employees to the given statements. The answers are categorized as strongly disagree (1), disagree (2), partially agree (3), agree (4), and strongly agree (5). The statements given to the employees to express their opinions within the scope of the survey are as follows:

1. I am satisfied with the cafeteria and the food served.
2. In the workplace, cleanliness, organization, and order are given importance.
3. The company attaches great importance to occupational health and safety issues.
4. The company provides the personal protective equipment required for the job.
5. I am satisfied with the working hours.
6. The behavior of the employees towards each other is good.
7. I have access to the things I need to do my job well.
8. My salary makes me satisfied.
9. In general, I am happy with my supervisor/top manager.
10. I am satisfied with the Company's Management.
11. Necessary security measures (other than occupational health and safety issues) are taken in our company.
12. I recommend this company to work with.
13. I am satisfied with the possibilities offered for the service.
14. Social areas within the construction site where we can spend time outside work are sufficient.
15. I am happy with the laundry and dormitory conditions.
16. The company promotes gender equality and ensures equal opportunities for all employees.

This survey will be conducted separately by the female CLO for the female employees, and in order to avoid trust issues, it will be stated that the female employees will share all their problems except for the questions and that these will remain anonymous if they wish. How the process of complaints or requests received here will work is explained in the Grievance Mechanism section.

Provide SEAH and GBV training or develop a safety plan for women workers before the construction starts. It is detailed at Labor and Working Conditions chapter at ESIA.

XIX.4. STAKEHOLDER IDENTIFICATION

In order to develop an effective SEP, it is necessary to determine who is likely to be affected (both directly and indirectly) by the Project (“affected parties”); who may have an interest in the Project (“interested parties”); and have the potential to influence project outcomes or operations.

An important stage of the stakeholder identification is the groups that are likely to be affected by the Project more or differently than other stakeholders, and whose influence on these possible impacts is expected to be relatively low. These groups are defined as "vulnerable groups" in the literature. One of the aims of the stakeholder engagement plan is to carry out an effective and sustainable communication, information and consultation process with these vulnerable groups. For this purpose, this SEP covers the following objectives related to vulnerable groups:

- Identifying vulnerable groups
- The method and frequency of communication with vulnerable groups
- Opportunities and priorities for vulnerable groups
- Monitoring process

XIX.4.1. Stakeholder Identification Methodology

Stakeholders were identified through a structured and participatory methodology aligned with international best practices, including IFC Performance Standard 1, the Equator Principles..

The identification process aimed to ensure the inclusion of all individuals, groups, and organizations who may be directly or indirectly affected by the project or who may influence its outcomes. The detailed methodological steps followed during this process are presented in Table XIX.13.

Table XIX.13 Methodological Steps for Stakeholder Identification Aligned with International Standards

Method	Description	Key Focus Areas	Target Groups / Sources
Desk-Based Review	Review of existing documentation and spatial data	Identification of affected areas, land parcels, community assets	ESIAs, Resettlement Frameworks and Baseline Studies, Local government records and cadastral maps, Previous stakeholder engagement records
Field Visits & Observations	On-site visits along proposed motorway corridor	Land use, mobility, seasonal migration (e.g., Yörük routes), presence of informal or unregistered groups	Local terrain and communities along the corridor
Key Informant Interviews (KIIs)	Semi-structured interviews with diverse local actors	Local insights on social dynamics, vulnerabilities, potential project impacts	Mukhtars, women, elderly, farmers, Yörük communities, seasonal workers, NGOs, CSOs
Vulnerability Mapping	Identification and assessment of at-risk populations	Vulnerability related to land acquisition, access to information, livelihood risks, social marginalization	Illiterate adults, women-headed households, seasonal workers, elderly, disabled, refugees

XIX.4.2. Stakeholder Categorization

Stakeholders were categorized into Project-Affected People, Vulnerable Groups, Interested Parties, and Governmental and Regulatory Stakeholders. This multi-tiered classification ensured a comprehensive and inclusive approach focused on human rights risks related to displacement, participation, and access to remedies (see Table XIX.14).

Table XIX.14 Stakeholder Categorization

Category	Description / Details
Project-Affected People (PAPs)	Individuals and households directly impacted by land acquisition or construction activities; business owners
Vulnerable Groups	Those with limited capacity to participate in decision-making or to absorb adverse impacts
Interested Parties	Institutions, NGOs, unions, academic groups, business owners, or the general public with a stake in the project outcomes. This includes civil society actors and service organizations supporting local communities, including those involved in health, social welfare, gender-based violence response, shelter, or community development.
Governmental and Regulatory Stakeholders	Local, provincial, and national-level authorities responsible for project permitting and oversight. This also includes emergency response units (e.g., disaster management authorities, fire brigades), public health services, municipal utilities, and security or protection bodies involved in addressing GBV and community safety.

The vulnerable groups identified in the Project are as follows:

- Children
- Children with special needs
- Out-of-school children (school-age children who cannot attend school)
- Elderly people (75+)
- Elderly people requiring care and social assistance (65+)
- Illiterate adults
- Persons with chronic illness (e.g., heart, diabetes, kidney)
- Persons with other serious health conditions (e.g., cancer, Alzheimer)
- Disabled persons (physical / mental)
- Unemployed people (even though they are actively seeking work)
- Seasonal agricultural workers
- Households dependent on natural resources (agriculture, livestock, forest products)
- Green Card holders
- State aid beneficiaries
- Informally employed workers (without social security)
- Physically and Economically displaced households
- Female-headed households
- Landless households
- Low-income households (below minimum wage)
- Migrant and refugee households (e.g., Syrian, Afghan)
- Ethnic or linguistic minority groups
- Semi-nomadic Yörük communities
- Households previously affected by expropriation

Gender inequality may be seen in stakeholder engagement process. Although it is not defined as a vulnerable group on its own, it is necessary to be sensitive to situations where women cannot take part in these stakeholder engagement activities. Project Sponsor should consider gender equality in the stakeholder engagement processes of the project and should approach with sensitivity to the problems that may arise in this regard. Project Company will take short and long-term steps towards resolving these problems. Arranging time and space so that women can participate in meetings and other

events equally is one of the simplest and most effective steps that can be taken in this regard. In addition to the above-mentioned vulnerable groups, gender equality will be considered in the process of stakeholder identification, consultation with stakeholders and grievance management process.

In the context of the Project, women are identified as a vulnerable group due to a combination of socio-economic, cultural, and spatial dynamics that influence their exposure to project-related impacts. Because the location area of the project is rural and peri-urban areas, women often rely on informal or subsistence-based economic activities - such as agriculture, livestock care, and seasonal labor - which are typically unregistered and under-recognized in compensation and livelihood restoration schemes. Moreover, women may face mobility restrictions due to gender norms and lack of access to private transportation, which can be further exacerbated if the motorway alters local routes, increases travel distances, or reduces public transportation availability. In areas like Manavgat, where tourism and agriculture are dominant, women's economic roles are often linked to place-based activities (e.g., local markets, childcare close to home), making them more vulnerable to displacement or disruption. Additionally, the influx of a temporary male workforce during construction may elevate risks of gender-based violence and harassment, particularly in communities with limited protective infrastructure or social services. For these reasons, it is crucial that the project incorporates a gender-sensitive approach in its impact assessments, stakeholder engagement processes, and mitigation strategies to ensure that women's voices are heard, their specific risks addressed, and their livelihoods and well-being protected.

In the neighborhoods within the impact area of the project, especially in the Central neighborhood of Serik district, it was determined in the field study conducted by Encon in June 2024 that Syrians under temporary protection status and Syrian Migrants live. According to Refugees Association's May 2025 Report, the number of Syrians living in Antalya is 6839. Attacks against Syrian refugees, especially in Serik district, were reported in the news.

On the other hand, nomads living in the Antalya region go to the plateau at certain times of the year. Antalya-Serik-Ovacık plateau visited by Yoruks is located within the project area. Nomads who will pass through this region are a vulnerable group both in terms of the impact of construction on their journeys and in terms of accommodation. The migration pathway of nomads is given in FigureVII.1 as referenced to the motorway alignment.

On the other hand, nomads living in the Antalya region go to the yayla at certain times of the year. A section of the migration route to the Antalya-Serik-Ovacık yayla, which is visited by the Yörüks, is located 1,200 meters from the project area. Nomads passing through this region are a vulnerable group in terms of both the impact of construction on their journeys and accommodation. The migration route of the nomads is given in Figure XIX.10 according to the highway route.

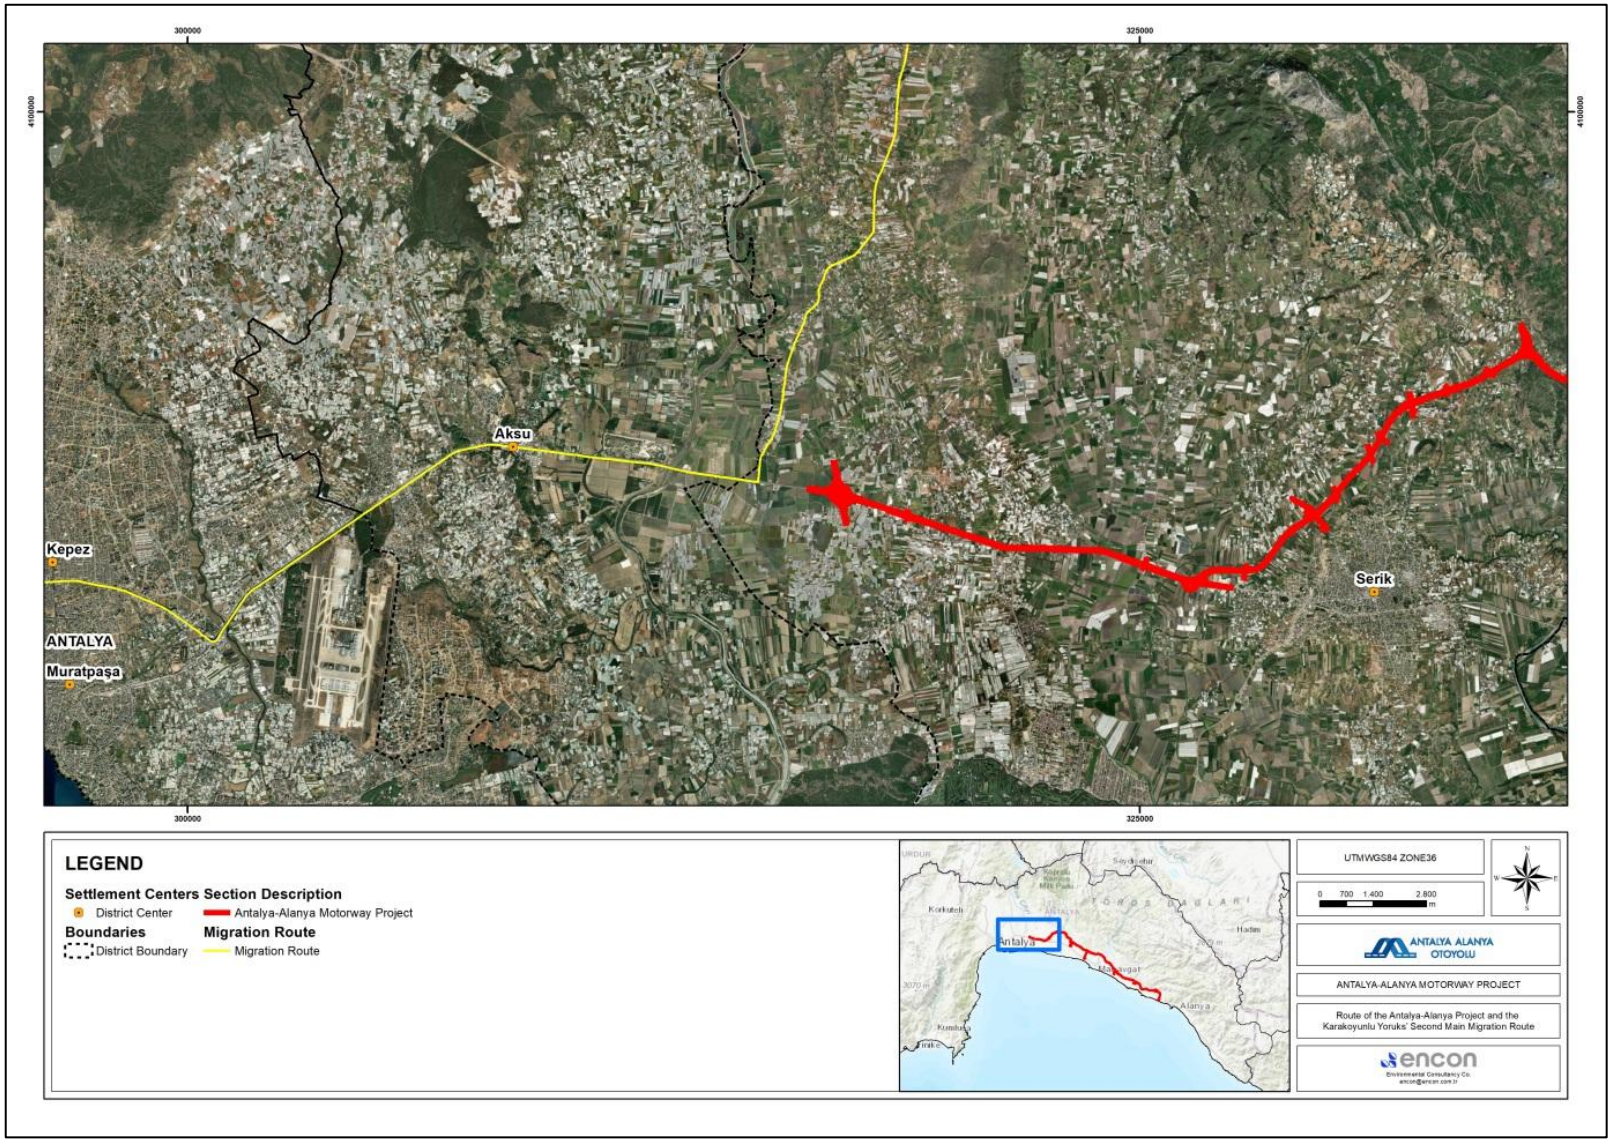

Figure XIX.10. The Migration Pathway of Nomads in the Region

XIX.4.2.1. Project-Affected People (PAPs)

Project-Affected People (PAPs) are defined as individuals, households, or communities who will experience either physical or economic displacement as a result of the Antalya–Alanya Motorway Project. The identification of PAPs is based on expropriation plans (as of April–May 2025), site-specific scoping studies, and preliminary stakeholder consultations. Impacts vary by geography, land tenure, land use, and vulnerability status. The categories of Project-Affected People (PAPs) identified for the Antalya–Alanya Motorway Project are summarized in Table XIX.15, based on expropriation plans, scoping studies, and preliminary consultations, reflecting variations in land tenure, land use, and vulnerability.

Table XIX.15 Categories of Project-Affected People (PAPs) for the Antalya–Alanya Motorway Project

Category	Description / Key Details
1. Landowners and Land Users	Privately-owned parcels will be subject to expropriation. These include agricultural fields, orchards, greenhouses, and constructible plots. Some parcels may become "orphaned land," and in addition, there are lands informally used by non-owners such as farmers or tenants.
2. Structure Owners	299 houses, 599 greenhouses, 37 business structures affected - many with multiple structures - Includes small-scale agricultural and informal businesses
3. Livelihood-Dependent Farmers	Households losing >20% of productive land, especially greenhouse/orchard farmers, at high economic displacement risk - Parcels <500 m² post-expropriation considered unviable for farming
4. Residents in Fragmented or Severed Parcels	Parcels divided by motorway causing difficult or impossible internal access - Planned engineering solutions (underpasses, culverts) to mitigate access loss; effectiveness to be confirmed via RAP consultations
5. Vulnerable and Marginalized Groups	Illiterate adults unable to comprehend expropriation/compensation - Elderly with limited mobility/access - Women without land title or informal income earners - Migrants, refugees, seasonal workers with undocumented tenure - Semi-nomadic Yörük communities with migration routes crossing project area
6. Users of State-Owned and Public Lands	Greenhouses/agricultural plots on state treasury or forest lands used informally by locals - May qualify for compensation or assistance under national policies or livelihood restoration programs

Project-Affected People by Settlement

Based on the expropriation data and field surveys from April–May 2025, the following neighborhoods are most significantly affected. In addition, specific findings on Migratory Status and Nomadic Populations (Yörük Communities) have been presented separately below the table, as the former draws on both ENCON fieldwork and data from the Refugees Association, while the latter was identified during the desk study stage.

Table XIX.16 Vulnerability Groups in the Expropriation Corridor

District	Neighbourhood	Vulnerable Groups
Serik	**Deniztepesi**	Other significant health issues, Economically displaced household
	Sarıabalı	Physically displaced household, Economically displaced household, Landless household, Household s who lose more than 20 percent of their total productive area, Women-headed household, Low income household, Unemployed (Although looking for a job), Chronic diseases, Children of school age who do not attend school, Illiterate, Mental Disability/ Issues, People who do not speak and/or understand Turkish
	Çandır	Economically displaced household, Household s who lose more than 20 percent of their total productive area
	Cumalı	Economically displaced household, Chronic diseases, Physical Disability, Mental Disability/ Issues
	Burmahancı	Economically displaced household, Landless household, Low income household, Household s who lose more than 20 percent of their total productive area
	Üründü	Economically displaced household, Households who lose more than 20 percent

District	Neighbourhood	Vulnerable Groups
		of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases
Manavgat	**Çakış**	Economically displaced household, Low income household, Households who lose more than 20 percent of their total productive area, Elderly (over 65) in need of care, Illiterate, Physical Disability
	Taşağıl	Economically displaced household, Landless household, Household s who lose more than 20 percent of their total productive area, Women-headed household, Low income household, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases, Other significant health issues
	Gündoğdu	Economically displaced household, Low-income households, Chronic diseases
	Hocalar	Economically displaced household, Landless household, Household s who lose more than 20 percent of their total productive area, Low-income households, Elderly (over 65) in need of care, Illiterate, Chronic diseases, Unemployed (Although looking for a job)
	Yavrudoğan	Economically displaced household, Households who lose more than 20 percent of their total productive area, Women-headed household, Low income household, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Illiterate, Chronic diseases
	Çolaklı	Physically displaced household, Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area, Women-headed household, Low income household, Seasonal agricultural worker, Illiterate, Chronic diseases
	Seki	Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Chronic diseases
	Kalemler	Economically displaced household, Households who lose more than 20 percent of their total productive area, Landless household, Women-headed household, Low income household, Elderly (over 65) in need of care, Chronic diseases, Physical Disability
	Evren	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases
	Yeniköy	Economically displaced household, Elderly (over 65) in need of care, Chronic diseases
	Şişeler	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Children with special needs, Chronic diseases
	Evrenleryavşi	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Children with special needs, Chronic diseases, Unemployed (Although looking for a job)
	Yukarıışıklar	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Illiterate, Physical Disability, Chronic diseases, Mental Disability/ Issues, Seasonal agricultural workers
	Dikmen	Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area
	Bucakşeyhler	Economically displaced household, Low income household, Illiterate, Physical Disability, Chronic diseases
	Ulukapı	Economically displaced household, Low income household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Aşağıışıklar	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Physical Disability, Chronic diseases, Other significant health issues
	Karaöz	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Aksaz	Economically displaced household, Landless household, Low income household, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Chronic diseases
	Hacıali	Economically displaced household, Low income household, Household resettled in the neighborhood after earthquake or other disasters (Fire), Households who lose more than 20 percent of their total productive area, Significantly affected by

District	Neighbourhood	Vulnerable Groups
		expropriation of other past projects, Advance Old Age (over 75), Illiterate, Chronic diseases
	Cevizler	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Chronic diseases
	Hacıisalı	Economically displaced household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases, Other significant health issues
	Hacıobası	Economically displaced household, Women-headed household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75, Chronic diseases, Physical Disability, Other significant health issues
	Uzunlar	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75, Chronic diseases, Elderly (over 65) in need of care, Physical Disability, Other significant health issues
	Kadılar	Economically displaced household, Women-headed household, Low income household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases, Other significant health issues, Beneficiary of governmental aid
	Örenşehir	Economically displaced household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Yalçıdibi	Economically displaced household, Women-headed household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75, Chronic diseases, Elderly (over 65) in need of care, Illiterate, Physical Disability, Other significant health issues
	Odaönü	Economically displaced household, Low income household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Karakaya	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Significantly affected by expropriation of other past projects, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Physical Disability, Chronic diseases, Seasonal agricultural workers
Alanya	**Alara**	Economically displaced household, Women-headed household, Landless household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Illiterate, Chronic diseases
	Çakallar	Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area, Advance Old Age (over 75), Elderly (over 65) in need of care, Illiterate, Chronic diseases, Mental Disability/ Issues, Beneficiary of governmental aid
	İncekum	Economically displaced household
	Türkler	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Chronic diseases, Physical Disability
	Emişbeleni	Economically displaced household, Landless household, Households who lose more than 20 percent of their total productive area, Illiterate
	Toslak	Economically displaced household, Landless household, Low income household, Households who lose more than 20 percent of their total productive area, Elderly (over 65) in need of care, Illiterate, Chronic diseases, Physical Disability, Mental Disability/ Issues, Employed without social security
	Telatiye	Economically displaced household, Households who lose more than 20 percent of their total productive area, Chronic diseases
	Elikesik	Economically displaced household, Landless household, Low income household, Illiterate, Chronic diseases, Seasonal agricultural workers

Migratory Status: Field research conducted by Encon in June 2024 identified Syrian citizens and other migrant groups under temporary protection, particularly in the Central District of Serik. Greenhouse owners in Serik, Manavgat, and Alanya districts have stated that they employ migrant workers. Seasonal workers are primarily Afghan and Syrian nationals. According to the RAP Report, registered and unregistered migrant workers are present in the neighborhoods of Emişbeleni, Aşağıçatma, Evren (registered), Toslak, and Çakış. According to the Refugees Association, as of May 2025, there are approximately 6,839 Syrians residing in Antalya. Tensions toward refugees have been

reported, particularly in Serik. Project materials will be provided in Arabic to support inclusive participation. Additionally, necessary information will be communicated specifically by CLOs.

Nomadic Populations (Yörük Communities): Seasonal nomadic groups such as the Yörüks were identified along migration routes passing near the project alignment (~1,200 m away at times). Semi-nomadic communities are also present in Toslak, Ulukapı, and Karakaya. These groups often:

- Rely heavily on livestock grazing and pasture access
- Have low literacy rates and limited access to health services
- Are excluded from formal consultation due to their mobile lifestyle

To support them, the project will incorporate culturally sensitive engagement methods, preserve grazing corridors where feasible, and consider compensation or assistance through the Livelihood Restoration Plan.

Within the scope of the Project, it is important to identify stakeholders at the beginning of the process to inform key stakeholders (local people, relevant state institutions and NGOs) about the Project and provide effective participation of the stakeholders. To this end, the following individuals and groups should be considered specifically:

- People who are likely to be affected, directly or indirectly by the Project,
- People or institutions may have an interest in the Project,
- People or institutions that have the potential to influence
- Project outcomes or company operations.

Besides it is an important process to identify vulnerable or disadvantaged people or groups, who are likely to be affected by the Project in certain phases, accurately during the identification of stakeholders. Possible stakeholders who are likely to be affected by the Project or have an influence on the Project are listed below:

- Project employees, including Contractors. Project parties;
- National governmental and non-governmental organizations (NGOs);
- Local governmental organizations and NGOs;
- Local residents (potentially project affected persons including vulnerable groups); and
- Local businesses and universities

The stakeholders listed in **Error! Reference source not found.** are the most prominent in the Project. Organizations or groups not listed can contact the Project Sponsor and provide their contact information to be informed about the Project.

People living in residential areas near the Project will be considered as potential Project affected people/population (PAP) in this Stakeholder Engagement Plan (SEP). These settlements are also listed in **Error! Reference source not found.**. Therefore, one of the objectives of the SEP is to effectively consult and share information with these groups and address their concerns.

Table XIX.17 Project's Stakeholders List

Level	Category	Organization / Entity

XIX.4.3. Field Study Report

The result of the field study is shown in the **Error! Reference source not found.**. Processes like expropriation, public consultation meetings, working conditions will be advanced according to these results.

Table XIX.18 The Result of the Field Study

District	Neigborhood	Findings About Vulnerable Gruops
Serik	Merkez	There is no vulnerable group that does not receive support within the knowledge of the mukhtar. There is a high proportion of Syrian refugees/immigrants living in this neighborhood.
Manavgat	Taşağıl	Since the elderly population in the neighborhood is high and the elderly population in need of care and social assistance is the dominant group, a focus group study was conducted.
Manavgat	Kalemler	A focus group study was conducted since the female population of the neighborhood is dominated by divorced/divorced women. Generally, female heads of households and single women work or their children provide care for those who are unable to work. **It was identified that the house and adjacent agricultural land in the potential impact area of the highway project belongs to a physically disabled household head (male). This person stated that he lives on his own. He stated that there is a risk of losing 95% of his land due to expropriation. Parcels: 136/6, 136/7.
Manavgat	Ulukapı	Considering the neighborhood population, the female household head vulnerable group is in the majority. A vulnerable focus group interview was conducted with female participants.
Manavgat	Hacıisalı	A focus group study was conducted in the neighborhood as the population of women who have lost their spouses/divorced and elderly people in need of care are the dominant group. It was informed that there are 3 people who will lose more than 20% of their total productive area in this neighborhood in the potential impact area of the motorway project. Two people have olive groves and one person has a glass greenhouse on the project route. It was informed that the land and residence of the female-headed household will probably be affected by the project.
Manavgat	Karakaya	Considering the neighborhood population, no dominant vulnerable group has been identified. It was informed that the route of the highway passes through the agricultural land and residence of the disabled person.
Alanya	Alara	There may be farmers who have lost more than 20% of their total productive area due to expropriation.
Alanya	Çakallar	There may be farmers who have lost more than 20% of their total productive area due to expropriation.
Alanya	Akdam	There may be farmers who have lost more than 20% of their total productive area due to expropriation. It was also informed that the land and residence of the female-headed household would likely be affected by the project.
Alanya	Toslak	There may be farmers who have lost more than 20% of their total productive area due to expropriation.
Alanya	Konaklı	There may be farmers who have lost more than 20% of their total productive area due to expropriation.

*Source: ENCON Field Study (2024)

XIX.5. STAKEHOLDER ENGAGEMENT PLAN

This part of the SEP introduces the stakeholder engagement plan for the Project Company and gives a detailed description of the disclosure process and timeline. It then presents AAMP's methods and frequencies for stakeholder engagement, along with the proposed stakeholder engagement plan for the construction and operation phases.

XIX.5.1. Methods and Tools for Information Dissemination and Stakeholder Engagement

Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. used appropriate methods to disclose information about the planned Project, consult with stakeholders on potential benefits and risks of the planned project and potential adverse impact mitigation measures. Disclosure of relevant project information helps stakeholders better understand the risks, impacts and opportunities associated with the proposed projects. Information will be disclosed using methods, which is suitable for various groups of stakeholders at all project implementation stages. For all disclosure attempts IFC PS1 and EPFI Principle 5 is followed and by doing so, the Project is kept in international standards. The relevant means for consultations with stakeholders are provided in Table XIX.19 and with possible timing in Table XIX.26 .

Different engagement methods are proposed and cover different stakeholder needs as stated below:

- Formal/ informal face-to-face meetings,
- Focus group meetings,
- One-on-one interviews,
- Digital communication tools (including web pages, correspondence by phone/email, WhatsApp, short message service),
- Written materials,
- Grievance mechanism,
- Social Media promotions.

A range of tools are being utilized for stakeholder engagement under this Project. Stakeholder engagement will continue to utilize these already established communication mechanisms, along with new mechanisms to be used as needed to ensure efficient and effective engagement throughout the lifetime of the Project. The project has and will continue to use the following methods for interacting with stakeholders:

Table XIX.19 Stakeholders / Purpose of Communication / Communication Methods

Stakeholders	Purpose for Communication	Type and Method of Communication
Local communities/settlements in the area (See Table XIX.9 .) Farmers and owners of the agricultural fields around the motorway route Related local businesses near the motorway route Local Universities Vulnerable groups specified under the stakeholder identification section of this document which include as follows: • Children • Children with special needs • Out-of-school children (school-age children who cannot attend school) • Elderly people (75+) • Elderly people requiring care and social assistance (65+) • Illiterate adults • Persons with chronic illness (e.g., heart, diabetes, kidney) • Persons with other serious health conditions (e.g., cancer, Alzheimer) • Disabled persons (physical / mental) • Unemployed people (even though they are actively seeking work) • Seasonal agricultural workers • Households dependent on natural resources (agriculture, livestock, forest products) • Green Card holders • State aid beneficiaries • Informally employed workers (without social security) • Physically and Economically displaced households • Female-headed households • Landless households • Low-income households (below minimum wage) • Migrant and refugee households (e.g., Syrian, Afghan) • Ethnic or linguistic minority groups • Semi-nomadic Yörük communities • Households previously affected by expropriation	Providing information on the nature of the proposed Project, duration of the Project, potential environmental, social and economic impacts (positive and negative) Opportunities for the community to be actively involved in the project activities Mechanism / opportunities for suggestions and proposals Discussions on the potential adverse impacts	Information through the notice boards in public places,community liaison officers, project information desks, official website etc. Information about the prepared documents related to the project (ESIA report and SEP). Construction signs and warnings during the construction phase Group or individual meetings to identify impacts, agree and implement mitigation measures, project announcement (leaflets, etc.) as necessary

Stakeholders	Purpose for Communication	Type and Method of Communication
Representatives of local communities (See Table XIX.9)	Providing information on the nature of the Project, duration of the Project, potential environmental, social and economic impacts (positive and negative) To generate opportunities for the community to be actively involved in the project activities To create mechanisms and/or opportunities for suggestions and proposals To give rise to discussions on the potential adverse impacts	Official correspondence and meetings to provide information on project progress and issues that concern local communities and providing direct information Information through the notice boards in public places,community liaison officers, project information desks, official website etc. Information about the Project (ESIA, SEP, Management Plans) Formal/Informal Meetings with related parties
Interested national and local NGOs Other interested organizations will be added, as identified throughout the life of the Project	Providing information on the nature of the Project, duration of the Project, potential environmental, social and economic impacts (positive and negative) These organizations can potentially help to identify key issues pertaining to the local community (vulnerable groups) and the local environment	Information through the notice boards in public places,community liaison officers, project information desks, official website etc. Information about the Project (ESIA, SEP, Management Plans) Formal/Informal Meetings with related parties
AFAD Local emergency services, fire brigades, utility owners and operators, local police, coast guard, health services	Inform relevant local authorities about Project and undertake official correspondence when needed	Official correspondence and meetings to prepare for and coordinate activities during operation.
Local and Central Governmental Institutions/Agencies	Informing regarding Project progress and undertake official correspondence Getting necessary approvals/opinions during project execution	Official correspondence and meetings, information disclosure and consultation reporting, monitoring, permit requests
General Directorate of Highways (KGM)	Providing information about the operation process of the Project, providing necessary information and reporting on relevant stakeholder engagement activities	Official correspondence and regular meetings to provide information on project progress and address issues that concern local communities and stakeholders Official correspondence and meetings, information disclosure and consultation reporting, monitoring, permit requests

**The website allows for anonymous communication.*
**During phone conversations, individuals will not be pressured to share their identity information; however, they will be informed that, in the absence of contact details, follow-up responses may not be provided.*

To ensure inclusive and equitable participation in the project lifecycle, the following gender-sensitive engagement measures are being implementing:

- **Targeted Outreach to Women**: Separate consultation meetings with women in each affected settlement, facilitated by female staff at every neigborhood in the Project area without exception from beginning of the construction. .It is defined below at the Stakeholder Engagement Plan Section.
- **Accessible Meeting Formats**: The meetings are organized to start at 10.00 - 11.00 a.m. the most convenient time of the day for women,
- **Trusted Local Channels**: Utilize existing women's networks, cooperatives, health centers, and neighborhood heads to disseminate project-related information.
- **Language and Literacy Considerations**: Use visual materials and oral communication methods to accommodate illiterate and semi-literate women.
- **Safe Reporting Mechanisms**: Design grievance systems that allow confidential reporting of gender-based risks and ensure that women feel secure using these channels.

- The call center with the Grievance Mechanism will have a dedicated contact number for women and ensure that the staff listening to the complaint/request are women.
- **Continuous Feedback Loops**: Review and, where appropriate, integrate women's feedback into project decisions, and provide tailored updates to explain how their input has been addressed..

These measures aim to strengthen social inclusion and minimize unintended harms by addressing the gender-specific barriers that may prevent full participation and benefit sharing.

All neighborhood mukhtars (names of neighborhoods are given below) within the project impact area will be interviewed, active communication will be maintained throughout the construction phase, if the mukhtars approved, separate Whatsapp groups are established for each district and active communication is ensured.

Before the Public Participation Meetings, meetings will be held with the neighborhood headmen of each district in Alanya, Manavgat and Serik districts in August 2025, and information was given about both the project and the public participation meetings.

The WhatsApp groups with Muhtars are been used to inform about the meetings, monitoring the complaint boxes and unexpected developments.

XIX.5.2. Specific Communication Strategies

Neigborhoods:

Antalya/Serik: Yukarıkocayatak, Aşağıkocayatak, Kayaburnu, Çandır, Aşağıçatma, Burmahancı, Cumalı, Üründü, Deniztepesi,Sarıabalı, Belpınarı, and Abdurrahmanlar neighborhoods

Antalya/Manavgat: Çakış, Taşağıl, Gündoğdu, Hocalar, Yavrudoğan, Çolaklı, Seki, Kalemler, Evren, Ilıca, Yeniköy, Şişeler, Evrenleryahşi, Dolbazlar, Yukarıışıklar, Dikmen, Bucakşeyhler, Ulukapı, Aşağıışıklar, Demirciler, Karaöz, Aksaz, Hacıali, Cevizler, Sülek, Hacıisalı, Hacıobası, Uzunlar, Kadılar, Örenşehir, Yalçıdibi, Odaönü, Karakaya

Antalya/Alanya: Alara, Çakallar, İncekum, Avsallar, Akdam, Türkler, Payallar, Emişbeleni, Toslak, Telatiye (Konaklı), Elikesik

Table XIX.20 Serik- Merkez Neigborhood

Category	Details
Target Groups	Local women, refugee women (especially Syrians), elderly residents, small-scale farmers
Identified Barriers and Risks	Women have limited access to formal consultation mechanisms, language barriers (Arabic speakers), time limitations due to domestic responsibilities, and discomfort attending mixed-gender meetings
Recommended Meeting Frequency	Every 3 months during the construction phase
Suggested Venue	S.S. Serik Boğazkent Women's Initiative Production and Business Cooperative or another trusted, central, and accessible space for women such as a municipal social center
Suggested Time	Weekday mornings (e.g., 10:00–11:00) or early afternoon for increased flexibility
Pre-Meeting Notification Method	Physical announcements (posters) at mukhtar offices, women's cooperative, and local grocery stores Bilingual printed materials (Turkish–Arabic) to reach refugee women

	Coordination with NGOs experienced in refugee engagement and women participation
Suggested Partners |	S.S. Serik Boğazkent Women's Cooperative Serik Municipality's Women and Family Services Unit Local NGOs working with refugee or displaced populations (e.g. Refugees Association, SGDD-ASAM if active locally)

Table XIX.21 Manavgat- Taşağıl Neigborhood

Category	Details
Target Groups	Women, elderly, low-income households, informal agricultural workers
Identified Barriers and Risks	Strong gendered norms discourage women's active participation; women may perceive they are not allowed or not qualified to speak; informal workers lack official channels to express concerns
Recommended Meeting Frequency	Every 3 months, especially before and after major project milestones
Suggested Venue	Municipal social hall, women's training center (if any), or a local school building temporarily adapted for community meetings
Suggested Time	Mid-morning or early afternoon (when domestic obligations are lower)
Pre-Meeting Notification Methods	Leaflets/posters in Turkish displayed at local market, health centers, mosque entrance, and mukhtar's Office Mosque loudspeaker announcements coordinated with the mukhtar Verbal reminders during market days or in front of local bakeries Tea/snack service and seating arrangement that reduces formality Any active women-led cooperatives or school-parent associations (if discovered later)

Table XIX.22 Manavgat- Kalemler and Hacısali Neigborhoods

Category	Details
Target Groups	Women, elderly, subsistence farmers, seasonal workers
Identified Barriers and Risks	GBV/SEAH risks due to incoming male construction workers Literacy barriers, especially among elderly women
Recommended Meeting Frequency	Every 3 months, especially in coordination with seasonal work cycles |i.e. April-May
Proposed Meeting Venue(s)	Local school building, Open-air gathering space (market place)
Notification Methods (Pre-Meeting)	• Mosque loudspeaker announcements coordinated with the mukhtar • Printed flyers distributed at local markets and shops • Word-of-mouth through health workers or midwives • WhatsApp messages forwarded via local grocery shop owners
Suggested Partners	• Mukhtar's office • Local schoolteachers or volunteers • Community health workers or nurses • Religious leaders or imams (to increase neutrality and reach)

Table XIX.23 Alanya- Toslak and Konaklı Neigborhoods

Category	Details
Target Groups	Refugee/migrant women (Arabic speakers), seasonal workers, low-income families, elderly
Identified Barriers and Risks	• Language barrier (Arabic speakers with limited or no Turkish) •Limited mobility for women due to social norms and safety concerns • GBV and SEAH risks related to incoming male labor force
Recommended Meeting Frequency	Every 3 months; more frequently during peak construction or labor influx periods |
Proposed Meeting Venue(s)	Local school building, Open-air gathering space (market place)

Category	Details
Notification Methods (Pre-Meeting)	Bilingual flyers (Turkish–Arabic) distributed at grocery shops, mosque entrance, and via female market vendors Mosque loudspeaker announcements coordinated with the mukhtar In-person outreach by social workers, local women representatives, or trusted Arabic-speaking NGO staff Door-to-door info sharing by female CLO or female municipal outreach staff
Suggested Partners	• Municipality's Women and Family Services • Local Arabic-speaking outreach volunteers • NGOs working with refugee/migrant communities (e.g. ASAM, IBC, CARE if present) • Local health unit or midwife, local female health staff network

Table XIX.24 Serik- Çandır, Aşağıkocayatak and Kayaburnu Neigborhoods

Category	Details
Target Groups	Yörük families (especially women), agricultural workers, elderly residents
Identified Barriers and Risks	• Seasonal mobility due to Yörük transhumance (yayla migration) • Low formal education and digital connectivity • Limited visibility of women in public consultation processes • Male-dominated decision-making structures • Safety concerns during yayla migration especially for women
Recommended Meeting Frequency	Twice per year: once before migration (spring) and once after return (early autumn) Also, every 3 months for stayers
Proposed Meeting Venue(s)	• Mukhtar's garden or shaded outdoor space • Mosque courtyard (off-prayer hours) • Nearby school building or mobile tent
Notification Methods (Pre-Meeting)	• Personal outreach via mukhtar and Yörük elders (aksakallar) • Announcements via mosque and village gatherings • Informal visits by community liaison team a few days before the meeting • Verbal invitation delivered through animal feed sellers or shepherds' network • Women-to-women verbal invitations via relatives
Suggested Partners	• Mukhtar and community elders • Local agricultural cooperatives • Nomadic family associations (if any) • Female outreach staff or locally respected women (e.g., imam's wife, elder women)

Special communication channels may need to be developed for some disadvantaged groups. Different disadvantaged groups can be targeted through home visits or phone calls for individuals who cannot leave their homes; visually oriented leaflets and phone calls for illiterate individuals; leaflets and posters in different languages.

Among the vulnerable groups potentially affected by the Project are nomadic Yörük families, refugee/migrant women, the elderly, subsistence farmers, and seasonal workers, all of whom face various social, cultural, and economic barriers.

The seasonal migration patterns of the Yörük communities make it difficult for them to access information meetings, while women's participation in public consultation processes is often limited by traditional gender norms. Therefore, it is planned to hold at least two information meetings annually-before and after migration-and to organize these meetings in familiar community spaces such as the village head's (mukhtar's) yard, mosque courtyards, or mobile tents. The notification process will be conducted through mukhtars, community elders, herder networks, and verbal communication among

women. Additionally, mobile teams will visit highland settlements (yaylas), safe transportation support will be provided for women, and female CLO will be actively involved in the process.

For refugee and migrant women, the main barriers identified are language limitations, restricted mobility, and the risk of gender-based violence (GBV/SEAH). Meeting announcements will be made via bilingual Turkish-Arabic brochures, and face-to-face outreach will be carried out by trusted local Arabic-speaking actors. In addition, special consultation sessions for women will be organized, focus group discussions with interpreter support will be held, and mobile support teams and psychosocial assistance mechanisms will be introduced to address SEAH risks.

Among elderly individuals and low-income women, low literacy rates and traditional norms that discourage women from speaking publicly reduce active participation. Therefore, meetings are already planned to be held in the late morning or near noon, with tea/snack services provided to create an informal and welcoming atmosphere. In addition to brochure distribution, home visits will be conducted. Furthermore, to increase women's participation, neighborhood-based mini women's advisory groups will be established and regular women-only information sessions will be organized.

A common challenge for all these groups is the hesitancy and distrust related to accessing grievance and feedback mechanisms. Therefore, it is essential to enhance awareness of the Grievance Mechanism (GM), with installed locked complaint boxes to allow for anonymous submissions, and introduce female CLO members who handles complaints submitted by women. Additionally, it is recommended to display simplified visual explanations of the grievance process, including the follow-up, resolution, and feedback loops, on community bulletin boards.

XIX.5.3. Operation Phase Community Engagement Plan (Post-Construction)

The stakeholder engagements developed during the construction process will be used effectively both in terms of public participation and authorized institutions, like NGOs and trade unions, and the communication and relations will continue to be used during the operation phase.

Table XIX.25 Operation Phase Focus Category

Category	Operation Phase Focus
Communication Objective	Ensure that vulnerable community members (women, elderly, children, pastoralist groups) are informed and can provide feedback on operational impacts such as traffic safety, access restrictions, and long-term social concerns.
Frequency of Communication	Twice per year (at minimum): Spring (prior to tourism and migration season) Autumn (after peak seasonal activity) Additional ad-hoc meetings in case of complaints or operational disruptions.
Communication Methods	•Posters and flyers at local hubs (muhtar, mosque, health centers) •WhatsApp messages and voice notes via community focal points •Public information sessions when relevant (e.g., new signage, access road changes) •Mobile info team visit once a year per settlement (if available)
Ongoing Risks / Key Topics	•Road safety (especially for children, elderly, school routes) •Access to agricultural land for women and small farmers •Yörük livestock migration coordination and crossing points •Street lighting needs in isolated or unlit areas •Gender-based violence (GBV) risks around roadside zones •Bus stop placements and pedestrian safety for women and elderly
Feedback & Grievance Channels	•Maintain grievance redress mechanism (GRM) •Add suggestion box in local gathering points (especially for women) •Use female CLO or trusted female intermediary for verbal reporting
Partners and Outreach Actors	•Mukhtar offices •School teachers and health workers •Local women's cooperatives •Elder women or pastoralist representatives •Municipal transport and safety units

XIX.5.4. Schedule and Timetable

The timing and form of activities for stakeholder engagement activities given in the previous section are detailed in Table XIX.26 below.

Table XIX.26 Proposed Stakeholder Engagement Program during Project Implementation

Activity	Method	Timing*
Field Study	Key informant interviews, focus group interviews, stakeholder meeting etc.	June 2024
Road Trip	Four Public Consultation Meetings alongside the motorway route (*, **), key informant interviews, etc.	August 2025
Public Announcements	Social Media announcements, Website of AAMP Community liaison officesetc.	Whenever required
Disclosure of Environmental and Social Reports	Website of AAMP	Annually
Activities with relevant stakeholders	Formal/Informal Meetings with representatives of relevant stakeholders	Whenever required
Reporting to KGM	Official correspondences, meetings and reports	Meetings: Biweekly Reporting: Monthly

** Timing of the activities may change due to changes that may occur during the implementation of the Project.*
***Shuttle vehicles will be arranged for the relevant residential areas in order to facilitate access to the upcoming Public Participation Meetings and to increase attendance rates.*

XIX.6. ROLES AND RESPONSIBILITIES

The anticipated activities in the SEP will be conducted and completed by Project Company and KGM. In activities such as the grievance mechanism, Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. will be responsible for following requests, suggestions and complaints, and in the upcoming process, AAOİAŞ will fulfil the requirements by being responsible for this mechanism in accordance with the IFC PS1, EPFI Principle 5 and Principle 6.

The implementation of this SEP will be conducted and monitored by Project Sponsor's Environmental and Social Manager who is responsible to appoint the Social Chief and the Environment and Social Deputy Manager to be responsible for the stakeholder engagement for the Project, implementation of this SEP and grievance management. The Social Chef and the Environment and Social Deputy Manager will perform the following functions:

- Information disclosure and obtaining feedback;
- Processing, managing and tracking grievances, including ensuring timely responses to and closure of grievances;
- Control over the implementation of the corrective actions to remedy grievances;
- Regular review and if necessary, update of the SEP and stakeholder engagement mechanism to ensure it is effective and reflects Project circumstances;
- Participation in discussion on responses and the resolution of disputes, and
- Assistance in the preparation of the Environmental and Social Performance Reports.

Depending on the complexity of issues, Project Sponsor's project management and experts of KGM may also be involved.

XIX.7. GRIEVANCE MECHANISM

XIX.7.1. Purpose of the Grievance Mechanism

The purpose of this mechanism is to establish a system for handling, evaluation and resolution of all kinds of external grievances, concerns, queries and proposals of the affected communities and other stakeholders, regarding the project activities.

Managing grievances, including avoiding and minimizing them as well as effective handling, is an integral part of a sound stakeholder engagement strategy. Experience shows that significant numbers of grievances arise from misunderstandings, and that such grievances can be avoided, or their numbers reduced, through proactive and consistent engagement with communities. Engagement also helps anticipate and review community concerns to prevent them from escalating into grievances.

In accordance with IFC PS 2 and EPFI Principle 6, a process is established by which people who deem that they have been adversely affected by the Project during planning, construction or operation can bring grievances to the Project for consideration and, if required, resolution. A specific Project grievance mechanism (GM) is beneficial in addressing community and individual concerns and complaints before they escalate beyond control.

XIX.7.2. Responsible Stakeholders

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. is responsible for implementing the grievance mechanism during the land preparation and construction and operation phases.AAOİAŞ has to ensure that the grievance mechanism is implemented effectively.

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. Community Liaison Officers (CLOs), under the supervision of the Social Chief and Environment and Social Manager, are responsible for receiving and managing grievances, coordinating the actions to be taken for resolution, and keeping proper records. The Environment and Social Manager is responsible for compiling and reporting grievance-related information to the General Directorate of Highways (KGM).

XIX.7.3. Grievance Mechanism at the National Level

Presidency's Communication Centre:

The Presidency's Communication Centre (CIMER) provides a centralized complaint system for Turkish citizens, legal persons and foreigners. CIMER only allow applications in Turkish. Contact details of CIMER are given in Table XIX.27 .

Through CIMER, applicants can direct their requests directly to the relevant authorities. The requests submitted to CIMER are resolved within 30 days. If the applicants do not receive feedback within this period, they can re-submit their grievance to CIMER or elevate it to the Ombudsman Institution (www.ombudsman.gov.tr).

Table XIX.27 Contact Details of CIMER

Webpage:	www.CIMER.gov.tr/ www.turkiye.gov.tr/
Call Centre (hotline):	150
Phone number:	+90 312 590 20 00

Fax number:	+90 0312 473 64 94
Official Letter/Petition:	Republic of Türkiye, Directorate of Communications T.C. Cumhurbaşkanlığı Külliyesi 06560 Beştepe/ Ankara
Individual Application:	Community relations desks at governorates, ministries and district governorates.

CIMER will be available to Project stakeholders as an alternative and well-known channel for conveying their Project-related grievances and feedback directly to state authorities.

Foreigners Communication Centre:

The Foreigners Communication Centre (YIMER) provides a centralized complaint system for foreigners. YIMER will be available to Project stakeholders as an alternative and well-known channel for conveying their Project-related grievances and feedback directly to state authorities. Contact details of YIMER are given in Table XIX.28 .

Table XIX.28 Contact Details of YIMER

Webpage:	www.YIMER.gov.tr
Email:	YIMER@goc.gov.tr
Call Centre (hotline):	157
Phone number:	+90 312 515 11 22
Fax number:	+90 312 920 06 09
Official Letter/Petition:	Republic of Türkiye General Directorate of Migration Management, Çamlıca Mahallesi 122. Sokak No: 4 Yenimahalle/ Ankara
Individual Application:	Republic of Türkiye General Directorate of Migration Management

XIX.7.4. Community Grievance Mechanism at the Project Level

The main aim of the community grievance mechanism is to assist in resolving complaints and grievances in a timely, effective, and efficient manner that satisfies all parties involved. The GM is intended to serve as a mechanism to:

- Allow identification and impartial, timely and effective resolution of issues affecting the project,
- Strengthen accountability of the beneficiaries, including project-affected stakeholders, and,
- Provide channels for the stakeholders to provide feedback and raise concerns.

External stakeholders can initiate the grievance/comment mechanism by using the following methods:

- Grievance/comment boxes and forms have been placedin public places including places commonly/ comfortably visited by women)
- Verbally during face-to-face meetings/visits to be held by the Project personnel (e.g. chiefs/ managers, CLOs)
- CLO's contact numbers have been shared with the mukhtars and also information leaflets have been hanged in each neighborhood sharing the contach information of the CLO's.
- E-mail (the e-mail address for the submittal of grievances/comments have been shared with the local communities.
- Website (with the anonymous option)

On the website of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. there is a Contact page which is available in Turkish and English (https://www.antalyaalanyaotoyolu.com.tr/). The grievances/requests related to Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş activities can be communicated through this page and the resolution process is followed. The page includes information on email, phone number and mailing address of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. Name e-mail address, telephone number and explanation/message/grievance could be entered in the online platform. Notification that the application has been received is made via e-mail address.

If the grievance/comment holder would like to fill out the form Annex-1 anonymously, the form will allow the grievance/comment holder to file it without any personal contact information. For grievances/comments received verbally in person, the Project representatives will request the grievance/comment holder to fill in the form himself/herself by providing the required guidance, where necessary. If the grievance/comment holder wishes the form to be filled out by the Project representatives, they will fill the form on behalf of the grievance/comment holder. In such cases, the grievance/comment holder will be required to read the filled form and both the grievance/comment holder and the Project representative who filled in the form will be required to approve and sign the form. The Project representative will provide a copy of the filled form to the grievance/ comment holder stakeholder. The CLO will ensure that the grievance/comment forms are collected from the grievance/comment boxes weekly.

Grievance boxes and information leaflets were placed in all affected neighborhoods at mukhtar's offices and the installation have been completed. An example of the installed grievance mechanism is shown in Figure XIX.11.

Figure XIX.11. The Grievance and Suggestion Box at Mukhtar's Office

The office in Serik, where the address is written, also works as an information office: ORTA, BELEK CADDESI, NO: 7, IÇ KAPI NO: 9 SERIK/ANTALYA. The temporary construction site can also be used as an information office.

Within the scope of the project, threeCLOs started to work within SPV. In addition, a call center has been established and can be reached at 0850 202 07 07.

The roles and responsibilities of CLOs are presented inTable XIX.29 .

Table XIX.29 Roles and Responsibilities of the CLO and Social Chief

Role	Responsibilities
Community Liaison Officer (CLO)	○ Inform the public about the scope, progress, and potential impacts of the Project. ○ Organize and facilitate regular community meetings, focus group discussions, and engagement forums. ○ Maintain open communication channels with project-affected persons (PAPs), community leaders, and local institutions. ○ Develop and distribute communication materials tailored to various community audiences. ○ Ensure that all internal and external complaints, including those under the Stakeholder Engagement Plan (SEP), are managed in line with the Grievance Mechanism (GM). ○ Log, track, and resolve complaints and appeals in a timely and respectful manner. ○ Provide regular training to site personnel during the construction phase. ○ Conduct regular internal audits and report non-conformities. ○ Ensure that non-conformities are recorded and promptly addressed. ○ Participate in the development and follow-up of

Role	Responsibilities
	corrective and/or improvement actions. ○ Report on the implementation performance of this Plan. ○ Support the review and update processes of this Plan. ○ Ensure that lessons learned and field experiences are reflected in plan revisions and training updates. ○ Collaborate with Health & Safety (H&S) and Social teams to address cross-cutting issues. ○ Facilitate resolution of community disputes or concerns related to project activities. ○ Assess how vulnerable or marginalized groups may be affected by the Project. ○ Propose mitigation measures or tailored engagement approaches for at-risk or underrepresented populations. ○ Ensure equitable participation in consultation processes, particularly for women, youth, elders, and people with disabilities. ○ Support the monitoring and recording of the implementation of the social related issues, including activities carried out by subcontractors. ○ Support the evaluation of the SEP's implementation performance and community feedback ○ Contribute to regular internal audits and the reporting of non-conformities. ○ Ensure that relevant non-conformities are recorded and addressed immediately. ○ Participate in the development of corrective and/or improvement actions and support their follow-up. ○ Support the periodic review and update of the SEP and related procedures in coordination with the E&S Manager. ○ Provide input to lessons learned from engagement outcomes and grievance trends. ○ Maintain up-to-date records of all stakeholder meetings, grievances, resolutions, and community commitments. ○ Submit routine reports to the Social Chief and/or E&S Manager summarizing community feedback, grievance status, and engagement Milestones. ○ Ensure confidentiality and proper data handling, especially for sensitive community issues.
Social Chief	○ Supervise and mentor CLOs, ensuring their work aligns with project priorities and stakeholder engagement strategy. ○ Develop and implement work plans and schedules for the CLO team. ○ Ensure consistent messaging, processes, and reporting methods across all field teams. ○ Conduct regular team meetings to review community issues, grievances, engagement outcomes, and field updates. ○ Lead the implementation of the Stakeholder Engagement Plan SEP and ensure it reflects community realities. ○ Oversee the planning and execution of community consultations, public meetings, and disclosure activities. ○ Ensure that engagement activities are inclusive of

Role	Responsibilities
	vulnerable and marginalized groups. ○ Build and maintain positive, trust-based relationships with local communities, leaders, and institutions. ○ Supervise the effective functioning of the grievance mechanism (GM) at community and project levels. ○ Ensure all grievances are recorded, processed, and resolved in a timely and transparent manner. ○ Analyse grievance trends and escalate systemic issues to the E&S Manager. ○ Contribute to the continuous improvement of the GRM process based on community feedback and internal review. ○ Monitor the performance of social engagement activities and their compliance with SEP objectives. ○ Ensure accurate, timely, and complete reporting of CLO activities, stakeholder interactions, and grievance outcomes. ○ Review and validate weekly/monthly reports from CLOs and prepare consolidated updates for senior management. ○ Ensure all engagement activities meet national regulations and international standards (e.g., IFC PS, Equator Principles). ○ Identify training needs and deliver or coordinate training for CLOs on stakeholder engagement, conflict resolution, and field documentation. ○ Promote professional development and capacity building within the social team. ○ Train subcontractors and relevant staff on community interaction protocols and grievance management. ○ Contribute to the development, review, and periodic updating of the SEP and related social management plans. ○ Ensure CLOs support the implementation and documentation of these plans at the field level. ○ Support the integration of lessons learned into updated plans and engagement strategies. ○ Coordinate with the E&S Manager, E&S Specialists, H&S, legal, and construction teams to address community-related impacts. ○ Support alignment between community concerns and project execution through proactive communication with technical departments. ○ Contribute social performance inputs to reports for lenders, regulators, and corporate leadership.

The Community Liaison Officers (CLOs) appointed within the Project hold undergraduate and/or postgraduate degrees in disciplines such as sociology, social policy, public relations, and other social sciences. With both strong academic backgrounds and practical experience, they significantly contribute to the effective implementation of environmental and social management processes. In total, three experts are expected to undertake the role of CLOs within the scope of the Project.The CLOs work under the supervision of the Social Chief, who has extensive experience in stakeholder engagement, coordination with local NGOs and public institutions, gender-sensitive approaches, and the implementation of social development and awareness-raising initiatives in line with national legislation and IFC Performance Standards.

In addition to meeting the above-mentioned qualifications, the current CLOs also possess practical knowledge of social performance management in accordance with World Bank and IFC standards. These experts play an active role in areas such as social impact management, establishment and monitoring of grievance mechanisms, stakeholder engagement processes, gender-sensitive approaches, field research, reporting, and communication. Their key competencies include reporting, problem-solving, leadership, data processing with SPSS, engaging with communities, expertise in child and women's rights programs, and compliance with relevant national and international regulations.

Furthermore, the experts have completed various training and certification programs in areas such as "Community Engagement and Gender-Based Violence Prevention," "Stakeholder Engagement," "Digital Literacy," "Family Counseling," "NLP," and "Play Therapy," thereby enhancing their professional skill sets. The Social Chief has also received adequate training in handling sensitive grievances, ensuring that such cases are managed with professionalism, confidentiality, and care.

XIX.7.4.1. Worker's Grievance Mechanism

The main aim of the worker's grievance mechanism is to ensure that all project workers have access to a fair, transparent, and accessible process for raising and resolving workplace-related concerns in a timely, effective, and confidential manner. The worker's grievance mechanism is intended to:

- Enable workers to raise employment-related concerns, complaints, or suggestions and ensure their impartial, timely, and effective resolution,
- Promote accountability of the employer and management towards fair treatment and workplace rights,
- Provide clear channels for workers to safely provide feedback and report issues without fear of retaliation.

Workers who report violations such as forced labor, mistreatment, or wage exploitation within the scope of the Project shall be protected against any form of retaliation in line with IFC Performance Standard 2 and IFC's Good Practice Note: Addressing Risks of Retaliation Against Project Stakeholders (2021). To this end, the grievance mechanism is designed to allow for anonymous submissions. Workers will be able to submit grievances safely either through anonymous online forms available on the Project website or via locked complaint boxes installed at the Temporary Const. Site, Viaduct 4, Viaduct 8, T-5 Entry, Viaduct 12, and in HRM32 - Registered Archaeological Site. As part of this process, the Internal Grievance Form provided in Annex-2 will be used to ensure that complaints are collected and evaluated in a standardized format. Additionally, the procedural steps established for the grievance mechanism will apply to both internal and external complaints (Table XIX.31). In addition, workers may submit their grievances and feedback by calling the toll-free line 0850 202 07 07 or by visiting the Information Office.

During the grievance review process, the identity of the complainant will remain strictly confidential and will be stored in encrypted systems accessible only to designated Community Liaison Officers (CLOs), and will not be shared with other managers under any circumstances. Meetings related to sensitive issues will be conducted exclusively by authorized social specialists, in private and secure settings, to ensure the safety and privacy of the complainant. Any adverse actions taken against a complainant following the submission of a grievance - such as reassignment, wage deduction, intimidation, or exclusion - will be treated as retaliation. In such cases, disciplinary proceedings will be initiated against the responsible individuals, and contracts with subcontractors may be suspended or terminated if necessary. The effectiveness of these procedures will be monitored by CLOs, and any potential retaliation incidents following grievance submissions will be tracked, documented, and reviewed.

XIX.7.4.2. Gender-Sensitive Accessibility to the Grievance Mechanism

Grievances Related GBV/SH/SEA

To properly address SEA/SH risks, the GM will be in place prior to contractors mobilizing. For GBV- and particularly SEA/SH-complaints, there are risks of stigmatization, rejection and reprisals against complainant. This creates and reinforces a culture of silence so complainant may be reticent to approach the project directly. To enable women to safely access the GM, multiple channels through which complaints will be registered in a safe and confidential manner will be enabled. The GM operators and CLO will to be trained on how to collect SEA/SH cases confidentially and empathetically (with no judgement).

Projects will have multiple complaint channels. No identifiable information on the survivor will be stored in the GM. The GM will not ask for, or record, information on more than the following related to the SEA/SH allegation:

- The nature of the complaint (what the complainant says in her/his own words without direct questioning);
- If, to the best of the survivor's knowledge, the perpetrator was associated with the project;
- If possible, the age and sex of the survivor; and
- If possible, information on whether the survivor was referred to services.

The information in the GM will be confidential-especially when related to the identity of the complainant.

To ensure equitable access to the Grievance Mechanism (GM), gender-specific challenges have been identified across affected communities in Serik, Manavgat, and Alanya. Women, especially those in rural or conservative settings, often face social, mobility, and communication barriers that limit their ability to file formal complaints.

Barriers identified include:

- Limited mobility due to unpaid care work and household responsibilities
- Lack of awareness of complaint channels, particularly among refugee or elderly women
- Discomfort speaking in male-dominated spaces or to male project staff
- Low literacy or digital skills
- Cultural norms discouraging women from voicing dissatisfaction publicly

Table XIX.30 Gender-Sensitive Accessibility to the Grievance Mechanism

Measure	Description
Female CLOs or trusted intermediaries	Women will have the option to submit grievances through female liaison officers or locally respected women (e.g., women cooperative members or mukhtar's wife)
Anonymous feedback channels	Lockable complaint boxes in women-accessed locations (e.g., cooperatives, health centers) and verbal relay via trusted mediators
Outreach using local networks	Use of female-focused WhatsApp groups and word-of-mouth messaging to raise awareness of the GM
Language support	Bilingual grievance forms (Turkish and Arabic) for refugee women in areas like Serik and Toslak
Verbal grievance intake	Women will be allowed to submit complaints orally, especially in low-literacy or elderly populations (e.g. Kalemler, Hacısali)
Culturally appropriate meeting spaces	Women-only consultation sessions where grievances and concerns can be voiced safely and privately
Communication Line	A separate hotline will be set up for women, and it will be explained through CDCs and leaflets that the person answering the phone is a woman and will listen to complaints anonymously, without

	prejudice or comment, and that complaints will be recorded according to the request

Table XIX.31 Procedural Steps of Grievance Mechanism

Step	Description of Process	Time Frame	Responsibility
GM implementation structure	There exist two Grievance Mechanism at the National Level: • Presidency's Communication Centre and • Foreigners Communication Centre	-	Presidency's Communication Centre, and Foreigners Communication Centre and related authorities, CLO
Grievance uptake	Grievances can be submitted via the following channels: • Telephone • Verbally • E-mail • Website • Grievance/comment boxes • Letter to Grievance focal points at local facilities Complaint form to be logged via any of the above channels • Walk-ins may register a complaint in a grievance logbook at a facility or suggestion box Anonymous Grievances can be submitted via the following channels: • Telephone • Letter to Grievance focal points at local facilities • Grievance box in headman's office and the camp sites • Website	CLO must open grievance boxes every week during the construction phase and every 30 working days during the operational phase	CLO
Sorting, processing	Any complaint received is forwarded to Environment and Social Manager and SPV General Manager, Logged in the Grievance Log, and categorized according to the complaint types3: If the complaint is assessed to be out of the scope of the Grievance Mechanism, a grievant will be notified through the desired communication method and an alternative mode of solution will be suggested.	Within 3 business days of receipt	CLO
Acknowledgement and follow-up	Receipt of the grievance is acknowledged to the complainant by CLO through a personal meeting, phone call or letter as appropriate, within a target of 3 business days after submission. If the grievance is not well understood or if additional information is required, clarification will be sought from the complainant.	Within 3 business days of receipt	CLO
Verification, investigation, action	Investigation of the complaint is led by Environment and Social Manager and SPV General Manager. The SPV General Manageris notified of Level 1, 2 or 3 grievances. The Social Chief, as appropriate, support the Environment and Social Manager in deciding who should deal with the grievance and determines	Responses within 30 business days of receipt	SPV General Manager, E&S Manager, Social Chief, Community Liaison Officers

[3] *Level 1 Complaint: A complaint that is isolated or 'one-off' (within a given reporting period - one year) and essentially local in nature.*

Note: Some one-off complaints may be significant enough to be assessed as a Level 3 complaint e.g., when a national or international law is broken (see Level 3).

Level 2 Complaint: A complaint that is widespread and repeated (e.g., noise from the facilities, dust, etc.).

Level 3 Complaint: A one-off complaint, or one which is widespread and/or repeated that, in addition, has resulted in a serious breach of the Project's policies or National law and/or has led to negative national/international media attention, or is judged to have the potential to generate negative comment from the media or other key stakeholders (e.g., inadequate waste management).

Step	Description of Process	Time Frame	Responsibility
	whether additional support for the response is necessary. A proposed resolution is formulated by Social Chief, as appropriate, supports the Environment and Social Manager and is communicated to the complainant by CLO through the grievance/comment close-out form.		
Monitoring and evaluation	Data on complaints are collected in a database and reported to SPV General Manager, Environment and Social Manager and AAOİAŞ HQ every three months	Quarterly	CLO
Provision of feedback	Feedback from complainants regarding their satisfaction with complaint resolution is collected by CLO through phone calls or face-to-face interviews.	15 business days after the implementation of the resolution	CLO

Once all possible means to resolve the complaint have been proposed and if the complainant is still not satisfied, then they should be advised of their right to legal recourse including the right of petition, right to information and appeal to the ombudsperson (constitution, article 74) and right to constitutional complaint (constitution, article 148).

In addition to the project's GM for its internal and external stakeholders, EP 6: Grievance Mechanism requires the establishment of a Workers' Grievance Mechanism (WGM) for the project workers. The project workers will use the WGM to convey their concerns or suggestions regarding their working conditions and workplace. The Worker Grievance Mechanism is defined as the mechanism that receives complaints from Project employees (including both direct and indirect employees).

Any comments or concerns will be brought to the Company's attention verbally or in writing (by post or e-mail) or by filling in a grievance form. The grievance form will be made available on the Company website, at the Project site, at the mukhtar's office, alongside a description of the grievance mechanism. All grievances will be:

- Acknowledged within seven days after receipt;
- Responded no later than within 30 business days after receipt, and
- Specifically, nominated and trained members of staff will record grievance information in a grievance register. The information in the grievance register will include Stakeholder name and contact details and details of the grievance and how and when it was submitted, acknowledged, responded to and closed out.

Individuals can request the right to have their names kept confidential, and this mechanism does not preclude the right for stakeholders to process grievances through other judicial means.

- Step 1: Receipt of grievance and registering of grievance (3 business days),
- Step 2: Assessment,
- Step 3: Acknowledgement of grievance (acknowledged within 3 business days after receipt),
- Step 4: Investigation and resolution of grievance,
- Step 5: Closure; and (30 business days)
- Step 6: Outcome of the corrective action (15 business days after completion).

Appeals Committee

In case the complainants are not satisfied with the decision of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş and/or EPC on their complaints, they can refer to the Appeals Committee via Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş social impact team.

Appeals Committee consisting of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş management teams is responsible for ensuring grievance mechanism is effectively managed. Furthermore, the committee will directly investigate and respond grievances as well as grievances that are not closed when complainant refuses the corrective actions, or the actions are not closed on time.

The mandate of the Appeals Committee covers considering complaints on the issues listed below (excluding those related with Labor Law and Expropriation Law):

- Unsolved grievance related to damage to environment,
- Unsolved grievance related to damage to public assets and infrastructure,
- Unsolved grievance related to damage to private assets (land, crops, houses etc.),
- Unsolved grievance related to impacts on livelihood.

The Appeals Committee carries out the following tasks:

- Meeting at least once a month or more often depending upon the existence of unresolved disputes,
- Reviewing the complaints by hearing both complainants and LİMAK and/or EPC
- Investigating the complaints in accordance with project requirements, LİMAK Policies, legal framework and referring to relevant expertise where required,
- Preparing an evaluation report based on the inquiries,
- Making a proposal on resolution of the disputes between parties.

The decision of the Appeals Committee is not binding and if parties do not agree on the Appeals Committee proposal, they still have the opportunity to either negotiate or litigate.

The Appeals Committee consists of the following members:

- SPV General Manager
- Health and Safety Manager
- Environment and Social Manager
- Expropriation Manager
- Social Chief
- Community Liaison Officer
- Matter Expert, if required
- Relevant NGO officer or village leaders

The grievance mechanism will be widely announced to the public with stakeholder meetings held for project affected communities. Additional meetings will be organized to target women PAPs and vulnerable groups for sharing information on grievance mechanism that also allows anonymous grievances. The grievances will be reviewed by the team according to the Project human rights and grievance mechanism.

The relationships developed through effective stakeholder engagement activities and the involvement of local organizations in the appeals committee will reduce concerns about objectivity and ensure a more transparent process for the grievance mechanism and the right to appeal.

Rules and Procedures of the Appeals Committee

1. Purpose and Scope

This manual outlines the procedures and operating rules of the Appeals Committee established under the grievance mechanism of the Antalya-Alanya Motorway Project. The purpose of the Appeals Committee is to ensure an effective, transparent, and fair review of grievances that remain unresolved or are not accepted by the complainant after the initial resolution process.

The Committee is responsible for investigating grievances that fall under its mandate, ensuring alignment with project policies, applicable legislation, and international environmental and social standards.

The Appeals Committee shall consider complaints unresolved by Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş and/or EPC, specifically on the following issues (excluding matters under Labor Law or Expropriation Law):

- Environmental damage
- Damage to public assets and infrastructure
- Damage to private property (land, crops, houses, etc.)
- Impacts on livelihood

2. Committee Structure and Responsibilities

The Appeals Committee includes the following members:

- SPV General Manager (Chair)
- Health and Safety Manager
- Environment and Social Manager
- Expropriation Manager
- Social Chief
- Community Liaison Officer
- Subject Matter Expert (as needed)
- Representative of local NGOs or village leadership

The Committee may invite additional stakeholders or technical advisors as needed, based on the nature of the grievance under review.

The Committee is responsible for the following tasks:

- Reviewing unresolved or escalated grievances submitted via the Social Impact Team.
- Ensuring complainants are heard fairly and respectfully.
- Conducting investigations in line with project requirements, legal frameworks, and LİMAK Group's environmental and social policies.
- Seeking input from technical experts and community representatives where appropriate.
- Developing reasoned proposals to resolve disputes.
- Preparing detailed evaluation reports for each reviewed grievance.

3. Implementation

- Appeals must be submitted to the CLOs, which will forward them to the Appeals Committee Secretariat.
- Appeals are logged, assigned a case number, and acknowledged within 5 working days.
- The Committee shall meet at least once a month, or more frequently if required by the number or urgency of unresolved grievances.
- The Committee verifies the grievance falls under its mandate.
- Both the complainant and the project/EPC representatives are given the opportunity to present their perspectives.
- The Committee may conduct site visits, consult experts, and review relevant documentation.
- Committee members engage in internal review processes in a confidential manner and aim to reach decisions through consensus wherever possible."
- A written resolution proposal is shared with both parties within three (3) business days following the Committee meeting.
- The grievance case documentation, including the Committee's findings, rationale, and resolution recommendations, is securely archived and integrated into the project's grievance monitoring and reporting system.
- All Committee members shall maintain strict confidentiality.
- Any member with a potential conflict of interest must recuse themselves from the specific case.

- The effectiveness of the Appeals Committee and its procedures will be reviewed annually.
- Lessons learned will be incorporated into future updates of this manual and SEP revisions.

Grievances Related GBV/SH/SEA

To properly address SEA/SH risks, the GM will be in place prior to contractors mobilizing. For GBV-and particularly SEA/SH-complaints, there are risks of stigmatization, rejection and reprisals against complainant. This creates and reinforces a culture of silence so complainant may be reticent to approach the project directly. To enable women to safely access the GM, multiple channels through which complaints will be registered in a safe and confidential manner will be enabled. These channels will be designed to respect privacy, ensure accessibility, and allow for anonymous reporting, using approaches such as - but not limited to - confidential verbal reporting, written submissions, or digital tools, depending on the local context and available resources.Anonymous submissions are accepted and processed with the same level of seriousness.

The Social Chef and CLO is ensure on how to collect SEA/SH cases confidentially and empathetically (with no judgement). Where possible, at least one female CLO shall be available to receive SEA/SH-related complaints.

The Project has multiple complaint channels. No identifiable information on the survivor will be stored in the GM and all data related to GBV/SH/SEA grievances will be handled and stored securely in accordance with applicable data protection laws and the AAOİAŞ's confidentiality policies. The GM will not ask for, or record, information on more than the following related to the SEA/SH allegation:

- The nature of the complaint (what the complainant says in her/his own words without direct questioning);
- If, to the best of the survivor's knowledge, the perpetrator was associated with the project;
- If possible, the age and sex of the survivor; and
- If possible, information on whether the survivor was referred to services.

In line with IFC's Good Practice Note: Addressing Risks of Retaliation Against Project Stakeholders (2021),the information in the GM will be confidential-especially when related to the identity of the complainants or witnesses. Any form of retaliation against individuals submitting GBV/SH/SEA grievances is strictly prohibited. Such actions may result in disciplinary measures for company personnel and, where applicable, appropriate contractual follow-up or escalation with third-party actors, including contractors and service providers.

Complainants will be informed about and referred to appropriate support services, such as medical care, psychosocial support, legal aid, or protection services. AAOİAŞ will maintain an up-to-date referral list of local service providers for this purpose.

GBV/SH/SEA grievances will be acknowledged within 3 business days and resolved as quickly as possible, with sensitivity to the emotional and physical needs of the Complainants. Complainants shall be informed of outcomes or steps taken, as appropriate and with their consent.

All GBV/SH/SEA grievances will be documented separately and securely, with access limited to authorized personnel. Non-identifiable summary data may be used for monitoring, evaluation, and reporting purposes only.

External Grievance/Suggestion Register Form that will use in the grievance mechanism is presented the Figure XIX.12.

Appeals Committee

In case the complainants are not satisfied with the decision of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş and/or EPC on their complaints, they can refer to the Appeals Committee via Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş social impact team.

Appeals Committee consisting of Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş management teams is responsible for ensuring grievance mechanism is effectively managed. Furthermore, the committee will directly investigate and respond grievances as well as grievances that are not closed when complainant refuses the corrective actions, or the actions are not closed on time.

The mandate of the Appeals Committee covers considering complaints on the issues listed below (excluding those related with Labor Law and Expropriation Law):

- Unsolved grievance related to damage to environment,
- Unsolved grievance related to damage to public assets and infrastructure,
- Unsolved grievance related to damage to private assets (land, crops, houses etc.),
- Unsolved grievance related to impacts on livelihood.

The Appeals Committee carries out the following tasks:

- Meeting at least once a month or more often depending upon the existence of unresolved disputes,
- Reviewing the complaints by hearing both complainants and LİMAK and/or EPC
- Investigating the complaints in accordance with project requirements, LİMAK Policies, legal framework and referring to relevant expertise where required,
- Preparing an evaluation report based on the inquiries,
- Making a proposal on resolution of the disputes between parties.

The decision of the Appeals Committee is not binding and if parties do not agree on the Appeals Committee proposal, they still have the opportunity to either negotiate or litigate.

The Appeals Committee consists of the following members:

- SPV General Manager
- Health and Safety Manager
- Environment and Social Manager
- Expropriation Manager
- Social Chief
- Community Liaison Officer
- Matter Expert, if required
- Relevant NGO officer or village leaders

The grievance mechanism will be widely announced to the public with stakeholder meetings held for project affected communities. Additional meetings will be organized to target women PAPs and vulnerable groups for sharing information on grievance mechanism that also allows anonymous grievances. The grievances will be reviewed by the team according to the Project human rights and grievance mechanism.

The relationships developed through effective stakeholder engagement activities and the involvement of local organizations in the appeals committee will reduce concerns about objectivity and ensure a more transparent process for the grievance mechanism and the right to appeal.

Rules and Procedures of the Appeals Committee

1. Purpose and Scope

This manual outlines the procedures and operating rules of the Appeals Committee established under the grievance mechanism of the Antalya-Alanya Motorway Project. The purpose of the Appeals Committee is to ensure an effective, transparent, and fair review of grievances that remain unresolved or are not accepted by the complainant after the initial resolution process.

The Committee is responsible for investigating grievances that fall under its mandate, ensuring alignment with project policies, applicable legislation, and international environmental and social standards.

The Appeals Committee shall consider complaints unresolved by Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş and/or EPC, specifically on the following issues (excluding matters under Labor Law or Expropriation Law):

- Environmental damage
- Damage to public assets and infrastructure
- Damage to private property (land, crops, houses, etc.)
- Impacts on livelihood

2. Committee Structure and Responsibilities

The Appeals Committee includes the following members:

- SPV General Manager (Chair)
- Health and Safety Manager
- Environment and Social Manager

- Expropriation Manager
- Social Chief
- Community Liaison Officer
- Subject Matter Expert (as needed)
- Representative of local NGOs or village leadership

The Committee may invite additional stakeholders or technical advisors as needed, based on the nature of the grievance under review.

The Committee is responsible for the following tasks:

- Reviewing unresolved or escalated grievances submitted via the Social Impact Team.
- Ensuring complainants are heard fairly and respectfully.
- Conducting investigations in line with project requirements, legal frameworks, and LİMAK Group's environmental and social policies.
- Seeking input from technical experts and community representatives where appropriate.
- Developing reasoned proposals to resolve disputes.
- Preparing detailed evaluation reports for each reviewed grievance.

3. Implementation

- Appeals must be submitted to the CLOs, which will forward them to the Appeals Committee Secretariat.
- Appeals are logged, assigned a case number, and acknowledged within 5 working days.
- The Committee shall meet at least once a month, or more frequently if required by the number or urgency of unresolved grievances.
- The Committee verifies the grievance falls under its mandate.
- Both the complainant and the project/EPC representatives are given the opportunity to present their perspectives.
- The Committee may conduct site visits, consult experts, and review relevant documentation.
- Committee members engage in internal review processes in a confidential manner and aim to reach decisions through consensus wherever possible."
- A written resolution proposal is shared with both parties within three (3) business days following the Committee meeting.
- The grievance case documentation, including the Committee's findings, rationale, and resolution recommendations, is securely archived and integrated into the project's grievance monitoring and reporting system.
- All Committee members shall maintain strict confidentiality.
- Any member with a potential conflict of interest must recuse themselves from the specific case.
- The effectiveness of the Appeals Committee and its procedures will be reviewed annually.
- Lessons learned will be incorporated into future updates of this manual and SEP revisions.

Grievances Related GBV/SH/SEA

To properly address SEA/SH risks, the GM will be in place prior to contractors mobilizing. For GBV- and particularly SEA/SH-complaints, there are risks of stigmatization, rejection and reprisals against complainant. This creates and reinforces a culture of silence so complainant may be reticent to

approach the project directly. To enable women to safely access the GM, multiple channels through which complaints will be registered in a safe and confidential manner will be enabled. These channels will be designed to respect privacy, ensure accessibility, and allow for anonymous reporting, using approaches such as - but not limited to - confidential verbal reporting, written submissions, or digital tools, depending on the local context and available resources.Anonymous submissions are accepted and processed with the same level of seriousness.

The Social Chef and CLO will to be trained on how to collect SEA/SH cases confidentially and empathetically (with no judgement). Where possible, at least one female CLO shall be available to receive SEA/SH-related complaints.

Projects will have multiple complaint channels. No identifiable information on the survivor will be stored in the GM and all data related to GBV/SH/SEA grievances will be handled and stored securely in accordance with applicable data protection laws and the AAOİAŞ's confidentiality policies (Please refer to Annex-3 for the Project Sponsor's confidentiality policy.). The GM will not ask for, or record, information on more than the following related to the SEA/SH allegation:

- The nature of the complaint (what the complainant says in her/his own words without direct questioning);
- If, to the best of the survivor's knowledge, the perpetrator was associated with the project;
- If possible, the age and sex of the survivor; and
- If possible, information on whether the survivor was referred to services.

In line with IFC's Good Practice Note: Addressing Risks of Retaliation Against Project Stakeholders (2021),the information in the GM will be confidential-especially when related to the identity of the complainants or witnesses. Any form of retaliation against individuals submitting GBV/SH/SEA grievances is strictly prohibited. Such actions may result in disciplinary measures for company personnel and, where applicable, appropriate contractual follow-up or escalation with third-party actors, including contractors and service providers.

Complainants will be informed about and referred to appropriate support services, such as medical care, psychosocial support, legal aid, or protection services. AAOİAŞ will maintain an up-to-date referral list of local service providers for this purpose.

GBV/SH/SEA grievances will be acknowledged within 3 business days and resolved as quickly as possible, with sensitivity to the emotional and physical needs of the Complainants. Complainants shall be informed of outcomes or steps taken, as appropriate and with their consent.

All GBV/SH/SEA grievances will be documented separately and securely, with access limited to authorized personnel. Non-identifiable summary data may be used for monitoring, evaluation, and reporting purposes only.

XX. ENVIRONMENTAL AND SOCIAL MANAGEMENT SYSTEM

In accordance with the Technical Specifications of KGM, Project Sponsor will establish or utilize existing certified (ISO 9001, ISO 14001 and ISO 45001) Quality Management Systems. These systems will aim to ensure that all the construction activities and the services to be provided would cover quality assurance aspects. In addition to providing quality assurance, the Project will be implemented in accordance with the requirements of the national environmental legislation, international agreements and protocols and international environmental and social standards including the Equator Principles (EPs) and International Finance Corporation's (IFC) Policy (2012) and related Performance Standards (PSs) on Environmental and Social Sustainability that would be applicable to the Antalya-Alanya Motorway Project. This "Environmental and Social Management System" (ESMS) has been developed as a part of the Project's ESIA process in order to generate a systematic approach for daily implementations within the Antalya-Alanya Motorway Project.

This ESMS consists of the following elements:

(i) Project's policies on environmental, health, safety and labor aspects;
(ii) Organizational structure of the Project;
(iii) An integrated Environmental and Social Management Plan (ESMP) defining the main management approaches and mitigation measures for relevant environmental and social subjects;
(iv) Framework for the monitoring and review of the ESMP

In addition, the Stakeholder Engagement Plan prepared as part of the ESIA Report is presented in Annex-8.

The Project ESMS has been established to ensure that all the implementations within the Project will be carried out in an environmentally sound manner. The ESMS will also provide the main framework for implementation of health and safety measures for the employees and the affected communities.

As a part of the ESMS, the ESMP will consist of plans and procedures indicating the good practices, mitigation measures and monitoring plan. However the system will not be limited with the provisions laid out in the document since continuous improvement will be carried out through an ongoing process of reviewing, correcting and improving. The ESMS will be implemented by the Project Sponsor and all the subcontractors involved. With effective implementation of the ESMS, compliance with the applicable national and international legislation and standards will be guaranteed.

XX.1. Environmental and Social Policy Framework

The Project Sponsor is committed to implement the Project in line with the commitments and measures contained in this ESIA, which have been developed and proposed on the basis of the Equator Principles and the relevant requirements of the IFC performance standards and EHS Guidelines.

In this context, the Project follows the principles outlined in the ESMS (including the ESMP) and utilizes the established ISO 9001, ISO 14001 and ISO 45001 management systems covering quality, environment and occupational health and safety.

Within the framework of the ESMS, a Project-specific Environmental and Social Policy has been developed and is being implemented by the Project Sponsor, incorporating but not limited to the following key principles.

XX.1.1. Environmental Policy

The objective for setting out an environmental policy is to follow sustainability principle by implementing all the Project activities in accordance with national and international environmental requirements. Within this context, environmental compliance will be taken into account in all phases of the Project.

The potential impacts of the Project and the mitigation measures to be taken are defined in the ESIA Report and the ESMP. The Project Sponsor will be the responsible party for taking all necessary measures in order to prevent or at least minimize these impacts to environment. Project Sponsor embraces a sustainability approach aligned with global goals, taking its responsibilities towards society, the environment, and its employees seriously, while committing to continuous improvement in fulfilling these responsibilities. In this context:

- Through its strategic direction, the company aims to create a positive impact on society and the planet by adopting a holistic sustainability approach that incorporates environmental and social responsibilities in all regions and areas of operation.
- In every area where the company operates, legal obligations are fully met, and all environmental protection efforts are regarded not only as a regulatory requirement but also as a demonstration of respect towards society.
- With the awareness that environmental protection is a shared responsibility of humanity, the company contributes to building and enhancing environmental awareness and sensitivity among its employees, stakeholders, and society at large.
- Actions are taken to promote efficient and sustainable use of resources required during operations, in line with the prevention of pollution, environmental protection, mitigation of climate change, and the conservation of biodiversity and ecosystems.
- In terms of waste management, a “zero waste” philosophy is adopted. Activities are planned and conducted with a focus on first preventing waste generation, followed by reducing waste at its source, reusing, recycling, recovering, and finally disposing of waste responsibly.
- Efforts are undertaken to reduce carbon emissions arising from project activities.
- To ensure a livable world for future generations, actions are taken to protect natural water resources, reduce water consumption, promote water recycling and reuse within the scope of water management; and to reduce energy consumption, increase energy efficiency, and encourage the use of renewable energy sources to the extent possible within the scope of energy management.

XX.1.2. Integrated Management Systems Policy

Project Sponsor has implemented an Integrated Management System that covers Quality, Environment, Occupational Health and Safety (OHS), and Road Traffic Safety across all construction and maintenance activities. The system is designed to fulfill the expectations of stakeholders, ensure responsibility towards society, the environment, and employees, and support continuous improvement of service quality.

The company’s approach is based on the following principles:

- Ensuring high-quality production and customer-oriented service delivery in all projects;
- Creating positive environmental and social impact through a comprehensive sustainability approach aligned with its strategic direction;
- Complying with all applicable national and international legislation on Quality, Environment, OHS, and Road Traffic Safety;
- Promoting awareness among employees, stakeholders, and the wider public regarding Quality, Environment, OHS, and Road Traffic Safety;

- Providing safe and healthy working conditions to prevent work-related injuries, illnesses, and traffic accidents;
- Identifying and eliminating hazards and reducing operational risks to the extent possible;
- Encouraging sustainable resource use to prevent pollution and support environmental protection;
- Allocating resources for climate change mitigation and adaptation, as well as for the conservation of biodiversity and ecosystems;
- Using energy and natural resources efficiently;
- Continuously improving the performance of the Integrated Management System;
- Ensuring that activities related to Quality, Environment, OHS, and Road Traffic Safety are embraced as a shared responsibility across the organization, and promoting employee consultation and participation;
- Acknowledging human capital as the company's most valuable asset, and therefore prioritizing the employment of competent personnel and maintaining high levels of employee development and satisfaction.

XX.1.3. Quality Policy

Project Sponsor aims to fulfill the expectations and requirements of its stakeholders, uphold its responsibilities towards society, the environment, and its employees, and ensure the continuous improvement of service quality. In alignment with these objectives, the following commitments are adopted:

- Adopting quality production and customer-oriented service as fundamental principles across all projects, with a focus on achieving high levels of stakeholder satisfaction;
- Creating a positive impact on society and the environment through a holistic sustainability approach, guided by a strong sense of environmental and social responsibility;
- Ensuring full compliance with applicable national and international laws, regulations, standards, and sector-specific innovations;
- Continuously improving the performance of the Quality Management System by integrating acquired knowledge and experience with operational outcomes;
- Promoting a shared sense of responsibility among employees for quality-related matters, while enhancing quality awareness across the company, stakeholders, and society;
- Sustaining corporate competitiveness by aligning organizational objectives with the company's policies, mission, vision, and values, and promoting continuous improvement at all levels;
- Enhancing operational efficiency through modern management practices and institutionalizing knowledge and experience across all departments;
- Advancing technological capabilities and embracing innovation to maintain leadership in the sectors in which the company operates;
- Recognizing human capital as the company's most valuable asset by employing highly qualified personnel and investing continuously in employee development to maintain high levels of satisfaction and competence.

XX.1.4. Occupational Health and Safety Policy

Project Sponsor recognizes that its most valuable asset is its human capital. With this awareness, the company aims to minimize all types of potential losses by ensuring a safe and healthy working environment and considers continuous improvement a key organizational objective. The company fulfills its responsibilities toward society, the environment, and its employees in line with the following principles:

- Compliance with all applicable national and international laws, regulations, and standards in all areas of operation, with OHS practices seen not only as legal obligations but also as a reflection of the company's respect for society and its workforce;
- Provision of safe and healthy working conditions to prevent occupational injuries and illnesses;
- Adoption of the "zero accident" and "zero occupational disease" targets, and implementation of proactive risk assessments and root cause analyses to identify and eliminate unsafe conditions and actions that could lead to accidents or health deterioration for employees, subcontractors, suppliers, and visitors;
- Promotion of shared responsibility for occupational health and safety at all levels of the organization, ensuring effective consultation and participation of employees in all OHS-related matters;
- Training of employees to establish and enhance OHS awareness, and ensuring that subcontractors, suppliers, and visitors comply with established safety procedures and rules;
- Continuous investment in employees to maintain high levels of competence, quality, and satisfaction.

XX.1.5. Sustainability Policy

Project Sponsor acknowledges that ensuring a sustainable future requires collective global effort in harmony with nature. Guided by this awareness, the company integrates sustainability into all aspects of its operations and decision-making processes. The Sustainability Policy is built upon the founding values, ethical principles, and global sustainability goals of its parent company, Limak Holding, and serves as a framework for all stakeholders within the company's value chain.

Business Approach Focus Areas

The Sustainability Policy is structured around three interrelated pillars. Antalya Alanya Motorway Construction, Investment and Operation Inc. is committed to the belief that sustainable economic development can only be achieved through environmental and social responsibility on a healthy planet.

Inclusive Development

In line with Limak's global sustainability vision, the company adopts an inclusive approach to economic development by actively engaging with employees, business partners, and stakeholders. Key commitments under this focus area include:

- Aligning operations with the United Nations Sustainable Development Goals (UN SDGs);
- Complying with the 10 Principles of the United Nations Global Compact, to which Limak is a signatory;
- Allocating resources to research and development across operational sectors;
- Supporting the development and implementation of innovative technologies that contribute to sustainability;
- Encouraging stakeholder participation in decision-making processes;

- Fostering a company-wide culture of sustainability through awareness-raising and internal communication;
- Sharing experiences and best practices through international partnerships and platforms;
- Promoting sustainability across the entire supply chain;
- Measuring and evaluating the economic, environmental, and social impacts of operations to identify areas for improvement;
- Publishing periodic sustainability reports in accordance with international standards;
- Maintaining a transparent, ethical, and anti-corruption business approach.

People-Centered Approach

The company prioritizes the protection of human health, support for personal development, and promotion of equal opportunities across all activities. Sustainability is considered inseparable from social development and employee commitment. Project Sponsor aims to create safe, accessible, and innovative environments that foster individual and social well-being.

Core actions under this pillar include:

- Ensuring and maintaining equal opportunity and public health, with particular attention to vulnerable groups;
- Monitoring and enhancing energy efficiency across all sectors, and investing in infrastructure improvements;
- Promoting the use of renewable energy sources in operations;
- Supporting projects that increase water efficiency and awareness among employees and stakeholders;
- Calculating, verifying, and monitoring emissions generated by operational activities as part of climate change mitigation efforts.

XX.1.6. Human Resources Policy

The Project Sponsor adopts a participatory and value-generating human resources management approach shaped by the vision, mission, competencies, and ethical values of Limak Holding, in line with principles of change and transformation.

In line with the Corporate Equality Policy, the Project Sponsor aims to raise awareness among all employees by providing a fair, transparent, efficient, healthy, and development-oriented working environment that supports gender equality. Based on the principles of equality and inclusiveness, all human resources practices—such as recruitment, training, promotion, performance management, career development, and remuneration—are free from discrimination based on gender, age, marital status, religion, language, ethnicity, pregnancy status or potential, and other personal characteristics. In addition, the Project Sponsor strictly opposes any forms of physical punishment, psychological pressure, verbal abuse, or mistreatment that may undermine human dignity in disciplinary actions.

An inclusive and equality-based communication approach is adopted in all internal and external communication, supporting skills and competencies. The Project Sponsor acts with full social responsibility awareness in line with national regulations, and does not employ children and/or individuals under the age of 18.

Except for short-term exceptional circumstances, working hours are maintained within the limits set by applicable labor legislation. In recruitment processes, priority is given to women candidates where male and female applicants have equal qualifications.

The following are actively supported as part of the company's commitment to gender equality and inclusion:

- Increasing the representation of women in middle and senior decision-making roles,
- Supporting the return of female employees to work after maternity leave and eliminating career development losses,
- Enhancing the participation of women in traditionally male-dominated sectors and roles, and of men in traditionally female-dominated fields,
- Promoting work-life balance, including equitable sharing of unpaid domestic responsibilities,
- Supporting paternity involvement and shared parental responsibilities in childcare and development.

A fair, transparent, and competitive remuneration system is implemented, based on job grades and competencies, aligned with market conditions and sensitive to the principle of equality. In accordance with the principle of "equal pay for work of equal value," all employee rights are protected.

A performance evaluation system is applied that fairly, transparently, and inclusively assesses knowledge, effort, and behavior. The outputs of this system form the basis for development and promotion processes. Career paths of all employees are managed with a development-focused approach, and access to personal, technical, and professional training programs is ensured based on identified needs. Internship opportunities are provided to students to support their professional growth.

The Project Sponsor adopts a Zero Tolerance Policy against workplace violence, domestic violence, and violations of sexual integrity in relationships among employees, between employees and stakeholders, and among stakeholders themselves. All necessary disciplinary measures are taken in the event of any violations.

The Project Sponsor also supports practices aimed at enhancing employee motivation and strengthening organizational loyalty by acting on insights gained from employee satisfaction initiatives conducted across group companies. Ensuring work-life balance through effective implementation of related policies and procedures is considered a priority.

XX.1.7. Data Privacy and Security Policy

This policy outlines the principles and measures to be followed by all employees of the Project Sponsor to ensure the confidentiality, security, integrity, and continuity of sensitive information. Employees acknowledge that unauthorized use or disclosure of confidential information may damage the organization's competitiveness and reputation. All employees are therefore responsible for managing confidential information in accordance with this policy.

Confidental Information

Confidential information includes, but is not limited to:

- Commercial, financial, operational, contractual, and technical data
- Trade secrets, inventions, intellectual property, and business methods
- Personal data, internal documentation, project details, pricing strategies, and software
- Information protected under confidentiality agreements with third parties

This information may pertain to the Project Sponsor or to related stakeholders such as employees, business partners, suppliers, clients, and even competitors.

Disclosure and Use

Confidential information must not be disclosed or used outside the permitted purposes unless:

- Disclosure is essential for business operations and covered by a Non-Disclosure Agreement (NDA);
- Required by law, regulatory orders, or court decisions (with prior notice to management);
- Written consent is obtained from third parties in case their confidential data is involved;
- Prior written authorization is granted by the relevant authority for exceptions.

Employees must ensure that:

- All information reasonably deemed confidential, even if not marked, is treated accordingly;
- Disclosure is limited to those with a legitimate “need-to-know”;
- Reproduction, alteration, or destruction of confidential information requires prior approval;
- Confidential information is not discussed in public areas or shared via social media;
- Confidential third-party data is handled with the same level of care as internal data;
- All suspected breaches are reported immediately to management;
- No employee may pressure another into disclosing confidential information;
- The Law on the Protection of Personal Data (No. 6698) is strictly followed;
- Confidential information is safeguarded per IT security protocols and returned upon termination of employment.

Information Security

The Project Sponsor implements necessary measures to ensure the confidentiality, integrity, and availability of information stored physically or electronically. Employees are expected to:

- Use information only within legal and internal policy limits;
- Follow proper procedures when disclosing data to third parties;
- Maintain user access credentials securely and never share them;
- Take necessary actions when a data breach is suspected;
- Store physical documents securely in designated areas;
- Seek authorization before removing any data from the premises;
- Use only designated equipment for handling sensitive data.

Information security protocols include:

- Regular staff training and awareness-raising
- Controlled access management (authorization matrix, logs, backups)
- Cybersecurity measures to prevent data loss, unauthorized access, or tampering
- Ongoing audits to monitor compliance

In case of uncertainty regarding policy implementation, or awareness of a possible violation, employees are required to consult or report the matter to the Ethics Committee for evaluation.

XX.1.8. Zero Tolerance Policy Against Violence and Violation Of Sexual Inviolability

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş (''AAOİAS'') is determined to provide a safe environment to its entire employees and other people with whom it has a business relationship which is free from all kinds of violence and violation of sexual inviolability, including sexual harassment and assault, and discrimination on any grounds.

Through this policy, it aims to implement the necessary application and referral procedures to ensure a working environment free from all cases of violence and violation of sexual immunity, including gender-based violence and harassment. AAOİAS aims to establish a corporate culture that does not tolerate any violence against employees and violation of sexual inviolability in order to ensure gender mainstreaming within the corporation. AAOİAS considers violence and violation of sexual inviolability not only as a violation of human rights, but also as a problem that negatively affects the effective participation of employees in business life and the working environment and acts with this awareness.

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş adopts a zero-tolerance policy for cases of violence and violation of sexual inviolability, dealing with all cases seriously and carries out all relevant transactions respectfully and ensures that all allegations of violence or violations of sexual inviolability are investigated on the basis of trust without delay. It accepts and is committed to providing a decent and safe working environment and adopting a holistic approach to combating violence and violations of sexual immunity. AAOİAS applies disciplinary actions that may lead to dismissal of an employee who is found to have committed violence to a person or violated his/her sexual inviolability.

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş takes the principles of confidentiality and acting upon with care and trust as basis in the implementation of the policy. AAOİAS protects the information of parties who alleged and witnessed violence or violation of sexual inviolability, takes the necessary measures to minimize any potential negative effects in the application process and behaves in a manner that does not damage the sense of trust in entire organization and among the parties with whom there are business relationships. In case the victim is not willing to share their identity information, AAOİAS ensures an anonymous complaint/application mechanism.

Antalya Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş has prepared this policy on the basis of national legislation and international human rights conventions.

XX.2. Environmental and Social Management System Structure

The ESIA resulted in the identification of E&S risks and potential impact factors for which specific mitigation measures were identified to mitigate the effects of the impact factors. The ESIA was prepared in accordance with both National Regulations and applicable international standards. The ESIA process included the following steps:

- Review of available Project and environmental and social documentation
- A Scoping report was prepared prior to the ESIA process and included general project information, legal framework, baseline and preliminary impact assessment and a methodology for ESIA process.
- An Inception Report was submitted in the first phase of the ESIA process. This report served as a foundational document to validate and ensure compliance with the scope, methodological approach, study boundaries and stakeholder expectations for environmental and social assessments.

- Biological and physical baseline surveys have been performed for physical (air quality, noise and vibration measurements at sensitive receptors, soil, groundwater) and biological (flora, fauna) components to provide an understanding of the environmental context in the Regional Study Area (RSA) and the Area of Influence (AoI) of the Project before its realization.
- A Biodiversity Action Plan (BAP) has been developed to manage and mitigate potential impacts on critical and natural habitats identified during the baseline ecological surveys. The BAP sets out actions to conserve biodiversity and ensure no net loss, in line with IFC Performance Standard 6.
- A Stakeholder Engagement process including community-level surveys, focus group discussions, key informant interviews
- A Resettlement Action Plan (RAP) is being prepared in line with relevant national legislation and international standards to address potential physical and economic displacement impacts. The RAP will outline compensation mechanisms, livelihood restoration strategies and stakeholder engagement procedures specifically targeting affected persons.
- An ESIA report has been prepared and includes the results of the ESIA process carried out as well as an assessment of the Project's adverse and positive impacts and includes mitigation measures that will be the basis for the preparation of ESMPs, a component of the Project's ESMS. The ESIA report includes a Non-Technical Summary (NTS) prepared for disclosure.

As the potential impacts and impact levels of the Project vary according to different phases of the Project (construction, operation and decommissioning) environmental and social management of the Project are assessed separately. ESIA consists of three main components in that scope, which are as follows:

- Mitigation Plan
- Monitoring Plan
- Monitoring Report

The graphical representation of the environmental and social management structure is given in Figure XX.1.

Figure XX.1 Environmental and Social Management Structure

XX.3. Environmental and Social Management Plans (ESMPs)

Environmental and Social Management Plans (ESMPs) are set forward to implement principles that are required to prevent, control and minimize potential impacts of the Project on the natural environment, wildlife and local communities. The idea is to apply environmentally sound management strategies in line with related national legislation, international agreements and protocols, and international standards to carry out project activities conserving the integrity of natural systems without negatively affecting the surrounding environment. As a part of the ESMS, an ESMP, consisting of sub-procedures on the management of environmental (e.g. water and wastewater, waste, hazardous materials, wildlife, etc.) and health and safety (occupational and community related) aspects of the Project has been prepared.

Within the scope of the ESMP, several topic-specific procedures have been developed that set out the main management approaches and mitigation measures, together with a monitoring plan to assess the effectiveness of the mitigation measures to be implemented. The Project ESMP including those procedures, as listed below, is presented in Annex-4 of the ESIA Report.

- Environmental Management Plan
  - Air Quality and Emissions Management Procedure
  - Water Quality, Wastewater and Stormwater Management Procedure
  - Solid Waste Management Procedure
  - Hazardous Waste Management Procedure
  - Noise Management Procedure
  - Habitat Alteration, Fragmentation and Wildlife Management Procedure
  - Quarry Management Procedure

- Occupational Health and Safety Management Plan
  - Physical Hazards Management Procedure
  - Chemical Hazards Management Procedure
  - Noise Management Procedure
  - Personal Protective Equipment (PPE) Management Procedure
  - Communication and Training Management Procedure
  - Workers Accommodation Procedure

- Community Health, Safety and Security Plan
    - Fire Management Procedure
    - Traffic Management Procedure

- Other Relevant Plans and Procedures
    - Subcontractor Management Plan
    - Change Management Procedure
    - Emergency Preparedness and Response Plan
    - Stakeholder Engagement Plan
    - Resettlement Action Plan
    - Chance Find Procedure.

In addition, an Emergency Preparedness and Response Plan and a Stakeholder Engagement Plan (including the Grievance Mechanism) were prepared as part of the ESIA Report and is submitted as annexes to this ESIA Report.

In addition to the topic-specific procedures incorporated under the ESMP, the following project-specific sub-management plans have been developed to ensure the effective implementation of the Environmental and Social Management System (ESMS) during the construction phase. These plans provide detailed guidance tailored to the specific activities, risks, and impacts anticipated during construction and are fully aligned with the overarching ESMP framework. Each sub-plan is designed to address particular environmental and social risks that may arise throughout the construction period. These Plans are:

- Air Pollution and Emissions Management Plan
- Hazardous Material Management Plan
- Solid Waste Management Plan
- Environmental Accident and Spill Response Management Plan
- Water Quality Wastewater and Storm Water Management Plan
- Noise and Vibration Management Plan
- Change Management Plan
- Community Health and Safety Management Plan
- Construction Camp Site Management Plan
- Emergency Preparedness and Response Management Plan
- Human Resources and Labor Management Plan
- Security Management Plan
- Supply Chain and Subcontractor Management Plan
- Traffic Management Plan
- Training and Communication Management Plan
- Occupational Health and Safety Plan
- Resource Efficiency Management Plan
- Excavated Material Management Plan
- Soil Management and Erosion Control Plan
- Cultural Heritage Management Plan
- Blasting Management Plan
- Quarry Management Plan

- Demolition Management Plan
- Environmental and Social Management and Monitoring Plan

An Operation Phase Environmental and Social Management Plan (O-ESMP) will be developed at least three months prior to the commencement of the operation phase, as required. This overarching plan will guide the implementation of environmental and social mitigation and monitoring measures during operation.

In addition, a set of operation phase sub-management plans will be prepared to address project-specific environmental and social risks. These plans will include, but are not limited to, the following:

- Waste Management Plan
- Noise Management Plan
- Emergency Preparedness and Response Plan
- Labour Management Plan
- Occupational Health and Safety Plan
- Traffic Management Plan
- Sub-contractor Management Plan

These plans will be aligned with the O-ESMP and the overall Environmental and Social Management System (ESMS) to ensure effective risk management and regulatory compliance during operation.

These sub-management plans serve as key implementation tools of the ESMP and are binding for all Project personnel, including contractors and subcontractors. Together, they ensure alignment with applicable national laws, IFC Performance Standards, and Good International Industry Practice (GIIP).

XX.4. Roles and Responsibility

The organizational structure presented in Figure XX.2 outlines the key management roles and reporting lines for the construction phase of the Project. This structure defines the hierarchical distribution of responsibilities and facilitates coordination among various departments involved in the execution of environmental and social management plans. Each role within this structure should ensure that assigned tasks are executed in line with the Project's ESMS requirements and that inter-departmental coordination is maintained effectively. In addition to the construction phase structure, the SPV (Special Purpose Vehicle) will assume overall responsibility for ensuring the implementation and oversight of the Environmental and Social Management System during the operation phase of the Project.

In support of this structure, Table XX.1 is provided to outline the roles and responsibilities specifically related to the implementation, monitoring, and reporting requirements of ESMPs. The table clarifies the functional duties of each party involved in ensuring the effective execution of the measures described herein and reinforces accountability across all relevant units.

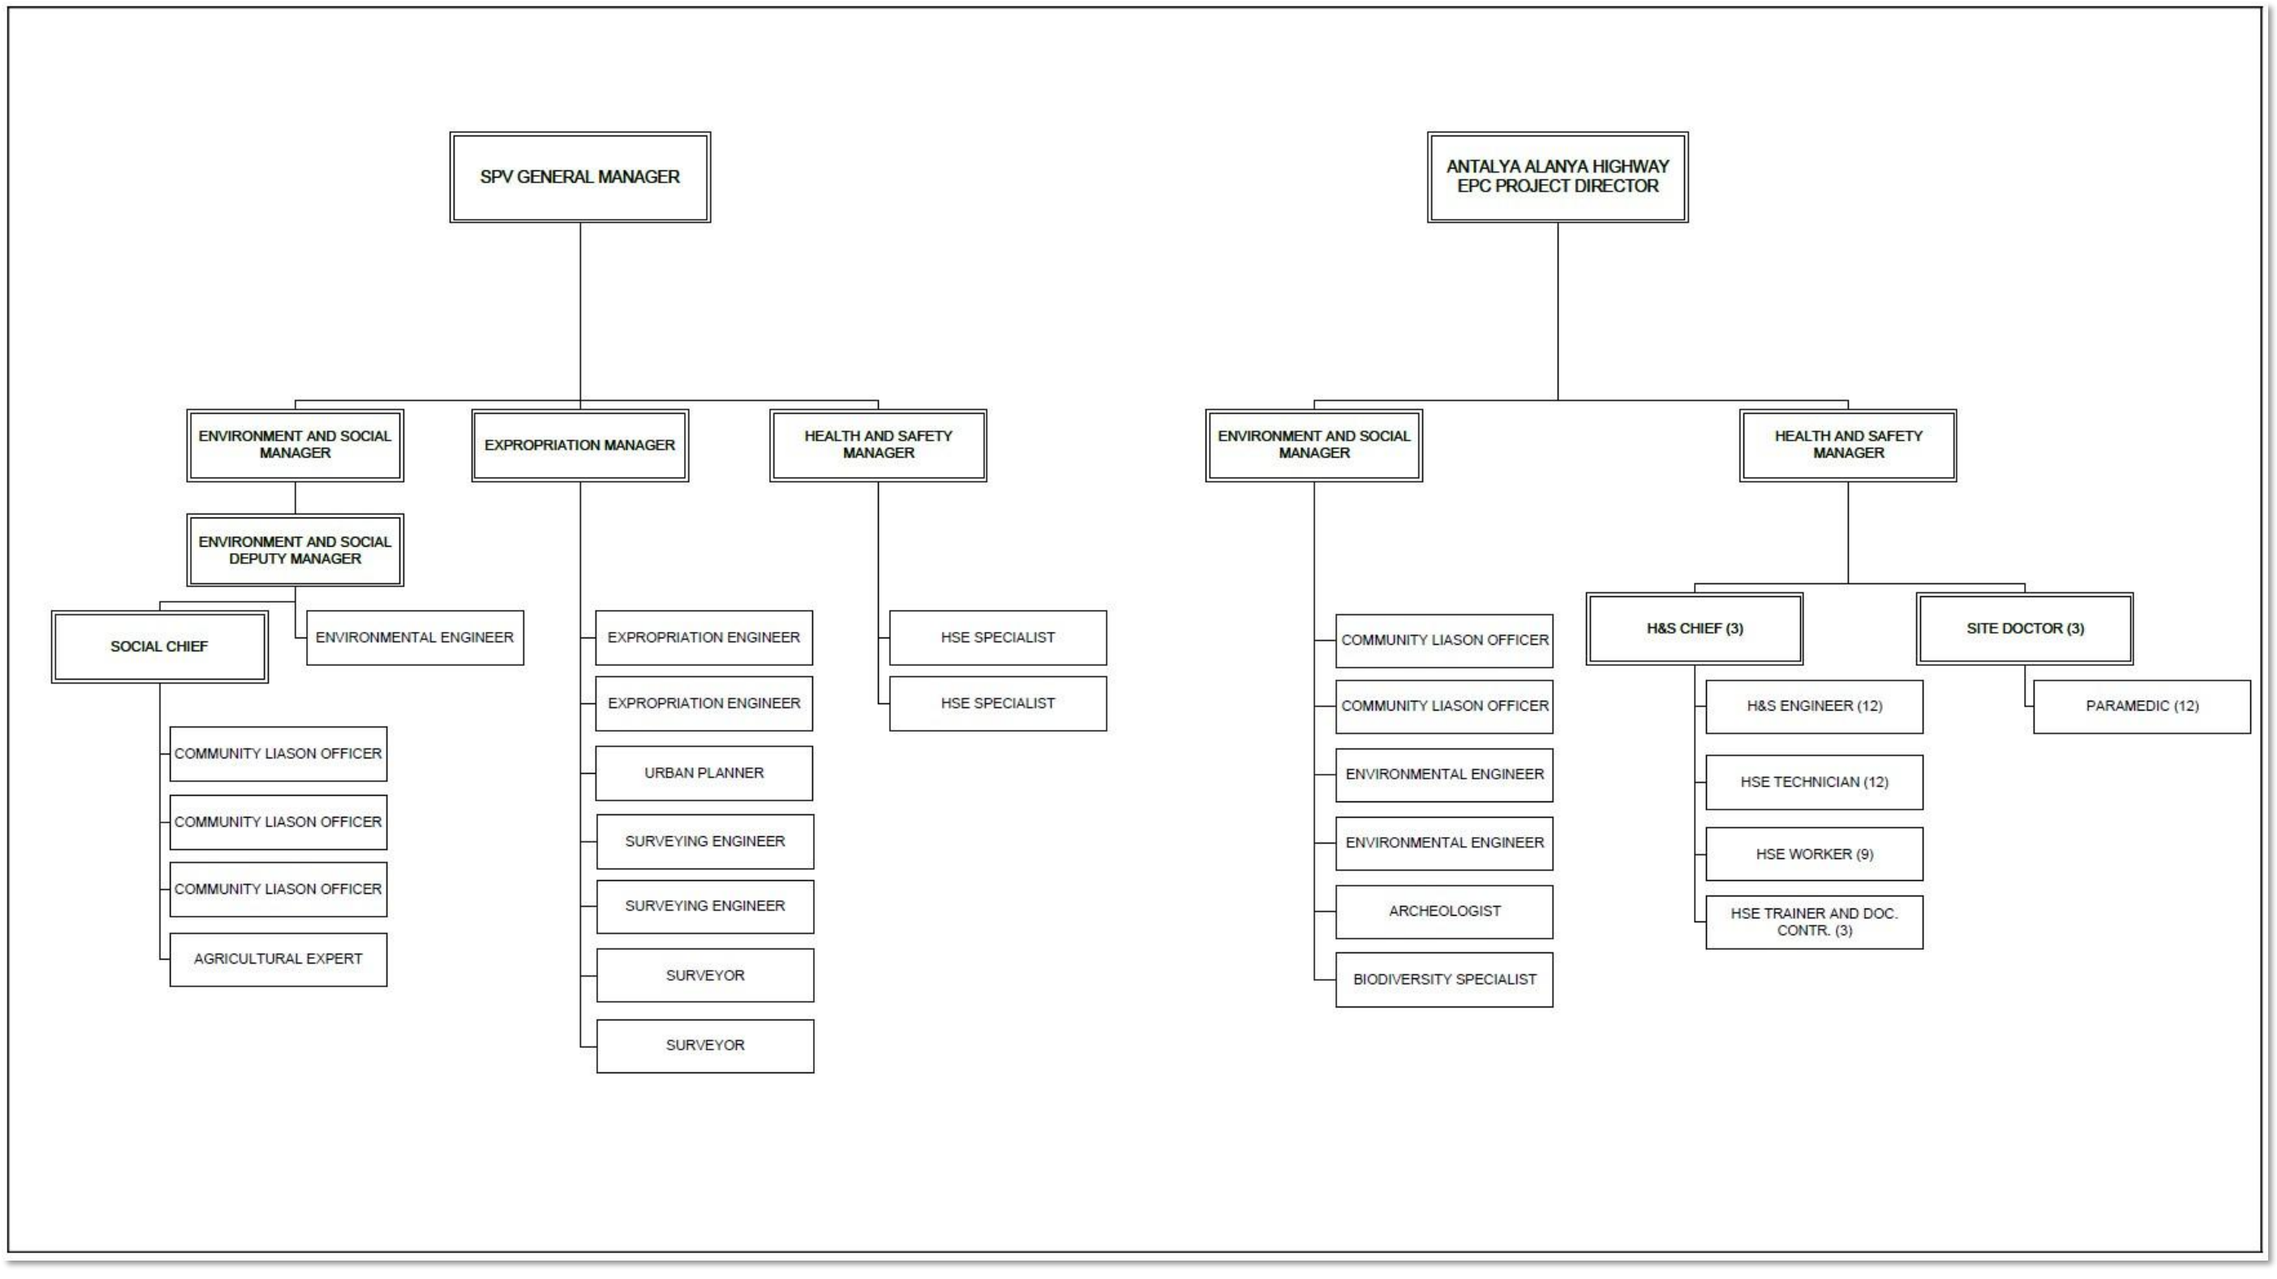

Figure XX.2 Organizational Structure of the Project Sponsor (AAOİAŞ) for the Project

Table XX.1 Allocation of Roles and Responsibilities for Plan Implementation

Roles	Responsibilities
General Manager (SPV)	○ Define and implement the overall business strategy and direction of the SPV in alignment with shareholder and stakeholder expectations. ○ Ensure the development, revision, and execution of project-specific management plans, including the Environmental and Social Management Plan (ESMP) in accordance with company policies and international standards. ○ Ensure the provision of necessary resources and organizational support for the implementation of all SPV plans, including E&S and H&S. ○ Oversee the day-to-day operations of the SPV to ensure project milestones and deliverables are achieved efficiently and sustainably. ○ Supervise and coordinate EPC contractors and subcontractors to ensure proper execution of construction, commissioning, and operational phases. ○ Ensure that managerial decisions are made regarding the implementation of all SPV policies and plans by EPCs and subcontractors. ○ Ensure the preparation, dissemination, and implementation of the Environmental and Social Management Plan, and that it is communicated clearly to all EPC contractors and subcontractors. ○ Supervise and ensure contractor/subcontractor compliance with E&S and H&S plans and standards. ○ In case of non-compliance, ensure correct and preventive actions are taken in collaboration with the EPC, SPV's E&S Manager, and H&S Manager. ○ Coordinate internal intervention and emergency response procedures in case of environmental, social, or safety-related incidents. ○ Make executive decisions on project budgeting, resource allocation, and capital management to support project execution and sustainability, H&S and E&S compliance. ○ Ensure sufficient funding and personnel are dedicated to environmental, social, and H&S obligations under the project's contractual and regulatory frameworks. ○ Ensure the monitoring environmental, social and financial performance, reporting, and risk exposure of the SPV, ensuring transparency and accountability to stakeholders and investors. ○ Promote a culture of environmental and social responsibility across the SPV and its stakeholders. ○ Ensure that all project activities comply with local laws, environmental regulations, corporate governance policies, and international best practices and lender requirements. ○ Liaise with legal counsel to manage the SPV's legal framework, mitigate risks, and fulfil all contractual obligations. ○ Provide timely updates, reports, and presentations on the SPV's performance, risks, compliance status, and community engagement efforts. ○ Foster positive relationships with government agencies, financial institutions, civil society, and project-affected communities. ○ Lead the development and execution of the exit strategy or asset disposal plan upon project maturity or completion. ○ Oversee the financial and legal wind-down of the SPV in accordance with regulatory and shareholder requirements.
E&S Manager (SPV)	○ Review and ensure the preparation, revision, and implementation of E&S Management Plans in accordance with national laws, regulations, company policies, international standards and lender requirements. ○ Develop and manage the overall E&S management system and project-specific sub-plans. ○ Review and update the E&S Management Plan in coordination with the EPC's E&S Manager and construction teams. ○ Ensure that environmental, and community safety measures are implemented through method statements and site practices.

Roles	Responsibilities
	○ Ensure that all construction site activities are carried out safely by EPC and subcontractors. ○ Ensure that EPC and subcontractors correctly implement site practices. ○ Provide technical support to EPC and subcontractors for the implementation of E&S Plans. ○ Collaborate with internal teams (e.g., H&S, Legal, Procurement) to integrate E&S criteria into project operations and contracts. ○ Monitor the environmental and social performance of EPC and subcontractors to ensure compliance. ○ Monitor EPC and subcontractor adherence to the requirements of the E&S Management Plan. ○ Monitor EPC and subcontractor adherence to the requirements of the E&S Management Plan. ○ Ensure EPC and subcontractors maintain accurate records, including those of corrective and preventive actions. ○ Supervise the E&S Deputy Manager oversee the implementation of monitoring systems. ○ Ensure that EPC and subcontractors provide required E&S training. ○ Review and validate training records and related documentation. ○ Ensure effective investigation and documentation of environmental and social incidents. ○ Lead or support the implementation of corrective actions and incident prevention measures. ○ Coordinate emergency preparedness and community safety procedures. ○ Prepare and submit E&S compliance and performance reports to internal and external stakeholders, including lenders and regulators. ○ Maintain documentation related to site compliance, audits, training, and grievances. ○ Support stakeholder engagement activities and consultations with local communities. ○ Oversee the Grievance Mechanism (GM) and ensure timely resolution of community and worker complaints. ○ Engage with regulatory authorities, auditors, and NGOs on E&S compliance and performance matters ○ Coordinate obtaining environmental related permits
H&S Manager (SPV)	○ Ensure the preparation, revision, and implementation of the health, safety, community related plans and documents in accordance with company policies, regulatory obligations, international standards and lender requirements. ○ Ensure the conditions and obligations specified in the health, safety, community related plans and documents are implemented and adhered to by EPC and subcontractors in accordance with company policies, regulatory obligations, international standards and lender requirements. ○ Contribute to project risk assessments and job hazard analyses (JHAs) and ensure these are updated regularly. ○ Ensure that all construction site activities are carried out safely by EPC and subcontractors. ○ Ensure that safety, health, and community safety measures are implemented by EPC and subcontractors through appropriate method statements and site practices. ○ Ensure that physical site boundaries are clearly defined and maintained by EPC and subcontractors to control site access and protect public safety. ○ Provide technical support to EPC and subcontractors for the proper implementation of the safety, health, and community safety related plans. ○ Supervise the integration of safety controls into daily work permits, toolboxes, and field activities. ○ Monitor the compliance of EPC and subcontractors with the safety, health, and community safety related plans, and applicable laws, international standards and lender requirements.

Roles	Responsibilities
	○ Conduct regular inspections, audits, and hazard identification walkthroughs on construction sites. ○ Track and analyze safety performance metrics (e.g., LTIs, near misses, TRIR) and recommend corrective measures. ○ Participate in and oversee comprehensive investigations of accidents and incidents. ○ Ensure root causes are identified, documented, and that corrective actions are implemented and verified. ○ Ensure timely and appropriate resolution of complaints related to public health and safety. ○ Support EPC and subcontractors in the development and delivery of site-specific H&S training programs. ○ Ensure safety inductions, toolbox talks, and job-specific training are conducted and recorded. ○ Maintain accurate records of inspections, incidents, safety meetings, and corrective actions. ○ Report on H&S performance, non-compliance, and corrective actions to Project General Manager and external stakeholders. ○ Coordinate with health and safety teams to align safety measures with broader site and community risk controls. ○ Engage with regulatory authorities on inspections, audits, and compliance verification.
Expropriation Manager (SPV)	○ Implement the Resettlement Action Plan (RAP) or equivalent frameworks in alignment with national regulations and international standards. ○ Identify affected lands, properties, and stakeholders in collaboration with survey, legal, and engineering teams. ○ Coordinate with government bodies and legal authorities for expropriation procedures and approvals. ○ Engage with landowners, occupants, and project-affected communities to explain project scope, land requirements, compensation processes, and grievance redress mechanisms. ○ Mediate and resolve disputes related to land ownership, valuation, or resettlement with tact and legal support where necessary. ○ Coordinate resettlement efforts where required, including livelihood restoration programs. ○ Maintain detailed documentation of compensation agreements, payments, and relocations. ○ Ensure expropriation processes comply with national laws, international standarts, lender requirements, and the SPV's internal policies. ○ Collaborate with E&S teams to ensure that land acquisition activities do not lead to violations of environmental or social management plans. ○ Track and report progress of land acquisition and resettlement activities to senior management and external stakeholders. ○ Provide input for audits, investor updates, and compliance reviews related to expropriation. ○ Identify and mitigate risks related to delayed acquisition, legal disputes, or community opposition. ○ Implement contingency plans to avoid disruption to project timelines due to expropriation issues.
Deputy E&S Manager (SPV)	○ Lead the development, implementation, and continuous improvement of the Environmental and Social Management. ○ Implement all project activities comply with local laws, environmental regulations, corporate governance policies, and international best practices and lender requirements. ○ Provide strategic leadership and oversight to the E&S team, including Managers, Specialists, Engineers, and Community Liaison Officers, ensuring effective coordination and resource allocation.

Roles	Responsibilities
	○ Ensure EPC contractors and subcontractors consistently comply with E&S requirements through monitoring, audits, corrective actions and training programs. ○ Oversee incident and non-compliance management, including investigations, corrective/preventive measures, and stakeholder communication. ○ Serve as the principal liaison for all environmental and social matters with government regulators, financial institutions, communities, NGOs, and other stakeholders. ○ Promote a culture of environmental and social responsibility across the SPV and its stakeholders, driving continuous improvement and risk mitigation. ○ Support executive decision-making by providing timely reports and insights on E&S performance, risks, and emerging trends. ○ Lead community engagement strategies in collaboration with the Environmental Engineer, Agricultural Expert, Social Chief and CLOs to ensure effective grievance management and positive relations with project-affected communities. ○ Ensure E&S considerations are integrated into project planning, budgeting, and closure activities, including restoration and post-construction monitoring. ○ Support the environmental and community safety measures are implemented through site practices and method statements by the EPC and subcontractors. ○ Ensure that the EPC and subcontractors carry out site practices correctly. ○ Ensure that EPC and subcontractors maintain relevant records. ○ Ensure that EPC and subcontractors maintain records of corrective and preventive actions. ○ Ensure that Management Plans are prepared, revised, and implemented in accordance with company policies. ○ Ensure that EPC and subcontractor provide the necessary training through the review of training records and relevant training documents. ○ Conduct comprehensive investigations in case of accidents and incidents. ○ Manage waste within the entire project footprint and area of influence, prioritizing the designated areas to be used under the scope of the Project. ○ Coordinate environmental and social monitoring programs
Social Chief (SPV)	○ Supervise and mentor CLOs, ensuring their work aligns with project priorities and stakeholder engagement strategy. ○ Develop and implement work plans and schedules for the CLO team. ○ Ensure consistent messaging, processes, and reporting methods across all field teams. ○ Conduct regular team meetings to review community issues, grievances, engagement outcomes, and field updates. ○ Lead the implementation of the Stakeholder Engagement Plan (SEP) and ensure it reflects community realities. ○ Oversee the planning and execution of community consultations, public meetings, and disclosure activities. ○ Ensure that engagement activities are inclusive of vulnerable and marginalized groups. ○ Build and maintain positive, trust-based relationships with local communities, leaders, and institutions. ○ Supervise the effective functioning of the grievance redress mechanism (GRM) at community and project levels. ○ Ensure all grievances are recorded, processed, and resolved in a timely and transparent manner. ○ Analyse grievance trends and escalate systemic issues to the E&S Manager. ○ Contribute to the continuous improvement of the GRM process based on community feedback and internal review. ○ Monitor the performance of social engagement activities and their compliance with SEP objectives. ○ Ensure accurate, timely, and complete reporting of CLO activities, stakeholder interactions, and grievance outcomes. ○ Review and validate weekly/monthly reports from CLOs and prepare consolidated updates for senior management.

Roles	Responsibilities
	○ Ensure all engagement activities meet national regulations and international standards (e.g., IFC PS, EBRD PR, Equator Principles). ○ Identify training needs and deliver or coordinate training for CLOs on stakeholder engagement, conflict resolution, ○ and field documentation. ○ Promote professional development and capacity building within the social team. ○ Train subcontractors and relevant staff on community interaction protocols and grievance management. ○ Contribute to the development, review, and periodic updating of the SEP and related social management plans. ○ Ensure CLOs support the implementation and documentation of these plans at the field level. ○ Support the integration of lessons learned into updated plans and engagement strategies. ○ Coordinate with the E&S Manager, E&S Specialists, H&S, legal, and construction teams to address community-related ○ impacts. ○ Support alignment between community concerns and project execution through proactive communication with ○ technical departments. ○ Contribute social performance inputs to reports for lenders, regulators, and corporate leadership.
Agricultural Expert (SPV)	○ Assess project impacts on agricultural land, productivity, and rural livelihoods in coordination with the expropriation and E&S teams. ○ Support the development and implementation of livelihood restoration strategies for project-affected farmers and agricultural households. ○ Conduct field visits to gather agricultural baseline data, monitor changes, and evaluate effectiveness of mitigation measures. ○ Provide technical input to social risk assessments, Resettlement Action Plans (RAPs), and Livelihood Restoration Plans (LRPs). ○ Engage with local agricultural institutions, cooperatives, and extension services to coordinate support and training programs. ○ Participate in community consultations with a focus on agricultural concerns and provide input into grievance resolution related to land use, crop loss, or livelihood impacts. ○ Help identify and implement sustainable farming initiatives and compensation strategies aligned with local practices and market trends. ○ Monitor and report on agricultural livelihood indicators, ensuring alignment with project and lender requirements. ○ Contribute to the review and update of relevant social and livelihood management plans. ○ Support the Social Chief and Community Liaison Officers in field-level implementation, training, and stakeholder engagement related to agricultural matters.
Expropriation Engineer (SPV)	○ Review and validate cadastral maps, land parcel data, and expropriation plans in coordination with the design and survey teams. ○ Prepare and update technical drawings, parcel-level expropriation maps, and cross-sections for engineering verification. ○ Ensure that technical documentation aligns with the project's legal, spatial requirements, international standards and lenders requirements for expropriation. ○ Support the preparation of expropriation folders with complete technical details for each parcel. ○ Conduct field inspections and site verifications to confirm parcel boundaries, existing structures, crops, and utilities. ○ Record and document physical conditions of affected properties, including GPS coordinates and photographic evidence.

Roles	Responsibilities
	○ Collaborate with surveyors, property evaluators, and legal experts during field visits and technical assessments. ○ Maintain a database of technical information related to affected parcels, expropriation status, and engineering reviews. ○ Prepare technical summaries, verification reports, and progress updates for the Expropriation Manager. ○ Assist in tracking parcel-by-parcel technical clearance and report on delays or technical discrepancies. ○ Support interactions with landowners during technical inspections, mapping explanations, and asset identification. ○ Coordinate with municipal engineers, cadastral offices, and other public institutions to resolve technical inconsistencies. ○ Assist the legal and valuation teams by providing technical input for asset valuation and compensation processes. ○ Ensure all engineering-related activities comply with national laws, environmental and social standards, international standards, lender requirements and project guidelines. ○ Support the preparation of technical annexes for land acquisition reports, grievance responses, and audit documentation. ○ Provide support during audits by lenders or regulatory agencies on technical matters related to expropriation.
Urban Planner (SPV)	○ Conduct land use assessments and spatial analysis to support expropriation, resettlement planning, and infrastructure alignment. ○ Identify and evaluate potential resettlement areas in collaboration with the social and engineering teams, ensuring suitability in terms of accessibility, services, and community integration. ○ Prepare or review layout plans for resettlement sites or impacted urban areas in compliance with national and local planning standards. ○ Support the preparation of expropriation and land-use strategy documents that align with municipal and regional development plans. ○ Ensure that project land acquisition activities are consistent with zoning, land classification, and regulatory requirements. ○ Liaise with urban planning authorities and municipalities to facilitate approvals, permits, and community development. ○ Work with the Legal and Expropriation teams to resolve spatial planning disputes or challenges related to land classification. ○ Participate in field visits, stakeholder consultations, and public meetings to present planning proposals and gather community feedback. ○ Prepare maps, presentations, and reports to communicate spatial strategies and resettlement layouts to stakeholders.
Surveying Engineer (SPV)	○ Plan, coordinate, and supervise all surveying activities related to the project, including topographic, cadastral, and engineering surveys. ○ Review and validate survey data, maps, and drawings prepared by EPC contractors or subcontractors to ensure accuracy and compliance with project requirements. ○ Support the expropriation process by verifying parcel boundaries, land ownership, and physical asset inventories. ○ Ensure that all survey activities are conducted using appropriate instruments (e.g., GPS, total station, drones) and are aligned with national and international standards. ○ Coordinate with design, engineering, and legal teams to resolve discrepancies in land measurements, maps, and legal documentation.

Roles	Responsibilities
	○ Maintain an up-to-date geospatial database of all surveyed areas and assets affected by the project. ○ Participate in site inspections and field verifications alongside Expropriation Engineers, CLOs, and property evaluators. ○ Provide technical inputs for land acquisition documentation, grievance resolution, and community consultation processes. ○ Ensure survey documentation is archived properly and is accessible for audits, regulatory reviews, and internal controls. ○ Supervise EPC and subcontractor survey teams to ensure the implementation of safe and efficient survey operations within the project area. ○ Liaise with relevant public institutions (e.g., cadastral offices, municipalities) for official validation of survey outputs when required. ○ Contribute to the preparation of maps, cross-sections, and spatial plans for environmental, social, and engineering applications.
Surveyor (SPV)	○ Conduct detailed topographic and cadastral surveys of affected land parcels and assets using appropriate tools and technologies. (e.g., total stations, GPS, drones) ○ Mark land boundaries in coordination with landowners, communities, and relevant authorities to support clear delineation for expropriation. ○ Assist in preparing and verifying land acquisition maps, parcel boundaries, and infrastructure alignments based on project design and engineering data. ○ Support inventory of physical assets (buildings, trees, irrigation systems, crops, etc.) for compensation assessment purposes. ○ Ensure coordination between survey data and GIS systems, and assist in maintaining an up-to-date spatial database of all expropriation-related parcels and assets. ○ Work closely with the Expropriation, Legal, Social, and Civil Engineering teams to ensure consistency and technical accuracy in documentation. ○ Participate in site verification visits with stakeholders, ensuring transparency and consensus during boundary marking and inventory. ○ Provide survey data and documentation required for legal registration, compensation, and permitting processes. ○ Ensure the safe, efficient use and maintenance of all surveying equipment. ○ Maintain clear records and archives of field data, survey results, and maps in compliance with company and regulatory standards.
HSE Specialist (SPV)	○ Support the execution of the safety, health and community safety related plans, and ensure site activities are carried out safely by EPC contractors and subcontractors in-line with applicable laws, international standards and lender requirements. ○ Conduct regular site inspections, hazard identification, and risk assessments; follow up on corrective and preventive actions. ○ Monitor compliance with safety protocols and ensure H&S measures are integrated into method statements and work procedures. ○ Maintain H&S documentation, including safety permits, incident records, and training logs, etc. ○ Participate in accident and incident investigations, ensuring findings are documented and lessons are communicated across teams. ○ Support H&S training delivery for all relevant site personnel and review contractor training records for adequacy. ○ Ensure the construction site is properly demarcated and safety signage and barriers are in place and maintained. ○ Assist in resolving complaints related to occupational health, site safety, and community safety in coordination with relevant teams. ○ Contribute to the review and update of safety plans and procedures based on field experience and audit findings. ○ Provide technical guidance to contractors and subcontractors to improve health and safety performance.

Roles	Responsibilities
	○ Implement the integration of safety controls into daily work permits, toolboxes, and field activities. ○ Assist to H&S manager to monitor the compliance of EPC and subcontractors with the safety, health, and community safety related plans, and applicable laws, international standards and lender requirements. ○ Conduct regular inspections, audits, and hazard identification walkthroughs on construction sites. ○ Prepare safety performance metrics (e.g., LTIs, near misses, TRIR) and recommend corrective measures. ○ Participate in and oversee comprehensive investigations of accidents and incidents. ○ Implement corrective actions and conduct root causes analysis. ○ Prepare documentation of remedial and corrective actions. ○ Conduct safety inductions, toolbox talks, and job-specific training are conducted and recorded. ○ Engage with regulatory authorities on inspections, audits, and compliance verification.
Project Director (EPC)	○ Define and oversee the implementation of the overall EPC execution strategy in alignment with contract objectives and company standards. ○ Lead interdisciplinary project teams, coordinating EPC functions to achieve key milestones. ○ Make strategic decisions regarding project resourcing, budget allocation, and the efficient use of materials and personnel. ○ Ensure all project personnel are fully informed of and compliant with project plans and standards. ○ Coordinate internal management intervention in case of emergencies. ○ Ensure the preparation, revision, and implementation of project management plans (HSE, E&S, QA/QC, etc.) in line with company policies, legal frameworks, international standards, SPV and lender requirements. ○ Communicate all relevant plans clearly to subcontractors and monitor their performance. ○ Approve and monitor regular site inspections and safety reviews. ○ Track project KPIs, timelines, and budgets to ensure performance objectives are met. ○ Ensure that all employees comply with the obligations specified in the project's management plans during activities. ○ In case of non-compliance, ensure appropriate corrective and preventive actions are taken in coordination with the E&S Manager and H&S Manager ○ Ensure all personnel receive necessary training in health, safety, environment, and social performance. ○ Approve training plans and assess their implementation across EPC and subcontractor teams. ○ Serve as the primary EPC representative to the SPV, client, and key stakeholders. ○ Maintain communication channels with project owners, subcontractors, and vendors to ensure alignment and compliance. ○ Coordinate with regulatory authorities, community representatives, and auditors as required. ○ Address stakeholder concerns proactively and transparently, particularly those related to safety, environmental, and social matters. ○ Oversee risk management and mitigation strategies related to technical, health, safety, community safety, environmental, and social aspects. ○ Ensure quality management systems are applied consistently across project phases. ○ Supervise the preparation and approval of documentation related to claims, variations, and commercial issues. ○ Monitor third-party inspections, audits, and due diligence efforts.

Roles	Responsibilities
	○ Supervise and coordinate subcontractors to ensure proper execution of construction phases.
E&S Manager (EPC)	○ Ensure the preparation, revision, and implementation of E&S Management Plans in accordance with company policies, international standards, and lender requirements. ○ Review and update the environmental and social management plans in coordination with relevant contractor specialists and construction teams. ○ Facilitate coordination with the SPV's E&S Manager for compliance audits and reporting. ○ Implement environmental and social measures through site practices and method statements. ○ Ensure that all conditions and obligations outlined in the environmental and social management plans are implemented and adhered to during project activities. ○ Ensure employees and contractors in fulfilling the requirements and relevant trainings of the environmental and social management plans. ○ Ensure the environmental and social management plans are communicated and implemented by Contractors/Subcontractors. ○ Monitor compliance of Contractors/Subcontractors with environmental and social management plans requirements. ○ Ensure implementation of safety measures such as traffic regulation and utility protection. ○ Ensure site boundaries are properly defined and monitored. ○ Participate in regulatory inspections and third-party assessments. ○ Integrate E&S KPIs into contractor evaluations and performance reviews. ○ Ensure all site personnel receive appropriate E&S training. ○ Oversee subcontractor E&S onboarding and refresher sessions. ○ Promote toolbox talks and informal training to reinforce E&S awareness. ○ Monitor E&S performance of subcontractors and ensure compliance. ○ Supervise the Environmental Engineers, Biodiversity Specialist, Archaeologist, CLOs and oversee monitoring systems. ○ Ensure the development and follow-up of corrective/improvement actions. ○ Lead E&S performance reporting to the Project Director ○ Promote continuous improvement via lessons learned and incident analysis. ○ Conduct comprehensive investigations of accidents and incidents. ○ Ensure prompt resolution of complaints related to environmental and social issues. ○ Enforce behaviour protocols related to community safety. ○ Establish emergency preparedness and response procedures for E&S incidents. ○ Ensure inclusive practices by integrating gender, vulnerability, and social inclusion principles into site-level practices.
H&S Manager (EPC)	○ Ensure the safe execution of all construction site activities in accordance with project standards, procedures, legal requirements, international standards, lender and SPV requirements. ○ Ensure the preparation, revision, and continuous improvement of Health & Safety Management Plans in accordance with EPC and SPV policies. ○ Ensure the implementation and compliance of the conditions and obligations specified in the H&S Plan during project activities. ○ Support all employees in fulfilling the conditions and obligations of this health and safety plans during project activities. ○ Provide technical support to Contractors/Subcontractors for the implementation of health and safety plans. ○ Monitor the compliance of Contractors/Subcontractors with the requirements of the health and safety plans and report non-conformities. ○ Maintain a site-specific risk register and ensure hazards are identified, assessed, and mitigated throughout the lifecycle of the project. ○ Implement health, safety and community safety measures through site practices and method statements.

Roles	Responsibilities
	○ Ensure that construction site boundaries are well-defined, adequately marked, and routinely monitored for safety. ○ Ensure the enforcement of behaviour protocols and community health and safety guidelines on and around the construction site. ○ Oversee the implementation of safety measures including traffic management, safe work zones, and protection of aboveground and underground utilities. ○ Coordinate emergency preparedness and response procedures, including drills and communication protocols, in collaboration with relevant departments. ○ Ensure toolbox talks, safety briefings, and daily pre-task planning meetings to reinforce safety culture and awareness on site. ○ Ensure that all personnel on-site, including contractors and subcontractors, receive regular and adequate safety training aligned with the obligations of the H&S Plan. ○ Ensure that this Plan is understood by all employees and Contractor/Subcontractor staff through regular training programs that include the obligations of this Plan. ○ Review and validate training records and related documentation from Contractor/Subcontractor. ○ Conduct and lead comprehensive investigations in the event of accidents, incidents, or near misses, ensuring findings are documented and corrective actions are implemented. ○ Ensure the development and follow-up of corrective and/or improvement actions to address safety-related gaps or risks. ○ Analyse trends from incidents and near-misses to identify systemic issues and develop long-term preventive strategies. ○ Ensure prompt and structured resolution of complaints related to public health, safety, and security. ○ Prepare regular reports to Project Director summarizing H&S performance, compliance status, and key risks. ○ Foster a safety-first culture by promoting active participation, feedback, and ownership of safety responsibilities at all levels of the workforce.
Site Doctor (EPC)	○ Provide on-site medical care, first aid, and emergency response to site personnel. ○ Monitor the health status of workers through routine check-ups and assessments. ○ Maintain accurate and confidential health records and incident logs. ○ Identify and manage occupational health risks and recommend preventive measures. ○ Ensure availability and readiness of medical equipment, first aid kits, and emergency protocols. ○ Conduct health awareness sessions and support mental health and wellness programs. ○ Coordinate with H&S teams to implement hygiene, sanitation, and disease control measures. ○ Ensure compliance with local occupational health laws and project-specific health standards. ○ Collaborate with external hospitals or clinics for referrals and medical emergencies. ○ Participate in site inspections and contribute to health-related sections of HSE audits. ○ Provide medical input to risk assessments, method statements, and H&S Plans. ○ Support COVID-19 or other outbreak response procedures as needed. ○ Detect occupational injuries and illnesses and prepare relevant prevention plans. ○ Track of all health records of all employees including occupational injuries and illnesses.
Archaeologist (EPC)	○ Conduct archaeological surveys and assessments within the project footprint prior to and during construction activities. ○ Monitor excavation and earthworks to identify and document any archaeological or cultural heritage findings. ○ Implement and support the continuous update of the Cultural Heritage Management Plan (CHMP) in compliance with national laws, project policies, international standards and SPV&Lender requirements.

Roles	Responsibilities
	○ Supervise the application of chance-find procedures across all construction areas and ensure proper documentation, preservation, or relocation of discovered artifacts. ○ Liaise with national and local cultural heritage authorities to secure necessary permits and approvals, and report findings as required. ○ Train construction personnel and subcontractors on cultural heritage awareness, including chance-find protocols and legal obligations. ○ Collaborate with Environmental, Social, and H&S teams to integrate cultural heritage considerations into broader site management and daily operations. ○ Participate in stakeholder engagement processes where cultural heritage concerns arise. ○ Coordinate with external experts or labs for advanced assessment and preservation strategies, when needed. ○ Maintain accurate records of archaeological work, including GPS data, photos, catalogues, and reports. ○ Promote community awareness and sensitivity toward cultural heritage protection where applicable. ○ Review contractor method statements and work plans to confirm inclusion of archaeological mitigation measures.
Biodiversity Specialist (EPC)	○ Conduct baseline biodiversity assessments to understand and document existing habitats, species, and ecosystem conditions in and around the project footprint. ○ Monitor biodiversity risks during construction activities, ensuring sensitive habitats, critical species, and ecological corridors are not adversely affected. ○ Ensure compliance with national environmental legislation and international biodiversity standards. ○ Implement Biodiversity Action Plan (BAP) and Biodiversity Management Plan (BMP) and associated mitigation measures in coordination with the Environmental Engineer and E&S Manager. ○ Implement ecological mitigation measures (e.g., habitat restoration, species relocation, buffer zones) by contractors and subcontractors. ○ Train construction and environmental teams on biodiversity protection requirements and promote awareness of key species and habitats on-site. ○ Monitor biodiversity indicators and report findings in line with project performance monitoring systems and environmental management plans. ○ Ensure corrective actions are taken promptly when biodiversity-related non-compliances are observed. ○ Liaise with local environmental authorities, consultants, and NGOs on biodiversity matters as required. ○ Support environmental inspections and audits related to biodiversity performance. ○ Maintain biodiversity records and contribute to periodic reports and updates to the E&S Manager and Project Director. ○ Assist with community awareness activities related to biodiversity conservation in collaboration with the Community Liaison Officer when relevant. ○ Ensure integration of biodiversity considerations into site planning, construction methods, and landscape rehabilitation. ○ Review contractor/subcontractor method statements and work plans to confirm inclusion of biodiversity mitigation measures.
H&S Chief (EPC)	○ Implement the safe execution of all construction site activities in accordance with project standards, procedures, legal requirements, international standards, lender and SPV requirements. ○ Implement the preparation, revision, and continuous improvement of Health & Safety Management Plans in accordance with EPC and SPV policies. ○ Perform the implementation and compliance of the conditions and obligations specified in the H&S Plan during project activities. ○ Support all employees in fulfilling the conditions and obligations of this health and safety plans during project activities. ○ Provide technical support to Contractor.

Roles	Responsibilities
	○ Monitor the compliance of Contractors/Subcontractors with the requirements of the health and safety plans and report non-conformities.rs/Subcontractors for the implementation of health and safety plans. ○ Maintain a site-specific risk register and ensure hazards are identified, assessed, and mitigated throughout the lifecycle of the project. ○ Implement health, safety and community safety measures through site practices and method statements. ○ Implement that construction site boundaries are well-defined, adequately marked, and routinely monitored for safety. ○ Ensure the enforcement of behaviour protocols and community health and safety guidelines on and around the construction site. ○ Perform the implementation of safety measures including traffic management, safe work zones, and protection of aboveground and underground utilities. ○ Perform emergency preparedness and response procedures, including drills and communication protocols, in collaboration with relevant departments. ○ Ensure toolbox talks, safety briefings, and daily pre-task planning meetings to reinforce safety culture and awareness on site. ○ Ensure that all personnel on-site, including contractors and subcontractors, receive regular and adequate safety training aligned with the obligations of the H&S plans. ○ Ensure that H&S plans are understood by all employees and Contractor/Subcontractor staff through regular training programs that include the obligations of H&S plans. ○ Review and validate training records and related documentation from Contractor/Subcontractor. ○ Review and validate training records and related documentation from Contractor/Subcontractor. ○ Conduct and lead comprehensive investigations in the event of accidents, incidents, or near misses, ensuring findings are documented and corrective actions are implemented. ○ Ensure the development and follow-up of corrective and/or improvement actions to address safety-related gaps or risks. ○ Follow prompt and structured resolution of complaints related to public health, safety, and security. ○ Prepare regular reports to H&S manager summarizing H&S performance, compliance status, and key risks. ○ Foster a safety-first culture by promoting active participation, feedback, and ownership of safety responsibilities at all levels of the workforce.
H&S Engineer (EPC)	○ Implement the safe execution of all construction site activities in accordance with project standards, procedures, legal requirements, international standards, lender and SPV requirements. ○ Implement the preparation, revision, and continuous improvement of Health & Safety Management Plans in accordance with EPC and SPV policies. ○ Perform the implementation and compliance of the conditions and obligations specified in the H&S Plan during project activities. ○ Support all employees in fulfilling the conditions and obligations of this health and safety plans during project activities. ○ Provide technical support to Contractors/Subcontractors for the implementation of health and safety plans. ○ Monitor the compliance of Contractors/Subcontractors with the requirements of the health and safety plans and report non-conformities. ○ Maintain a site-specific risk register and ensure hazards are identified, assessed, and mitigated throughout the lifecycle of the project. ○ Implement health, safety and community safety measures through site practices and method statements. ○ Implement that construction site boundaries are well-defined, adequately marked, and routinely monitored for safety. ○ Ensure the enforcement of behaviour protocols and community health and safety guidelines on and around the construction site.

Roles	Responsibilities
	○ Perform the implementation of safety measures including traffic management, safe work zones, and protection of aboveground and underground utilities. ○ Perform emergency preparedness and response procedures, including drills and communication protocols, in collaboration with relevant departments. ○ Ensure toolbox talks, safety briefings, and daily pre-task planning meetings to reinforce safety culture and awareness on site. ○ Ensure that all personnel on-site, including contractors and subcontractors, receive regular and adequate safety training aligned with the obligations of the H&S plans. ○ Ensure that H&S plans are understood by all employees and Contractor/Subcontractor staff through regular training programs that include the obligations of H&S plans. ○ Review and validate training records and related documentation from Contractor/Subcontractor ○ Conduct and lead comprehensive investigations in the event of accidents, incidents, or near misses, ensuring findings are documented and corrective actions are implemented. ○ Ensure the development and follow-up of corrective and/or improvement actions to address safety-related gaps or risks. ○ Follow prompt and structured resolution of complaints related to public health, safety, and security. ○ Prepare regular reports to H&S manager summarizing H&S performance, compliance status, and key risks. ○ Foster a safety-first culture by promoting active participation, feedback, and ownership of safety responsibilities at all levels of the workforce.
HSE Technician (EPC)	○ Support the implementation of the Health, Safety, and Environmental (HSE) Management Plans on-site. ○ Conduct field-level hazard identification and risk assessments under the supervision of the HSE Engineer or H&S Manager. ○ Assist in the inspection of site conditions, equipment, and practices to ensure compliance with HSE protocols. ○ Monitor proper use of PPE by workers and subcontractors and ensure daily compliance. ○ Assist in the documentation of incidents, near-misses, and unsafe acts/conditions. ○ Support the organization of safety toolbox talks and drills, and participate in site safety briefings. ○ Assist in maintaining updated HSE records, permits to work, and site-specific risk registers. ○ Coordinate with site teams to ensure safe work zones and adherence to safety signage and barriers. ○ Escalate HSE issues and observations to senior HSE personnel for timely corrective actions. ○ Promote a proactive safety culture through daily site presence and informal engagement with workers.
HSE Worker (EPC)	○ Perform routine safety checks and observations on construction activities to support accident prevention. ○ Support field-level enforcement of basic HSE requirements such as PPE usage, housekeeping, and emergency access. ○ Report unsafe behaviours, near-misses, or incidents to the HSE Technician or Engineer. ○ Assist with basic safety logistics such as placement of safety signs, first aid kits, and fire extinguishers. ○ Provide assistance during emergency drills and real-time evacuations if needed. ○ Participate in on-site HSE briefings and serve as a communication link between labour teams and HSE staff. ○ Support the distribution and collection of HSE materials, permits, and records. ○ Assist in controlling site entry for compliance with safety rules (e.g., helmet, vest, ID badge).

Roles	Responsibilities
	○ Support spill response and clean-up efforts as guided by supervisors
HSE Trainer and Document Controller (EPC)	○ Develop and deliver HSE training modules tailored to job roles and risk levels in collaboration with the HSE Manager. ○ Maintain training matrices, attendance records, and competency certifications for all EPC and subcontractor staff. ○ Organize safety induction programs for new employees and visitors. ○ Organize refresher trainings, emergency drills, and awareness campaigns (e.g., heat stress, confined space). ○ Ensure that all training materials, method statements, and HSE procedures are up-to-date and properly archived. ○ Manage document control systems related to HSE plans, permits, inspection reports, and safety data sheets. ○ Ensure traceability of document revisions and compliance with audit requirements. ○ Support internal and external audits by providing required HSE documentation and evidence. ○ Contribute to the improvement of training content based on site observations and lessons learned.
Paramedic (EPC)	○ Provide immediate emergency medical care, stabilize patients, and coordinate medical evacuation when necessary. ○ Assist the Site Doctor in conducting health checks, maintaining patient records, and supporting follow-up treatments. ○ Monitor the stock and condition of emergency medical supplies, medicines, and first aid kits. ○ Respond to health-related incidents, accidents, or illnesses on-site and record incident details accurately. ○ Participate in health and safety drills and emergency response exercises. ○ Support hygiene monitoring and health awareness campaigns. ○ Maintain clean, safe, and operational medical facilities and first aid stations. ○ Contribute to incident investigations involving health or medical issues. ○ Report health risks or trends to the Site Doctor and H&S Manager.
Environmental Engineer (SPV and EPC)	○ Implement the monitoring and recording of this Plan's execution (including implementation by Subcontractors). ○ Ensure project activities comply with national environmental legislation, permits, international standards and lender requirements. ○ Implement and monitor the Environmental & Social Management Plans and its site-specific sub-plans to ensure compliance with national legislation, international standards, and lender requirements. ○ Conduct routine environmental inspections and ensure that all site activities by contractors and subcontractors are carried out in accordance with approved method statements and mitigation measures. ○ Implement environmental monitoring programs. ○ Maintain up-to-date environmental records and databases; support preparation of reports for regulatory or lender audits. ○ Manage waste within the entire project footprint and area of influence, prioritizing designated areas to be used under the scope of the Project. ○ Monitor contractor and subcontractor adherence to approved waste storage, segregation, and disposal practices. ○ Provide regular training to site personnel during the construction phase. ○ Ensure that necessary training on environmental management is provided and that all personnel receive the required training. ○ Support toolbox talks and induction sessions to raise site-level environmental awareness. ○ Conduct regular internal audits and report non-conformities. ○ Ensure that non-conformities are recorded and immediately addressed. ○ Participate in the development and follow-up of corrective and/or improvement actions.

Roles	Responsibilities
	○ Support investigation of environmental incidents and assist in root cause analysis and follow-up reporting. ○ Report the implementation performance of this Plan. ○ Support the review and update of this Plan. ○ Ensure lessons learned and field experiences are incorporated into plan revisions and training updates. ○ Collaborate with the H&S and Social teams to address cross-cutting issues. ○ Coordinate with subcontractors to ensure implementation of project-specific environmental measures. ○ Liaise with external laboratories, consultants, or regulators as needed for environmental monitoring or reporting. ○ Support obtaining environmental related permits ○ Ensure all environmental permits are obtained, renewed, and complied with throughout the project lifecycle. ○ Contribute to the periodic review and revision of environmental plans based on site experience, regulatory changes, and stakeholder feedback. ○ Prepare and submit environmental performance reports to the E&S Manager and relevant stakeholders. ○ Coordinate with construction teams to integrate environmental requirements into work plans. ○ Ensure appropriate waste management practices are applied across the site, including segregation, storage, transportation, and disposal in designated and approved facilities. ○ Conduct internal audits and inspections; identify non-conformities and follow up on corrective and preventive actions.
Community Liaison Officer (CLO) (SPV and EPC)	○ Inform the public about the Project's scope, progress, and potential impacts. ○ Organize and facilitate regular community meetings, focus groups, and engagement forums.. ○ Maintain open lines of communication with project-affected persons (PAPs), community leaders, and local institutions. ○ Develop and distribute communication materials tailored to various community audiences. ○ Ensure that all internal and external complaints, including those under the SEP, are managed in accordance with the Grievance Mechanism (GM). ○ Log, track, and follow up on grievances and appeals in a timely and respectful manner. ○ Facilitate resolution of community disputes or concerns related to project activities. ○ Assess how vulnerable or marginalized groups may be affected by the Project. ○ Propose mitigation measures or tailored engagement approaches for at-risk or underrepresented populations. ○ Ensure equitable participation in consultation processes, particularly for women, youth, elders, and people with disabilities. ○ Support the monitoring and recording of the implementation of the social related issues, including activities carried out by subcontractors. ○ Support the evaluation of the SEP's implementation performance and community feedback ○ Contribute to regular internal audits and the reporting of non-conformities. ○ Ensure that relevant non-conformities are recorded and addressed immediately. ○ Participate in the development of corrective and/or improvement actions and support their follow-up. ○ Support the periodic review and update of the SEP and related procedures in coordination with the E&S Manager. ○ Provide input to lessons learned from engagement outcomes and grievance trends. ○ Maintain up-to-date records of all stakeholder meetings, grievances, resolutions, and community commitments. ○ Submit routine reports to the Social Chief and/or E&S Manager summarizing community feedback, grievance status, and engagement Milestones.

Roles	Responsibilities
	○ Ensure confidentiality and proper data handling, especially for sensitive community issues.
All Personnel (including Contractor/Subcontractor Personnel)	○ Follow this Plan and all related Plans and Procedures, and carry out all activities in accordance with the requirements of this Plan. ○ In case of any non-compliance related to the implementation of this Plan, report it first to the CLO and the E&S Manager. ○ Participate in relevant trainings. ○ Ensure self-sufficiency in the implementation of this Plan. ○ Fulfil and ensure the implementation of the requirements of this Plan

XX.5. Organization Capacity and Competency

In line with IFC Performance Standard 1, a tailored organizational chart is prepared before the construction phase, outlining the main roles, responsibilities, and authorities necessary for the effective implementation of the Environmental and Social Management System (ESMS). As of May 2025, both the SPV and EPC Contractor have partially mobilized their Environmental and Social (E&S) and Health and Safety (H&S) teams in accordance with the ESMS organizational structure.

As the Project Owner, key responsibilities of KGM will include the approval of Motorway route and design; execution of the expropriation works in line with the relevant provisions of the Expropriation Law, acquisition of other land use (forestry, agricultural, pasture, etc.) permits, easement rights, etc. in accordance with relevant Turkish legislation and ensuring minimum traffic guarantee.

The Project Sponsor will be the main responsible party for the implementation of the ESMS including the ESMP, while it will also have a coordinating role in the actions to be undertaken by the third parties (i.e. sub-contractors, Provincial Directorate of Environment, Urbanization and Climate Change, other related authorities), as required. Expropriation works will be conducted by the Project Sponsor and financed by KGM.

The project proponent remains committed to ensuring full staffing of the ESMS organizational structure as outlined in the Figure XX.2. Updates on staffing progress will be included in the regular monitoring reports.

XX.5.1. Construction Phase

During the construction phase, workforce requirements of the Project will be large-scale (including the sub-contractors, anticipated to reach up to a 2,300 during the peak phase of the activities). According to the BOT Contract, Contract Duration covers both the construction and operation phases. Contract duration for the Project has been specified as 15 years, within which construction phase will be completed in 3 years. Though the construction phase will be temporary, the Project Sponsor will ensure that an organizational capacity sufficient for the implementation of the ESMS is established and maintained throughout the construction phase.

In order to ensure the effective implementation of the Environmental and Social Management Plan (ESMP), a comprehensive organizational structure has been established, encompassing both the Project Sponsor (or SPV) and the Engineering, Procurement and Construction (EPC) Contractor (see Figure XX.2). This structure outlines the distribution of responsibilities across environmental, social, land acquisition, and occupational health and safety domains.

A dedicated RAP Implementation Team, highlighted with dashed outlines in the organizational chart, has also been established to carry out land acquisition and livelihood restoration activities in line with the Resettlement Action Plan (RAP).

XX.5.2. Operation Phase

Following the completion of construction, the operation phase of the Contract duration which is specified as 15 years, will start. If the construction period, which is specified as 3 years, exceeds, the delay time (the time after 3 years) will be deducted from the operation period. If the construction of the Motorway is completed before the end of construction period (3 years), the remaining time will be added to the end of the operation period.

In the operation phase, approximately 250 personnel will be employed across the control, operation and maintenance centers, toll plazas, and service areas. At each toll plaza, 4-5 personnel will provide services in shifts for the arrangement of cash payments. Similarly, 4-5 personnel will work at each control center established at the toll collection areas. The operation and maintenance centers will employ both white and blue-collar workers who will be responsible for snow removal services as well as maintenance, technical, repair and workshop operations. Additionally, the Project will create employment opportunities for local people at the service areas, which will include restaurants, tea and coffee houses, shops, gas stations, kiosks, and similar facilities.

The SPV will continue to ensure that an organizational capacity sufficient for the implementation of the ESMS is maintained throughout the operation phase under the BOT Contract Duration. At the end of the contract duration, the Motorway will be transferred to the KGM. No guaranteed minimum vehicle traffic payment will be made for this additional period; however, if the number of vehicles exceeds the guaranteed minimum traffic amount, additional income will be shared between the operator (Project Sponsor) and the Administration (KGM) equally.

The organizational structure of the Project Sponsor will be adapted to the requirements of the operation phase prior to start of Motorway's operation. To ensure competency, the Project Sponsor will ensure that the operation and maintenance personnel are properly trained in their specialty and successfully completed the necessary security investigations in accordance with the related terms of the BOT Contract. For the same purpose, trainings on the aspects related with the operation and maintenance of Motorway will be provided by the Project Sponsor to KGM's designated operation and maintenance personnel one year ahead of the end of the contract duration.

The Project/Operating Manager on behalf of the Project Sponsor will coordinate the relations with the Provincial Directorate of Environment, Urbanization and Climate Change and other related authorities.

XX.6. Monitoring and Review

The effective implementation of the ESMS/ESMP will be monitored through appropriate tools such as site audits, environmental monitoring efforts, checking of related documents, etc. In this context, an Environmental and Social Monitoring Plan has been prepared for the Project. This program will be used as a tool to support the ESMP monitoring. Within this regard, internal and external monitoring will be carried out. Costs associated with the environmental monitoring will be supplied by the Project Sponsor from the Project Budget.

The ESMS is a living system which needs to evolve with the Project and should be reviewed and revised by the Environmental and Social Department of the Project Sponsor, if necessary, to do so. In this case, the supplementary documents should be submitted to Lenders for their approval as well.

XX.6.1. Internal Monitoring

Environmental and Social Manager of the Project Sponsor will conduct internal inspections and audits to verify compliance with the desired ESMS/ESMP outcomes. The frequency of the monitoring will be as follows:

- Quarterly during the construction phase;
- Bi-annually during first two years of operation phase then as agreed with lenders throughout the BOT Contract Duration.

The results of the environmental and social monitoring activities will be compiled in "ESMP Performance Review and Monitoring Reports (Monitoring Reports)" to be prepared according to the monitoring periods. The Monitoring Reports will include documentation of Project's compliance against ESIA commitments as well. Based on the monitoring results, necessary corrective and preventive actions will be identified and amendments will be made on the ESMS and the ESMP accordingly. Such amendments will be included in the monitoring program and followed up in the upcoming monitoring studies to ensure effective implementation. If requested the monitoring reports will also be shared with the governmental authorities.

The Environmental and Social Manager will also share the key monitoring results and performance review of the ESMS with the senior management (SPV-General Manager) and plan the necessary measures to be taken to ensure effective implementation of environmental and social measures.

XX.6.1.1. Project Area Inspection

The EPC Contractor will be responsible for conducting regular internal monitoring to ensure compliance with the project's environmental, health, and safety requirements during the construction phase. This will include:

- Weekly joint inspections of the construction sites and facilities, to be carried out in collaboration with the E&S Manager. These inspections aim to verify the effective implementation of environmental and social mitigation measures.
- Daily oversight by the EPC Contractor's site teams across all active work areas. These routine checks will provide ongoing assurance that the commitments outlined in the ESMP are being adhered to in practice.
- All findings from internal monitoring activities will be recorded, tracked, and reported as part of the project's Environmental and Social Management System (ESMS), and any non-compliance identified will be addressed promptly through corrective actions.

<u>Daily Oversight Monitoring</u>

Daily oversight monitoring is a core component of the E&S Management Plan and is conducted to assess whether the environmental, social, health, and safety (ESHS) mitigation measures are being properly implemented and are effective in ensuring compliance with the Project's requirements. This monitoring helps determine whether current practices are successfully avoiding or minimizing ESHS impacts, or if adjustments, improvements, or corrective actions are necessary.

Oversight monitoring is conducted on a daily basis by E&S Manager, who observe all active Project Area as part of their routine responsibilities. When necessary, the SPV General Manager may join these inspections to support decision-making or address emerging issues. Observations gathered during these site visits are reviewed with the E&S Manager to determine any required corrective actions.

The daily oversight monitoring serves a dual purpose: highlighting both good performance and instances of non-conformance. Where issues are identified, the necessary corrective actions are determined in coordination with the E&S Manager and discussed with the E&S Deputy Manager and EPC-E&S Manager responsible for the inspected activities.

All monitoring results, including identified issues and corrective actions, are recorded and followed up through the Monitoring Plan, ensuring continuous improvement and accountability throughout the construction phase.

XX.6.2. External Monitoring

In addition to internal monitoring, external monitoring activities will be carried out quarterly in the construction phase and semi-annually during the operation phase of the project by external/independent third party experts (ESAP monitoring experts) to verify environmental and social monitoring information and perform monitoring services. Within the scope of external monitoring, final external evaluation will be carried out to assess if the outcome of the ESMS/ESMP implementation is in conformity with the requirements of the national environmental legislation, international agreements and protocols and international environmental and social standards including the Equator Principles and IFC Policy (2012) and related Performance Standards on Environmental and Social Sustainability that would be applicable to the Antalya-Alanya Motorway Project as well as the commitments specified in the ESIA Report.

Besides, local authorities and the Ministry of Environment, Urbanization and Climate Change (MoEUCC) has the authority to execute monitoring and inspection activities to follow-up the conformity of the Project activities with the environmental requirements as per the relevant legislation.

Table XX.2 Environment and Social Monitoring Plan for the Project

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
Land Preparation and Construction							
C1	Environmental and Social Management System (ESMS)	C1.1. Policy and ESMP	-Project-specific Environment and Social Policy -Organizational Structure (number and CVs of the personnel employed under the Environmental and Social Interaction Department) -Periodical ESMP Performance Review and Monitoring Reports -Number of non-compliant situations -Project-specific Emergency Preparedness and Response Plan -Existence and validity of the legal environmental and health and safety permits -Number and scope of trainings, number of participants, training hours per employee, training materials, trainings provided to sub-contractors, etc. -Measures taken to ensure compliance of sub-contracts with ESMP measures	Project office	Document review	Monthly	SPV
C2	Land Use and Property	C2.1. Forest lands	-Forestry permits/applications -Afforestation protocols made with the Ministry of Agriculture and Forestry -Area of lost forestland (in hectare) -Number of the trees cut -Records on forest fires (if any)	Project office	Document review	Weekly	SPV
		C2.2. Agricultural lands	-List of expropriated agricultural parcels (inc. information on area and characteristics of the land plot) -Site allocation documents for expropriated lands; bilateral agreements, commitment and consent letters for non-expropriated lands	Project office	Document review	Weekly	SPV
			-Grievances received in the subjects of crossing of the expropriation borders, start of activities on non-expropriated lands, etc.	Project office	Review of grievance logs	Weekly	SPV
			-Number of cut trees	Project office	-Review of design documents -Site audit -Review of grievance logs	Weekly	-SPV -EPC
		C2.3. Pasturelands	-Area and number of pasturelands for which land use permits taken	Project office	Document review	Weekly	SPV
		C2.4. State-owned lands	-Area and number of state-owned lands for which land use permits taken	Project office	Document review	Weekly	SPV
		C.2.5. Privately-owned lands	-List and number of expropriated private parcels (inc. information on area and characteristics of the land plot) -Site allocation documents for expropriated lands; bilateral agreements, commitment and consent letters for non-expropriated lands	Project office	Document review	Weekly	SPV
			-Number of grievances received in the subjects of crossing of the expropriation borders, start of activities on non-expropriated lands, etc.	Project office	Review of grievance logs		SPV
C3	Topography and Soils	C3.1. Top soil management	-Grievances received in the subjects of crossing of the expropriation borders, start of activities on non-expropriated lands, etc.	-Expropriation boundaries	Site audit	Weekly	SPV
		C3.2.Earthworks	-Excavation and fill volumes (m^3) -Volume of reused materials (m^3) -Conditions at the storage sites -Inspection of dump sites and quarries	Excavated material storage sites (Km 52+544, Km 59+580, Km 61+500, Km 64+160, Km 71+800, Km 74+360, Km 76+240, Km 78+790, Km 86+340, Km 87+800, Km 95+410 , Km 95+410, Km 98+290, Km 100+000, Km 107+850, Km 110+820, Km 113+050, Km 123+000, Km 124+250, Km 127+000, Km 130+400, Km 132+720)	Site audit	Daily	-SPV -EPC -Sub-Contractor

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
			Grievance	All active construction and camp areas, dump sites	Number of grievances received regarding to excavated material management, will be recorded.	Weekly	-SPV -EPC
		C3.3. Erosion	-Erosion control measures taken (drainage channels, barriers, settling structures, etc.) -Area of exposed lands at each camp sites (m^2)	Locations of exposed lands within the expropriation corridor	Site audit	Daily	-SPV -EPC -Sub-Contractor
		C3.4. Quarry	- -Mining method applied -Blasting activities -Production amount (m^3/day) -Slope stability -Borders of the camp sites -Management of waste rock	Location of quarries (Km 56+500, Km 58+500, Km 104+750, Km 105+000, Km 106+000, Km 114+200, Km 117+000, Km 119+500, Km 134+000)	Site audit	Daily	SPV EPC -Sub-Contractor
		C3.5. Soil quality	-Number of spill/leakage incidents and corrective measures taken	-Camp Sites (Km 64+500, Km 87+800, Km 124+300) -Road construction sites -Quarries (Km 56+500, Km 58+500, Km 104+750, Km 105+000, Km 106+000, Km 114+200, Km 117+000, Km 119+500, Km 134+000)	Site audit	Daily	-SPV -EPC -Sub-Contractor
C4	Wastes	C4.1. Waste management	-Type (i.e. municipal, packaging, waste oil, etc.) and amount of wastes produced/disposed of	Camp Site-1 (Main) at Km 64+400, Camp Site-2 at Km 87+500, and Camp Site-3 at Km 124+300. Borrow pits : Sarıabalı (AO-1) Borrow Pit at Km 53+800 and the Dikmen Borrow Pit at Km 83+000. Quarries: Çakış (TOY4a) Quarry at Km 56+500, the Kuruçay (TOY4b) Quarry at Km 58+500, the Bademliyar (TO2) Quarry at Km 104+750, the Uzunlar (TOY5) Quarry at Km 106+000, the Karakaya Quarry at Km 114+200, the Saburlar Quarry at Km 117+000, the Karamanlar Quarry at Km 119+500, and the Soğukpınar Quarry at Km 134+000. Asphalt plants: Asphalt Plant-1 at Km 59+400, Asphalt Plant-2 at Km 87+700, and Asphalt Plant-3 at Km 124+300. Concrete plants include Concrete Plant-1 at Km 55+450, Concrete Plant-2 at Km 59+400, Concrete Plant-3 at Km 80+400, Concrete Plant-4 at Km 87+700, Concrete Plant-4a at Km 89+700, Concrete Plant-5 at Km 99+200, and Concrete Plant-6 at Km 124+300. Mechanical plants: Mechanical Plant-1 at Km 59+400, Mechanical Plant-2 at Km 87+700, and Mechanical Plant-3 at Km 124+300.	-Site audit -Document review	Monthly	-SPV -EPC -Sub-Contractor
			Validity and completeness of waste management/disposal agreements with licensed companies			Before every waste transfer	
			Review and implementation consistency of Waste Management Plans			Yearly	
			Inspection and condition of Temporary Waste Storage Areas			Monthly	SPV -EPC -Sub-Contractor
			-Site practices on waste management (e.g. general housekeeping rules, source separation practice, containers, containment structures, etc.)	Camp Site-1 (Main) at Km 64+400, Camp Site-2 at Km 87+500, and Camp Site-3 at Km 124+300	Visual inspection	Daily	-SPV -EPC -Sub-Contractor
		C4.2. Hazardous material management	-List of hazardous materials/chemicals supplied, stored and used (inc. information on type and amount/volume)	Camp Site-1 (Main) at Km 64+400, Camp Site-2 at Km 87+500, and Camp Site-3 at Km 124+300.	-Site audit -Document review	Monthly	-SPV -EPC -Sub-Contractor

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
				Borrow pits : Sarıabalı (AO-1) Borrow Pit at Km 53+800 and the Dikmen Borrow Pit at Km 83+000. Quarries: Çakış (TOY4a) Quarry at Km 56+500, the Kuruçay (TOY4b) Quarry at Km 58+500, the Bademliyar (TO2) Quarry at Km 104+750, the Uzunlar (TOY5) Quarry at Km 106+000, the Karakaya Quarry at Km 114+200, the Saburlar Quarry at Km 117+000, the Karamanlar Quarry at Km 119+500, and the Soğukpınar Quarry at Km 134+000. Mechanical plants: Mechanical Plant-1 at Km 59+400, Mechanical Plant-2 at Km 87+700, and Mechanical Plant-3 at Km 124+300.			
			Soil contamination risk from hazardous substances (e.g., fuel)	Project area and sensitive receiving environments (e.g., soil, surface water)	Visual inspection for signs of leakage or spills; inspection of storage and handling practices; SDS and training record review	Daily	SPV -EPC -Sub-Contractor
			General site practices related to hazardous materials management	Entire construction corridor	Field observations on container integrity, spill kits, PPE use, and storage conformity	Weekly	SPV -EPC -Sub-Contractor
			Environmental enforcement actions and non-compliance records	Project area	Review of regulatory audit reports, notifications, and enforcement communications	Monthly	SPV -EPC -Sub-Contractor
C5	Water Resources	C5.1. Water quality	Annex-5, Table 2 of the Regulation on the Surface Water Quality Regulation	-Receiving water bodies for treated wastewater discharges (Kaymazboğazı Stream)	-Water quality sampling, , laboratory analyses	Quarterly	-SPV -EPC - Acridities Laboratory
			Baseline monitoring surface and ground water quality measurement (Table 5, the Annex.5 of Regulation on Surface Water Quality, and IFC EHS Guideline Environmental Waste water and Ambient Water Quality)	ESIA baseline sampling points	Laboratory analyses	Annualy	-SPV -EPC
			Water supply point for humanitarian usage	Water quality sampling, laboratory analyses	Laboratory analyses	Quarterly	-SPV, -EPC, -Community Health Laboratory
		C5.2. Groundwater	- Groundwater usage permit - Water usage amount	Groundwater usage locations	-Water quality sampling, , laboratory analyses	Monthly	-SPV -EPC
		C5.3. Water supply	-Sources and amount of water supply -Water supply permits	All water usage areas (camp sites, concrete batching plants, dust suppression,etc.)	-Document review	Monthly	-SPV -EPC -Acridities Laboratory
			Suppliers' water availability and capacity	Project office	Document review	Monthly	-SPV -EPC
		C5.5. Wastewater management	-Environmental permits for package domestic wastewater treatment plant discharges -Wastewater disposal agreements/channel connection permits to be done with municipalities -Capacity of package domestic wastewater treatment plant	Package domestic wastewater treatment plants (Km 64+500, Km 87+800, Km 124+300)	-Document review	Quarterly	-SPV -EPC

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
			- Waste water treatment plant maintenance and inspection records				
			Quality of treated wastewater from the discharge of package domestic wastewater treatment plants (Water Pollution Control Regulation (Table 21.1))	Camp Sites(Km 64+500, Km 87+800, Km 124+300)	Water quality sampling, laboratory analyses	*In the period to be specified in the environmental permit	-SPV -EPC, -Accredited Laboratories
			Wastewater management practices at concrete plants	- -Concrete Plant locations (Km 55+450,00, Km 59+400,00, Km 80+400,00, Km 87+700,00, Km 89+700,00, KM 99+200,00, Km 123+900,00)	-Site audit -Document review	Weekly	-SPV -EPC
			-Maintenance (WWTP)	WWTPs (Camp Sites(Km 64+500, Km 87+800, Km 124+300))	as per the Plan relevant part	Daily, weekly, annually	-SPV, -EPC
C6	Ecology and Biodiversity	C6.1.Terrestrial Flora	*Pyrus serikensis* species	Maquis and rocky habitats around flora sampling points 11 (X: 344079,Y: 4087799) and 36 (X: 339991,Y: 4090218)	-Site survey	Annual (timing to be determined by experts)	-SPV
			Endemic plant species	At the flora sampling point 11 (X: 344079,Y: 4087799) for *Sideritis congesta,* sampling point 11 (X: 344079,Y: 4087799) and 25 (X: 394464,Y: 4055587) for *Phlomis leucophracta*, sampling point 25 (X: 394464,Y: 4055587for *Phlomis lycia*, sampling point 28 (X: 335259,Y: 4093731) for *Phlomis nissolii*			
			Maquis, Arboreal Matorral and Thermo-mediterranean Scrub	Maquis habitats along the motorway, especially at the maquis assessed as critical.		One-off (timing to be determined by experts)	
		C.6.2. Terrestrial Fauna	*Lyciasalamandra atifi*	Coniferous forest habitats in the AoI at the elevation between 200-500m	-Site survey	Annual (timing to be determined by experts)	-SPV
			Lacerta pamphylica	Coniferous forest habitats in the AoI			
			Myotis capaccinii	Rocky areas, caves and flight corridors within the AoI, especially at the location of quarries (Km 56+500, Km 58+500, Km 104+750, Km 105+000, Km 106+000, Km 114+200, Km 117+000, Km 119+500, Km 134+000)			
			Rhinolophus mehelyi				
			Animal passes	Culvert locations along the motorway, Culverts are strategically positioned along the motorway, providing adequate passage for wildlife crossing.			
		C.6.3 Aquatic Flora/Fauna	*Alburnus baliki, Capoeta antalyensis, Oxynoemacheilus eregliensis, Pseudophoxinus fahrettini*	Locations where the motorway crosses surface running waters, at aquatic sampling points	Site survey	Annual (timing to be determined by experts)	-SPV

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
C7	Air Quality	C7.1. Dust and Gaseous Emissions	-PM_{10} -$PM_{2.5}$ -Settled dust -NO_x, SO_X, VOC	Sensitive receptors considering all project components including: Camp Site-1 (Main) at Km 64+400, Camp Site-2 at Km 87+500, and Camp Site-3 at Km 124+300. Borrow pits : Sarıabalı (AO-1) Borrow Pit at Km 53+800 and the Dikmen Borrow Pit at Km 83+000. Quarries: Çakış (TOY4a) Quarry at Km 56+500, the Kuruçay (TOY4b) Quarry at Km 58+500, the Bademliyar (TO2) Quarry at Km 104+750, the Uzunlar (TOY5) Quarry at Km 106+000, the Karakaya Quarry at Km 114+200, the Saburlar Quarry at Km 117+000, the Karamanlar Quarry at Km 119+500, and the Soğukpınar Quarry at Km 134+000. Asphalt plants: Asphalt Plant-1 at Km 59+400, Asphalt Plant-2 at Km 87+700, and Asphalt Plant-3 at Km 124+300. Concrete plants include Concrete Plant-1 at Km 55+450, Concrete Plant-2 at Km 59+400, Concrete Plant-3 at Km 80+400, Concrete Plant-4 at Km 87+700, Concrete Plant-4a at Km 89+700, Concrete Plant-5 at Km 99+200, and Concrete Plant-6 at Km 124+300. Mechanical plants: Mechanical Plant-1 at Km 59+400, Mechanical Plant-2 at Km 87+700, and Mechanical Plant-3 at Km 124+300. Bademliyar Quarry, Güçlüköy, Gençler, Taşkesiği Uzunlar, Hacıobası Districts, Saburlar, D-7 and Motorway Route -Villages where vehicles will pass while transporting materials (Bademliyar Quarry, Güçlüköy, Gençler, Taşkesiği Uzunlar, Hacıobası Districts, Saburlar, D-7 Locations)	-Site measurements	Quarterly or Upon Grievance	-SPV -EPC -Accredited laboratories
				-Hacıali Neighbourhood (Sensitive Receptor)	-Site measurements	Monthly and Upon grievance	

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
			-Number of water trucks -Frequency of road watering	-Camp Sites, road construction sites, quarries, stabilized roads) -	-Document review	Daily or more frequently	-SPV -EPC -Sub-Contractor
			-Grievances received on impacts related with dust, air emissions	-Project Office	-Review of grievance logs	Weekly	-SPV -EPC
		C 7.2 Emissions	-Exhaust emissions	-Project office	- Maintenance records	Annually	-SPV -EPC
		C 7.3 Weather conditions and humidity	Weather conditions and humidity	-High risk area due to flammable material storage and close to the forest area	-Weather forecast report changing	-Daily during summer period	-SPV -EPC
		C 7.4 Roads surface integrity and any damage	Roads surface integrity and any damage	-Vehicles	-Measurement	-Annually	-EPC Environmental Engineer
C8	Climate Change	C8.1 Emissions	-GHG emissions due to fuel consumption	-Project office	-Document review	Quarterly	SPV
			-Environmental permits for concrete plants, asphalt plants	-Project office	-Document review	Quarterly	SPV
			-Exhaust emissions	-Project office	- Maintenance records	Quarterly	SPV
		C8.2 Physical Risks	-Extreme Rainfall, Overflow and Floods -Wildfires -Cold Waves and Snowfall - Heatwaves	-Project office -On site	-Visual review	Daily	SPV
		C8.3 Transition Risks	-Policy and Legal Risks -Technology Risks -Market Risks -Reputational Risks	-Project office	-Document Review	Quarterly	SPV
C9	Environmental Noise and Vibration	C9.1. Environmental Noise	Environmental Noise (dBA)	Sensitive Receptors considering all Project components including: Borrow pits : Sarıabalı (AO-1) Borrow Pit at Km 53+800 and the Dikmen Borrow Pit at Km 83+000. Quarries: Çakış (TOY4a) Quarry at Km 56+500, the Kuruçay (TOY4b) Quarry at Km 58+500, the Bademliyar (TO2) Quarry at Km 104+750, the Uzunlar (TOY5) Quarry at Km 106+000, the Karakaya Quarry at Km 114+200, the Saburlar Quarry at Km 117+000, the Karamanlar Quarry at Km 119+500, and the Soğukpınar Quarry at Km 134+000. Asphalt plants: Asphalt Plant-1 at Km 59+400, Asphalt Plant-2 at Km 87+700, and Asphalt Plant-3 at Km 124+300. Concrete plants include Concrete Plant-1 at Km 55+450, Concrete Plant-2 at Km 59+400, Concrete Plant-3 at Km 80+400, Concrete Plant-4 at Km 87+700, Concrete Plant-4a at Km 89+700, Concrete Plant-5 at Km 99+200, and Concrete Plant-6 at Km 124+300. Mechanical plants: Mechanical Plant-1 at Km 59+400, Mechanical Plant-2 at Km 87+700, and Mechanical Plant-3 at Km 124+300.	-Site measurements (24 hour)	Quarterly/ Monthly and upon grievance (depending on the intensity of construction work and the sensitivity of location)	-SPV -EPC -Sub-Contractor -Accredited laboratories

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
				Sarıabalı District (Sensitive Receptor)		Quarterly/ Monthly and upon grievance (depending on the intensity of construction work)	
			Number of non-conformance records related to noise emission management	Project construction and operation areas	Review and control of non-conformance logs	Quarterly	Environmental Eng. (SPV) and Environmental Eng. (EPC)
			Statistics on the grievances received on impacts related with noise generation	Project office	-Review of grievance logs	Weekly	CLO - SPV and EPC
		C9.2. Vibration	Ground vibration value	Sensitive Receptors considering all Project components including: Borrow pits : Sarıabalı (AO-1) Borrow Pit at Km 53+800 and the Dikmen Borrow Pit at Km 83+000. Quarries: Çakış (TOY4a) Quarry at Km 56+500, the Kuruçay (TOY4b) Quarry at Km 58+500, the Bademliyar (TO2) Quarry at Km 104+750, the Uzunlar (TOY5) Quarry at Km 106+000, the Karakaya Quarry at Km 114+200, the Saburlar Quarry at Km 117+000, the Karamanlar Quarry at Km 119+500, and the Soğukpınar Quarry at Km 134+000. Asphalt plants: Asphalt Plant-1 at Km 59+400, Asphalt Plant-2 at Km 87+700, and Asphalt Plant-3 at Km 124+300. Concrete plants include Concrete Plant-1 at Km 55+450, Concrete Plant-2 at Km 59+400, Concrete Plant-3 at Km 80+400, Concrete Plant-4 at Km 87+700, Concrete Plant-4a at Km 89+700, Concrete Plant-5 at Km 99+200, and Concrete Plant-6 at Km 124+300. Mechanical plants: Mechanical Plant-1 at Km 59+400, Mechanical Plant-2 at Km 87+700, and Mechanical Plant-3 at Km 124+300.	-Measurement with vibrometer	Quarterly or Upon Grievance	-SPV -EPC -Sub-Contractor
			Number of non-conformance records related to vibration management	Project construction areas	Review and control of non-conformance logs	Quarterly	Environmental Eng. (SPV) and Environmental Eng. (EPC)
			Statistics on the grievances received on impacts related with blasting operations	-Project office	-Review of grievance logs	Weekly	-SPV -EPC

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
		C9.3. Noise and Vibration Training	Number of training sessions conducted	Project personnel and contractor workers	Tracking and recording training delivery	Quarterly	EPC E&S Manager / SPV Deputy E&S Manager
C10	Cultural Heritage	C10.1. Chance finds	-Employment data on cultural heritage expert/archaeologist -Number of chance finds procedure operated	Road construction sites	-Document review -Site audit	Weekly	SPV
		C10.2. Protected sites	Actions taken in accordance with the decisions of Conservations Boards (e.g. planning of bridges, embankments, etc.; number of georadar studies conducted, test or salvage excavations conducted, etc.)	Road construction sites	-Document review -Site audit	Quarterly	-SPV -EPC
C11	Socio-economy	C11.1. Employment	Employment statistics (direct and contracted workers, local/non-local/foreign)	Project office	-Document review	Monthly	SPV
			Employment agreements	Project office	-Document review	During the recruitment process	SPV EPC
		C11.2. Expropriation	-Agreement level for expropriation works -Number of court cases	Project office	-Document review	Monthly	SPV
		C11.3. Social responsibility/volunteer activities	Number and scope of social responsibility/volunteer projects/activities conducted	Project office	-Document review	Quarterly	SPV
		C11.4. Local Infrastructure	Local infrastructure (e.g. roads) relocated/maintained/improved	Project office	-Document review	Monthly	SPV
		C11.5. Land use restrictions	Locations and dimensions for culverts and underpasses that provide access to agricultural and/or pasturelands	Project office	-Document review -Site audit	Weekly	SPV
C12	Health and Safety/ Labour and Working Conditions	C12.1. Occupational Health and Safety/Labour and Working Conditions	-Number of work incidents/accidents/near misses -Number of personnel who are infected with an infectious disease -Source and quality of drinking water	-Project office -Camp Sites(Km 64+500, Km 87+800, Km 124+300)	-Document review	Weekly	-SPV -EPC
			-Use of PPEs -Health and safety signs -Fire safety equipment/systems -Accommodation conditions	Camp Sites(Km 64+500, Km 87+800, Km 124+300) -Road construction sites - Quarries (Km 56+500, Km 58+500, Km 104+750, Km 105+000, Km 106+000, Km 114+200, Km 117+000, Km 119+500, Km 134+000)	-Site audit -Visual observation	Daily	-SPV -EPC
			Number of health and safety trainings provided	-Project office -Camp Sites(Km 64+500, Km 87+800, Km 124+300)	-Document review	Monthly	SPV EPC
			-Number of drills conducted	Project office	-Document review	Semi-Annual	SPV EPC
			-Grievance mechanisms for Project personnel -Grievances received from Project personnel	Project office	-Document review	Weekly	SPV
			Number of trainings conducted related to traffic	Construction camp and administrative offices	Tracking the number of Project personnel and contractor workers who have received training	Quarterly	-SPV -EPC
		C12.2. Community Health and Safety	-Employment data on the security personnel	-Project office -Camp Sites(Km 64+500, Km 87+800, Km 124+300)	-Document review	Weekly	-SPV - EPC
			-Trainings provided to security personnel			Quarterly	
			-Grievances received and replied to regarding the acts of security personnel			Weekly	
			Number of complaints received on traffic	Public relations records and grievance system	Logging and monitoring of grievances as per the Grievance Mechanism Procedure	Weekly	-SPV - EPC
			Certificates of operators and drivers	Relevant department	Certificates will be ensured by the relevant department	During the recruitment process	-SPV - EPC
			Number of Trainings, participants, Conducted	Project personnel and contractor workers receiving training	Review of training records	Monthly	-SPV - EPC
C13	Visual Aesthetics	C13.1. Visual Disturbance	-Visual barriers	-Camp Sites(Km 64+500, Km 87+800, Km 124+300)	-Site audit -Review of grievance logs	Monthly	SPV

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
				Quarries (Km 56+500, Km 58+500, Km 104+750, Km 105+000, Km 106+000, Km 114+200, Km 117+000, Km 119+500, Km 134+000) -The settlements that are classified as the fully visible (Aşağıçatma, Çakallar, Kayaburnu, Kızılot, Kökez, Merkez (Serik), Sarılar, Soğukpınar, Sülek, Üründü, Uzunlar)			
C14	Public Consultation	C14.1. Stakeholder Engagement	-Implementation of Stakeholder Engagement Plan -Number of stakeholder engagement activities/events conducted -Presence and functionality of Project web-site	Project office	-Document review	Weekly	-SPV - EPC
		C14.2. Grievance Mechanism	-Statistics on the grievances received and solved	Project office	-Document review -Media screen	Monthly	SPV
Operation Phase							
O1	Environmental and Social Management System (ESMS)	O1.1. Policy and ESMP	-Project-specific Environment and Social Policy -Organizational Structure (number and CVs of the personnel employed under the Environmental and Social Interaction Department) -Periodical ESMP Performance Review and Monitoring Reports -Number of non-compliant situations -Existence and validity of the legal environmental and health and safety permits -Budget allocated/spent for ESMP implementation -Number and scope of trainings, number of participants, training hours per employee, training materials, trainings provided to sub-contractors, etc. -Measures taken to ensure compliance of sub-contracts with ESMP measures	Project office	Document review	Semi-Annual	SPV
O2	Land Use and Property	O2.1. Afforestation	Implementation of afforestation (area afforested, number of trees planted, success of planting, etc.)	Project office	-Document review -Site audit	Semi-Annual	SPV
O3	Topography, Soils and Geology	O3.1. Erosion	Erosion control measures taken (drainage channels, barriers, settling structures, etc.)	-Embankment locations -Motorway surroundings	Site audit	Semi-Annual	SPV
		O3.2. Quarry	Rehabilitated area	Location of quarries(Km 56+500, Km 58+500, Km 104+750, Km 105+000, Km 106+000, Km 114+200, Km 117+000, Km 119+500, Km 134+000)	Site audit	Semi-annually for the first two years, then annually	SPV
		O.3.3. Geotechnics	Structural motion, undermining, maintenance requirement of engineering structures	Foundations and legs of viaducts (between Km 55+456.830 and Km 134+759.809) and other structural elements	Site audit	Semi-annually for the first two years, then annually	SPV
O4	Wastes	O4.1. Waste management	-List of hazardous materials/chemicals supplied, stored and used (inc. information on type and amount/volume) -Type (i.e. municipal, packaging, waste oil, etc.) and amount of wastes produced/disposed of -Waste management/disposal agreements done with licensed companies -Waste Management Plans -Temporary Waste Storage Areas -Site practices on waste management (e.g. general housekeeping rules, source separation practice, containers, containment structures, etc.)	-Operation facilities/buildings(Serik Junction, Taşağıl Junction, Manavgat Junction, Manavgat East Junction, Alarahan Junction, Konaklı Junction, Alanya West Junction) -Service areas	-Site audit -Document review	Semi-annually for the first two years, then annually	SPV
O5	Water Resources	O5.1. Drainage	Presence and functionality of drainage system	-Motorway route	-Site audit	Semi-Annual	SPV
		O5.2. Water supply	-Sources and amount of water supply -Water supply permits	-Operation facilities/buildings -Service areas	-Site audit -Document review	Semi-annually for the first two years, then annually	SPV

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
		O5.3. Wastewater management	-Wastewater disposal agreements/channel connection permits to be done with municipalities	- Service Areas	-Document review	Semi-annually for the first two years, then annually	SPV
O6	Ecology	O6.1.Terrestrial Flora	*Pyrus serikensis* species	Maquis and rocky habitats around flora sampling points 11 (X: 344079,Y: 4087799) and 36 (X: 339991,Y: 4090218)	Site survey	Annually in the first two years of operation	SPV
			Endemic plant species	At the flora sampling point 11 (X: 344079,Y: 4087799) for *Sideritis congesta,* sampling point 11 (X: 344079,Y: 4087799) and 25 (X: 394464,Y: 4055587) for *Phlomis leucophracta*, sampling point 25 (X: 394464,Y: 4055587for *Phlomis lycia*, sampling point 28 (X: 335259,Y: 4093731) for *Phlomis nissolii*		
			Maquis, Arboreal Matorral and Thermo-mediterranean Scrub	Maquis habitats along the motorway, especially at the maquis assessed as critical.		One-off (timing to be determined by experts)	
		O.6.2. Terrestrial Fauna	*Lyciasalamandra atifi*	Coniferous forest habitats in the AoI at the elevation between 200-500m		Semi-Annual (timing to be determined by experts)	SPV
			Lacerta pamphylica	Coniferous forest habitats in the AoI			
			Myotis capaccinii	Rocky areas, caves and flight corridors within the AoI, especially at the location of quarries (Km 56+500, Km 58+500, Km 104+750, Km 105+000, Km 106+000, Km 114+200, Km 117+000, Km 119+500, Km 134+000)			
			Rhinolophus mehelyi				
			Animal passes	Culvert locations along the motorway		One-off	
		O.6.3 Aquatic Flora/Fauna	*Alburnus baliki, Capoeta antalyensis, Oxynoemacheilus eregliensis, Pseudophoxinus fahrettini*	Locations where the motorway crosses surface running waters, at aquatic sampling points		Semi-Annual (timing to be determined by experts)	SPV
O7	Air Quality	O7.1. Gaseous Pollutants	NO_x, SO_X, VOC	-Serik (UTM WGS84 ZONE 36 X: 330608/Y:4089427) and Taşağıl (UTM WGS84 ZONE 36 X: 343326/Y:4087476) Neighbourhoods	-Site measurements	Semi-annually for the first two years, then annually	SPV
			GHG emissions due to fuel and electricity consumption	Project office	-Document review	Semi-annually for the first two years, then annually	SPV
			Grievances received on impacts related with gaseous emissions	Project office	-Review of grievance logs	Semi-annually for the first two years, then annually	SPV
O8	Climate Change	O 8.1 Emissions	-GHG emissions due to fuel consumption	Project office	-Document review	Quarterly	SPV
			-Environmental permits for concrete plants, asphalt plants	Project office	-Document review	Quarterly	SPV
			-Exhaust emissions	Project office	- Maintenance records	Quarterly	SPV

No	Subject	Sub-topic	Monitoring Parameter	Monitoring Station/Location	Monitoring Method	Monitoring Frequency	Responsibility*
		O 8.2 Physical Risks	-Extreme Rainfall, Overflow and Floods -Wildfires -Cold Waves and Snowfall - Heatwaves	Project office	-Visual review	Daily	SPV
		O 8.3 Transition Risks	-Policy and Legal Risks -Technology Risks -Market Risks -Reputational Risks	Project office	-Document Review	Quarterly	SPV
O9	Environmental Noise and Vibration	O9.1. Environmental Noise	Environmental Noise (dBA)	-At the points where baseline studies are carried out (Table IX.6) -Critical Receptors	-Site measurements	Semi-annually for the first two years, then annually	SPV
			Grievances received on impacts related with traffic noise	Project office	-Review of grievance logs	Upon Grievance	SPV
O10	Cultural Heritage	O10.1. Newly registered sites	Number of sites, which have been registered as a result of Project's cultural heritage studies	Project office Databases of Cultural Heritage authorities	-Document review	One-off at the beginning of operation	SPV

DENEY RAPORU / Test Report

A. GİRİŞ

ENCON Laboratuvarı A.Ş. tarafından 5 noktada yapılan pasif örnekleme ile NO_2 ve SO_2 analizleri yapılmıştır.

B. ÖLÇÜM YAPILAN BÖLÜM, ÖLÇÜM PARAMETRELERİ, ÖLÇÜM YÖNTEMİ VE ÖLÇÜM CİHAZI VE SONUÇLARI

Ölçüm yapılan noktalara ait koordinatlar tablo-1 de verilmiştir.

Tablo 1: Ölçüm Noktası Koordinatları

Ölçüm Noktası	Koordinatlar
Konaklı	36S 401287 – 4049717
Hacıobası	36S 373104 – 4065985
Sarılar	36S 360448 – 4076493
Serik	36S 330608 – 4089427
Taşağıl	36S 343326 - 4087476

Analizde kullanılan ölçüm yöntemi tablo-2 de verilmiştir.

Tablo 2: Ölçüm Parametresine Göre Analiz Yöntemleri

Ölçüm Parametresi	Analiz Yöntemi	Örnekleme
*NO_2 ve SO_2 Analizi	Pasif Analiz Yöntemi (TS EN 13528-1, TS EN 13528-2, TS EN 13528-3, İşletme İçi Metot TA.152)	Pasif örnekleme tüpleri ile örnekleme

*işaretli örneklemeler ENCON Laboratuvarı A.Ş. tarafından yapılmış olup, analizler laboratuvarımızda akreditasyon kapsam dışı yapılmıştır.

Bu rapor, laboratuarın yazılı izni olmadan kısmen kopyalanıp çoğaltılamaz / This report shall not be reproduced other than in full except with the permission of the laboratory. İmzasız ve mühürsüz raporlar geçersizdir / Testing reports without signature and seal are not valid.

Kalibrasyon laboratuvarı olarak faaliyet gösteren PROTOS, TÜRKAK'tan AB-0078-K ile TS ISO IEC 17025: 2017 standardına göre akredite edilmiştir.

PROTOS accredited by TÜRKAK under registration number AB-0078-K for TS ISO IEC 17025: 2017 as Calibration Laboratory"

Türk Akreditasyon Kurumu(TÜRKAK) kalibrasyon sertifikalarının tanınırlığı konusunda Avrupa Akreditasyon Birliği(EA) ile Çok Taraflı Anlaşma ve Uluslararası Laboratuvar Akreditasyon Birliği(ILAC) ile karşılıklı tanıma anlaşması imzalamıştır.

Turkish Accreditation Agency (TURKAK) is a signatory to the European co-operation for Accreditation (EA) Multilateral Agreement (MLA) and to the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) for the recognition of calibration certificates

Ölçüm sonuçları, genişletilmiş ölçüm belirsizlikleri ve kalibrasyon metotları bu sertifikanın tamamlayıcı kısmı olan takip eden sayfalarda verilmiştir.

The measurements, the uncertainties with confidence probability and calibration methods are given on the following pages which are part of this certificate.

1. Kalibrasyon Sonuçları

Tablo 1. SLM A-ağırlıklı filtrenin frekans tepkileri sonuçları

Frekans (Hz)	Nominal SPL (dB)	A-ağırlıklı filtrenin karakteristiği (dB)	Hesaplanan SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
31	93,9	-39,4	54,5	54,6	0,1	± 1,5
63	94,0	-26,2	67,8	68,1	0,3	± 1,0
125	94,0	-16,1	77,9	78,1	0,2	± 1,0
250	94,0	-8,6	85,4	85,5	0,1	± 1,0
500	94,0	-3,2	90,8	90,9	0,1	± 1,0
1000	94,0	0,0	94,0	94,1	0,1	± 0,7
2000	94,0	1,2	95,2	95,4	0,2	± 1,0
4000	94,0	1,0	95,0	95,1	0,1	± 1,0
8000	93,9	-1,1	92,8	92,0	-0,8	+1,5;-2,5
12500	93,8	-4,3	89,5	87,6	-1,9	+2,0;-5,0
16000	93,6	-6,6	87,0	85,3	-1,7	+2,5;-16,0

Tablodaki değerler SLM A-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

Tablo 2. SLM C-ağırlıklı filtrenin frekans tepkileri sonuçları

Frekans (Hz)	Nominal SPL (dB)	C-ağırlıklı filtrenin karakteristiği (dB)	Hesaplanan SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
31	93,9	-3,0	90,9	91,1	0,2	± 1,5
63	94	-0,8	93,2	93,5	0,3	± 1,0
125	94	-0,2	93,8	94,0	0,2	± 1,0
250	94	0,0	94,0	94,1	0,1	± 1,0
500	94	0,0	94,0	94,1	0,1	± 1,0
1000	94	0,0	94,0	94,1	0,1	± 0,7
2000	94	-0,2	93,8	93,9	0,1	± 1,0
4000	94	-0,8	93,2	93,3	0,1	± 1,0
8000	93,9	-3,0	90,9	90,1	-0,8	+1,5;-2,5
12500	93,8	-6,2	87,6	86,9	-0,7	+2,0;-5,0
16000	93,6	-8,5	85,1	85,0	-0,1	+2,5;-16,0

Tablodaki değerler SLM C-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

Bu sertifika, laboratuvarın yazılı izni olmadan kısmen kopyalanıp çoğaltılamaz.
İmzasız ve mühürsüz sertifikalar geçersizdir.
This certificate shall not be reproduced other than in full except with the permission of the laboratory
Calibration certificates without signature and seal are not valid.

Tablo 3. SLM Lin-ağırlıklı filtrenin frekans tepkileri sonuçları

Frekans (Hz)	Nominal SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
31	93,9	94,1	0,2	± 1,5
63	94	94,1	0,1	± 1,0
125	94	94,1	0,1	± 1,0
250	94	94,1	0,1	± 1,0
500	94	94,1	0,1	± 1,0
1000	94	94,1	0,1	± 0,7
2000	94	94,1	0,1	± 1,0
4000	94	94,0	0,0	± 1,0
8000	93,9	93,8	-0,1	+1,5;-2,5
12500	93,8	93,5	-0,3	+2,0;-5,0
16000	93,6	93,0	-0,6	+2,5;-16,0

Tablodaki değerler SLM Lin-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

Tablo 4. SLM 1 kHz'deki doğrusallık kontrolü sonuçları

Frekans (Hz)	Uygulanan		Ölçülen		Tepki Farkı (dB)	Tolerans
	SPL (dB)	Seviye	SPL (dB)	Seviye		
1000	94,0	0,0	94,1	0,0	0,0	±0,3
	104,0	10,0	104,1	10,0	0,0	
	114,0	20,0	114,1	20,0	0,0	

Tablodaki değerler SLM A-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

Tablo 5. SLM Zaman Ağırlıklı filtrelerinin Hızlı(Fast) ve Yavaş(Slow) Kontrolü Sonuçları

Frekans (Hz)	Hızlı			
	Nominal SPL (dB)	Olçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
1000	105,0	105,0	0,0	±0,5
2000	105,0	105,1	0,1	
4000	105,0	105,1	0,1	
Frekans (Hz)	Yavaş			
	Nominal SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
1000	101,9	102,0	0,1	±0,5
2000	101,9	102,1	0,2	
4000	101,9	102,1	0,2	

Tablodaki değerler SLM A-ağırlıklı filtre modunda iken elde edilmiştir.

Bu sertifika, laboratuvarın yazılı izni olmadan kısmen kopyalanıp çoğaltılamaz.

İmzasız ve mühürsüz sertifikalar geçersizdir.
This certificate shall not be reproduced other than in full except with the permission of the laboratory
Calibration certificates without signature and seal are not valid.

Tablo 6. SLM Yarım saatlik çalışmasında okunan değerdeki en büyük sapma sonuçları

İlk Değer SPL (dB)	Son Değer SPL (dB)	En büyük sapma * (dB)	Toleranı (dB)
94,1	94,1	0,0	± 0,3

*En büyük sapma, ölçülen değerdeki yarım saatlik okuma süresi boyunca olan değişimdir.
Tablodaki değerler SLM A-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

8. Ölçüm Belirsizliği
Ses düzeyi ölçerin kalibrasyonundaki belirsizlik 0,2 dB'dir.
Beyan edilen genişletilmiş ölçüm belirsizliği, standart belirsizliğin k=2 olarak alınan genişletme katsayısı ile çarpımı sonucunda bulunan değerdir ve %95 oranında güvenilirlik sağlamaktadır.

9. Görüşler, Açıklamalar
Kalibrasyon sonuçları sadece kalibrasyonu yapılan ses düzeyi ölçer cihazına aittir. Cihazın performansı için gerekli çevre şartlarında kullanımından ve uygun aralıklarla kalibrasyonunun sağlanmasından kullanıcı sorumludur.

10. Ölçüm Sonuçlarının Şartnamelere veya Standartlara Uygunluk Beyanı
Ölçüm sonuçları IEC 61672-1 standartında 1.Sınıf Ses Düzeyi Ölçerler için verilen toleranslarla karşılaştırılmıştır. Herhangi bir uygunluk beyanı talebi bulunmamaktadır.

11. Karar Kuralı
Karar kuralı yoktur.

Bu sertifika, laboratuvarın yazılı izni olmadan kısmen kopyalanıp çoğaltılamaz.
İmzasız ve mühürsüz sertifikalar geçersizdir.
This certificate shall not be reproduced other than in full except with the permission of the laboratory
Calibration certificates without signature and seal are not valid.

Kalibrasyon Sertifikası
Calibration Certificate

Cihazın Sahibi' adresi / Customer / address	: ANKALAB ÇEVRE ANALİZ LABORATUVARI SAN. TİC. LTD. ŞTİ Göklüçağlı Mahalleri 1200. Sk. 12/13 Dikmen / Çankaya ANKARA
İstek Numarası / Order No.	: 422/2023
Malzeme/Cihaz / Instrument/Device	: Ses Seviyesi Ölçer
İmalatçı / Manufacturer	: SVANTEK
Tip / Type	: SVAN957
Seri Numarası / Serial Number	: 12366
Kalibrasyon Tarihi / Date of Calibration	: 03.03.2023
Sertifikanın Sayfa Sayısı / Number of pages of the Certificate	: 5

Bu kalibrasyon sertifikası, Uluslararası Birimler Sisteminde(SI) tanımlanmış birimleri realize eden ulusal ölçüm standartlarına izlenebilirliği belgeler.
This calibration certificate documents the traceability to national standards,which realize the unit of measurement according to the International System of Units (SI).

Kalibrasyon laboratuvarı olarak faaliyet gösteren PROTOS, TÜRKAK'tan AB-0078-K ile TS ISO IEC 17025: 2017 standardına göre akredite edilmiştir.
PROTOS accredited by TÜRKAK under registration number AB-0078-K for TS ISO IEC 17025: 2017 as Calibration Laboratory"

Türk Akreditasyon Kurumu(TÜRKAK) kalibrasyon sertifikalarının tanınırlığı konusunda Avrupa Akreditasyon Birliği(EA) ile Çok Taraflı Anlaşma ve Uluslararası Laboratuvar Akreditasyon Birliği(ILAC) ile karşılıklı tanıma anlaşması imzalamıştır.
Turkish Accreditation Agency (TURKAK) is a signatory to the European co-operation for Accreditation (EA) Multilateral Agreement (MLA) and to the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) for the recognition of calibration certificates

Ölçüm sonuçları, genişletilmiş ölçüm belirsizlikleri ve kalibrasyon metotları bu sertifikanın tamamlayıcı kısmı olan takip eden sayfalarda verilmiştir.
The measurements, the uncertainties with confidence probability and calibration methods are given on the following pages which are part of this certificate.

Mühür/Kaşe / Seal	Yayınlandığı Tarih / Date	Kalibrasyonu Yapan / Calibrated by	Onaylayan / Approval

Tablo 3. SLM Lin-ağırlıklı filtrenin frekans tepkileri sonuçları

Frekans (Hz)	Nominal SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
31	93,9	94,1	0,2	± 1,5
63	94	94,1	0,1	± 1,0
125	94	94,1	0,1	± 1,0
250	94	94,1	0,1	± 1,0
500	94	94,1	0,1	± 1,0
1000	94	94,1	0,1	± 0,7
2000	94	94,1	0,1	± 1,0
4000	94	94,0	0,0	± 1,0
8000	93,9	93,8	-0,1	+1,5;-2,5
12500	93,8	93,5	-0,3	+2,0;-5,0
16000	93,6	93,0	-0,6	+2,5;-16,0

Tablodaki değerler SLM Lin-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

Tablo 4. SLM 1 kHz'deki doğrusallık kontrolü sonuçları

Frekans (Hz)	Uygulanan		Ölçülen		Tepki Farkı (dB)	Tolerans
	SPL (dB)	Seviye	SPL (dB)	Seviye		
1000	94,0	0,0	94,1	0,0	0,0	±0,3
	104,0	10,0	104,1	10,0	0,0	
	114,0	20,0	114,1	20,0	0,0	

Tablodaki değerler SLM A-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

Tablo 5. SLM Zaman Ağırlıklı filtrelerinin Hızlı(Fast) ve Yavaş(Slow) Kontrolü Sonuçları

Frekans (Hz)	Hızlı			
	Nominal SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
1000	105,0	105,0	0,0	±0,5
2000	105,0	105,1	0,1	
4000	105,0	105,1	0,1	
Frekans (Hz)	Yavaş			
	Nominal SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
1000	101,9	102,0	0,1	±0,5
2000	101,9	102,1	0,2	
4000	101,9	102,1	0,2	

Tablodaki değerler SLM A-ağırlıklı filtre modunda iken elde edilmiştir.

Tablo 6. SLM Yarım saatlik çalışmasında okunan değerdeki en büyük sapma sonuçları

İlk Değer SPL (dB)	Son Değer SPL (dB)	En büyük sapma * (dB)	Tolerans (dB)
94,1	94,1	0,0	± 0,3

*En büyük sapma, ölçülen değerdeki yarım saatlik okuma süresi boyunca olan değişimdir.
Tablodaki değerler SLM A-ağırlıklı filtre ve Fast modunda tkeu elde edilmiştir.

8. Ölçüm Belirsizliği
Ses düzeyi ölçerin kalibrasyonundaki belirsizlik 0,2 dB'dir.
Beyanı edilen genişletilmiş ölçüm belirsizliği, standart belirsizliğin k=2 olarak alınan genişletme katsayısı ile çarpımı sonucunda bulunan değerdir ve %95 oranında güvenilirlik sağlamaktadır.

9. Görüşler, Açıklamalar
Kalibrasyon sonuçları sadece kalibrasyonu yapılan ses düzeyi ölçer cihazına aittir. Cihazın performansı için gerekli çevre şartlarında kullanımından ve uygun aralıklarla kalibrasyonunun sağlanmasından kullanıcı sorumludur.

10. Ölçüm Sonuçlarının Şartnamelere veya Standartlara Uygunluk Beyanı
Ölçüm sonuçları IEC 61672-1 standartında 1.Sınıf Ses Düzeyi Ölçerler için verilen toleranslarla karşılaştırılmıştır. Herhangi bir uygunluk beyanı talebi bulunmamaktadır.

11. Karar Kuralı
Karar kuralı yoktur.

Bu sertifika, laboratuvarın yazılı izni olmadan kısmen kopyalanıp çoğaltılamaz. 5/5
İmzasız ve mührüsüz sertifikalar geçersizdir.
This certificate shall not be reproduced other than in full except with the permission of the laboratory FR708.02.01

Device to be Calibrated

Cihazın Adı *Name of the Instrument*	:	Ses Seviyesi Ölçüm Cihazı / Ön Yükseltici / Mikrofon *Sound Level Meter*
İmalatçısı *Manufacturer*	:	SVANTEK / SVANTEK / ACO
Seri Numarası *Serial Number*	:	23305 / 24173 / 71251
Ölçüm Aralığı *Measuring Range*	:	25 dB - 140 dB
Bölüntüsü *Scale Division*	:	0,1
Tipi *Type*	:	SVAN 958 / SV 12L / 7052E

2. Cihazın Laboratuvara Kabul Tarihi : 09.11.2023
Date of Receipt of Device

3. Kalibrasyon Metodu
Calibration Method

Ölçüm tablolarında belirtilen tolerans değerler IEC 61672-1 standardından alınmıştır. Ölçümler IEC 61672-3 standardında tarif edilen testlere göre yapılmıştır. Bu testler PR.LBBR.501 Elektroakustik Ses Seviye Ölçerleri Periyodik Kalibrasyon Prosedürüne göre yapılmıştır. Ölçümlerden önce ses seviyesi ölçüm cihazı 94 dB 1000 Hz' de kalibre edilmiştir.

The tolerance values indicated in test results are taken from IEC 61672-1 standard. Sound level meter is calibrated according to tests which are described in IEC 61672-3. PR.LBBR.501 Procedure was used in calibration of the sound level meters. Sound level meter was calibrated before measurement at 94 dB 1000 Hz.

4. Çevresel Şartlar
Environmental Conditions

Ortam Sıcaklığı *Ambient Temperature*	: (22 ± 3)	°C	
Bağıl Nem *Relative Humidity*	: (47 ± 25)	%	
Ortam Basıncı *Ambient Pressure*	: (912 ± 1)	mbar	

5. Kalibrasyonda Kullanılan Referans Cihazlar
Reference Equipments Used During Calibration

Cihaz *Device*	İmalatçı *Manufacturer*	Seri No *Serial No*	Sertifika No *Certificate No*	İzlenebilirlik *Traceability*

8. Uygunluk Beyanı
Statement of Compliance

Ölçüm sonuçları ve ölçüm belirsizliği yukarıda verilmiştir. Kullanıcı bunları dikkate alarak uygunluğuna karar vermelidir. Beyan edilen genişletilmiş belirsizlikteğeri standart belirsizliğin normal dağılımı için; yaklaşık % 95 güvenilik seviyesini sağlayan k=2 kapsam faktörü ile çarpımının sonucudur. Standart ölçüm belirsizliği GUM ve EA-4/02 dokümanlarına uygun olarak belirlenmiştir. Ölçüm sonuçları, genişletilmiş ölçüm belirsizlikleri ve kalibrasyon metotları bu sertifikanın tamamlayıcı bir bölümüdür.

The measurement results and measurement uncertinity were given above. The user have to consider the results and decide compliance of the device. The reported expended uncertainty of measurement is stated as the standart uncertainty of multitude by coverage factor k=2, which for a normal distribution corresponds to coverage of approximately 95%. The standard measurement uncertainty is defined according to the GUM and EA-4/02documents. Measurement results, the expanded measurement uncertainty of measurement and calibration methods. is an integral part of the this certificate.

9. Açıklamalar
Remarks

Bu sertifikada bulunan sonuçlar cihazın kalibrasyon tarihindeki durumu kapsar ve uzun dönem kararlığı hakkında bir öngörü içermez.

The result reported in this certificate refer to the condition of the instrument on the date of calibration and carry no implication regarding the long-term stability of the instrument

Device to be Calibrated

Cihazın Adı *Name of the Instrument*	:	Ses Seviyesi Ölçüm Cihazı / Ön Yükseltici / Mikrofon *Sound Level Meter*
İmalatçısı *Manufacturer*	:	SVANTEK / SVANTEK / ACO
Seri Numarası *Serial Number*	:	23361 / 24173 / 71251
Ölçüm Aralığı *Measuring Range*	:	25 dB - 140 dB
Bölüntüsü *Scale Division*	:	0,1
Tipi *Type*	:	959 / SV12L / 7052E

2. Cihazın Laboratuvara Kabul Tarihi : 16.10.2023
Date of Receipt of Device

3. Kalibrasyon Metodu
Calibration Method

Ölçüm tablolarında belirtilen tolerans değerler IEC 61672-1 standardından alınmıştır. Ölçümler IEC 61672-3 standardında tarif edilen testlere göre yapılmıştır. Bu testler PR.LBBR.501 Elektroakustik Ses Seviye Ölçerleri Periyodik Kalibrasyon Prosedürüne göre yapılmıştır. Ölçümlerden önce ses seviyesi ölçüm cihazı 94 dB 1000 Hz' de kalibre edilmiştir.

The tolerance values indicated in test results are taken from IEC 61672-1 standard. Sound level meter is calibrated according to tests which are described in IEC 61672-3. PR.LBBR.501 Procedure was used in calibration of the sound level meters. Sound level meter was calibrated before measurement at 94 dB 1000 Hz.

4. Çevresel Şartlar
Environmental Conditions

Ortam Sıcaklığı *Ambient Temperature*	:	(20,5 ± 3)	°C
Bağıl Nem *Relative Humidity*	:	(40 ± 25)	%
Ortam Basıncı *Ambient Pressure*	:	(907 ± 1)	mbar

5. Kalibrasyonda Kullanılan Referans Cihazlar
Reference Equipments Used During Calibration

Cihaz *Device*	İmalatçı *Manufacturer*	Seri No *Serial No*	Sertifika No *Certificate No*	İzlenebilirlik *Traceability*

8. Uygunluk Beyanı
Statement of Compliance

Ölçüm sonuçları ve ölçüm belirsizliği yukarıda verilmiştir. Kullanıcı bunları dikkate alarak uygunluğuna karar vermelidir. Beyan edilen genişletilmiş belirsizlik değeri standart belirsizliğin normal dağılımı için; yaklaşık % 95 güvenirlik seviyesini sağlayan k=2 kapsam faktörü ile çarpımının sonucudur. Standart ölçüm belirsizliği GUM ve EA-4/02 dokümanlarına uygun olarak belirlenmiştir. Ölçüm sonuçları, genişletilmiş ölçüm belirsizlikleri ve kalibrasyon metotları bu sertifikanın tamamlayıcı bir bölümüdür.

The measurement results and measurement uncertainty were given above. The user have to consider the results and decide compliance of the device. The reported expended uncertainty of measurement is stated as the standard uncertainty of multiple by coverage factor k=2, which for a normal distribution corresponds to coverage of approximately 95%. The standard measurement uncertainty is defined according to the GUM and EA-4/02documents. Measurement results, the expanded measurement uncertainty of measurement and calibration methods, is an integral part of the this certificate.

9. Açıklamalar
Remarks

Bu sertifikada bulunan sonuçlar cihazın kalibrasyon tarihindeki durumu kapsar ve uzun dönem kararlığı hakkında bir öngörü içermez.

The result reported in this certificate refer to the condition of the instrument on the date of calibration and carry no implication regarding the long-term stability of the instrument.

Kalibrasyon Tarihi *Date of calibration*	:	10.11.2023
Sertifika Sayfa Sayısı *Number of pages*	:	5

Bu kalibrasyon sertifikası, Uluslararası Birimler Sisteminde (SI) tanımlanmış birimleri realize eden ulusal ölçüm standartlarına izlenebilirliği belgeler.

This calibration certificate documents the traceabilty to national standards, which realize the unit of measurement according to the International System of Units (SI).

Kalibrasyon laboratuvarı olarak faaliyet gösteren AVL Kalibrasyon Laboratuvarı, TÜRKAK'tan AB-0089-K dosya numarası ile TS EN ISO/IEC 17025-2017 standardına göre akredite edilmiştir.

AVL Kalibrasyon Laboratuvarı is accredited by TÜRKAK under registration number AB-0089-K for TS EN ISO/IEC 17025-2017 as test laboratory.

Türk Akreditasyon Kurumu(TÜRKAK) deney raporlarının tanınması konusunda Avrupa Akreditasyon Birliği (EA) ve Uluslararası Laboratuvar Akreditasyon Birliği (ILAC) ile karşılıklı tanınma antlaşmasını imzalamıştır.

The Turkish Accreditation Acency (TURKAK) is signatory to the multilateral agreements of the European co-operation for the Accreditation(EA) and of the International Laboratory Accreditation (ILAC) for the Mutual recognation of test reports.

Ölçüm sonuçları, genişletilmiş ölçüm belirsizlikleri ve kalibrasyon metotları bu sertifikanın tamamlayıcı kısmı olan takip eden sayfalarda verilmiştir.

The measurements, the uncertainties with confidence probability and calibration methods are given on the following pages which are part of this certificate.

Ölçüm Aralığı *Measuring Range*	:	25 dB - 140 dB
Bölüntüsü *Scale Division*	:	0,1
Tipi *Type*	:	958 / SV12L / 7052E

2. Cihazın Laboratuvara Kabul Tarihi : 16.10.2023
Date of Recipt of Device

3. Kalibrasyon Metodu
Calibration Method

Ölçüm tablolarında belirtilen tolerans değerler IEC 61672-1 standardından alınmıştır. Ölçümler IEC 61672-3 standardında tarif edilen testlere göre yapılmıştır. Bu testler PR.LBBR.501 Elektroakustik Ses Seviye Ölçerleri Periyodik Kalibrasyon Prosedürüne göre yapılmıştır. Ölçümlerden önce ses seviyesi ölçüm cihazı 94 dB 1000 Hz' de kalibre edilmiştir.

The tolerance values indicated in test results are taken from IEC 61672-1 standard. Sound level meter is calibrated according to tests which are described in IEC 61672-3. PR.LBBR.501 Procedure was used in calibration of the sound level meters. Sound level meter was calibrated before measurenment at 94 dB 1000 Hz.

4. Çevresel Şartlar
Environmental Conditions

Ortam Sıcaklığı *Ambient Temperature*	:	(20,5 ± 3)	°C
Bağıl Nem *Relative Humidity*	:	(40 ± 25)	%
Ortam Basıncı *Ambient Pressure*	:	(907 ± 1)	mbar

8. Uygunluk Beyanı

Statement of Compliance

Ölçüm sonuçları ve ölçüm belirsizliği yukarıda verilmiştir. Kullanıcı bunları dikkate alarak uygunluğuna karar vermelidir. Beyan edilen genişletilmiş belirsizlik değeri standart belirsizliğin normal dağılımı için; yaklaşık % 95 güvenirlik seviyesini sağlayan k=2 kapsam faktörü ile çarpımının sonucudur. Standart ölçüm belirsizliği GUM ve EA-4/02 dokümanlarına uygun olarak belirlenmiştir. Ölçüm sonuçları, genişletilmiş ölçüm belirsizlikleri ve kalibrasyon metotları bu sertifikanın tamamlayıcı bir bölümüdür.

The measurement results and measurement uncertinity were given above. The user have to consider the results and decide compliance of the device. The reported expended uncertainity of measurement is stated as the standart uncertainity of multitude by coverage factor k=2, which for a normal distribution corresponds to covarage of approximately 95%. The standard measurement uncertainty is defined according to the GUM and EA-4/02documents. Measurement results, the expanded measurement uncertainty of measurement and calibration methods, is an integral part of the this certificate.

9. Açıklamalar

Remarks

Bu sertifikada bulunan sonuçlar cihazın kalibrasyon tarihindeki durumu kapsar ve uzun dönem kararlığı hakkında bir öngörü içermez.

The result reported in this certificate refer to the condition of the instrument on the date of calibration and carry no implication regarding the long-term stability of the instrument

Tablo 3. SLM Lin-ağırlıklı filtrenin frekans tepkileri sonuçları

Frekans (Hz)	Nominal SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
31	93,9	94,1	0,2	± 1,5
63	94	94,1	0,1	± 1,0
125	94	94,1	0,1	± 1,0
250	94	94,1	0,1	± 1,0
500	94	94,1	0,1	± 1,0
1000	94	94,1	0,1	± 0,7
2000	94	94,1	0,1	± 1,0
4000	94	94,0	0,0	± 1,0
8000	93,9	93,8	-0,1	+1,5;-2,5
12500	93,8	93,5	-0,3	+2,0;-5,0
16000	93,6	93,0	-0,6	+2,5;-16,0

Tablodaki değerler SLM Lin-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

Tablo 4. SLM 1 kHz'deki doğrusallık kontrolü sonuçları

Frekans (Hz)	Uygulanan		Ölçülen		Tepki Farkı (dB)	Tolerans
	SPL (dB)	Seviye	SPL (dB)	Seviye		
1000	94,0	0,0	94,1	0,0	0,0	±0,3
	104,0	10,0	104,1	10,0	0,0	
	114,0	20,0	114,1	20,0	0,0	

Tablodaki değerler SLM A-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

Tablo 5. SLM Zaman Ağırlıklı filtrelerinin Hızlı(Fast) ve Yavaş(Slow) Kontrolü Sonuçları

Frekans (Hz)	Hızlı			
	Nominal SPL (dB)	Olçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
1000	105,0	105,0	0,0	±0,5
2000	105,0	105,1	0,1	
4000	105,0	105,1	0,1	
Frekans (Hz)	Yavaş			
	Nominal SPL (dB)	Ölçülen SPL (dB)	Tepki Farkı (dB)	Tolerans (dB)
1000	101,9	102,0	0,1	±0,5
2000	101,9	102,1	0,2	
4000	101,9	102,1	0,2	

Tablodaki değerler SLM A-ağırlıklı filtre modunda iken elde edilmiştir.

Bu sertifika, laboratuvarın yazılı izni olmadan kısmen kopyalanıp çoğaltılamaz.

İmzasız ve mühürsüz sertifikalar geçersizdir.
This certificate shall not be reproduced other than in full except with the permission of the laboratory
Calibration certificates without signature and seal are not valid.

Tablo 6. SLM Yarım saatlik çalışmasında okunan değerdeki en büyük sapma sonuçları

İlk Değer SPL (dB)	Son Değer SPL (dB)	En büyük sapma * (dB)	Toleranı (dB)
94,1	94,1	0,0	± 0,3

*En büyük sapma, ölçülen değerdeki yarım saatlik okuma süresi boyunca olan değişimdir.
Tablodaki değerler SLM A-ağırlıklı filtre ve Fast modunda iken elde edilmiştir.

8. Ölçüm Belirsizliği
Ses düzeyi ölçerin kalibrasyonundaki belirsizlik 0,2 dB'dir.
Beyan edilen genişletilmiş ölçüm belirsizliği, standart belirsizliğin k=2 olarak alınan genişletme katsayısı ile çarpımı sonucunda bulunan değerdir ve %95 oranında güvenilirlik sağlamaktadır.

9. Görüşler, Açıklamalar
Kalibrasyon sonuçları sadece kalibrasyonu yapılan ses düzeyi ölçer cihazına aittir. Cihazın performansı için gerekli çevre şartlarında kullanımından ve uygun aralıklarla kalibrasyonunun sağlanmasından kullanıcı sorumludur.

10. Ölçüm Sonuçlarının Şartnamelere veya Standartlara Uygunluk Beyanı
Ölçüm sonuçları IEC 61672-1 standartında 1.Sınıf Ses Düzeyi Ölçerler için verilen toleranslarla karşılaştırılmıştır. Herhangi bir uygunluk beyanı talebi bulunmamaktadır.

11. Karar Kuralı
Karar kuralı yoktur.

Bu sertifika, laboratuvarın yazılı izni olmadan kısmen kopyalanıp çoğaltılamaz.
İmzasız ve mühürsüz sertifikalar geçersizdir.
This certificate shall not be reproduced other than in full except with the permission of the laboratory
Calibration certificates without signature and seal are not valid.

ACCREDITATION CERTIFICATE

Türk Akreditasyon Kurumu

AKREDİTASYON SERTİFİKASI

Deney Laboratuvarı olarak faaliyet gösteren,

ANKALAB ÇEVRE ANALİZ LABORATUVARI ÖLÇÜM HİZMETLERİ MÜHENDİSLİK DANIŞMALIK SANAYİ VE TİCARET LİMİTED ŞİRKETİ

Merkez Adres: ATA MAH. 1069 CAD. No:3/1 ÇANKAYA/ANKARA Ankara / Türkiye

TÜRKAK tarafından yapılan denetim sonucunda TS EN ISO/IEC 17025:2017 standardına göre Ek'te yer alan kapsamlarda akredite edilmiştir.

Akreditasyon No : AB-0415-T

Akreditasyon Tarihi : 07.11.2010

Revizyon Tarihi / No : 25.02.2025 / 15

Bu Sertifika, yukarıda açık adı ve adresi yazılı Kuruluşun TS EN ISO/IEC 17025:2017 Standardına, ilgili Yönetmelik ve Tebliğlere uygunluğunu sürdürmesi halinde **04.07.2027** tarihine kadar geçerlidir.

Gülden Banu Müderrisoğlu
Genel Sekreter

Türk Akreditasyon Kurumu (TÜRKAK) ISO/IEC 17025 alanında Avrupa Akreditasyon Birliği (EA) ve Uluslararası Laboratuvar Akreditasyon Birliği (ILAC) ile çok taraflı anlaşma (MLA/MRA) imzalamıştır.

Bu belge 5070 sayılı elektronik imza kanununa göre Gülden Banu Müderrisoğlu tarafından güvenli elektronik imza ile imzalanmıştır. E-imzalı belgeyi doğrulamak için QR kodunu kullanabilirsiniz.

Client Name / Address	ENCON Çevre Danışmanlık LTD. ŞTİ. / Prof. Dr. Ahmet Taner Kışlalı, Bangabandhu Blv. Özçelik İmaj İş Merkezi No:94/39 Çankaya/ ANKARA
Proposal Number	LT24_0155
Report Date / Number of Pages	10.06.2025 / 2
Sample Record Number	NUM.25.2637
Sampler Institution / Company	ENCON Laboratuvarı A.Ş.
Sampling Location	Antalya-Alanya Motorway Project – T-42 (Taş Ocağı) (Coordinate: 36.658918/31.901682)
Sample Type / Sample Sign	Soil / Sealed
Way and Aim the Sampling	-- / Monitoring
Person Conducted Sampling	Serhat UÇAR
Sampling Standard	TS 9923
Sampling Date / Date of Samples Received	30.05.2025 / 31.05.2025
Delivery Conditions of the Sample	Plastic (Cold Preservation), Glass (Cold Preservation)
Environmental Conditions During Sampling	Cloudly / 19 °C
Remarks	Analyses are done in line with the Client's request. This report cannot be used for official permit purposes in accordance with Turkish Environmental Legislation.
Date of Test	31.05.2025 / 04.06.2025

ENCON Laboratuvarı A.Ş. is accredited by TÜRKAK under registration number AB-0168-T for TS EN ISO/IEC 17025 as a test laboratory.
Turkish Accreditation Agency (TURKAK) is a signatory to the European co-operation for Accreditation (EA) Multilateral Agreement (MLA) and to the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) for the recognition of test reports.
The test and/or measurement results, the uncertainties (if applicable) with confidence probability and test methods are given on the following pages which are part of this report.

Person Conducted Sampling	Enes AKÇER
Sampling Standard	TS EN ISO 5667-11
Sampling Date / Date of Samples Received	24.09.2024 / 25.09.2024
Delivery Conditions of the Sample	Plastic; Cool, HNO_3 Preservation, Glass; HCl, zinc asetate, H_2SO_4 Preservation
Environmental Conditions During Sampling	Sunny
Remarks	Analyses are done in line with the Client's request. This report cannot be used for official permit purposes in accordance with Turkish Environmental Legislation.
Date of Test	25.09.2024 / 07.10.2024

ENCON Laboratuvarı A.Ş. is accredited by TÜRKAK under registration number AB-0168-T for TS EN ISO/IEC 17025 as a test laboratory.
Turkish Accreditation Agency (TURKAK) is a signatory to the European co-operation for Accreditation (EA) Multilateral Agreement (MLA) and to the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) for the recognition of test reports.
The test and/or measurement results, the uncertainties (if applicable) with confidence probability and test methods are given on the following pages which are part of this report.

TEST REPORT

Client Name / Address	ENCON Çevre Danışmanlık LTD. ŞTİ. / Prof. Dr. Ahmet Taner Kışlalı, Bangabandhu Blv. Özçelik İmaj İş Merkezi No:94/39 Çankaya/ ANKARA
Proposal Number	LT24_0155
Report Date / Number of Pages	13.11.2024 / 3
Sample Record Number	NUM.24.2761
Sampler Institution / Company	ENCON Laboratuvarı A.Ş.
Sampling Location	Antalya-Alanya Motorway Project – GW-3 (Coordinate: 36S 343273/4087097)
Sample Type / Sample Sign	Ground Water / Unsealed
Way and Aim the Sampling	Grab Sample / Monitoring
Person Conducted Sampling	Enes AKÇER
Sampling Standard	TS EN ISO 5667-11
Sampling Date / Date of Samples Received	18.09.2024 / 19.09.2024
Delivery Conditions of the Sample	Plastic; Cool, HNO_3 Preservation, Glass; HCl, zinc asetate, H_2SO_4 Preservation
Environmental Conditions During Sampling	Sunny
Remarks	Analyses are done in line with the Client's request. This report cannot be used for official permit purposes in accordance with Turkish Environmental Legislation.
Date of Test	19.09.2024 / 07.10.2024

ENCON Laboratuvarı A.Ş. is accredited by TÜRKAK under registration number AB-0168-T for TS EN ISO/IEC 17025 as a test laboratory.
Turkish Accreditation Agency (TURKAK) is a signatory to the European co-operation for Accreditation (EA) Multilateral Agreement (MLA) and to the International Laboratory Accreditation Cooperation (ILAC) Mutual Recognition Arrangement (MRA) for the recognition of test reports.
The test and/or measurement results, the uncertainties (if applicable) with confidence probability and test methods are given on the following pages which are part of this report.

OHS	Occupational Health and Safety
CLO	Community Liaison Officer

1. INTRODUCTION

Ministry of Transport, and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project, has tendered for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). Following the tendering process, KGM has awarded Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ or the Project Sponsor) with a Build, Operate and Transfer (BOT) contract for the implementation of the Project. Accordingly, AAOİAŞ will be referred as Project Sponsor[1] in the scope of this report. The main contractor for the Project has been designated as Limak and will henceforth be referred to as the Contractor (or EPC).

The project is designed to connect the districts of Serik and Alanya via the Manavgat district of Antalya province. The Project will enhance the existing transportation network services with its surrounding provinces: Burdur, Muğla, Konya, Isparta, Karaman and Mersin. Various environmental, social, and technical studies have been conducted along the initial route of the Project tendered by the KGM. Based on these studies, the route was optimized, incorporating engineering practices and addressing environmental and social considerations, particularly issues of involuntary and economic resettlement, before being finalized. According to the most current design, the total length of the Motorway, which will be a dual carriageway of mostly 3 and partially 2 lanes (3x2 and 2x2) in each direction, is 117.8 kilometers including the main carriageway and the access roads[2].

This Emergency Preparedness and Response Management Plan ("Plan") has been prepared by Antalya-Alanya Highway Construction Investment and Operation Inc. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Highway Project ("Project") in accordance with national legislation, the Equator Principles ("EP"), the International Finance Corporation ("IFC") Performance Standards ("PSs"), and the international standards that reference the relevant legislative sections. The Plan covers the construction phase of the Project.

1.1. Project Description

The Project starts at Serik Interchange (Km: 52+000) and then proceeds eastward, following the corridor at the foothills of the Taurus Mountains within the boundaries of Serik and Manavgat districts, ending at north of Konaklı neighborhood of Alanya District (Km: 136+000). From this point onwards, the route turns southward with a 2x2 lane connection road and connects to the D400 state road at the Alanya West Interchange. As of April 2025, the current Project design includes a total of 117.8 kilometers of road, comprising 84 kilometers of main road (motorway) and 33.8 kilometers of access roads.

The map showing the construction components and road route within the scope of the Project's construction activities is provided in *Figure I-1.*

[1] The BOT Contract uses the term "Appointed Company" to refer Project Sponsor

[2] It should be noted that the environmental and social baseline characterization, maps and scoping assessments provided in this report are based on the most current design

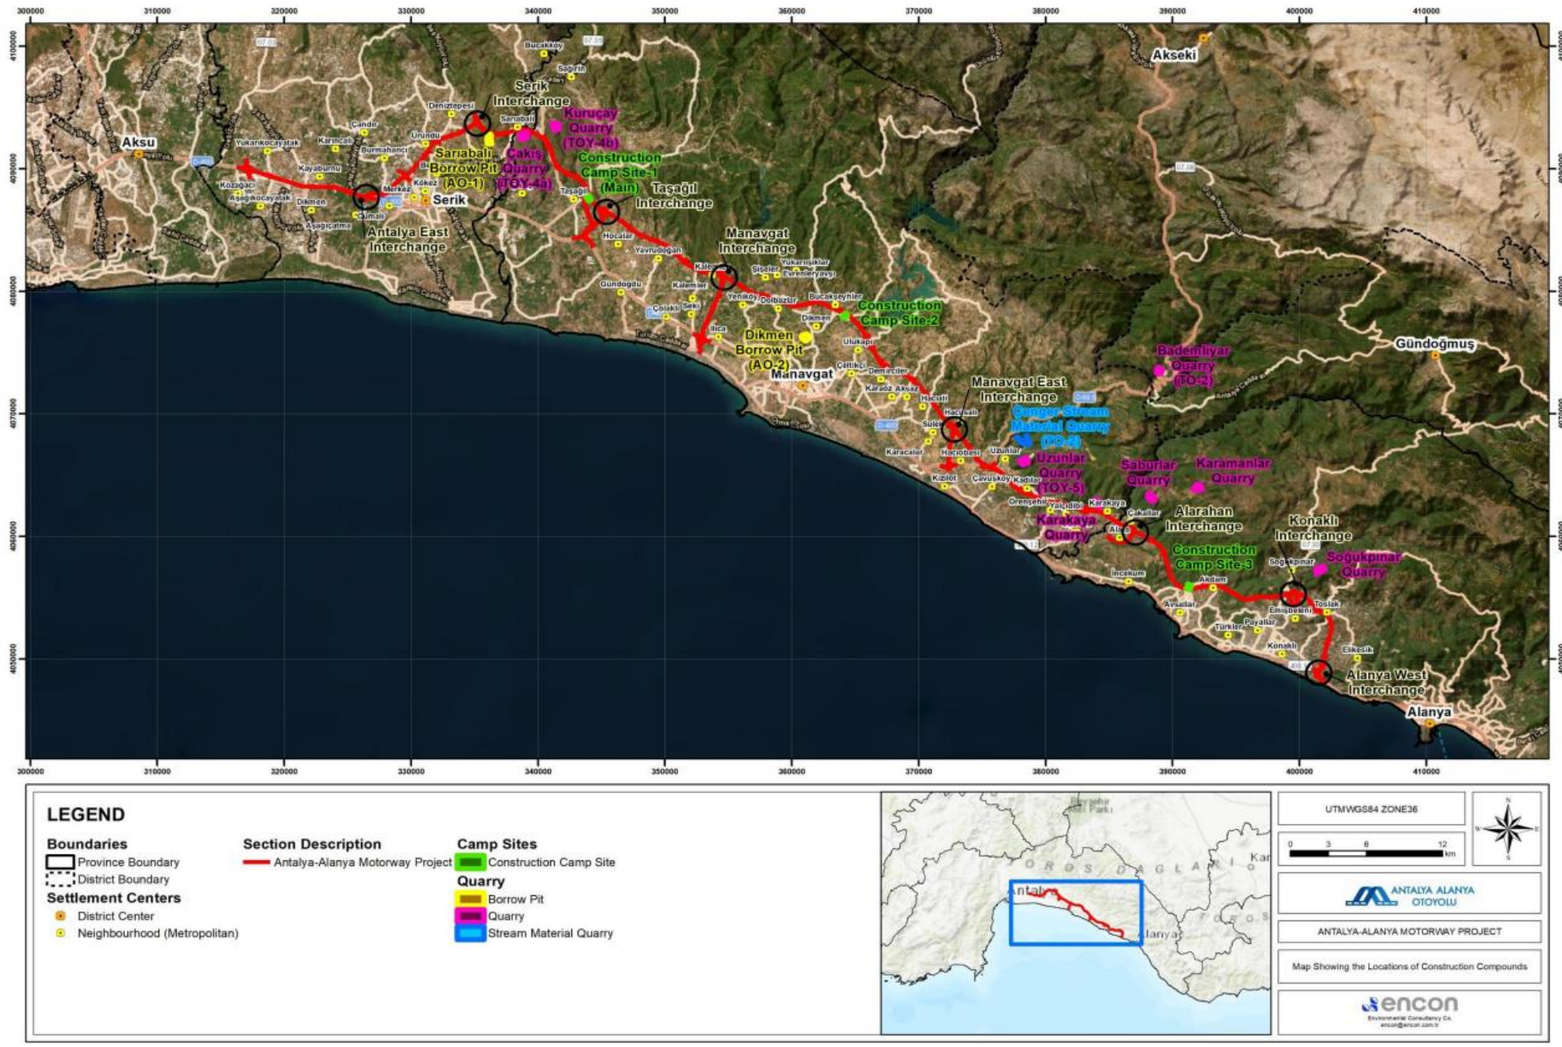

Figure 1.1-1.Map Showing the Locations of Construction Compounds

1.2. Purpose

Ministry of Transport, and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project ("The Project"), has tendered for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). Following the tendering process, KGM has awarded Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ or the Project Sponsor) with a Build, Operate and Transfer (BOT) contract for the implementation of the Project. Accordingly, AAOİAŞ will be referred as Project Sponsor[3] in the scope of this report. The main contractor for the Project has been designated as Limak and will henceforth be referred to as the Contractor (or EPC).

The Project is designed to connect the districts of Serik and Alanya via the Manavgat district of Antalya province. The Project will enhance the existing transportation network services with its surrounding provinces: Burdur, Muğla, Konya, Isparta, Karaman and Mersin. Various environmental, social, and technical studies have been conducted along the initial route of the Project tendered by the KGM. Based on these studies, the route was optimized, incorporating engineering practices and addressing environmental and social considerations, particularly issues of involuntary and economic resettlement, before being finalized. According to the most current design, the total length of the Motorway, which will be a dual carriageway of mostly 3 and partially 2 lanes (3x2 and 2x2) in each direction, is 117.8 kilometers including the main carriageway and the access roads.

The Project is anticipated to deliver benefits including relieving congestion on the Akdeniz Region's existing road network and building capacity for future traffic, providing better access to employment, markets, education, healthcare and cultural and tourism facilities and improved emergency response times, and creating social and local economic benefits through job creation and local and regional development.

- Motorway (84 km);
- Access roads (33.8 km);
- Viaducts (16);
- Bridges (22);
- Culverts (305);
- Interchanges (25);
- Overpasses (56);
- Underpasses (43); and
- Tunnels (5).

Facilities to be constructed for use during operation include toll collection areas, service areas and a maintenance and operations area. During construction, temporary facilities required including three temporary construction camps with facilities, borrow pits/quarries (11 identified sites according to the draft Environmental and Social Impact Assessment (ESIA), June 2025), and storage sites (22 identified).

The Project starts at Serik Interchange (Km: 52+000) and then proceeds eastward, following the corridor at the foothills of the Taurus Mountains within the boundaries of Serik and Manavgat districts, ending at

[3] The BOT Contract uses the term "Appointed Company" to refer Project Sponsor

north of Konaklı neighborhood of Alanya District (Km: 136+000). From this point onwards, the route turns southward with a 2x2 lane connection road and connects to the D400 state road at the Alanya West Interchange. As of April 2025, the current Project design includes a total of 117.8 kilometers of road, comprising 84 kilometers of main road (motorway) and 33.8 kilometers of access roads[4].

The purpose of the Emergency Preparedness and Response Plan (EPRP) is to define the actions and measures necessary for the overall management of and response to emergencies within the Antalya Alanya Motorway Project specific activity area of influence. The Plan aims to:

- Outline the applicable legislation and standards relevant to this Plan;
- Define roles and responsibilities;
- Incorporate the requirements of the Regulatory Environmental Impact Assessment (EIA) findings, the Environmental and Social Impact Assessment (ESIA), international standards, Turkish legislation, Lenders requirements and any Project specific permits: and
- Provide procedures of action for foreseeable emergency scenarios
- Define the lines of communication to be followed during emergencies.

This management plan is a living document developed with the best available information and will be reviewed and revised as necessary due to the nature of the construction and progress.

1.3. Scope and Validity

The present ERP scope covers the construction phase of the Antalya Alanya Motorway Project only and applies to all AAOİAŞ and its subcontractors' activities (including third party subcontracted sites (quarries, borrow pits etc.). The area of influence is therefore limited to all Project activities related to the motorway construction process. The ERP will be further updated one month before slope-earth cut excavation activities), which can be assumed as the beginning of the Motorway Construction. The updated ERP scope will take into account all of the Project Area of influence and all motorway construction activities.

The Plan incorporates the requirements of the Antalya Alanya Motorway Turkish EIA Report findings, the Antalya Alanya Motorway ESIA Report findings, IFC Performance Standard 1: Assessment and Management of Environmental and Social Risks and Impacts, IFC Performance Standard 4: Community Health, Safety and Security, Turkish Legislation, Project Lenders requirements and any Project specific permits.

This Emergency Preparedness and Response Management Plan ("EPRMP" or "Plan") has been prepared by Antalya-Alanya Highway Construction Investment and Operation Inc. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Highway Project ("Project").

This Plan should be applied by all parties involved in the construction phase, including the Project Sponsor, Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ or SPV), the Main Contractor (EPC or Limak), and all subcontractors. The EPRMP will be updated following the start of slope excavation works, which can be considered the beginning of motorway construction. The following Worksites are defined , as below to deliver the Project component described in the previous section:

[4] It should be noted that the environmental and social baseline characterization, maps and scoping assessments provided in this report are based on the most current design

- Motorway
- Access roads
- Viaducts
- Bridges
- Culverts
- Interchanges
- Overpasses
- Underpasses and
- Tunnels

In addition to the main worksites defined above, temporary worksites and all access roads, borrow pits, quarries, stream material quarries, labour camp sites, and social areas are considered within the scope of this Plan.

2. LEGISLATIONS AND STANDARDS

ISO 45001:2081, ISO 14001:2015, Applicable IFC standards include, IFC Performance Standard (PS) 1: Assessment and Management of Environmental and Social Risks and Impacts IFC Performance Standard (PS) 4: Community Health, Safety and Security, IFC General Environmental Health and Safety (EHS) Guidelines and IFC EHS Guidelines for Toll Roads which sets out a range of recommendations with regards to emergency management. EPC will comply with these requirements when implementing the Project. Key requirements of these standards include:

- Establishment of an Emergency Response System so that the EPC, in collaboration with appropriate and relevant third parties, will be prepared to respond to accidental and emergency situations associated with the project in a manner appropriate, to prevent and mitigate any harm to people and/or the environment.
- Where applicable, EPC will also assist and collaborate with the potentially Affected Communities and the local government agencies in their preparations to respond effectively to emergency situations, especially when their participation and collaboration are necessary to ensure effective response. If local government agencies have little or no capacity to respond effectively, the EPC will play an active role in preparing for and responding to emergencies associated with the project.

In addition to the above, the following impact assessment reports prepared for the Project will be used as reference documents:

- Antalya Alanya Motorway Project ESIA Report;
- Antalya Alanya Motorway Project EIA Report; and

The requirements of the Turkish laws and regulations with regards to emergencies in accordance with the Project design and construction will be implemented including the following regulations:

- Regulation on Emergencies in Worksites
- Regulation on Structures to be Built in Disaster Areas
- Regulation on Buildings to be Built in Earthquake Areas

The following AAOİAŞ plans, procedures and policies related to engagement with emergencies will also be used as reference documents:

- Solid Waste Management Plan
- Hazardous Material Management Plan
- Environmental Accident and Spill Response Management Plan
- Community Health and Safety Management Plan
- Construction Camp Site Management Plan
- Air Pollution and Emission Management Plan
- Water Quality, Wastewater and Storm Water Management Plan
- Noise and Vibration Management Plan
- Change Management Plan
- Emergency Response and Management Plan
- Human Resources and Labour Management Plan
- Security Management Plan
- Subcontractor Management Plan
- Training and Communication Management Plan
- Resource Efficiency Management Plan
- Excavated Material Management Plan
- Soil Management and Erosion Control Plan
- Stakeholder Engagement Plan
- Employment Policy
- Project HSE Policy

To ensure responsible operations, AIIB adheres to policies addressing environmental and social impacts as outlined in its Environmental and Social Framework (“ESF”) document. Updated in June 2024, the ESF reflects AIIB's commitment to international standards and sustainable development practices.

In addition to above following international requirements and standards, and Good International Industrial Practice (GIIP) regarding occupational health and safety.

- ISO 45001:2018 Occupational Health and Safety Management Systems
- IFC Performance Standards (2012), specifically:

o Performance Standard 1: Assessment and Management of Environmental and Social Risks and Impacts

o Performance Standard 2: Labor and Working Conditions

o Performance Standard 4: Community Health, Safety, and Security

- Worker' accommodation: process and standards. A guidance note by IFC and the EBRD, 2009
- IFC Environmental, Health and Safety (EHS) General Guidelines (2007)
- IFC Guidance Notes (2012)
- Equator Principles IV (2020)
- European Union Road Safety Policy Guidelines and Directives=
- European Bank for Reconstruction and Development's (EBRD's) Performance Requirement (PR) 4 – Health, Safety, and Security (2019)
- Addressing Gender-Based Violence and Harassment – Good Practice Note for the Private Sector, December 2019 – Emerging Good Practice for Private Sector
- Addressing Gender-Based Violence and Harassment – Emerging Good Practice for Private Sector
- Asian Infrastructure Investment Bank's (AIIB's) Environmental and Social Framework (2021)
- Worker' accommodation: process and standards. A guidance note by IFC and the EBRD, 2009
- International Finance Corporation's (IFC's) Sustainability Framework (2012) and associated applicable Performance Standard (PS) 2 - Labour and Working Conditions
- Approved Code of Practice and guidance on regulations L8 (Fourth edition)
- The Lifting Operations and Lifting Equipment Regulations 1998 (LOLER)
- OSHA 1926.651 Specific Excavation Requirements
- OSHA 1910.252 Welding, Cutting and Brazing (Hot Works)
- ILO Safety and Health in Building and Engineering Work
- ILO Safety and Health in Construction, 1992Health and Safety in Construction, HSG150, 2006
- Health and Safety at Work etc. Act 1974

It should be noted here that; where two or more of the identified standards are inconsistent or contradictory, unless otherwise justified, the EPC will adopt the more stringent.

3. ENVIRONMENTAL HEALTH AND SAFETY-MANAMENT SYSTEMS (EHS-MS) INTERACTION

The ERP forms part of the Project EHS-MS and therefore should be read in conjunction with the related EHS-MS elements. These elements include the overarching ESMP and individual EHS Management Plans and Procedures. The ERP will therefore be implemented together with the related plans and procedures in order to manage emergencies. The plans and procedures which are relevant to ERP include:

- Occupational, Health, Safety and Environment Plan
- Stakeholder Engagement Plan – Grievance Mechanism
- Hazardous Materials Management Plan
- Traffic Management Plan
- Biodiversity Action Plan
- Community Health and Safety Management Plan
- Environmental Accident and Spill Response Management Plan
- Environmental and Social Management Plan (ESMP) of the Antalya Alanya Motorway Project together with the Commitments Register (See Annex A for commitments on emergency response together with how the commitments will be implemented)

4. GENERAL ROLES AND RESPONSIBILITIES

Antalya Alanya Otoyol İnşaat Yatırım ve İşletme A.Ş. (SPV) as the Project Sponsor and Limak (EPC) as the main contractor of the Project will be responsible for the following:

- Ensure sufficient resources are allocated on an ongoing basis to meet the requirements of this ERP,
- Describe the resources allocated to and responsible for the execution of each task and requirement contained therein,
- Describe how roles and responsibilities are communicated to relevant personnel,
- Ensure all subcontractors and relevant third parties are bound by this plan and briefed on its content
- Regularly review the implementation and effectiveness of this plan and make adjustments where necessary
- Ensure that all personnel responsible for the execution of the tasks and requirements contained within this plan are competent on the basis of education, training and experience, and
- Undertake the training and awareness requirements necessary for the effective implementation of ERP.

SPV General Manager

- Oversee the financial, legal, and operational compliance of the SPV, including emergency preparedness obligations, in line with local laws, environmental regulations, corporate governance, and international standards/lender requirements.
- Ensure necessary resources (financial, human, and technical) are allocated for the effective implementation of emergency preparedness and response (EPR) measures.
- Promote a culture of safety, environmental, and social responsibility across SPV and stakeholders.
- Support the SPV H&S Manager in the development, dissemination, and execution of the EPRMP.

- Ensure corrective and preventive actions are taken in case of emergency-related non-compliance.
- Monitor the performance of EPC contractors in relation to EPRMP implementation and report to stakeholders.

SPV Health and Safety Manager

- Ensure the preparation, revision, and implementation of emergency-related procedures in compliance with ESIA/EIA, corporate policies, and lender requirements.
- Supervise EPC and subcontractors' emergency preparedness activities, including drills, training, and method statements.
- Ensure proper investigation and root cause analysis of emergency incidents and implement corrective actions.
- Coordinate with authorities and stakeholders regarding emergency notifications, inspections, and compliance.
- Track EPR performance indicators (e.g., incident response times, near misses, TRIR).
- Report emergency preparedness status and non-compliances to the SPV General Manager.

SPV HSE Specialist

- Support the SPV H&S Manager in monitoring EPC's and subcontractors' implementation of EPRMP measures.
- Conduct site inspections focusing on emergency equipment, signage, drills, and hazard identification.
- Maintain emergency-related documentation (drill records, training logs, incident reports).
- Support accident/incident investigations and communicate lessons learned.
- Assist in resolving complaints regarding occupational, site, or community safety linked to emergencies.

EPC Project Director

- Has overall accountability for ensuring EPC's compliance with the EPRMP.
- Allocate adequate resources (competent staff, emergency equipment, PPE, budget) to implement emergency risk mitigation measures.
- Approve emergency and HSE-related management plans.
- Ensure effective corrective actions are taken in response to emergency-related incidents.
- Maintain transparent communication with SPV, subcontractors, regulators, and communities regarding emergency issues.
- Oversee risk management and mitigation strategies, including emergency preparedness for technical, health, safety, environmental, and community safety aspects.

EPC Construction Manager

- Ensure construction works integrate required emergency precautions.

- Verify that emergency access routes are available and properly maintained.
- Ensure work teams have job-specific emergency plans, equipment, and PPE.
- Incorporate lessons learned from drills or incidents into work practices.

EPC Line Managers

- Prepare job-specific method statements that include emergency response measures.
- Ensure emergency risks are assessed and mitigation measures are in place before activities begin.
- Collaborate with ES&H teams to correct nonconformities identified during inspections.
- Support accident/incident investigations and corrective action processes.
- Ensure staff participation in emergency trainings and drills.

EPC Health and Safety Manager

- Lead the preparation, revision, and implementation of EPC's EPR procedures.
- Integrate emergency controls into daily operations, work permits, and toolbox talks.
- Supervise emergency drills, inspections, and audits.
- Maintain the site-specific risk register for hazards and emergencies.
- Coordinate with authorities and SPV on emergency incidents, notifications, and verifications.
- Report on EPC's EPR performance and key risks to the EPC Project Director.
- Foster a proactive safety and emergency culture.

EPC HSE Chief

- Support EPC H&S Manager in implementing site emergency preparedness.
- Ensure compliance of contractors with emergency procedures.
- Conduct emergency training, toolbox talks, and safety briefings.
- Maintain risk registers and track hazards related to emergencies.
- Participate in accident/incident/near-miss investigations and ensure corrective actions are followed.
- Provide reports to EPC H&S Manager on emergency preparedness status.

EPC HSE Engineer

- Support EPC HSE Chief in implementing emergency plans and monitoring compliance.
- Conduct site-level emergency inspections and hazard assessments.
- Ensure proper implementation of behaviour protocols and community safety guidelines.
- Support incident investigations and ensure corrective measures are documented and implemented.
- Address emergency-related complaints in coordination with supervisors.

EPC HSE Technician

- Conduct daily field-level hazard identification and inspections.
- Ensure workers comply with PPE and emergency signage/barrier requirements.
- Support documentation of emergency drills, incidents, and near misses.
- Escalate observed deficiencies to HSE Engineer/Chief.

EPC HSE Worker

- Conduct basic emergency checks on-site (e.g., PPE, housekeeping, fire extinguishers).
- Report unsafe conditions, emergencies, or near misses.
- Support emergency drills and evacuation activities.
- Assist in implementing emergency signage and access controls.

EPC Trainer and Document Controller

- Develop and deliver EPC emergency preparedness training (induction, refresher, drills).
- Maintain training and drill records.
- Ensure EPR-related documentation is archived and traceable.
- Support audits by providing emergency preparedness records.

Site Doctor

- Provide first aid, emergency care, and health monitoring.
- Maintain emergency medical records and health surveillance.
- Identify occupational health risks and integrate into emergency procedures.
- Ensure readiness of emergency medical equipment.
- Coordinate with hospitals and authorities during medical emergencies.

Paramedic

- Provide immediate on-site medical response and stabilization.
- Support emergency evacuation of patients.
- Monitor and restock emergency medical supplies.
- Participate in drills and support incident investigations.

Other Stakeholders

Workers, Subcontractors, and Suppliers

- Follow emergency training and drills.
- Report unsafe conditions, emergencies, and near misses immediately.
- Comply with emergency signage, PPE, and site safety requirements.

Visitors and Consultants

- Receive general emergency induction before site access.
- Always be accompanied by trained site personnel.
- Comply with site-specific emergency instructions

5. EMERGENCY ROLES AND RESPONSIBILITIES

In addition to broad roles and responsibilities in accordance with this Plan, which are outlined in Section 4; roles and responsibilities in the event of any emergency are detailed below. Names and other details of the personnel who are appointed for these roles and responsibilities are presented in Annex B. This contact list will be reviewed monthly by the HSE Manager. Access to internal contact information will be restricted to authorized personnel only. Updated versions will be redistributed after any personnel changes. Contact details of external authorities / agencies are submitted in Annex C.

5.1. Emergency Controllers

Leading responsible employees (2 persons working together or may split according to situation) on the site regarding emergency situations. Take control of the emergency situation and direct the emergency response team, sub-contractors, supervisors, visitors and all other personal. Arrange relevant management and emergency services to be contacted. Direct and liaise with the emergency services. Additionally, are responsible for initiating an evacuation process if needed, and securing a practical perimeter around the incident location. Emergency Controllers have responsibility for reporting relevant developments to the Project Manager.

5.2. Administrative Assistant

Mainly responsible for communicating with and informing the Project Manager and Emergency Services (fire department, police, ambulance, etc.). Also assists the Emergency Controller. The Administrative Assistant has responsibility for reporting relevant developments to the Emergency Controllers.

5.3. Emergency Response Team

They are the first personnel to respond to the emergency before any emergency services arrive at the site. They conduct basic emergency response actions such as fire-fighting, rescue and hazardous material mitigation under the command of the Emergency Controller. Assist in emergency notification and public protective actions, accounting for personnel outside the hazard zone or implementing In-Place Protection (IPP) within the workplace, and assist the emergency services (fire department, police, etc.) on arrival to the site. The Emergency Response Team has responsibility for reporting relevant developments to the Emergency Controllers

5.4. First Aid Personnel

Provide first aid treatment to casualties. Liaise with and assist ambulance service on arrival on site. First Aid Personnel have responsibility to report relevant developments to site doctor.

Paramedics/ambulance staff shall be stationed at designated locations within the Project (near the infirmary), and shall be responsible for the following:

- Providing first aid treatment to workers, local community members, or site visitors in case of an emergency, when needed,

- Conducting routine site patrols within the Project,
- Referring the worker to the nearest hospital or infirmary after administering the necessary first aid treatment, if deemed necessary,
- Performing 24-hour checks to ensure that all medical equipment in the on-site ambulance is complete and reporting any missing items to the H&S team,
- Reaching the incident site in the shortest possible time by using the designated route after the emergency is reported,
- Conducting daily patrols on site and maintaining familiarity with the traffic plan on open road.

Sufficient number of certificated first aid personnel will be employed according to the total personnel number during the construction phase

5.5. Security

In case of an emergency controls the traffic, directs vehicle away from the incident area and escorts emergency vehicles. Security has responsibility to report relevant developments to Emergency Response Team

5.6. Environmental Engineer

Assess extent of environmental threat and/or contamination and liaise with Emergency Controller to minimize effects. Informs Provincial Directorate of Environment and Urbanisation / Fisheries Authorities. Environmental Engineer has responsibility to report relevant developments to Emergency Controllers

5.7. Emergency Wardens

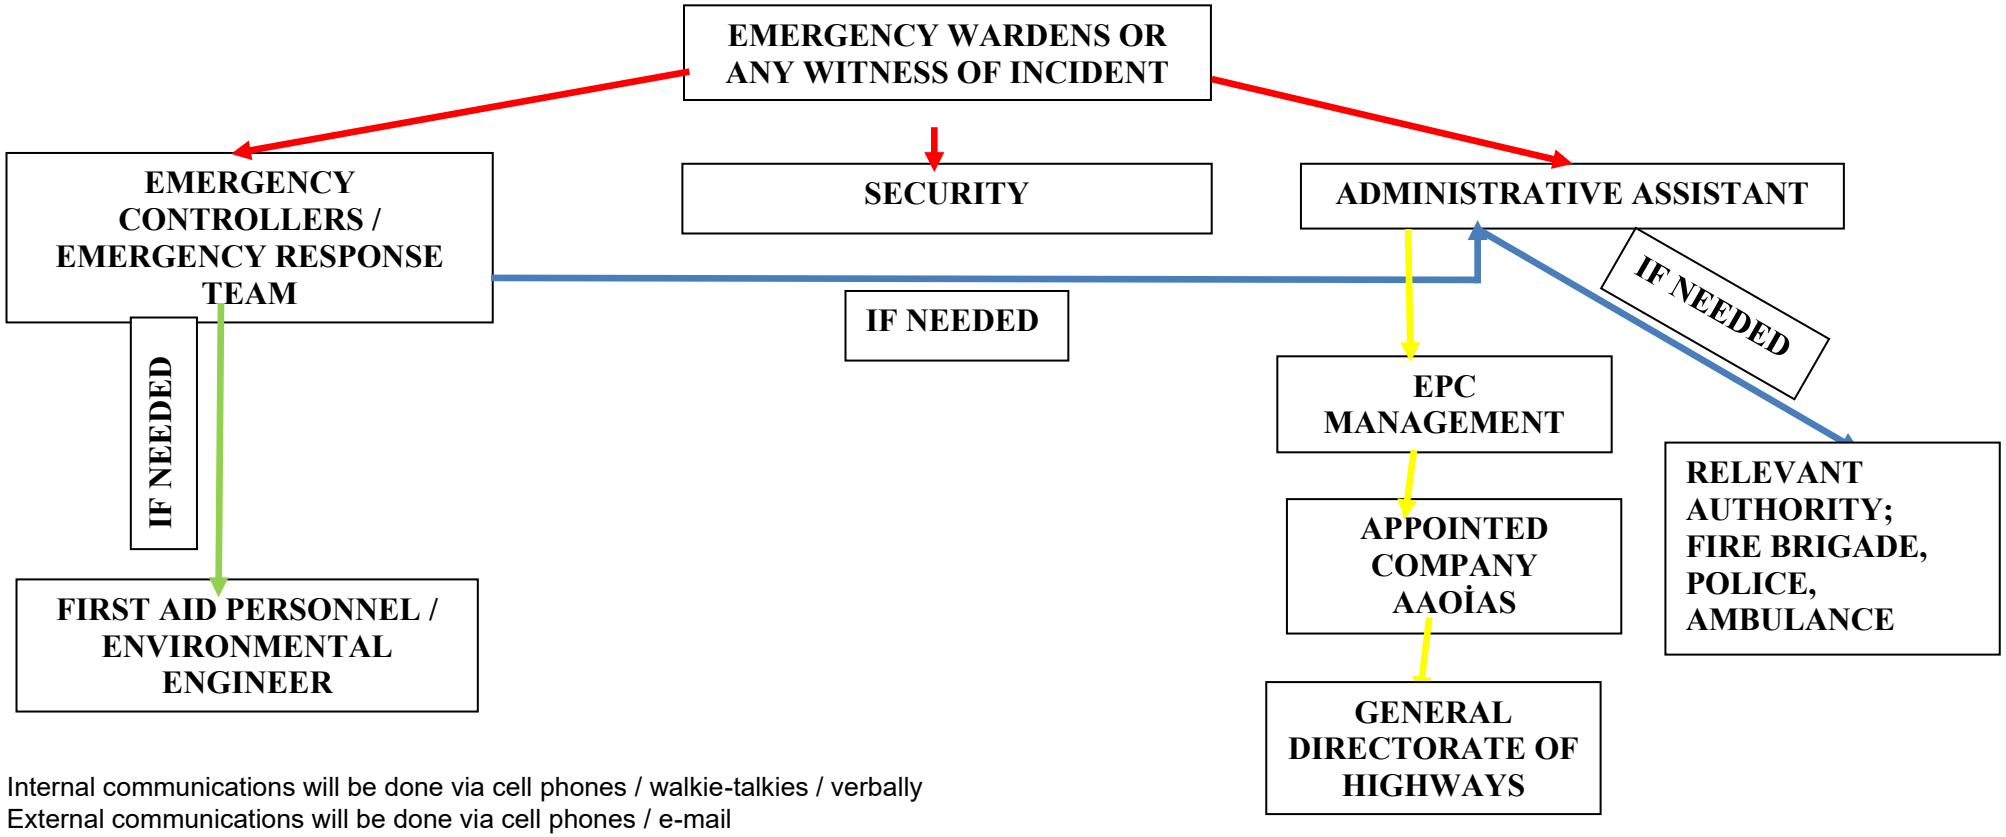
They will be chosen by the Emergency Controller and will be present in every work area. The Emergency Wardens will evaluate the emergency and evacuate the work area if needed. They will conduct a head count at Assembly Points, and account for all personnel, subcontractors and visitors. Reports personnel and visitors who are missing to the Emergency Response Team and H&S Manager. Restricts entry into affected areas to emergency personnel only. Assists the Emergency Controller as needed. Emergency Wardens have responsibility for reporting relevant developments to the Emergency Response Team.

5.8. Site Doctor

Administers relevant treatment to patients and follows the Emergency Controller’s and Emergency Response Team’s instructions on other issues.

6. COMMUNICATION

In any emergency, communication flow presented below will be followed:



- Internal communications will be done via cell phones / walkie-talkies / verbally
- External communications will be done via cell phones / e-mail

7. RISK ASSESSMENT

Relevant Health & Safety risk assessment studies have been conducted already for Motorway construction. Risks assessments have been conducted in accordance with the method submitted in Occupational Health and Safety Plan. Main topics and findings of onshore risk assessment studies are:

Site excavation works risk assessment

Main consequences of hazards of site excavation works are:

- Physical injury
- Environmental pollution – spills
- Overturn of equipment

Lifting risk assessment

Main consequences of hazards of lifting works are:

- Falling – physical injury
- Overturn of equipment

Jet grout risk assessment

Main consequences of jet grout works are:

- Chemical burns – physical injury
- Overturn of equipment
- Environmental pollution – spills

Based on site-specific risk assessments and operational configurations, the following zones within the Project are identified as high-risk areas requiring special control and emergency readiness measures:

- **Tunnel portals and interior segments** – due to limited egress, poor ventilation, and risk of collapse or equipment fire.
- **Fuel and chemical storage areas** – due to flammability, spill potential, and environmental contamination risks.
- **Bridge decks and viaducts under construction** – due to height-related hazards and fall risks.
- **Electrical distribution zones (e.g., transformer areas, substations)** – due to arc flash and electrocution risk.
- **Heavy equipment and crane operation zones** – risk of mechanical failure, struck-by incidents, and collapse.
- **Confined spaces (e.g., stormwater culverts, manholes)** – due to oxygen deficiency, toxic gases, and limited rescue options.
- **Excavation edges and unstable slopes** – due to fall or collapse hazard.

All high risks shall be clearly marked with hazard signage, physically restricted where possible (e.g., barriers, fencing), regularly monitored and reviewed by the H&S team and included in emergency response drills.

8. INCIDENT CLASSIFICATION

8.1. Level 1 Incident (High)

Level 1 incidents are incidents that cannot be managed using normal EPC resources; i.e. the capabilities of the EPC to respond are exceeded by the initial impacts of the event. This type of incident would necessitate a direct call to local emergency authorities by the administrative assistant under the supervision of the Emergency Controller and/or Project manager and initiation of evacuation procedures outlined in Annex E. A Level 1 incident will require significant resources and multiple operational periods until containment/control is achieved.

Examples of a Level 1 incident in the context of this Plan are:

- Terrorism
- Major fire or explosion – Catastrophic fire & explosion events which cannot be managed using normal EPC resources. Incidents which have possibility to spread all construction site quickly.
- Earthquake

8.2. Level 2 (Medium) and Level 3 (Low) Incident

Level 2 and Level 3 incidents require a response from EPC emergency responsible persons. In the event of a Level 2 incident additional resources and services from local emergency authorities will be needed but EPC emergency responsible persons have duties until local emergency authorities arrive.

Examples of a Level 2 & 3 incident in the context of this Plan are:

- Physical injuries
- Minor Fire or Explosion – Fire and/or explosion events which can be managed with EPC resources until local emergency authorities arrive. Incidents which can be confined in a specific area.
- Overturn of equipment

Level 3 incidents can be managed by EPC's emergency responsible persons only. Section 7 below outlines the response procedures for Level 2 and Level 3 incidents.

9. EMERGENCY RESPONSE PROCEDURES FOR LEVEL 2 AND LEVEL 3 INCIDENTS

Response procedures for Level 2 and 3 emergencies are outlined in this section. Material requirements (e.g. PPEs, adsorbents, walkie-talkies etc.) for emergencies are provided in ANNEX D. Evacuation procedures for relevant emergencies which can be distributed to relevant locations of construction site are submitted in ANNEX E.

9.1. Physical Injuries

Emergency Wardens or any witness to the incident can start the response procedure by alerting relevant responsible persons. Minor cuts and/or bruises can be treated by a ***First Aid Personnel*** or be taken along to the site medical clinic for treatment. In the event of a significantly injured individual on site at any time of day or night;

- Contact must be made with the ***Emergency Controller*** by ***Administrative Assistant***.
- ***First Aid Personnel*** will inform the site doctor
- ***Site doctor*** will assess the patient's situation:

  (i) If the patient should not be moved; an ambulance will directly be called by the ***Administrative Assistant*** and relevant treatment will be administered by the ***site doctor*** until an ambulance arrives.

  - ***Security*** will be informed by the ***Administrative Assistant*** on the issue
  - ***Security*** will direct the ambulance to the injured person

  (ii) If moving the patient does not have any risk; the patient will be treated until stable enough to travel and will then be transferred to the site medical clinic

  - ***Site doctor*** will assess the patient's condition and decide if they can be cared for at the site clinic or if they require transfer to the hospital.
  - Ambulance will be called by the ***Administrative Assistant*** or any witness
  - ***Security*** will be informed by the ***Administrative Assistant*** on the issue
  - ***Security*** will direct the ambulance to the injured person

9.2. Minor Fire or Explosion

Anybody who discovers indication of a fire such as smell, smoke, if it is not unsafe to respond, should try to extinguish the fire by using the nearest fire extinguisher – all employees shall be subject to training on the use of fire extinguishers-. In the event of any fire OR explosion;

- ***Emergency Wardens*** or the witness(es) will sound the alarm to alert all personnel
- ***Emergency Wardens*** will evacuate the area if needed and will direct personnel to the assembly point.
- ***Administrative Assistant*** will notify the fire brigade
- ***Emergency Controller*** and ***Emergency Response Team*** will eliminate flammable material (e.g. fuel) sources and will de-energize power supply if necessary
- Without endangering their safety; ***Emergency Controller*** and ***Emergency Response Team*** will try to control the fire until the fire brigade arrives the site.
- ***Security*** will be informed by ***Administrative Assistant*** on the issue
- ***Security*** will direct the fire brigade to the fire scene.
- Fire brigade on arrival will be in charge of fighting the fire.
- The process of response in relation to a physical injury **(see section 6.)** will be implemented for any causalities.

9.3. Collapse of Equipment / Structure / Excavation

In case of any collapse,

- The priority will be for the ***Emergency Controller*** to make the area safe.

- The damaged zone must be barricaded, and non-authorized access shall be prohibited by the ***Emergency Controller***. Response and rescue shall be implemented after evaluating all risks.
- ***Emergency Response Team*** will be directed to the area by ***Emergency Controller***
- ***Emergency Response Team*** and ***Emergency Controller*** will evaluate the situation and while doing that; they direct ***Security*** in order to set up an exclusion zone.
- ***Emergency Response Team*** will develop a rescue plan under the supervision of the ***Emergency Controller.***
- The final plan will be discussed with ***Emergency Controller*** for its approval
- Local Search and Rescue authority will be contacted by ***Administrative Assistant*** if needed. If Search and Rescue authority are called on to attend the scene:
    - ***Security*** will be informed by Administrative Assistant on the issue
    - ***Security*** will direct Search and Rescue authority to the scene.
    - Search and Rescue authority on arrival will be in charge
- If the rescue plan is considered as appropriate; it can be implemented by internal resources
    - All staff in the area of incident should be considered as trapped
    - Rescue plan will be implemented
- During this process; relevant flow of physical injury response (***See Section 7.1***) will be implemented for causalities.

9.4. Overturn of Equipment

It should be noted here that, in the event of equipment overturning outside of the construction site, the incident will be considered as “road traffic accident”. See Section 8.5 please.

- ***Emergency Wardens*** or any witness can inform the ***Emergency Controller*** about the incident
- ***Administrative Assistant*** will inform the ***Project Manager*** about the incident
- The stability of the equipment will be considered by the ***Emergency Controller*** together with experienced riggers and operators before the appropriate response is initiated
- The definite weight of the equipment and centre of the gravity will be checked from operator manual.
- Rescue operation will be supported by experienced riggers and operators
- To rescue any turned over equipment or vehicle, proper capacity crane and hoisting gears will be provided by Project Manager.
- Possible oil and/or fuel leakages will be considered, and necessary precautions will be taken.
- Smoking and the use of any open flames will be prohibited
- Around the equipment, a safety zone will be established, and the surrounding area will be barricaded for non-authorized access by ***Security***.

9.5. Road Traffic Accident

In case of a road traffic accident within the construction site boundaries; the relevant procedure(s) clarified in this Plan must be implemented. For instance; the procedure for physical injuries and/or the procedure for overturn of equipment may need to be followed.

In case of a road traffic accident outside of the construction site, the instruction for drivers is given below:

- Use caution exiting your vehicle. Other vehicles may still be trying to pass or come to a stop.
- Check to see if anyone is injured. If someone is injured, request medical assistance immediately. Perform first aid, if necessary, within the limits of your training and experience.
- Call the police immediately, even if the accident appears to be minor. And then notify your supervisor. During notifying your supervisor; briefly describe what has happened and state if you need assistance.
- Secure the site with warning signs.
- Put out safety cones in relevant locations in order to attract the attention of other drivers
- Do not speak with the media or other parties at the scene.
- Do not argue with the others involved, do not admit liability for the accident or do not make any comments on the causes of the accident with anyone except the police.
- Gather as much information about the accident as possible.
- If possible; write down the names, addresses and phone number of everyone involved.
- Get the automobile insurance company names and policy numbers of all vehicle owners.
- Write down the year, model and plate number of all vehicles
- Note the location and extent of all the damage to all vehicles.
- Write down the names, addresses and phone numbers of any witnesses.
- Note the location of the accident - street names, cross streets, landmarks, route or exit numbers.
- For each vehicle, note the direction of travel, road signs or signals, and the number of lanes.
- Note the time of day, weather conditions, and road conditions.
- If a camera is available, take a photo of the scene from four directions. Also, take a photo of the location of the damage of each vehicle.
- Write a brief description of the accident and sketch the scene if possible.
- Ask the police officer where and when you can get a copy of the report. Note the badge number and name of the officer, as well as the report number.
- Follow instructions given by the police.

9.6. Falling into the Water

- In the event of anybody falling into the water; The Medical Team should be notified immediately about the incident
- Emergency Wardens or any witness can throw the rescue wheel

- The person will be pulled to land or onto a vessel if it is safe to do so. If not you should wait for the Coast Guard to arrive.
- The physical injury response procedure (See Section 6.) will be implemented if necessary.

9.7. Confined Space Rescue

If a person in a confined space gets into trouble, the stand-by employee must inform the ***Emergency Controller*** so the necessary support can be sent. The stand-by employee must never enter the confined space to assist. When ***Emergency Controller*** and ***Emergency Response Team*** arrive;

- ***Emergency Controller*** and ***Emergency Response Team*** will check the atmosphere and ventilate the area as needed in accordance with Occupational Health and Safety Plan
- The possibility for collapsing will be considered
- Safety harnesses, lifeline tripods etc. will be used to access the confined space
- The safety of the ***Emergency Response Team*** must not be endangered
- ***First Aid Personnel*** will be informed by ***Administrative Assistant***
- The physical injury response procedure (***See Section 7.1***) will be implemented if necessary

9.8. Spills

In case of any spill incident; the ***Emergency Controller*** can be informed ***by Emergency Wardens*** or any witness.

- ***Emergency Controller*** and ***Emergency Response Team*** will assess the situation for the possibility of a fire breaking out, the location will be evacuated immediately, and the incident area will be isolated by ***Security.***
- Small spills will be cleaned immediately by the operator using absorbents, which will be disposed of as hazardous waste.
- Large or hazardous spills will be managed by the Emergency Response Team, who will assess severity, contain, and clean up.
- Local Communities will be alerted and informed by appropriate means including telephone, audible alarms and vehicle mounted speakers via supervision of CLOs.

As spill responses need different approaches according to the type of the material; instructions in accordance to the type of the material are submitted below sections:

9.1.1. Diesel Fuel and Gasoline Spills

- Avoid inhalation of any vapours by staying upwind. Use chemical-resistant personal protective equipment (gloves, boots and safety glasses) during clean-up activities,
- Gasoline and gasoline vapours are highly flammable. Remove sources of heat, sparks, flame, and electricity. Gasoline may create an explosive atmosphere,
- Stop the source of the spill/leak and contain (isolate) it as soon as possible; move leaking equipment away from drains and surface waters if needed,

- Apply absorbents (sheets or granular material). Dike the area with absorbent or soil if needed; prevent liquid from spreading and entering drains or surface waters. Allow time for the absorbent material to soak up the spilled material. Restrict access to the area,
- Once the spill is contained and free product is absorbed, put the used absorbent (contaminated absorbent) in a plastic bag, secure the bag with a metal tie, and place the bag in a labelled container with a secure lid,
- Shovel any contaminated soil into drums with secure lids. Pump any free product into a separate and secure drum or appropriate holding tank. Label containers/drums with the date, location of spill, name of product spilled, approximate quantity, and type of material recovered,
- Used absorbents and contaminated soils should be classified and treated as waste.
- Dispose of all free products as either hazardous waste or as material to be recycled,
- Environmental Engineer will supervise the process,
- Implement Environmental Accident and Spill Response Plan.

9.1.2. Hydraulic Fluid, Lubricant and Oil Spills

- Avoid inhalation of any vapours by staying upwind. Use chemical-resistant personal protective equipment (gloves, boots, and safety glasses) during clean-up activities. Restrict to use open flames close to the spill area,
- Stop the source of the spill/leak and contain (isolate) it as soon as possible; move leaking equipment away from drains and surface waters if needed,
- Apply absorbents (sheets or granular material). Dike the area with absorbent or soil if needed; prevent liquid from spreading and entering drains or surface waters. Allow time for the absorbent material to soak up the spilled material. Restrict access to the area,
- Once the spill is contained and free product is absorbed, drain absorbents of any free product and place them in a plastic bag, secure the bag with a metal tie, and place the bag in a labelled container with a secure lid. Shovel any contaminated soil into drums with secure lids. Pump any free product into a separate and secure drum or appropriate holding tank. Label containers/drums with the date, location of spill, name of product spilled, approximate quantity, and type of material recovered,
- Used absorbents and contaminated soils should be classified and treated as waste.
- Dispose of all free product as either hazardous waste or as material to be recycled,
- Environmental Engineer will supervise the process,
- Implement Environmental Accident and Spill Response Plan.

9.1.3. Chemical Spills (e.g. acid caustics)

- Avoid inhalation of any vapours by staying upwind. Use chemical-resistant personal protective equipment (gloves, boots, safety glasses) during clean-up activities. Restrict open flames from the spill area.
- Stop the source of the spill/leak and contain (isolate) it as soon as safely possible.

- Refer to Material Safety Data Sheets (MSDS) for any special hazards and clean up procedures associated with the spilled chemical, especially for reactivity with other substances in the spilled area,
- Apply absorbents. Dike the area with absorbent or soil if needed; prevent liquid from spreading and entering drains or surface waters.
- Once the spill is contained and free product is absorbed, drain absorbents of any free product and place them in a plastic bag, secure the bag with a metal tie, and place the bag in a labelled container with a secure lid. Shovel any contaminated soil into drums with secure lids. Pump any free product into a separate and secure drum or appropriate holding tank. Label containers/drums with the date, location of spill, name of product spilled, approximate quantity, and type of material recovered,
- Used absorbents and contaminated soils should be classified and treated as waste.
- Determine if free product that cannot be used must be classified as hazardous waste. Similarly, determine if used absorbents are hazardous waste. Dispose of hazardous and non-hazardous waste, separately, offsite using a licensed disposal company and to a licensed landfill,
- Environmental Engineer will supervise the process,
- Implement Environmental Accident and Spill Response Plan.

9.9. Flooding

During a flood incident;

- Emergency Wardens or any witness can start evacuation for all personnel who are not involved in flood emergency situations
- If necessary and safe to do so; Emergency Controller and Emergency Response Team will arrange de-energizing any electrical equipment and outlets in the affected areas. Relevant electricians will supervise the process
- Emergency Controller and Emergency Response Team will take measures to stop the flow of water through the buildings by using diver pumps
- If safe to do so; any equipment or supply will be relocated to an unaffected area of the site

9.10. Earthquake

In case of an earthquake, everybody must follow the instructions listed in the “Evacuation Procedure in the Event of Earthquake” which is included as ANNEX E to this Plan. After the shaking stops the Emergency Controller will brief the below mentioned instructions/reminders to personnel at the Assembly point:

- Do not use matches/lighters or other sources of ignition
- Power outages may occur; fire alarms and sprinkler systems may be activated
- If possible, provide assistance to individuals with disabilities who may need it or alert emergency responders to their location
- Do not enter any building that has been deemed or appears to be unsafe
- Leave the area if you smell gas or chemical fumes
- Be prepared for aftershocks

- If you are properly trained and able, provide first aid to victims
- Do not move the seriously injured unless they are in immediate danger of further injury
- Open doors carefully
- Watch for falling objects
- Use radios for internal communications where possible and avoid using telephones except where necessary, e.g. to contact the emergency services.

9.11. Adverse Weather and Storm Preparedness

To ensure preparedness for adverse weather conditions and climate-related events, the following preventive and response measures will be implemented across all construction sites under the Project;

- Meteorological alerts issued by the Turkish State Meteorological Service (MGM) will be continuously monitored and used to trigger site-level emergency notifications.
- Work at height, crane operations, and tunnel activities will be temporarily suspended when wind speeds exceed 70 km/h or lightning is observed within a 5 km radius of the construction site. All personnel will be promptly notified through internal communication channels.
- Drainage systems will be designed and maintained to prevent flooding and erosion.
- Sump pumps and sandbags will be used to prevent water accumulation during rain.
- Hazardous material storage areas will be sealed.
- During storm-prone seasons (e.g., late summer, early winter), high-risk activities such as lifting operations, material transport, or exposed electrical works will be scheduled for early morning or low-risk weather windows.
- Backup power generators will be made available at key operation centres in anticipation of grid outages due to storms.
- All personnel working in exposed outdoor areas will be directed to designated shelter locations in the event of a storm. These shelters will be adequately equipped and maintained to accommodate emergency situations.
- Post-storm clean-up will involve safe collection and separation of debris (metal sheets, cables, etc.) to prevent further hazards or environmental contamination.
- Following any storm event, a detailed inspection of the site will be conducted to assess physical damage, environmental impacts, and structural integrity. Work will only resume after safety conditions are verified and documented.
- A table top exercise and field practice with a storm/emergency weather scenario will be conducted. All personnel will be informed in accordance with these scenarios.

This Emergency Preparedness and Response Management Plan will be updated after each adverse weather incident, as necessary.

In addition to the preventive measures listed above, the Project's emergency planning considers recovery and continuation of operations following climate-related incidents. This includes:

- Controlled shutdown of operations in the event of site-wide safety risks due to extreme weather conditions.
- Safe evacuation of personnel from affected zones using pre-identified muster points and evacuation routes.
- Rapid assessment and reactivation of essential systems and access roads to enable phased return to normal operations.

9.12. Terrorism and Security Threat

- In the event of an armed conflict, or suspected terrorist activity, the following actions shall be taken:
- Emergency Wardens or any witness shall immediately inform the Emergency Controllers of the suspected threat.
- Emergency Controllers will assess the situation and activate the evacuation plan if deemed necessary.
- Evacuation will be carried out under the coordination of Security personnel and in close communication with the Gendarmerie or Police authorities.
- All personnel shall follow the instructions of Emergency Controllers and shall not attempt to intervene under any circumstances.
- The Administrative Assistant will notify relevant external authorities (Police, Gendarmerie) and inform the Project Director.
- Internal communication will be restricted to authorized personnel to avoid misinformation or panic.
- Security personnel will secure the area, restrict access to the threat zone, and support emergency services upon arrival.
- The Emergency Response Team will be on standby to assist with evacuation and first aid if required.
- Assembly Points will be used as temporary gathering areas until the threat is fully cleared by security authorities.
- No personnel shall return to the workplace until official clearance is given by law enforcement and confirmed by the Emergency Controller.

9.13. Site-Type Specific Emergency Consideration

Emergency preparedness and response procedures must consider site-specific characteristics due to the varied nature of construction activities within the Project. The following principles shall guide site-type differentiated response planning:

➢ **Tunnel Areas:**

- Emergency exits, lighting and ventilation systems must be operational at all times.
- Tunnel-specific muster points shall be designated outside tunnel portals.
- Radios or communication lines must be redundant due to poor signal inside tunnels.
- Fire and smoke response must consider limited escape routes and toxic atmosphere risk

➢ **Construction Camps:**

- Evacuation maps must be posted in each sleeping and dining area.
- Emergency drills (especially fire) must be performed during both day and night shifts.
- Utility shut-off points (electricity, gas, water) must be clearly marked and accessible

➢ **Open Construction Sites:**

- Muster points should be identified for each working zone and updated as construction progresses.
- Overhead work, excavation, and equipment operation must have risk-specific emergency triggers (e.g. crane collapse, fall hazards).

➢ **Bridges, Viaducts, Elevated Structures:**

- Fall protection systems must include emergency descent devices.
- In case of structural instability, immediate clearance radius must be observed as per engineering advice.
- Emergency access must be available from both ends of the elevated structure

Annex F illustrates emergency assembly points, the location of the fire extinguishers, employee's rest areas and parking areas.

9.14. Emergency Infrastructure Controls

Emergency utility shut-off points will be provided to ensure timely and effective response to various emergency scenarios such as fire, electrical hazard, fuel spill or flooding.

- *Electrical Panels:* Marked with the symbol "E", all main power panels are labelled and equipped with lock-out capability to isolate circuits during fire, flooding, or electrical hazard scenarios.
- *Fuel Shut-Off Valves:* Located at diesel and fuel storage tanks, marked "F", these valves are accessible without requiring entry into the tank containment area and include visual signage in both Turkish and English.
- *Water Main Valves:* Marked "W", primary water supply shut-off points are located near accommodation blocks, canteens, and equipment washing areas.

To ensure rapid and effective emergency response, Project, site-wide emergency equipment and location information are shown in the tables below.

Detailed Emergency Equipment List

Equipment	Quantity	Maintenance Frequency

Tunnel Ventilation System	2 system per tunnel	Daily test, annual maintenance
Emergency Exit Guidance Lights	1 every 25 meters	Monthly inspection
Fire Cabinets and Hose Reels	1 every 50 meters	Monthly inspection, biannual maintenance
Smoke Detectors (Tunnel)	1 every 50 meters	Monthly functionality test
Emergency Alarm Buttons	1 every 100 meters	Monthly inspection
Vibration and Strain Sensors	1 set per viaduct	Test every 3 months
Wind Speed Measurement Device	1 per viaduct	Monthly inspection, annual calibration
Seismic Activity Sensor	1 per viaduct	Test every 6 months
Smoke Detectors (Accommodation)	1 per room, corridors, common areas	Monthly inspection
Fire Alarm System	1 system / camp	Monthly inspection
Emergency Lighting	1 system per building	Monthly inspection
First Aid Kits	1 per 20 people	Monthly stock check
Portable Fire Extinguishers	1 per 100 m²	Monthly inspection, annual maintenance
Emergency Communication Devices	1 per shift supervisor	Weekly test
Chemical Spill Kit	1 per storage unit	Inspection every 3 months
Eyewash and Emergency Shower Unit	1 per chemical area and tunnels	Weekly functionality test
Fire Detection and Alarm System	1 per facility/corridors	Monthly inspection
Personal Protective Equipment (PPE) Set	1 per worker	Daily user check/ Monthly stock check
Emergency Exit Signs	1 per Exit	Monthly inspection
Automated External Defibrillators (AEDs)	1 per 100 people	Monthly inspection

Location Information of Emergency Equipment

Equipment	Location
Portable Fire Extinguishers	Each accommodation block entrance and dining hall
Smoke Detectors	Each room, corridors, and common areas
First Aid Kits	1 per 20 workers, placed in visible common areas
Emergency Lighting & Exit Signs	Staircases and exits of all buildings
Automated External Defibrillators (AEDs)	Camp infirmary and ambulance
Fire Cabinets and Hoses	Every 50 m inside tunnel
Emergency Exit Guidance Lights	Every 25 m along tunnel base
Portable Gas Detectors (CO, CH4, O2)	Tunnel maintenance points and ventilation control rooms
Thermal Cameras	Tunnel entry points and ERT vehicles
Wind Speed Measurement Device	Midspan or tower locations
Vibration Sensors	Main structural columns
Portable Fire Extinguishers	Maintenance zones and bridge approaches
Chemical Spill Kits	Inside each chemical storage unit, tunnels and maintenance area at each camp sites

Equipment	Location
Eyewash and Emergency Shower Units	Next to hazardous material storage and one per chemical area
Gas Dispersal Equipment	Chemical handling rooms
Portable Lighting Units	Night shift work zones (excavation, paving)
Reflective Warning Signs	Road junctions and worksite boundaries
Mobile Barriers with Impact Absorbers	High-risk road segments

10. EMERGENCY DRILLS AND TRAINING &UPDATE

10.1. Drills

10.1.1. Fire Drill

Two times in a year, a fire drill will be conducted involving all employees. The scenario will be prepared and implemented by *Emergency Response Team*. Every employee including subcontractors' employees must have experience of using a fire extinguisher at least once. Fire Drills will be recorded, and the response time and effectiveness will be evaluated. Faults will be determined, and corrective actions will be planned, and related revisions will be done on this Plan.

10.1.2. Evacuation Drill

Two times in a year, an evacuation drill will be conducted, unannounced, to test the real response of the employees in case of an emergency. The duration times will be observed for the gathering of all employees at muster point and the full evacuation of the workplace. The gathered personnel will be listed, and the muster sheet compared with the normal working daily list. Faults will be determined, and corrective actions will be planned, and related revisions will be done on this Plan.

10.1.3. Environmental Accident Drill

To achieve the target of no harm to environment, including from any possible release of any hazardous material to environment, Emergency Response Team will conduct an environmental accident drill twice in a year to demonstrate how to use a spill kit effectively. The scenario will be prepared and implemented by the *Environmental Engineer*. The environmental accident drill will be recorded, and the response time and effectiveness will be evaluated. Faults will be determined, and corrective actions will be planned, and related revisions will be done on this Plan.

10.2. Training & Update

Necessities of the Training Program including, but not limited to:

- Firefighting, spill response, evacuation, rescue and internal radio usage for Emergency Response Team
- First Aid for First Aiders
- Training will be repeated two times in a year. Training exercises to allow personnel the opportunity to test emergency preparedness will be provided, including:
    - Desktop exercises with emergency responsible persons, where the contact lists are checked, and the facilities and communication assessed

- Drills (See Section 10.1) for testing of equipment and logistics

- Upon completion of a training exercise; Emergency Controller will review the effectiveness of the exercise to assess what worked well and what aspects require improvement
- This Emergency Response Plan will be updated as required after each exercise. Elements of the Plan subject to significant change (such as contact lists) will be replaced
- Training activities and outcomes of the training will be recorded
- Participation in drills is mandatory for all personnel present on-site during the scheduled activity.
- Attendance sheets and drill evaluation forms shall be completed for each event and archived by the HSE Document Controller.
- Drill outcomes shall be reviewed by the HSE Manager, and improvement actions shall be documented and followed up.

11. EMERGENCY REPORTING

Emergency reporting will be according to Accident and Event Reporting Procedure.

12. KEY PERFORMANCE INDICATORS

In order to check efficiency and implementation of emergency response activities and commitments listed in Annex A, determination of key performance indicators and relevant targets are needed. So, key performance indicators according to this procedure in general and targets are given in below table

ID	KPI	Target
KPI-1	Number of reported non-compliances with the requirements of this Procedure. This will be determined during drills for response capability of personnel and by daily site tours for equipment availability	Zero per three months
KPI-2	Number of non-compliances closed due to corrective actions being taken within the defined timeframe (set on a case by case basis).	100% of all non-conformities remedied within the defined timeframe
KPI-3	% of all relevant community who have received relevant community awareness training	100% compliance with training requirements
KPI-4	% of all staff who have received relevant and adequate training	100% compliance with training requirements
KPI-5	% of all staff who have participated emergency drills	100% compliance with drill requirements

ID	KPI	Target
KPI-6	Number of reports of near misses reviewed for root cause and a corrective action identified and shared across the Project construction sites within 48 hours to prevent future occurrence.	100% of near miss reports reviewed and shared
KPI-7	Success of training tests	Expected average 85%

It is not always possible to achieve relevant targets, but continuous improvement will be the major principle in accordance with KPIs.

13. MONITORING, REVIEW AND UPDATE

To ensure the continued relevance and effectiveness of the Emergency Preparedness and Response Plan (EPRP), the following measures shall be implemented:

- The EPRP shall be formally reviewed by the SPV in coordination with the EPC.
- Additional reviews shall be conducted following any major incident, regulatory change, or organizational restructuring that may affect emergency response capacity.
- All changes and updates shall be logged in a revision control table and archived by the HSE Document Controller.
- The updated version of the plan must be submitted for approval by the SPV H&S Manager before dissemination.
- A summary of key findings and improvements shall be documented and communicated during toolbox talks and safety briefings.

Table 1: Key Monitoring Activities

Parameter	Monitoring Station / Location	Monitoring Method	Monitoring Frequency	Responsible Parties
Number of drills conducted	Project office	-Document review	Semi-Annual	SPV EPC

ANNEX A COMMITMENT REGISTER IMPLEMENTATION

Commitment	Where the commitment will be implemented	When the commitment will be implemented	Who will implement the commitment	Monitoring and Assurance
Local emergency services will be alerted in event of emergency that risks collateral damage to the local communities. As part of the community engagement process, details regarding the nature of emergencies and their response plans (e.g. Emergency Prevention and Response Plan) will be shared with the local communities. Channels of communication will be established and agreed upon, and in event of emergency, the communities will be alerted and informed by appropriate means including telephone, audible alarms and vehicle mounted speakers, for example.	The Emergency Action Plan will be accessible through local village mukhtar offices and relevant municipalities – Alanya, Manavgat, Serik.	Start of construction and whenever the Emergency Action Plan is updated	• ***HSE Manager***	• HSE Manager and/or its representatives will control relevant locations monthly to check Emergency Action Plan is present or not.
Provisions of the Turkish 'Regulation on Structures to be Built in Disaster Areas and Turkish 'Regulation on Buildings to be Built in Earthquake Areas will be adhered to during construction.	Any structure to be built	During design and construction of any structure	• ***Project manager*** will enforce • ***HSE Manager*** will supervise	• HSE Manager will monitor design and construction
Provisions of the 'Disaster Regulation on Engineering Structures Along Highways' will be complied with. The Project will undertake consultation with the relevant authority before the design is finalised and request the input of the regulators who are responsible for the Disaster Regulation on Engineering Structures Along Highways.	Any structure to be built	During design and construction of any structure	• ***Project manager*** will enforce • ***HSE Manager*** will supervise	• HSE Manager will monitor design and construction
The Motorway and its structures will need to be designed to meet Turkish and international standards for design and operation to minimise the risks and provide appropriate response in the event of an incident occurring. With adoption of the AAO A.S. EPR Policy, AAO A.S. will commit to set-up and implement: (1) measures to prevent emergencies; (2) measures to respond to emergencies; and (3) measures to assess damages and recover after emergencies.	Any structure to be built	During design and construction of any structure	• ***Project manager*** will enforce • ***HSE Manager*** will supervise	• HSE Manager will monitor design and construction
Coordinate with emergency responders to ensure that appropriate first aid is provided in the event of accidents.	Location of accident	In the event of an accident	• ***Emergency Coordinator***	• Renewal of first aid certificates whenever needed • First aid drills
Project Sponsors will require all contractor and sub-contractor personnel to take necessary measures to avoid forest fires and immediately respond to any fire event that could not be avoided by measures taken, including - o Project personnel will be trained to immediately inform forestry authorities about the location and scale of any fire incident. o Fire fighting equipment will be provided at construction sites (as relevant for different types of fires), inspected regularly and staff trained to use the equipment.. o Proper fire extinguishers will be kept ready at site where hot/welding works will be performed. o Smoking will only be permitted in designated, safe areas. o Staff will be trained on fire protection awareness and response.	Location of the incident	In the event of an incident	• ***Emergency Coordinator***	• Emergency drills • HSE Manager will ensure relevant equipment and training is provided
The key mitigation to be implemented involves the adoption of road traffic management measures, including an effective spill containment and clean-up plan, as per the EPR Plan specified in the ESMP. The EPR Plan will be prepared for the construction stage, and then updated later to apply to Motorway and Bridge operations.	• Nearby schools - Alanya, Manavgat, Serik. • Construction sites	Starting from 2018	• ***CLOs will conduct the work*** • ***HSE Manager will supervise***	• CLOs will monitor communities and HSE manager will monitor workers

Commitment	Where the commitment will be implemented	When the commitment will be implemented	Who will implement the commitment	Monitoring and Assurance
Measures will be in place to prevent members of the local community, especially children, from unauthorised entry to Project-related sites/installations, thus prevent or lower the risks of accidents, as well to the AAO Project employees and contractors in order to prevent the spread of STDs and other cummunicable diseases in local communities. Such measures will include, e.g.: • Awareness training about construction site hazards to children/youths in nearby village schools; •training of health workers in disease treatment and the provision of health services for the workers •performing immunisation programmes for workers • Placement of fencing or other barricades around dangerous construction installations with warning signs of the hazards; • Use of professionally trained security guards at construction sites.	• Construction sites	Construction phase	• ***CLOs*** • ***H&S manager***	• CLOs will monitor communities and HSE manager will monitor workers

ANNEX E EVACUATION PROCEDURES

EVACUATION PROCEDURE IN THE EVENT OF EARTHQUAKE

In case of the earthquake, EVERYBODY SHALL;

- **<u>If in the slip platform and on the top of the legs</u>**;
  - ✓ Only wait for the shaking stops!
  - ✓ **<u>DO NOT MAKE PANIC</u>**!!!
  - ✓ Do not jump!
  - ✓ Hold the guardrails!
  - ✓ Do not use elevator!
- **<u>If indoors during an earthquake;</u>**
  - ✓ Drop to the ground!
  - ✓ TAKE COVER by moving under a sturdy table or other piece of furniture. HOLD ON until shaking stops!
  - ✓ If you cannot take cover under a piece of furniture, tuck your head into your knees and cover your head with your arms!
  - ✓ Evacuate only after shaking has stopped and it is safe to do so!
- **<u>If outdoors during an earthquake;</u>**
  - ✓ Remain outdoor; DO NOT enter a container!
  - ✓ Move away from buildings, trees, streetlights and utility wires!
  - ✓ Drop to your knees and into fetal position, close your eyes, and cross your arms over the back of your neck for protection!
  - ✓ Remain in this position until shaking stops!
  - ✓ Stay in an open area!
- **<u>If in a vehicle during an earthquake;</u>**
  - ✓ Stop as quickly as safety permits and stay in the vehicle!
  - ✓ Avoid stopping near or under buildings, trees, overpasses, and utility wires!
  - ✓ Proceed cautiously once shaking has stopped!
  - ✓ Avoid roads, bridges, or ramps that might have been damaged by the earthquake!
- **<u>After shaking stops;</u>**
  - ✓ Go to designated **"Assembly Point"** within the site compound!
  - ✓ Remain at **"Assembly Point"** until all clear is given by the **Emergency Controller** to return to the workplace!

EVACUATION PROCEDURE IN THE EVENT OF FIRE OR EXPLOSION

If you discover an emergency (*e.g. fire*) and you are the first on the scene, carry out the following procedure:

- Shout out a warning and alert people in immediate area!
- **Contact Emergency Controller** by phone on **Ext**. … or **MOBILE** …… or **using internal radio system** to advise them of the situation.
- If you consider that you can without endangering yourself or others, contain / control the emergency you should:
    - ***Take necessary steps to control emergency***

      (e.g. Use appropriate fire extinguisher, contain leak or spillage.)
- **Leave** by nearest exit, close doors behind you.
- **Go** to designated Assembly Point within site compound.
- **Remain** at **"Assembly Point"** until all clear is given by the **Emergency Controller** to return to the workplace.

EVACUATION PROCEDURE IN THE EVENT OF NON–FIRE/EXPLOSION

If you discover an emergency other than fire or explosion (*e.g.* ***Spill or Flood***) and you are the first on the scene, carry out the following procedure:

- Shout out a warning and alert people in immediate area!
- **Contact Site Emergency Controller** by phone on **Ext**. … or **MOBILE** …… or **using internal radio system** to advise them of the situation.
- If you consider that you can without endangering yourself or others, contain / control the emergency you should:
    - ***Take necessary steps to control emergency***

      (e.g. Use appropriate fire extinguisher, contain leak or spillage, use pumps.)
- **Leave** by nearest exit, close doors behind you.
- **Go** to designated Assembly Point within site compound.
- **Remain** at **"Assembly Point"** until all clear is given by the **Emergency Controller** to return to the workplace.

EVACUATION PROCEDURE IN THE EVENT OF TERRORISM

If you discover an emergency (e.g. terrorism) and you are to carry out the following procedure:

- Keep Calm down!
- **Contact Emergency Controller** by phone on **Ext**. …or **MOBILE** ……. or **using internal radio system** to advise them of the situation.

EVACUATION PROCEDURE IN THE EVENT OF FIRE – WORKER CAMP / ACCOMMODATION

If you discover a fire within the camp facility (sleeping quarters, dining hall, etc.):

- Shout out a warning and activate the nearest fire alarm.
- **Contact Emergency Controller** by phone on **Ext**. …or **MOBILE** ……. immediately.
- Attempt to extinguish small fires using a nearby extinguisher only if safe to do so.
- Do not stop to collect personal items.
- Evacuate using marked exit doors and follow escape route signage.
- Proceed to the Camp Muster Point (outside the main dining facility).
- Camp personnel must not return until declared safe by the Emergency Controller and/or Fire Brigade.

EVACUATION PROCEDURE IN THE EVENT OF EMERGENCY – TUNNEL WORK AREA

If an emergency (e.g. fire, gas leak, collapse) occurs in a tunnel area, follow the steps below:

- Shout out a warning and alert all personnel in the tunnel.
- Immediately inform the Emergency Controller via radio or internal communication system.
- Do NOT use any electrical equipment unless instructed.
- Use designated tunnel escape routes (as marked) and proceed on foot to the tunnel portal.
- If available, activate emergency lighting and ventilation systems.
- Assist any injured person only if safe to do so.
- Exit through the nearest safe egress point.
- Once outside the tunnel, proceed to the designated Tunnel Assembly Point located near the portal entrance.
- Remain at the Assembly Point until clearance is given by the Emergency Controller.

EVACUATION PROCEDURE IN THE EVENT OF STRUCTURAL INCIDENT – BRIDGES OR ELEVATED WORK ZONES

In case of suspected collapse, movement, or instability on a bridge, viaduct or similar structure:

- Evacuate immediately using access ladders or ramps if available.
- Do NOT attempt to retrieve tools or materials.
- Alert others verbally and notify the Emergency Controller by radio.
- Emergency personnel will restrict entry until structural stability is confirmed.
- Assemble at the nearest safe open area as defined in bridge-specific signage plans.
- Follow instructions from Emergency Controllers and avoid returning to the structure until professionally inspected.

EVACUATION PROCEDURE IN THE EVENT OF GENERAL SITE INCIDENT – OPEN CONSTRUCTION AREA

If a hazardous incident occurs in the general construction site (e.g. heavy equipment failure, fuel spill, explosion):

- Warn surrounding workers loudly and clearly.
- Leave the immediate area using the safest path, avoiding machinery and excavation zones.
- Notify Emergency Controllers or Emergency Wardens.
- Do not block access routes for emergency responders.
- Proceed to the designated General Site Muster Point.
- Wait at the Assembly Point and do not return to the site unless authorized.

AIR POLLUTION and EMISSIONS MANAGEMENT PLAN

I. INTRODUCTION

Ministry of Transport, and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project, has tendered for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). Following the tendering process, KGM has awarded Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ or the Project Sponsor) with a Build, Operate and Transfer (BOT) contract for the implementation of the Project. Accordingly, AAOİAŞ will be referred as Project Sponsor[1] in the scope of this report. The main contractor for the Project has been designated as Limak and will henceforth be referred to as the Contractor (or EPC).

The project is designed to connect the districts of Serik and Alanya via the Manavgat district of Antalya province. The Project will enhance the existing transportation network services with its surrounding provinces: Burdur, Muğla, Konya, Isparta, Karaman and Mersin. Various environmental, social, and technical studies have been conducted along the initial route of the Project tendered by the KGM. Based on these studies, the route was optimized, incorporating engineering practices and addressing environmental and social considerations, particularly issues of involuntary and economic resettlement, before being finalized. According to the most current design, the total length of the Motorway, which will be a dual carriageway of mostly 3 and partially 2 lanes (3x2 and 2x2) in each direction, is 117.8 kilometers including the main carriageway and the access roads[2].

This Air Pollution and Emissions Management Plan ("APEMP" or "Plan") has been prepared by Antalya-Alanya Highway Construction Investment and Operation Inc. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Highway Project ("Project") in accordance with national legislation, the Equator Principles ("EP"), the International Finance Corporation ("IFC") Performance Standards ("PSs"), and the international standards that reference the relevant legislative sections. The Plan covers the construction phase of the Project.

I.1 Project Description

The Project starts at Serik Interchange (Km: 52+000) and then proceeds eastward, following the corridor at the foothills of the Taurus Mountains within the boundaries of Serik and Manavgat districts, ending at north of Konaklı neighborhood of Alanya District (Km: 136+000). From this point onwards, the route turns southward with a 2x2 lane connection road and connects to the D400 state road at the Alanya West Interchange. As of April 2025, the current Project design includes a total of 117.8 kilometers of road, comprising 84 kilometers of main road (motorway) and 33.8 kilometers of access roads.

The map showing the construction components and road route within the scope of the Project's construction activities is provided in *Figure I-1.*

[1] The BOT Contract uses the term "Appointed Company" to refer Project Sponsor

[2] It should be noted that the environmental and social baseline characterization, maps and scoping assessments provided in this report are based on the most current design

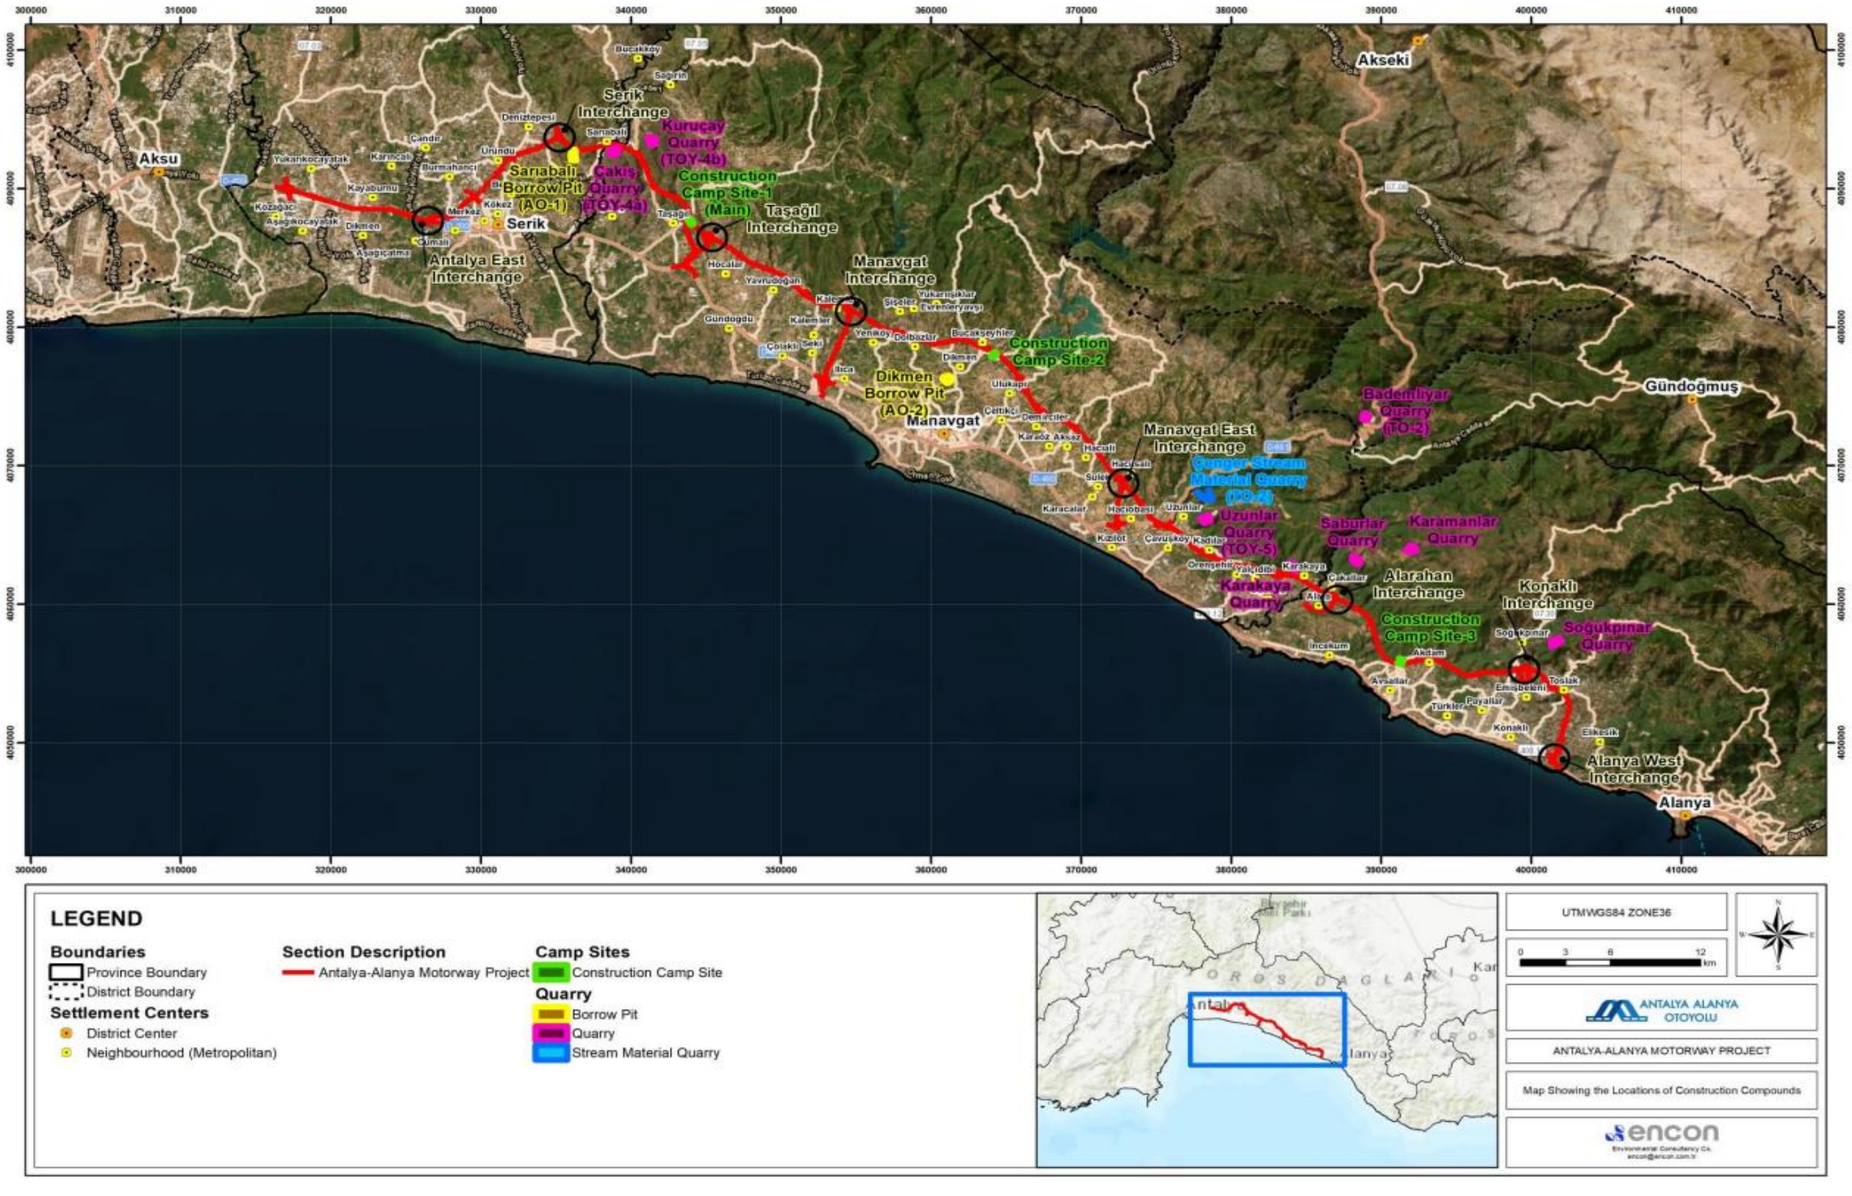

Figure I-1.Map Showing the Locations of Construction Compounds

Other structures to be built as part of the project are as follows:

- 16 viaducts,
- 22 bridges,
- 305 culverts,
- 25 interchanges,
- 56 overpasses,
- 43 underpasses, and
- 5 tunnels.

The activities that should be addressed within this plan and can be considered as emission sources are as follows:

I. Earthworks and Excavation-Filling Operations,
   - Excavation Work
   - Filling Operations
   - Material Storage

II. Material Transportation,
   - Truck Traffic
   - Use of Roads

III. Use of Construction Equipment,
   - Heavy Machinery (excavators, dozers, loaders, and trucks etc.)

IV. Dust Sources at the Construction Site
   - Dusting in Open Areas
   - Temporary Storage Areas

V. Dynamite and Blasting Operations
   - Blasting

VI. Worker and Construction Site Traffic
   - Personnel Vehicles
   - Use of Temporary Roads

I.2 Purpose and Scope

The purpose of this Plan:

- Defining country legislation and Project standards,
- Defining the duties and responsibilities of the personnel, and
- Identify air emission sources and outline mitigation, control, and monitoring measures to minimize adverse environmental and social impacts during the construction phase.

This management plan is a living document developed with the best available information and will be reviewed and revised as necessary due to the nature of the construction and progress.

The Plan has been developed in alignment with applicable national legislation and relevant international standards, including the requirements of international financial institutions. It outlines actions that should be done to manage dust and gas emissions effectively across construction-related activities and facilities. This plan will provide mitigation alternatives and an impact monitoring schedule in accordance with Turkish and international regulations and standards.

This Plan should be applied by all parties involved in the construction phase, including the Project Sponsor, Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ), the Main Contractor (EPC or Limak), and all subcontractors. Responsibilities for implementation, monitoring, and reporting of air quality-related issues should be clearly assigned. Necessary updates to the Plan should be considered in case of changes in project design, construction methodology, or regulatory requirements.

Emissions during project construction will contribute to national air pollutant levels and thereby affect the health of nearby communities. The overall objective of this management plan is to identify and minimize air pollutant emissions and potential impacts from construction activities.

The plan refers to potential emission sources during construction and identifies how effective safeguards and appropriate emission controls will be implemented to ensure ambient air quality is maintained and minimize air quality impacts on adjacent receptors.

The primary air pollutants associated with construction of motorway projects include nitrogen oxides (NO_x – NO_2 and NO), particulate matter (PM), carbon monoxide (CO), hydrocarbons (HC), sulfur dioxide (SO_2), and volatile organic compounds (VOCs). Among these, particulate matter emissions are particularly significant and are expected to arise primarily from activities such as material extraction and supply, cut and fill operations, and the storage of excavated materials. This plan will be used to minimize the air quality impacts arising during the construction activities. The details necessary to minimize the impacts are addressed in *Section 5.*

Air pollutant levels derived from construction activities will be assessed against legal requirements and international standards. If the particulate matter level is found to be at risk of exceeding these conditions, preventive actions will be reviewed and enhanced by AAOİAŞ to reduce emissions to a reasonable level. Near sensitive areas such as residential units, schools, public parks, recreational areas and ecologically sensitive areas will be monitored to ensure minimal impact associated with the construction activities.

II. LEGISLATIVE FRAMEWORK AND REFERENCE STANDARDS

The Plan has been structured to align with both national and international requirements, including legislation, guidelines, and sectoral standards that define permissible emission levels and air quality thresholds. Accordingly, the following sources of reference will be used to guide the implementation and compliance procedures.

The regulations and standards to be applied in the project are provided in the following section.

II.1 National Requirements

The following Turkish laws and regulations will be used as the legal basis for managing air emissions during construction:

- Environmental Law No. 2872
- Regulation on the Assessment and Management of Air Quality
- Industrial Air Pollution Control Regulation
- Regulation on the Control of Exhaust Gas Emissions

- Regulation on Decreasing the Ozone Depleting Materials
- Regulation on Monitoring of Greenhouse Gas Emissions
- Regulation on the Control of Air Pollution Caused by Heating
- Regulation on Ozone Depleting Substances
- Regulation on Control of Exhaust Gas Emission and Quality of Petrol and Diesel
- Regulation on the Reduction in the Sulphur Content of Some Fuel Types
- Regulation on the Control of Odorous Emissions.

Ambient air quality limit values for various air pollutants defined in Turkish Regulation on Assessment and Management of Air Quality are presented in *Table.II.1*. . AAOİAŞ and its subcontractors are responsible for reviewing relevant local legislation and requirements to capture all requirements. The standards in *Table.II.1* are the target values for 2024 and further years.

Table.II.1Turkish Regulations: Ambient Air Quality Limit Values

Parameter	Duration	Limit Value*
SO_2	Hourly (cannot be exceeded more than 24 times in a year) **($\mu g/m^3$)**	350
	24 hour (cannot be exceeded more than 3 times in a year) **($\mu g/m^3$)**	125
	Long term limit **($\mu g/m^3$)**	60
	Annual and winter season (from 1 October to 31 March) **($\mu g/m^3$)**	20
NO_2	Hourly (cannot be exceeded more than 18 times a year) **($\mu g/m^3$)**	200
	Annual **($\mu g/m^3$)**	40
PM_{10}	24 hour (cannot be exceeded more than 35 times a year) **($\mu g/m^3$)**	50
	Annual **($\mu g/m^3$)**	40
Settled Dust	Short-Term Limit Value (**mg/m^2day)**	390
	Long-Term Limit Value (**mg/m^2day)**	210
CO	8 hour daily maximum **($\mu g/m^3$)**	10,000
Total VOC**	Hourly **($\mu g/m^3$)**	280
	24-hour **($\mu g/m^3$)**	70
In the Settled Dust	Pb and its compounds (long term limit value) (**mg/m^2day)**	250
	Cd and its compounds (long term limit value) (**mg/m^2day)**	3.75
	Tl and its compounds (long term limit value) (**mg/m^2day)**	5

** Regulation on Assessment and Management of Air Quality (RAMAQ)*
*** Industrial Air Pollution Control Regulation (IAPCR)*

II.2 International Standards and Conventions

In addition to national requirements, the following international guidelines frameworks, standards and agreements should be considered to ensure alignment with best practices and financial institution requirements:

To ensure responsible operations, AIIB adheres to policies addressing environmental and social impacts as outlined in its Environmental and Social Framework ("ESF") document. Updated in June 2024, the ESF reflects AIIB's commitment to international standards and sustainable development practices.

Moreover, the following standards, guidelines and directives should be used to align Project practices with international lender requirements and good practice environmental and social management:

- IFC Performance Standards (2012), specifically:
  - Performance Standard 3: Resource Efficiency and Pollution Prevention
  - Performance Standard 4: Community Health, Safety, and Security
- IFC Environmental, Health and Safety (EHS) General Guidelines (2007)
- IFC EHS Guidelines for Toll Roads (2007)
- IFC Guidance Notes (2012)
- Equator Principles IV (2020)
- EU Ambient Air Quality Directive (2008/50/EC)
- European Union Road Safety Policy Guidelines and Directives
- World Health Organization (WHO) Ambient Air Quality Guidelines (2005 and 2021)

These references should be used to guide the implementation, monitoring, and performance evaluation of air pollution and emissions control measures on-site throughout the construction phase.

IFC General EHS Guideline for Air Emissions and Air Quality refers to the limit values recommended by the World Health Organization Ambient Air Quality Guidelines which are presented in Table II.2. In addition, the newly adopted Directive (EU) 2024/2881 of the European Parliament and of the Council of 23 October 2024 on ambient air quality and cleaner air for Europe (see Table II.3) strengthens and updates the existing framework by setting more stringent air quality standards and reinforcing provisions on public information and air quality plans. AAOİAŞ and its subcontractors are responsible for reviewing relevant international standards to capture all requirements.

Table II.2.1 IFC General EHS Guidelines: Environmental Air Emissions a nd Ambient Air Quality Standards (WHO Ambient Air Quality Guidelines)

Parameter	Duration	Guideline Value (µg/m^3)*
SO_2	10 minute	500
	24 hour	20
NO_2	Hourly	200
	Annual	40
PM_{10}	24 hour	50
	Annual	20
$PM_{2.5}$	24 hour	25
	Annual	10

Parameter	Duration	Guideline Value (µg/m³)*
Ozone	8-hour Daily Maximum	100

Table II.3: EU Regulations: Ambient Air Quality Limit Values

Parameter	Duration	Guideline Value (µg/m3)*	Permitted Exceedances / Notes
Particulate Matter (PM_{10})	24-hour average	50 µg/m³	Not to be exceeded more than 35 times/year
	Annual average	40 µg/m³	
Particulate Matter ($PM_{2.5}$)	Annual average	25 µg/m³	
Nitrogen Dioxide (NO_2)	1-hour average	200 µg/m³	Not to be exceeded more than 18 times/year
	Annual average	40 µg/m³	To be reduced to 20 µg/m³ by 2030
Sulfur Dioxide (SO_2)	1-hour average	350 µg/m³	Not to be exceeded more than 24 times/year
	24-hour average	125 µg/m³	Not to be exceeded more than 3 times/year
Carbon Monoxide (CO)	Maximum daily 8-hour mean	10 mg/m³	
Lead (Pb)	Calendar Year	0,5 µg/m³	
Cadmium (Cd)	Calendar Year	5,0 ng/m³	

II.3 Project Standards

To ensure compliance with national and international air quality requirements, the strictest limits among Turkish regulations, international standards should be applied during the construction phase of the Project. Table II.4 outlines the applicable pollutant limits, which should be used for monitoring and mitigation planning. If exceedances occur, corrective actions should be implemented immediately by Limak and its subcontractors.

Table II.4 Reference Limits and Standards for Monitoring and Mitigation

Pollutant	Averaging Period	Turkish Legislation	IFC/WHO (µg/m³)	EU Regulation	Applied Limit
SO_2 (µg/m³)	Hourly (max 24 exceedances/year)	350	-	350	350
	24-hour (max 3 exceedances/year)	125	20	125	20
	Long-term	60	-	-	60
	Annual (winter period)	20	-	-	20
	10-minute	-	500	-	500

NO_2 (µg/m³)	Hourly (max 18 exceedances/year)	200	200	200	200
	Annual average	40	40	40	40
PM_{10} (µg/m³)	24-hour (max 35 exceedances/year)	50	50	50	50
	Annual average	40	40	40	40
$PM_{2.5}$ (µg/m³)	Annual average	-	10		10
	Annual average	-	25	25	25
Settled Dust (mg/m²day)	Short-Term Limit Value	390	-	-	390
	Long-Term Limit Value	210	-	-	210
CO (mg/m³)	8-hour daily maximum	10		10	10
	Maximum daily 8-hour average in one year	120	-	-	120
Ozone (O_3)	Long-term	120	-	-	120
Lead (Pb) in Settled Dust	Long-term	250	-	-	250
Cadmium (Cd) in Settled Dust	Long-term	3,75	-	-	3,75
Total VOC	Hourly	280			
	24-hour	70			

III. LINKAGE WITH OTHER PROJECT PLANS AND PROCEDURES

This Plan is supported by other management plans and procedures developed under the Environmental and Social Management System ("ESMS") of the Project. The following plans and procedures are particularly relevant and should be implemented in coordination with the Air Pollution and Emissions Management Plan:

- Solid Waste Management Plan,
- Spill Response Management Plan,
- Community Health and Safety Management Plan,
- Traffic Management Plan,
- Hazardous Material Management Plan,
- Blasting Management Plan,
- Demolition Management Plan,
- Environmental and Social Management and Monitoring Plan (ESMMP)

The effective integration of these plans should be ensured to maintain compliance with national regulations and international standards and to minimize the cumulative environmental and social impacts of construction activities.

IV. ROLES AND RESPONSIBILITIES

Antalya Alanya Otoyol İnşaat Yatırım ve İşletme A.Ş. (SPV) as the Project Sponsor and Limak (EPC) as the main contractor of the Project will be responsible for the following:

General Manager (SPV):

-Define and implement the overall business strategy and direction of the SPV in alignment with shareholder and stakeholder expectations.

-Ensure the provision of necessary resources and organizational support for the implementation of APEMP.

-Supervise and coordinate EPC contractors and subcontractors to ensure proper execution of construction, commissioning, and operational phases.

-Support the E&S Manager in preparing, disseminating, and implementing this plan.

E&S Manager (SPV):

-Review and ensure the preparation, revision, and implementation of APEMP in accordance with national laws, regulations, company policies, international standards and lender requirements.

-Ensure the development, revision, and execution of project-specific management plans, including the Environmental and Social Management and Monitoring Plan (ESMMP) in accordance with company policies and international standards.

-Monitor the environmental and social performance of EPC and subcontractors to ensure compliance

H&S Manager (SPV):

-Ensure the conditions and obligations specified in the health, safety, community related plans and documents are implemented and adhered to by EPC and subcontractors in accordance with company policies, regulatory obligations, international standards and lender requirements.
-Contribute to project risk assessments and job hazard analyses (JHAs) and ensure these are updated regularly.
-Ensure that all construction site activities are carried out safely by EPC and subcontractors.

Deputy E&S Manager (SPV):
-Lead the development, implementation, and continuous improvement of the Environmental and Social Management.
-Review the ESHS documents of subcontractors and suppliers and ensure that they comply with the Project ESHS requirements.
-Monitor performance through Key Performance Indicators (KPIs), reports, audits, and meetings.
-Oversee incident and non-compliance regarding to air quality , including investigations, corrective/preventive measures, and stakeholder communication.
-Support E&S Manager (SPV) executive decision-making by providing timely reports and insights on E&S performance, risks, and emerging trends.
-Lead community engagement strategies in collaboration with the Environmental Engineer and, and Social Chief to ensure effective grievance management and positive relations with project-affected communities.
-Ensure that EPC and subcontractor provide the necessary training through the review of training records and relevant training documents.

Social Chief (SPV):
-Supervise and mentor CLOs, ensuring their work aligns with project priorities and stakeholder engagement strategy.
-Develop and implement work plans and schedules for the CLO team.
-Ensure that complaints regarding air quality are recorded, processed, and resolved in a timely and transparent manner.
-Ensure accurate, timely, and complete reporting of CLO activities, stakeholder interactions, and grievance outcomes and inform the E&S Deputy Manager about the complaints and coordinate the assessment and solution of grievances with EPC team.
-Coordinate with the E&S Deputy Manager, CLOs and Environmental Engineer, and construction teams to address community-related impacts.

Project Director (EPC):
-Define and oversee the implementation of the overall EPC execution strategy in alignment with contract objectives and company standards.
-Lead interdisciplinary project teams, coordinating EPC functions to achieve key milestones.

-In case of non-compliance regarding to air quality, ensure appropriate corrective and preventive actions are taken in coordination with the E&S Manager and H&S Manager

E&S Manager (EPC):

-Facilitate coordination with the SPV's E&S Manager for compliance audits and reporting.

-Implement environmental and social measures through site practices and method statements.

-Ensure that all conditions and obligations outlined in the Plan are implemented and adhered to during project activities.

H&S Manager (EPC):

-Ensure the safe execution of construction activities in compliance with APE MP, H&S Plan, legal requirements, international standards, SPV and lender obligations.

-Prepare, review, and improve H&S Plans by integrating air quality control measures into site-specific risk registers, method statements, and monitoring programs.

-Supervise and support Contractors/Subcontractors to implement air quality mitigation measures, and monitor their compliance with H&S and APEMP requirements.

-Coordinate with SPV H&S Manager to address air quality -related incidents, risks, and community safety concerns.

-Ensure that all site personnel receive regular training and toolbox talks covering APEMP MP obligations, air quality risks, and safe working practices.

-Oversee emergency preparedness and response procedures for air quality incidents (e.g., blast vibration exceedances, community complaints).

-Conduct investigations of air quality -related incidents or complaints, ensure corrective/preventive actions are taken, and report findings to Project Director and SPV.

-Promote a safety-first culture by ensuring air quality risks are proactively managed and lessons learned are integrated into continuous improvement.

Line Manager:

-Ensure the implementation of watering and other dust suppression measures on site,

-Ensuring the appropriate selection of vehicles and equipment and monitoring their regular maintenance.

-Ensure the maintenance, watering, and compliance with speed limits on internal roads.

Environmental Engineer (SPV and EPC):

-Implement and monitor the Air Pollution and Emission Management Plan (APEMP) on-site, including subcontractor compliance.

-Conduct routine inspections and measurements of routine inspections and measurements of air quality and dust levels to ensure mitigation measures are effective.

-Maintain accurate records and databases for air quality monitoring, and support reporting for audits or regulatory compliance.

-Support training, toolbox talks, and inductions related to air quality awareness for site personnel.

-Participate in investigations of APEMP-related incidents and coordinate corrective/preventive actions with HSE and E&S teams.

-Implement and monitor the APEMP on-site, including subcontractor compliance.

-Conduct routine inspections and measurements of air quality; maintain records and report performance to E&S Manager and relevant stakeholders.

-Support training, toolbox talks, and inductions for site personnel on air quality awareness.

-Coordinate corrective/preventive actions for APEMP-related incidents in collaboration with HSE, E&S teams, and subcontractors.

-Liaise with external consultants, laboratories, and regulators for air quality monitoring, reporting, and permit compliance.- Assess on a daily basis the level of dust during construction activities at the RoW, access roads, camp site, general facilities and all temporary facilities.

-Integrate APEMP requirements into work plans, method statements, and construction activities.

Community Liaison Officer (CLO)(SPV and EPC):

-Communicate with project-affected communities about construction activities, including potential air quality impacts.

- Log, track, and follow up on community complaints or grievances related to air quality, ensuring timely resolution via the Grievance Mechanism (GM).

- Support monitoring and documentation of APEMP implementation at site level, including subcontractor activities affecting the community.

- Facilitate equitable community engagement and consultations, ensuring vulnerable or sensitive groups are informed about air quality impacts.

- Coordinate with E&S Manager and other project teams to integrate community feedback into APEMP updates and corrective actions.

V. AIR QUALITY AND EMISSIONS MANAGEMENT APPROACH

The primary air pollutants associated with motorway projects include nitrogen oxides (NO_x – NO2 and NO), particulate matter (PM), carbon monoxide (CO), hydrocarbons (HC), sulfur dioxide (SO2), and volatile organic compounds (VOCs). Among these, PM10 emissions are particularly significant and are expected to arise primarily from activities such as material extraction and supply, cut and fill operations, and the storage of excavated materials. Particulate matter can vary in size and composition; however, PM10—defined as particles with an aerodynamic diameter smaller than 10 µm—is commonly used as a standard indicator, as it represents particles likely to be inhaled. Therefore, regulatory limit values are generally defined for PM10 concentrations.

Additional emissions during the construction phase will originate from the operation of construction machinery, transport vehicles, and equipment, as well as from heating systems at camp facilities. Emissions such as PM10, NO_x, CO, SO2, VOCs, benzene, NH_3, and N_2O are expected,

primarily during working hours. The type and quality of fuel used will directly influence the level of pollutant emissions. Furthermore, seasonal heating demand, particularly during winter, will contribute to increased emissions. .

In the scope of the Environmental and Social Impact Assessment study of the Antalya Alanya Motorway Project, air quality baseline measurements were conducted to determine ambient air quality of the region and limitations of the activities during both construction and operation phases. As part of the baseline assessment, in addition to PM_{10}, $PM_{2.5}$, and settled dust, other air pollutants such as SO_2, NO_2, and Volatile Organic Compounds (VOCs) were also measured. Ambient air quality measurements were conducted at 21 locations during September–October 2024. The campaign covered PM_{10}, $PM_{2.5}$, settled dust, and heavy metals in settled dust. PM measurements were taken over 24-hour periods at each location, consistent with IFC's Environmental, Health and Safety (EHS) Guidelines for Air Emissions and Ambient Air Quality, which recommend 24-hour averaging periods for particulate matter to ensure comparability with WHO and national standards. SO_2 and NO_2 were monitored using passive sampling over a one-month period between September 21 and October 21, 2024, at the five selected locations. VOC measurements were conducted on October 17, 2024. The points where baseline measurements were taken are shown in the Figure V-1.

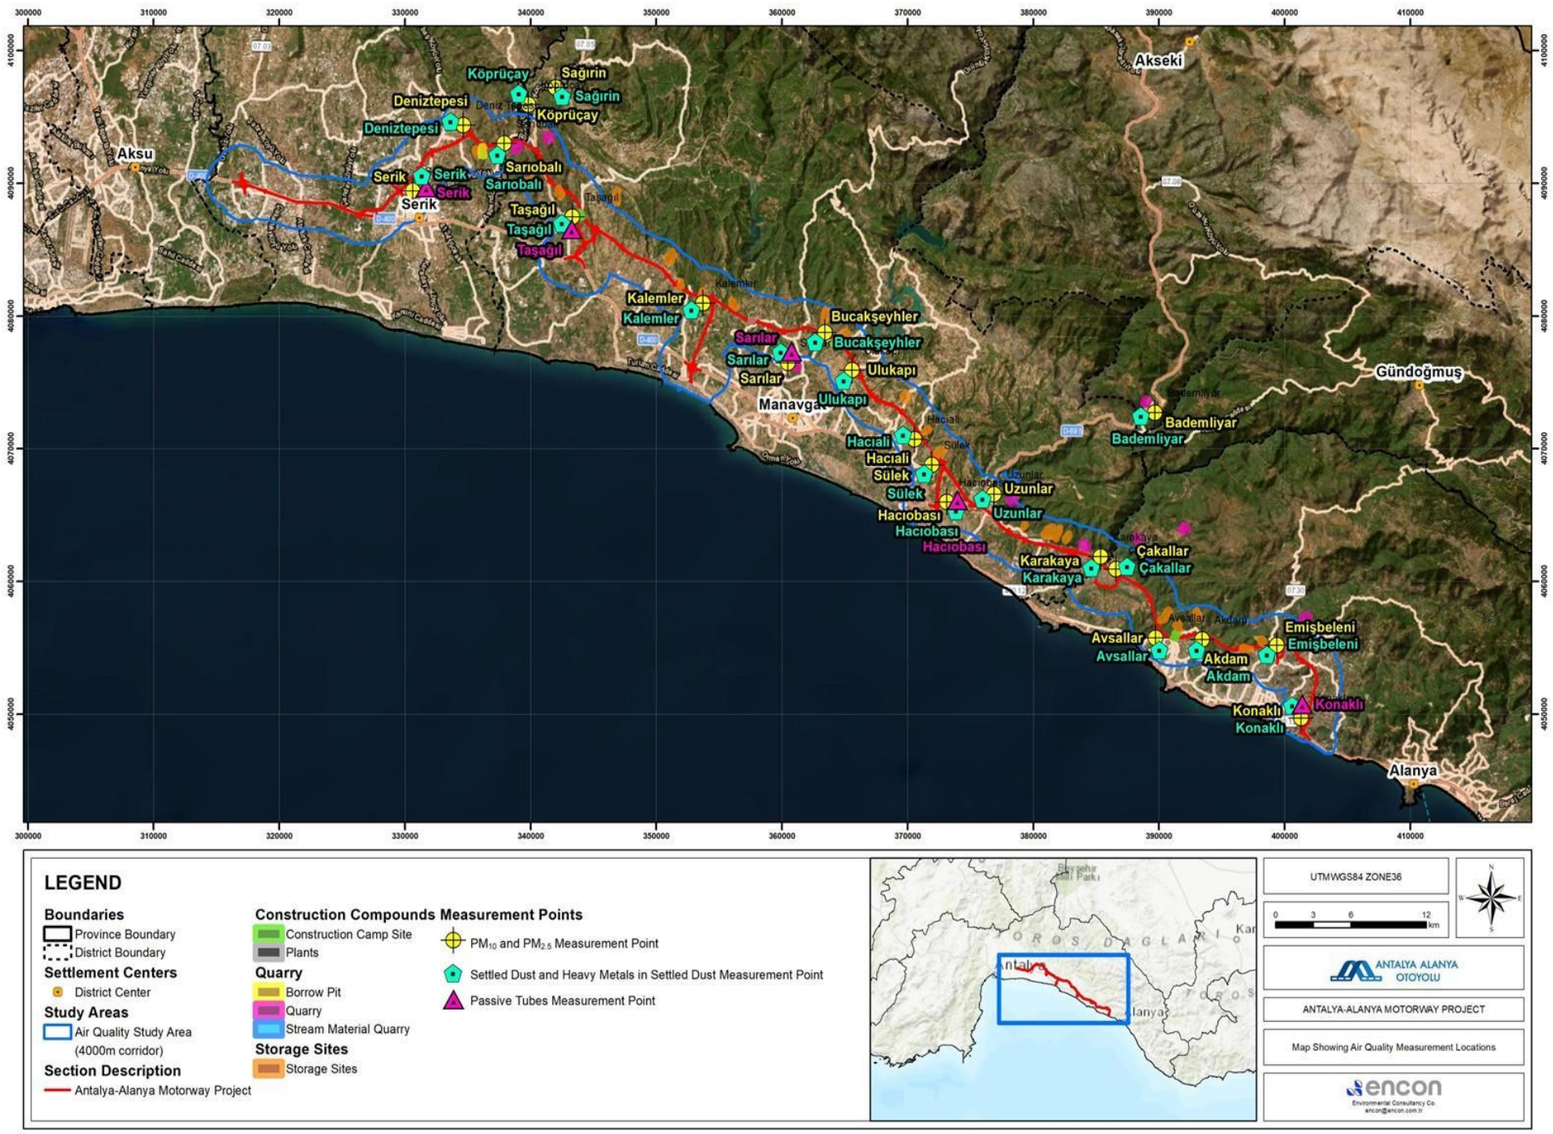

Figure V-1: Sampling Points of Air Quality Baseline Measurement Points

Sensitive receptors are defined as areas that host vulnerable populations, such as residential neighbourhoods, schools, healthcare facilities, and recreational areas, where people may be more susceptible to the adverse effects of air pollution. Within the scope of this Project, residential neighbourhoods located in close proximity to the motorway construction corridor are considered sensitive receptor zones.

A review of the Project alignment has identified several neighbourhoods across three districts—Serik, Manavgat, and Alanya—that are located within the immediate vicinity of the construction area. These are listed in Table V.1. Given their spatial proximity to active construction zones, these neighbourhoods warrant increased attention to ensure that air quality impacts are properly managed.

Table V.1 Settlements Located in The Vicinity of the Motorway Components

Districts	Neighborhoods		
Serik	• Aşağıçatma • Aşağıkocayatak • Burmahancı • Çandır	• Cumalı • Deniztepesi • Dikmen • Kayaburnu	• Kökez • Merkez • Sarıabalı • Üründü • Yukarıkocayatak
Manavgat	• Aksaz • Aşağıışıklar • Bucakşeyhler • Çakış • Çavuşköy • Cevizler • Demirciler • Dikmen • Dolbazlar • Evrenleryavşı • Gültepe • Gündoğdu	• Hacıali • Hacıisalı • Hacıobası • Hatipler • Hocalar • Ilıca • Kadılar • Kalemler • Karacalar • Karakaya • Karaöz • Kızılot • Odaönü	• Örenşehir • Sağırin • Sarılar • Side • Şişeler • Sülek • Taşağıl • Ulukapı • Uzunlar • Yalçıdibi • Yavrudoğan • Yeniköy • Yukarıışıklar
Alanya	• Akdam • Alara • Avsallar	• Çakallar • Elikesik • Emişbeleni • İncekum	• Konaklı • Soğukpınar • Toslak • Türkler

It should be noted that the current designation of sensitive receptors is based solely on geographic proximity to the construction corridor. Air quality dispersion modelling studies have not yet been conducted; as such, the extent and distribution of sensitive receptor areas may be revised once model-based assessments are carried out. These future evaluations will help define more accurately the zones potentially affected by construction-related air emissions and allow for a more refined monitoring and mitigation strategy.

The proximity of some settlements to the Project route—several of which are located directly beneath or adjacent to construction sites—necessitates a proactive air quality monitoring approach. Monitoring efforts should prioritize these sensitive receptors, particularly in areas where baseline data

indicates a potential for pollutant concentrations approaching regulatory thresholds. Measures such as continuous or periodic ambient air measurements, visual inspections, and responsive grievance mechanisms should be implemented to assess the effectiveness of air pollution mitigation strategies.

By aligning targeted air quality monitoring with the spatial distribution of sensitive receptors and integrating feedback from community stakeholders, the Project will be better equipped to maintain compliance with national and international standards, while also safeguarding the health and well-being of local communities. Air quality emissions during construction are closely associated with the locations and operations of site-specific emission sources along the Project corridor. These sources include construction camps; borrow pits, quarries, stream material quarries. The locations and their spatial distribution along the alignment is illustrated in *Figure V.2.*

These components span the entire motorway corridor and are located across Serik, Manavgat, and Alanya districts. Their proximity to settlements requires a targeted emissions monitoring and mitigation strategy. For instance, Construction Camp Sites at Km 64+400, 87+500, and 124+300 will host the workforce, contributing to heating-related emissions, while mechanical plants represent major dust and exhaust emission points. Quarries such as Soğukpınar, Karakaya, and Çenger Stream Quarry are located near residential neighborhoods, increasing the importance of dust suppression measures in those areas. The site layout captured in Figure V.2 allows a clear visualization of how these emission sources align with populated zones. The close proximity of several settlements to the Project route, including areas directly adjacent to construction sites, requires a proactive air quality monitoring approach. Possible problems caused by different types of emissions are listed below (see Table V.2)

Table V.2:Air Emissions and Issues

Emission Types	**Possible Problem**
Dust	Environmental, social, health
Greenhouse Gases (GHG)	Environmental
Exhaust Gases	Environmental, social, health
Vapor	Health, social
Gases	Environmental, social, health

According to the Project components, emission type also changes. The emission sources according to the components and their potential emission types are summarized below (see Table V.3).

Table V.3: Emission Sources in the Project Areas

Project Areas	**Emission Sources**
Road Construction	Excavation and embankment processes, transport vehicles, energy sources (electrical generators), working machinery, blasting activities
Disposal Areas	Excavation and embankment processes, transport vehicles, loading/unloading/disposal processes
Camp Areas	Energy sources (electrical generators), heating systems and transport vehicles inside the camp areas, blasting activities
Quarry and Borrow Areas	Site clearance, spot blasting, earthworks, "open-air" blasting excavation, rock extraction
Washing and Screening Plant, Crushing Plant	Emissions into the atmosphere caused by plant operations and electrical generators

Project Areas	Emission Sources
Concrete Batching Plants	Emissions into the atmosphere from batching plants aoperations and electrical generators
Vehicles	Exhaust emissions

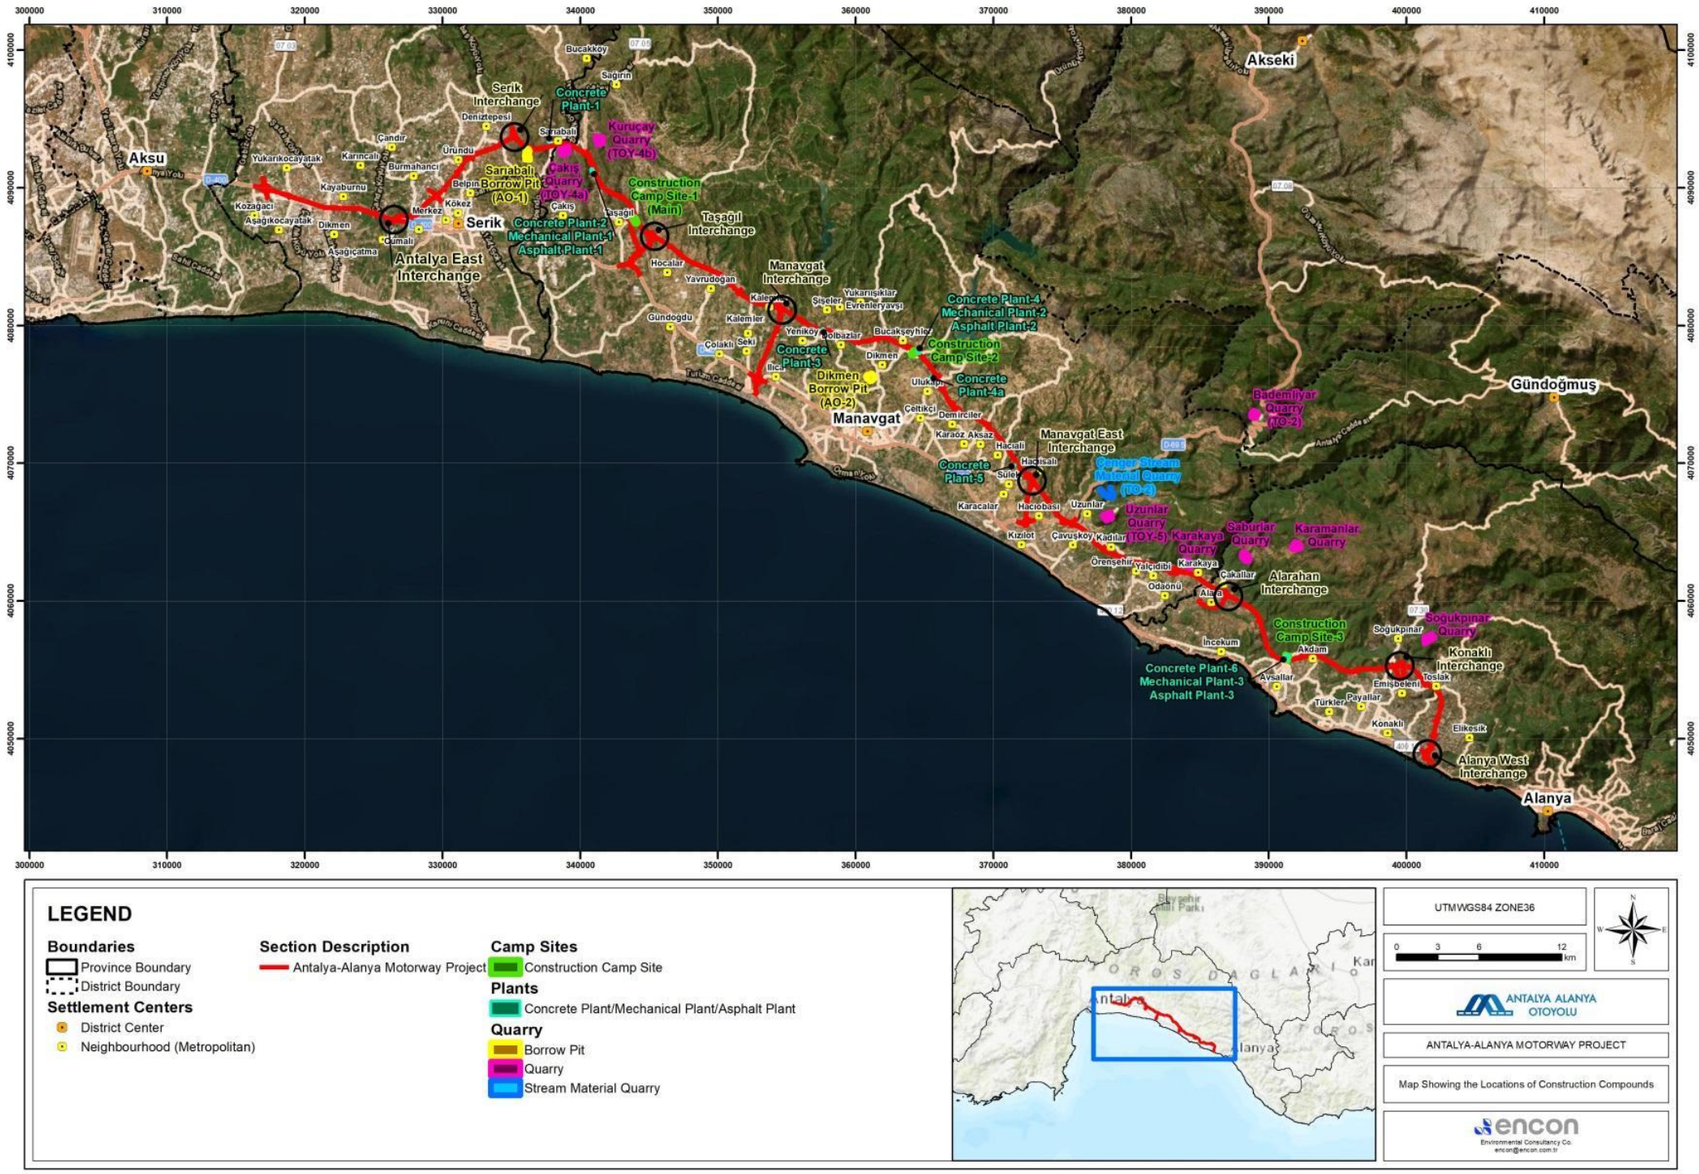

Figure V-2. Spatial Distribution of Construction Camp Sites, Plants, and Material Sources along the Project Route

VI. MITIGATION MEASURES FOR IMPACTS ON AIR QUALITY

The following measures will be implemented throughout the Project sites to prevent or minimize adverse impacts on air quality due to construction activities:

Material Handling and Storage:

- Dust emissions from sources such as conveyors, bins, and crushing-screening plants will be controlled through enclosures, covers, and dedicated dust suppression systems (e.g., water sprays, baghouse filters, or cyclones).
- All dust-emitting units within crushing-screening operations will be placed in enclosed structures equipped with appropriate dust control systems.
- The drop height of fine or dusty materials during loading/unloading will be minimized to reduce airborne dust.
- Loading and unloading operations will be conducted without scattering or throwing materials.

Open Area and Road Dust Controls:

- Open sources such as material stockpiles will be managed using covers, enclosures, or by maintaining adequate moisture content.
- Dust suppression measures including regular watering using water trucks or pressurized spraying systems will be applied on construction sites, service roads, access roads, and at quarry or storage areas. These measures will be enforced as needed, including nights, weekends, and non-working days.
- Speed limits (e.g., 30 km/h general, 20 km/h in residential/village roads) for all construction vehicles will be established and enforced to minimize dust resuspension.
- Project roads, especially those accessing quarries, will be upgraded and widened where necessary to support safe, low-dust vehicle movement.
- If nearby roads are actively used by traffic, continuous dust suppression will be applied to maintain safety and visibility. On unused roads, dust control will focus on residential and commercial areas.

Transport and Vehicle Controls:

- All trucks transporting excavated or raw materials will be covered with nylon tarpaulin.
- Construction vehicles will not be permitted to idle unnecessarily on- or off-site.
- A regular maintenance program will be in place to ensure engine efficiency and minimize emissions.
- Driving through residential settlements will be avoided when alternative routes exist.
- Vehicle exhaust emission measurements will be performed periodically.

Blasting Activities:

- Blasting operations will be conducted in full compliance with applicable regulations and aligned with industry best practices to minimize short-term dust releases.

Dust Barrier and Wind Protection:

- Windbreaks, fences, or vegetative barriers will be installed around material storage areas and other emission-prone zones to reduce dust dispersion.

Monitoring and Compliance:

- Air quality management will comply with legal regulations and applicable international standards.
- During the pre-construction phase, PM10 and PM2.5 will be measured for a period of one week at the locations which will be decided considering the sensitivity of receptors.

Given the current PM concentrations in Hacıali, additional targeted reduction measures are required. These include:

- Dust-generating activities will be limited during stagnant meteorological conditions (e.g., inversions or low wind scenarios).
- Intensive dust-producing operations will be relocated away from Hacıali where technically and logistically feasible.
- Road paving and soil stabilization techniques will be employed to reduce dust lift-off.
- The use of wind barriers or vegetation buffers will be prioritized between emission sources and residential receptors in Hacıali.
- PM_{10} measurements will be conducted in Hacıali (monthly monitoring and, if necessary, more frequent if required in case of any complaints)

GHG specific emissions

Türkiye's NDC commits to a 41% reduction in GHG emissions by 2030 relative to the Business-As-Usual (BAU) scenario, with a peak in emissions by 2038. GHG emissions generated during land preparation and construction phase of the Project can be considered as relatively short-term emissions when compared to the emissions of operation of the Motorway. Within this regard the following measures are suggested to mitigate the potential impacts of the Project on climate change through greenhouse gas emissions:

- High-efficiency and low-emission construction machinery will be prioritized at construction sites to minimize fuel consumption.
- Regular maintenance of equipment will be conducted to improve engine efficiency and reduce the idling time of stop-and-go heavy vehicles.
- Electricity demand during construction activities will be met as much as possible through renewable energy sources.
- The use of recycled and locally sourced materials will be encouraged to reduce indirect emissions from material transportation.
- An effective waste management plan will be implemented to control organic waste that may cause methane emissions.

All these measures will be monitored and reported to align with the Türkiye's 41% reduction target in 2030 ensure that the Antalya–Alanya Motorway serves as a low-carbon transport infrastructure in the long term from existing road network.

- Reduce the requirement for construction materials and excavation. The excavation-fill balance of the project has been optimized to minimize the transport of excavated material, thereby reducing both costs and greenhouse gas emissions.

- Substitute construction elements for lower-carbon alternatives (e.g., specifying concrete with a higher portion of ground-granulated blast furnace slag (GGBS) content which is widely available in Türkiye); and
- Use efficient construction processes, such as design for manufacture and assembly.
- Energy consumption including fuel usage by, for example, reducing the requirement for earth movements to/from and within the construction site will be minimized;
- The local sourcing of materials and local waste management facilities will be maximized.
- The Project with a view to maximizing the potential for reuse and recycling of materials/elements at the end-of-life stage will be specified and constructed. Approximately 90% of the excavated material from the project is planned to be used as fill.
- High efficiency mechanical and electrical equipment will be specified and constructed.
- Transport logistics (locations/routes) will be optimized to ensure efficient carriage of raw materials and promote fuel efficiency
- Vehicle idling times will be reduced through focus on scheduling of construction operations.
- The use of fuel-efficient transportation vehicles will be prioritized, and regular maintenance of vehicles ensured.
- The timing for works implementation (Traffic management) will be optimized to minimize traffic delays due to rehabilitation, widening or maintenance work zones on existing road sections.
- Energy efficiency specifications for new and retrofitted site accommodation (for example, usage of high-efficiency lightning, usage of led lighting, water fixture selection criteria, etc) will be created.
- Sourcing renewable energy will be considered if applicable.
- Energy efficiency usage among workers will be promoted.

AAOİAŞ will ensure that the mitigation measures listed above are implemented by Limak and its subcontractors. In addition, AAOİAŞ commits to review site management and implement suitable additional mitigation measures if monitoring show exceedances of Project standards for dust deposition, PM10 and/or PM2.5, or if complaints regarding dust mobilization / settlement are received.

Ongoing stakeholder engagement will include consultation with authorities, local communities and any other relevant stakeholders with regard to Air Quality Management during construction phase. Any grievances received from stakeholders will be managed in accordance with Grievance Mechanism as detailed in Project SEP.

VII. TRAINING

Upon hiring, all staff will receive structured training addressing sources of air emissions and dust, air quality degradation, and associated health risks, along with the corresponding mitigation strategies applicable to their responsibilities within the project (e.g., appropriate use of protective equipment, maintenance of machinery). In addition, personnel assigned to air quality monitoring will be provided with specialized training to ensure accurate and compliant performance of their duties.

VIII. MONITORING

A structured internal monitoring program will be implemented to assess the effectiveness of air quality and emissions mitigation measures outlined in this Plan during the construction phase of the Project. The scope and frequency of monitoring activities will be periodically reviewed and revised where necessary, based on site-specific conditions, air quality trends, stakeholder concerns, or changes in applicable environmental regulations.

Monitoring activities will be coordinated by E&S Manager and his/her team, in close collaboration with the H&S Manager and his/her team. Key responsibilities will include verifying the implementation of dust suppression practices, monitoring equipment and vehicle emissions, evaluating the maintenance status of construction machinery, and ensuring the consistent application of mitigation measures near sensitive receptors such as residential areas, schools, and healthcare facilities.

Regular air quality monitoring will be conducted at designated locations across all worksites to evaluate compliance with national ambient air quality standards and Project-specific emission limits. This will include the measurement of key parameters such as PM_{10}, $PM_{2.5}$, NO_x, and SO_2, as well as visual inspections for dust dispersion, and checks on the use of water spraying systems and covering of materials during transport and storage.

The performance of contractors and subcontractors in implementing air quality management requirements will be reviewed through environmental audits, site supervision reports, and field observations. Any identified non-conformities will trigger timely corrective and preventive action plans. Monitoring will also include follow-up assessments to confirm the effectiveness of implemented measures and to ensure recurrence is prevented.

In addition to internal monitoring, inspections may be carried out by relevant public institutions, including the Ministry of Environment, Urbanization and Climate Change, in accordance with Turkish legislation. The frequency and scope of these inspections will be determined by the authorities and may include review of monitoring data, on-site emission control practices, and documentation of compliance.

- Periodic visual inspections of activities resulting in impact to air quality. Visual inspections will reflect the ethos of ‘see it, own it’, in terms of identifying and addressing significant air quality impacts. Where significant impacts are observed, these will be recorded and closed out.
- Regular inspections during the site preparation phase to review air and dust issues and dust suppression techniques altered as required.

Dust monitoring will primarily be addressed through site inspection to ensure that good site practice with respect to dust control is being effectively implemented on site. Dust sampling is not considered to be an effective means of monitoring dust during construction due to the delay between sampling and the receipt of sampling results. More immediate real time means of identifying unacceptable levels of dust, such as visual observation, is required so that remedial measures can be

implemented immediately. Environmental Engineer will assess on a daily basis the level of dust during construction activities at the RoW, access roads, camp site, general facilities and all temporary facilities. Mitigation measures will be implemented as required immediately. If there is a complaint from the sensitive receptors about the dust generation, then dust measurement will be conducted. Dust monitoring samples will be taken at sensitive receptors' locations according to the ESIA requirements.

Monitoring efforts will be guided by the framework provided in Table VIII.1, which outlines the parameters to be monitored, the corresponding monitoring locations, frequency of measurements, and responsible parties. These monitoring activities will be essential for evaluating the effectiveness of air quality and emissions mitigation measures and ensuring full compliance with national regulations and Project standards.

Table VIII.1 Key Monitoring Activities

Parameter	Monitoring Station / Location	Monitoring Method	Monitoring Frequency	Responsible Parties
PM_{10}, $PM_{2.5}$, Settled Dust, NO_x, SO_x, VOC	Sensitive receptors*	Site measurements	Quarterly and upon grievance	AAOİAŞ, EPC , Accredited Laboratories
PM10	Hacıali and other sensitive locations which will be decided considering result of modelling studies	Site Measurements	Monthly and upon grievance	AAOİAŞ, EPC, Accredited Laboratories
Number of water trucks and frequency of road watering	Camp sites, road construction sites, quarries, stabilized roads	Visual inspection	Daily or more frequently during high risk, dry and windy conditions.	AAOİAŞ, Limak
Grievances related to dust and air emissions	The field subject to the complaint	Review of grievance logs	Weekly	AAOİAŞ, EPC,
Weather conditions and humidity	High-risk area due to flammable material storage and close to the forest area	Weather forecast report checking	Daily during summer period	AAOİAŞ, EPC
record findings	Around the site, particularly near receptors (including roads)	Site inspection Inspection log	Daily	SPV & EPC Environmental Engineer
Roads surface integrity and any damage	Internal haul roads	Site inspection	Weekly	Environmental specialist
Exhaust emission measurement for construction vehicle	Vehicles	Measurement	Annually	EPC Environmental Eng.

** Sensitive receptors have been discussed in detail under Chapter V. Air Quality and Emissions Management Approach.*

In cases of non-compliance identified through internal oversight or external audits, AAOİAŞ will ensure that corrective and preventive measures are promptly implemented in coordination with the Contractor (Limak) and relevant subcontractors.

All air quality-related findings, including exceedance of limit values, non-compliance incidents, or complaints received from surrounding communities, will be documented in accordance with national environmental regulations and Project procedures. In the event of serious violations—such as significant exceedance of short-term or long-term limit values—AAOİAŞ will ensure that the issue is reported to the competent authorities and that appropriate technical, procedural, and contractual actions are taken.

IX. KEY PERFORMANCE INDICATORS

The following Key Performance Indicators (KPIs) will be monitored, verified, and evaluated.

Table IX.1 Key Performance Indicators – Construction Phase KPIs

Monitoring Parameter / Performance Indicator	Target	Frequency	Responsible Party
On-site air quality training for workers	100% compliance	Monthly	AAOİAŞ, EPC
Complaints related to air quality	Less than five complaints per month	Continuous (upon each complaint)	AAOİAŞ, EPC
Speed limit enforcement for site vehicles	100% compliance with designated limits	Daily	AAOİAŞ, EPC Experts
Vehicle maintenance records	100% compliance with manufacturer's recommendations	Monthly	AAOİAŞ, EPC
PM_{10} and $PM_{2.5}$ particulate matter levels	Should not exceed WHO / IFC and national limit values	Quarterly/Monthly	AAOİAŞ, EPC Accredited Laboratories

X. AUDIT AND REVIEW

The implementation of this Plan should be regularly monitored and reviewed in accordance with the ESMMP. All incidents and non-conformities related to air quality management should be documented and reported as outlined in the Plan. Contractors and subcontractors should be subject to audits conducted by the Project Sponsor within the scope and schedule defined in the Contractor and Subcontractor Management Plan. These audits and the associated records should be managed in compliance with the Project's established management plans. Records to be reviewed during air quality audits will include, but are not limited to, air emissions monitoring reports, water truck operation logs, maintenance records of construction machinery and equipment, dust suppression activity records, environmental permit files for concrete plants, and air quality-related grievance logs. Observations and deficiencies identified during audits should be recorded in formal audit reports, and all findings requiring improvement should be registered under Corrective Actions. Project management should review audit outcomes and corrective action records, follow up on progress, and ensure that additional measures are implemented where necessary to ensure full compliance with national regulations and applicable international standards regarding air quality management.

XI. REPORTING

Regular reporting will be conducted to ensure the effective implementation and continuous improvement of solid waste management activities throughout the construction phase of the Project. Reporting will be structured to address both internal monitoring and auditing outcomes, as well as external compliance obligations and stakeholder engagement requirements.

Based on monitoring results, necessary corrective and preventive actions will be identified, and the required updates will be incorporated into this Plan. The training program will also be revised accordingly to address any observed gaps. Regular audits and visual inspections will be conducted to verify that all activities are being undertaken in accordance with the provisions of this Plan.

Quarterly Environmental and Social Monitoring Report will cover at least, but not limited to, the following items. The report will be prepared by the SPV with input data provided by EPC to evaluate the Project performance and compliance of the related plans.

- KPIs and performance trends (*see Table IX.1*)
- Current situation Key Monitoring Activities (*see Table VIII.1*)
- Relevant training activities completed and attendance registers to be maintained;
- Legal Authorities Audit reports;
- Site Inspection logs

In addition, the following external reporting will be done:

- All environmental and social incidents will be appropriately documented, notified and reported in accordance with established procedures the terms and conditions by EPC to SPV,
- Incident notification and reporting to relevant Turkish regulatory bodies will be performed in line with applicable legislation in force and as stipulated in permits and licenses.
- The Lenders will be notified of incidents pursuant to the terms and conditions agreed upon in the Finance Agreements through SPV.

All personnel are encouraged to raise concerns, suggestions, or complaints related to this Plan through the established grievance mechanism by completing the grievance form. The communication channels available for submitting grievances are outlined in the Stakeholder Engagement Plan.

HAZARDOUS MATERIAL MANAGEMENT PLAN

I. INTRODUCTION

Ministry of Transport and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), through the General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project, has initiated a tender process for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). Following the tendering process, KGM has awarded Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ or the Project Sponsor) with a Build, Operate and Transfer (BOT) contract for the implementation of the Project. Accordingly, AAOİAŞ will be referred as Project Sponsor[1] in the scope of this report. The main contractor for the Project has been designated as Limak and will henceforth be referred to as the Contractor (or EPC).

The Project is designed to connect the district Serik and Alanya via the Manavgat district of Antalya province will enhance the existing transportation network services with its surrounding provinces: Burdur, Muğla, Konya, Isparta, Karaman and Mersin. Various environmental, social, and technical studies have been conducted along the initial route of the Project tendered by the KGM. Based on these studies, the route was optimized, incorporating engineering practices and addressing environmental and social considerations, particularly issues of involuntary and economic resettlement, before being finalized. According to the most current design, the total length of the Motorway, which will be a dual carriageway of mostly 3 and partially 2 lanes (3x2 and 2x2) in each direction, is 117.8 kilometers including the main carriageway and the access roads[2].

This Hazardous Material Management Plan ("HMMP" or "Plan") has been prepared by Antalya-Alanya Highway Construction Investment and Operation Inc. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Highway Project ("Project") in accordance with national legislation, the Equator Principles ("EP"), the International Finance Corporation ("IFC") Performance Standards ("PSs"), and the international standards referred to in the relevant legislation section . The Plan covers the construction phase of the Project.

I.1 Project Description

The Project begins at Serik Interchange (Km: 52+000) and then proceeds eastward, following the corridor at the foothills of the Taurus Mountains within the boundaries of Serik and Manavgat districts, ending at north of Konaklı neighborhood of Alanya District (Km: 136+000). From this point onwards, the route turns southward with a 2x2 lane connection road and connects to the D400 state road at the Alanya West Interchange.

As of April 2025, the current Project design includes a total of 117.8 kilometers of roadway, comprising 84 kilometers of main road (motorway) and 33.8 kilometers of access roads. Other structures to be built as part of the project are as follows:

- 16 viaducts,
- 22 bridges,
- 305 culverts,
- 25 interchanges,
- 56 overpasses,

[1] The BOT Contract uses the term "Appointed Company" to refer Project Sponsor

[2] It should be noted that the environmental and social baseline characterization, maps and scoping assessments provided in this report are based on the most current design

- 43 underpasses, and
- 5 tunnels.

The map illustrating the construction components and road route within the scope of the Project's construction activities is provided in Figure I-1 .

ANTALYA-ALANYA MOTORWAY PROJECT

Revision No: 3 **Date:** 08.09.2025

HAZARDOUS MATERIAL MANAGEMENT PLAN

II. PURPOSE AND SCOPE

This Plan has been prepared by Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Motorway Project ("the Project").

This management plan is a living document developed with the best available information and will be reviewed and revised as necessary due to the nature of the construction and progress.

The purpose of this Plan is to define the principles and procedures for the management of hazardous materials in accordance with applicable national regulations and international standards. The Plan aims to minimize risks to human health, property, and the environment arising from the use, storage, transportation, and disposal of hazardous materials during the construction phase.

This Plan outlines actions that should be done to ensure that hazardous materials are handled in a safe, compliant, and environmentally responsible manner. It also provides guidance on spill prevention and response, storage and transportation protocol. Moreover, the comprehensive management of h azardous wastes is thoroughly detailed in the solid waste management plan .

The Plan should be implemented by all parties involved in the construction phase, including the Project Sponsor – AAOİAŞ , the Main Contractor (Limak), and all subcontractors. Roles and responsibilities regarding hazardous materials management should be clearly defined. The Plan should be reviewed and updated as necessary to reflect changes in project conditions, design, or legal requirements.

III. LEGISLATIVE FRAMEWORK AND REFERENCE STANDARDS

This Plan has been developed in alignment with both national legislation and internationally recognized environmental and social standards. The legal and institutional framework presented below defines the obligations and guidance applicable to the management of hazardous substances during the construction phase of the Project.

III.1 National Requirements

The following Turkish laws and regulations should be used as the legal basis for the management, storage, transportation, and disposal of hazardous materials during construction:

- Environmental Law (Law No. 2872),
- Occupational Health and Safety Law (Law No. 6331),
- Regulation on Environmental Impact Assessment,
- Regulation on Environmental Permits and Licenses,
- Regulation on Waste Management,
- Regulation on Waste Oil Management,
- Regulation on Waste Batteries and Accumulators,
- Regulation Regarding Transport of Hazardous Materials on Highways
- Regulation on the Control of Medical Wastes,
- Regulation on the Classification, Labeling and Packaging of Substances and Mixtures,
- Regulation on Safety Information Forms on Hazardous Substances and Mixtures
- Regulation on Occupational Health and Safety in Construction Works,
- Regulation on Personal Protective Equipment Use in Workplaces,
- Regulation on Emergency Measures in Workplaces,
- Regulation on Occupational Health and Safety Training,

- Regulation on Health and Safety Signs,
- Regulation on the Use of Work Equipment,
- Regulation on Fire Protection of Buildings,
- Regulation on Workers' Health and Safety in Working with Chemicals,
- Regulation on Preventing and Reducing the Effects of Major Industrial Accidents,
- Regulation on Health and Safety Measures of Working with Asbestos,
- Communiqué on Training Program of Asbestos Demolition,
- Regulation on Biocidal Products.

III.2 International Standards and Guidelines

The following international standards and procedures are applicable to the Project to ensure alignment with national legislation and recognize good industry practices.

AIIB is a multilateral development bank established to promote sustainable economic growth and improve infrastructure connectivity. According to the Articles of Agreement, AIIB aims to invest in infrastructure and productive sectors while fostering regional cooperation through partnerships with other development institutions. To ensure responsible operations, AIIB adheres to policies that address environmental and social impacts, outlined in its Environmental and Social Framework (ESF). The ESF, updated in June 2024, and reflects AIIB's commitment to international standards and sustainable development practices. The ESF includes the Environmental and Social Policy (ESP), which sets mandatory requirements for all projects.

Also, the following international standards and reference frameworks should be used to align Project practices with international lender requirements and good practice environmental and social management:

- IFC Performance Standards (2012), specifically:
  - Performance Standard 3: Resource Efficiency and Pollution Prevention
  - Performance Standard 4: Community Health, Safety, and Security
- IFC Environmental, Health and Safety (EHS) General Guidelines (2007)
- IFC EHS Guidelines for Toll Roads (2007)
- IFC Guidance Notes (2012)
- Equator Principles IV (2020)
- IFC Sector-Specific EHS Guidelines for Hazardous Materials Management
- Registration, Evaluation, Authorization, and Restriction of Chemicals (REACH)
- European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR)
- International Maritime Dangerous Goods (IMDG) Code
- ICAO Technical Instructions (for air transport)
- Regulations concerning the International Carriage of Dangerous Goods by Rail (RID).

These standards should guide the development of site-specific procedures, monitoring strategies, and corrective actions. In cases where national legislation and international standards diverge, stricter requirements should be adopted.

IV. LINKAGE WITH OTHER PROJECT PLANS AND PROCEDURES

This Plan is supported by other management plans and procedures developed under the Environmental and Social Management System (ESMS) of the Project. The following plans and procedures are

particularly relevant and should be implemented in coordination with the Hazardous Materials Management Plan:

- Solid Waste Management Plan,
- Water Quality, Wastewater and Storm Water Management Plan,
- Community Health and Safety Management Plan,
- Air Pollution and Emission Management Plan,
- Occupational Health and Safety Plan,
- Traffic Management Plan,
- Construction Site Management Plan,
- Environmental, Social, Management and Monitoring Plan (ESMMP),
- Labour and Working Conditions,
- Emergency Response Management Plan,
- Subcontractor Management Plan.
- Training and Communication Management Plan,
- Environmental Accident and Spill Response Management Plan,
- Blasting Management Plan,
- Emergency Preparedness and Response Management Plan.

The effective integration of these plans should be ensured to maintain compliance with national regulations and international standards, and to minimize cumulative environmental, health, and safety risks associated with hazardous material use during the construction phase.

V. ROLES AND RESPONSIBILITIES

Antalya Alanya Otoyol İnşaat Yatırım ve İşletme A.Ş. (SPV) as the Project Sponsor and Limak (EPC) as the main contractor of the Project will be responsible for the following:

General Manager (SPV):

- Follow-up the overall responsibility and accountability for the Project including delivery of the construction activities in line with applicable national and international standards.
- Ensure overall compliance with the HMMP and national regulations.
- Ensure that relevant activities are carried out in accordance with this management plan and related procedures and shall ensure the provision of all sources to carry out this Plan.
- Approve storage, handling, and disposal procedures for hazardous materials.
- Allocate resources for hazardous material management and emergency response.
- Ensures the availability of professional resources and materials, undertake to comply with the Regulation, the Contract and the ESMPs, and demands the respect of the same from the organization. He is also committed to apply for the necessary corrective actions, following the findings of the monitoring action.
- Ensure that relevant activities are carried out in accordance with this management plan and related procedures and shall ensure the provision of all sources to carry out this Plan.
- Ensure that all line managers and subcontractors understand and fulfil their responsibilities with hazardous material procedures during construction phases.

E&S Manager (SPV)

- Prepare, review, update, and implement HMMP, ESMP, and project-specific E&S plans per laws, policies, and standards.

- Coordinate with EPC, subcontractors, and internal teams; provide technical support for E&S plan implementation.
- Monitor compliance, site practices, and record-keeping of actions, incidents, and training.
- Ensure delivery and validation of E&S training.
- Investigate incidents, implement corrective actions, and oversee emergency and safety procedures.
- Prepare reports and maintain documentation for audits, compliance, and grievances.
- Support community engagement, grievance resolution, and coordination with authorities and permit processes.

H&S Manager (SPV)

- Prepare, review, and implement health, safety, community, and hazardous materials plans per company policies, regulations, standards, and lender requirements.
- Ensure EPC and subcontractors follow H&S, community safety, and hazardous materials handling procedures, including site boundaries and method statements.
- Provide technical support for safe implementation of hazardous material and safety plans; integrate controls into daily work.
- Monitor compliance, conduct inspections, audits, and hazard walkthroughs, including hazardous materials storage and use.
- Track safety and hazardous material performance, investigate incidents, identify root causes, and implement corrective actions.
- Support H&S and hazardous material training, maintain records, and report performance to management and stakeholders.
- Engage with regulatory authorities and ensure timely resolution of public health, safety, and hazardous material-related complaints.

Deputy E&S Manager (SPV)

- Lead Environmental, Social, and Hazardous Materials management and ensure compliance.
- Review subcontractors' ESHS and hazardous material documents.
- Monitor performance, incidents, and corrective actions.
- Ensure EPC and subcontractors follow E&S and hazardous material procedures.
- Support training, record-keeping, and reporting.
- Oversee community engagement and grievance management.
- Coordinate environmental, social, and hazardous material monitoring.

Social Chief (SPV)

- Ensure EPC and subcontractors follow the HMMP.
- Review reports and ensure compliance with regulations and standards.
- Train staff in engagement, grievance handling, and hazardous materials management.
- Coordinate with E&S Deputy Manager and construction teams on community and hazardous materials issues.

HSE Specialist (SPV)

- Support H&S and HMMP; ensure safe site activities.
- Conduct inspections, hazard assessments, audits, and follow up corrective actions.
- Monitor compliance and integrate H&S and hazardous material measures into work procedures.
- Maintain documentation of permits, incidents, training, and corrective actions.

- Participate in investigations and implement lessons learned.
- Support and review H&S and hazardous material training for site personnel.
- Ensure proper site demarcation, signage, and barriers.
- Assist in resolving safety and hazardous material-related complaints.

Project Director (EPC)

- Define and oversee EPC execution strategy, project management plans (HSE, E&S, QA/QC), and hazardous materials management.
- Lead teams and coordinate EPC functions, ensuring compliance with plans, standards, regulations, and hazardous material procedures.
- Approve and monitor site inspections, safety reviews, and training, including hazardous materials handling.
- Track KPIs, timelines, budgets, and implement corrective actions for non-compliance, including hazardous material issues.
- Serve as EPC representative to SPV, clients, stakeholders, and authorities; address safety, environmental, social, and hazardous material concerns.
- Oversee risk management, quality systems, and mitigation strategies covering technical, HSE, social, and hazardous material aspects.
- Supervise subcontractors and ensure proper execution of construction phases and hazardous materials management.

E&S Manager (EPC)

- Prepare, review, and implement E&S and Hazardous Materials Management Plans per policies, standards, and lender requirements.
- Coordinate with SPV, contractors, and construction teams to ensure compliance and effective site practices.
- Monitor and enforce contractor/subcontractor compliance with E&S and hazardous material requirements.
- Ensure site boundaries, traffic, utility protection, and community safety measures are maintained.
- Oversee E&S training, onboarding, toolbox talks, and awareness programs for all personnel.
- Supervise E&S staff, monitor performance, lead investigations, and implement corrective actions.
- Manage grievance resolution, emergency preparedness, and integration of social inclusion principles.
- Report E&S and hazardous material performance to Project Director and promote continuous improvement.

H&S Manager (EPC)

- Develop, implement, and update the H&S and Hazardous Materials Management Plans.
- Ensure EPC and subcontractors fully comply with safety and hazardous material requirements.
- Manage risk assessments, site safety controls, traffic, utilities, and community protection.
- Lead inspections, incident investigations, and corrective actions, including hazardous material events.

- Oversee training, toolbox talks, and emergency drills on health, safety, and hazardous materials.
- Report performance and risks to the Project Director and foster a proactive safety culture.

Biodiversity Specialist (EPC)

- Ensure integration of biodiversity safeguards into the HMMP, preventing contamination of soil, water, and ecosystems.
- Oversee ecological mitigation measures (e.g., buffer zones, habitat restoration) that also serve as protective barriers against hazardous material impacts.
- Train site teams on biodiversity–hazardous material interactions, raising awareness of risks to sensitive habitats and species.
- Monitor biodiversity indicators and report non-compliances related to hazardous material impacts to the E&S Manager.
- Coordinate with contractors and subcontractors to include biodiversity and hazardous material controls in work plans and method statements.

Warehouse Supervisor (EPC)

- Keep accurate records of all hazardous materials upon receipt and during distribution.
- Ensure safe and secure storage in designated areas with proper labeling and containment.
- Conduct regular inventory checks to monitor stock levels and avoid shortages or excess.
- Prevent risks by identifying and reporting damaged, expired, or leaking hazardous materials, arranging for safe disposal in compliance with regulations.
- Maintain complete documentation of inventory, inspections, and disposal activities for auditing and compliance purposes.
- Coordinate with the E&S Manager and HSE team during inspections, audits, and incident investigations related to hazardous materials.
- Support training and awareness on safe handling, storage, and emergency procedures involving hazardous substances.

Transport Coordinator / Logistics Team (EPC)

- Ensure all hazardous materials are transported via licensed carriers and in compliance with ADR, IMDG, ICAO, and RID regulations
- Maintain proper documentation for transportation.
- Provide spill containment kits and secondary containment during transfers.
- Confirm containers are approved, labeled, and leak-proof before transport.

Maintenance Team / Equipment Operators (EPC)

- Regularly inspect machinery and equipment to prevent leaks or contamination.
- Manage collection and temporary storage of oil and oily residues according to approved procedures.

Ensure used oil is sent to authorized recycling or disposal facilities without mixing with other chemicals.

Emergency Response Team (EPC)

- Conduct drills and respond to chemical spills, fires, or other hazardous incidents.
- Maintain and operate firefighting equipment near hazardous material storage.

- Coordinate with Safety Officer and Project Manager during emergencies.
- Ensure fire exits and evacuation routes are always clear.

Site Doctor (EPC)

- Provide first aid, medical care, and emergency response for incidents, including hazardous material exposure.
- Monitor workers' health, detect occupational illnesses/injuries, and recommend preventive measures.
- Maintain confidential health records, including hazardous material–related cases.
- Ensure medical equipment, first aid kits, and emergency protocols are ready and aligned with HMMP.
- Support training and awareness on health risks, hygiene, sanitation, and hazardous material safety.
- Coordinate with H&S teams, external hospitals, and authorities for emergencies and compliance.

Paramedic (EPC)

- Provide emergency medical care for all site incidents, including hazardous material exposures.
- Assist the Site Doctor with health monitoring, records, and follow-up treatments.
- Maintain and monitor first aid kits, emergency supplies, and decontamination equipment.
- Respond to accidents or hazardous material incidents and report details accurately.
- Participate in drills, health awareness, and hygiene programs related to hazardous materials.
- Report health risks and exposure trends to the Site Doctor and H&S Manager.

Environmental Engineer (SPV and EPC)

- Implement and monitor the Environmental & Social Management Plan (ESMP) and Hazardous Materials Management Plan (HMMP) on-site, including subcontractor activities.
- Conduct routine inspections and audits to ensure safe handling, storage, and disposal of hazardous materials and general environmental compliance.
- Maintain environmental records, support reporting, and assist in incident investigations, including hazardous material incidents.
- Provide training, toolbox talks, and awareness programs on environmental and hazardous material management.
- Coordinate with H&S, Social teams, contractors, and regulators to integrate environmental and hazardous material requirements into site activities.
- Support obtaining, renewing, and complying with all environmental permits.

Community Liaison Officer (CLO) (SPV and EPC)

- Communicate project activities and potential hazardous material risks to local communities.
- Organize community meetings, focus groups, and engagement forums to inform and receive feedback.
- Manage grievances and complaints, including those related to hazardous material incidents, through the Grievance Mechanism (GM).
- Assess impacts on vulnerable or marginalized groups and propose tailored mitigation or engagement approaches.

- Support monitoring, reporting, and documentation of community concerns and contractor compliance with environmental and hazardous material measures.
- Maintain confidentiality and ensure proper handling of sensitive community information.

All Personnel (including Contractor/Subcontractor Personnel)

- Follow the Hazardous Materials Management Plan (HMMP) and related procedures during all site activities.
- Report any non-compliance or hazardous material incidents to the CLO and E&S Manager.
- Participate in relevant HMMP and safety training programs.
- Ensure safe handling, storage, and use of hazardous materials in daily work.
- Take responsibility for implementing HMMP requirements and maintaining a safe working environment.

VI. HAZARDOUS MATERIAL MANAGEMENT APPROACH

The management of hazardous materials is critical to ensuring environmental protection, worker safety, and regulatory compliance throughout the project lifecycle. Structured approach reduces risks to human health and the environment, ensures regulatory compliance, and supports the project's overall environmental and social management objectives. This approach establishes procedures for the identification, handling, storage, transport, and disposal of all hazardous substances used or generated on-site.

- All hazardous materials are cataloged according to type, quantity, and associated risks. Materials are classified in line with local regulations and internationally recognized standards (e.g., GHS – Globally Harmonized System of Classification and Labeling of Chemicals).
- Hazardous substances are stored in designated, secure areas with appropriate containment systems to prevent leaks or spills. Storage facilities are equipped with fire suppression, secondary containment, and clear labeling.
- Staff handling hazardous materials receive specialized training on safe procedures, personal protective equipment (PPE) use, and emergency response.
- Movement of hazardous materials follows strict protocols to prevent accidents and environmental release, including secure packaging, labeling, and transport documentation.
- Spill response kits, fire-fighting equipment, and emergency action plans are maintained and regularly tested. Clear reporting and notification procedures are in place.
- Hazardous waste is segregated, treated, or disposed of according to national regulations and international best practices, minimizing environmental impact. Where feasible, recycling and recovery options are implemented.
- Regular inspections, audits, and monitoring ensure adherence to management procedures, legal requirements, and performance standards. Records are maintained for traceability and reporting purposes.

During the construction works, both temporary and permanent facilities will be established. These include construction campsites, concrete and mechanical plants, quarries, borrow pits, service roads, and other supporting infrastructure. Hazardous materials such as fuel and oil will be stored in designated depots within the three project campsites (Temporary Taşağıl, Manavgat, and Alanya). Temporary construction camps with facilities, borrow pits / quarries

.

During the construction phase of the Project, the main types of hazardous materials are the following:

- Chemical solutions used in construction and maintenance activities;
- Empty or partially full chemical containers;
- Flammable materials;
- Contaminated soil and absorbent materials;
- Contaminated materials such as used personal protective equipment (PPE), workwear, and other construction-related materials.

At the project's camping sites, hazardous materials such as lubricants and chemicals are carefully managed to protect workers, residents, and the surrounding environment. All materials are stored in designated, secure areas with secondary containment to prevent leaks or spills, and access is restricted to trained personnel only. Refueling and transfer operations are conducted in controlled zones equipped with spill response kits and fire-fighting equipment. Staff are provided with personal protective equipment (PPE) and trained in safe handling, emergency response, and proper disposal of hazardous material. Regular inspections, monitoring, and record-keeping ensure compliance with regulatory requirements and minimize the risk of contamination or accidents in the camp areas.

HAZARDOUS MATERIAL MANAGEMENT PLAN

Within the scope of the project, hazardous chemicals and substances will be stored in chemical storage areas in accordance with the storage conditions specified in their Safety Data Sheets (SDSs). There will be at least one hazardous material storage area in every construction site. These storage areas will be properly ventilated in accordance with the SDSs, protected from moisture, humidity, and sunlight, equipped with the necessary fire extinguishing systems, and fitted with spill kits for use in the event of a spill. Chemicals will be stored separately according to their types, and their placement will be determined based on their properties such as flammability, combustibility, corrosiveness, acidity, etc.

The hazardous storage areas will have their own spillage control bund. The areas will be protected against wind and rain, securely fenced and access to this site will be provided only for authorized people. These areas will also be labelled as hazardous storage areas. There should be a secure section to keep personal protection equipment, spill kits (e.g. absorbents), emergency equipment (for firefighting), eyewash and emergency shower and the SDSs for storage hazardous chemicals.

All fuel depots and tank farms will be equipped with secondary containment (e.g., bunds) to prevent soil and water contamination. Storage and handling areas will be clearly marked, fenced, and access controlled. Fuel and oil stockpiling in open areas will not be permitted. Under the EPA SPCC Regulation, flood (secondary) containment capacity of at least 110% of the volume of the facility's largest storage tank must be provided (see Figure VI-1).

Figure VI-1 . Fuel depots and tanks

The transportation of hazardous material will be undertaken using licensed transportation companies, in accordance with national regulations. Hazardous material will be transported in leak-proof, securely closed, and clearly labeled containers to prevent spillage, leakage, or human exposure. All transport activities will ensure the protection of personnel and environmental integrity throughout the process. Final disposal of hazardous waste will be carried out at licensed treatment and disposal facilities, based on the classification and properties of the waste. Moreover, the comprehensive management of hazardous waste is thoroughly detailed in the Solid Waste Management Plan.

Waste oils will be transported to the licensed processing and disposal/recover facilities. Waste Oil Declaration Form in Appendix of Regulation on Management of Waste Oils will be filled and sent to the Provincial Directorate of Environment, Urbanization and Climate Change by the end of February of the following year.

Explosives and blasting materials will not be stored on-site under any circumstances. Moreover, campsites will include facilities such as cafeteria, infirmary, showers and toilets, wastewater treatment plants/septic tanks, water supply facilities. The implementation of this project will be entirely pesticide-free.

Inventory and stock control will be carried out regularly by the Warehouse Supervisor. As part of the HMMP, the Supervisor will ensure that all hazardous materials are properly recorded upon receipt, stored in designated and secure areas, and distributed in line with safety procedures. The Supervisor will also be responsible for monitoring stock levels, preventing overstock or shortages, and ensuring that expired or damaged materials are immediately reported and safely disposed of in accordance with applicable regulations. Regular inspections and documentation will support compliance with environmental, health, and safety standards throughout the construction period

To support proper classification and management of hazardous materials, Table VI.1 outlines the key hazardous characteristics used to define substances and materials under national and international standards. This table should be used as a complementary reference when assessing whether a substance presents a risk to human health or the environment, particularly when it is not immediately clear whether a material meets the criteria of hazardous material. The hazardous characteristics of substances and materials are summarized in Table VI.1 .

Table VI-1 Hazardous Characteristics of Substances and Materials

Characteristic	Definition
Explosive	Substances and preparations that can explode in the presence of a flame or are more sensitive to shock and friction than dinitrobenzene.
Oxidizing	Substances and preparations that, in contact with other materials, especially flammable ones, cause strongly exothermic reactions.
Highly Flammable	Substances and preparations that (i) in liquid phase have a flash point below 21°C or spontaneously ignite in air, (ii) in solid phase ignite easily and continue burning, (iii) in gas phase are flammable under normal pressure, or (iv) produce flammable gases upon contact with water or moist air.
Flammable	Liquid substances and preparations with a flash point equal to or greater than 21°C and equal to or less than 55°C.
Irritant	Non-corrosive substances and preparations that may cause inflammation upon immediate, prolonged, or repeated contact with skin or mucous membranes.
Harmful	Substances and preparations that may pose limited but significant risks when inhaled, ingested, or absorbed through the skin.
Toxic	Substances and preparations that may cause serious, acute or chronic health risks, or death when inhaled, ingested, or absorbed through the skin (including highly toxic substances).
Carcinogenic	Substances and preparations that may cause or increase the risk of cancer when inhaled, ingested, or absorbed through the skin.
Corrosive	Substances and preparations that can destroy living tissue upon contact.
Infectious	Substances containing microorganisms or their toxins known to cause disease in humans or other organisms, or with a reasonable assumption of such risks.
Reproductive Toxic	Substances and preparations that may cause or increase non-hereditary adverse effects in offspring or impair reproductive functions and capabilities.
Mutagenic	Substances and preparations that may cause or increase the frequency of heritable genetic disorders when inhaled, ingested, or absorbed through the skin.
Reactive with Water	Substances and preparations that release toxic or highly toxic gases upon contact with water, air, or acids.
Sensitizing	Substances and preparations that may cause hypersensitivity when inhaled or absorbed through the skin, so that repeated exposure leads to harmful effects.
Eco toxic	Substances and preparations that pose actual or potential immediate or delayed risks to one or more environmental components.
Dangerous to the Environment	Substances and preparations that, upon disposal, may exhibit one or more hazardous characteristics by any pathway (e.g., via leachate or breakdown products).

VII. MITIGATION MEASURES FOR IMPACTS OF HAZARDOUS MATERIALS

The following mitigation measures will be implemented under the H MMP to ensure proper handling, storage, transportation, and disposal of hazardous material during the construction phase of the Project.

General Principles

- All necessary measures will be taken to prevent the release of hazardous materials and minimize environmental impact.
- Hazardous substances will not be disposed of on-site (e.g., incineration, burial) and will not enter surface water, groundwater, or areas where they could cause harm.
- Oil and oily residues will be collected and managed according to approved procedures. Where appropriate, used oil may be sent to authorized facilities for recycling or reuse, ensuring it is not mixed with degreasers, solvents, antifreeze, or brake fluid.
- Construction machinery and equipment will be regularly inspected and maintained to prevent spills or contamination.
- Material Safety Data Sheets (MSDS) for all hazardous substances will be available in storage and working areas.
- Full compliance with national regulations will be ensured.
- Hazardous materials in solid or liquid form will be stored in appropriate containers with clear labeling of type, source, quantity, and storage date.
- Hazardous materials will be transferred only to licensed facilities authorized for handling, recovery, recycling, or disposal.
- Proper labeling of hazardous products will be maintained, including content descriptions, quantity, and storage dates.
- Personnel handling hazardous materials will wear appropriate Personal Protective Equipment (PPE).
- Corrosive liquids will be stored separately from flammable substances.
- Information posters on hazardous materials will be displayed in accessible areas.
- Regular inspections will be conducted to ensure compliance with hazardous material management procedures.
- Medical materials from on-site medical facilities will be temporarily stored in sealed, labeled containers and disposed of according to regulations.
- Materials potentially containing hazardous substances (e.g., detergents, petroleum products, asphalt, concrete compounds) will be handled and stored to prevent environmental release.
- A hazardous materials minimization program will be implemented, including substitution with safer alternatives where feasible.
- Engineering controls and technological improvements will be applied to mitigate chemical risks.
- Site-specific and individual risk assessments will be conducted for each hazardous chemical prior to use.
- Collective protective measures (e.g., ventilation, process modifications) will be prioritized, with personal protection used where necessary.
- All control measures will be regularly monitored for effectiveness.
- Working alone with hazardous chemicals is strictly prohibited.
- Eating, drinking, and smoking are not allowed in hazardous material handling or storage areas.
- All personnel must receive hazardous chemical handling training before starting work.

Classification and Labeling of Hazardous Materials

- Hazardous chemicals will be classified based on their physical, toxicological, and environmental risks. This information will be available in Material Safety Data Sheets (MSDS) and on chemical labels.
- Classification aims to identify the risks of chemicals during handling and usage. Once classified, hazardous substances will be properly labeled to inform workers, the public, and the environment.
- Project suppliers will be required to comply with REACH (Registration, Evaluation, Authorization, and Restriction of Chemicals) regulations for hazardous material supply.
- Labels will include the chemical's common and trade names, potential physical and health hazards, the manufacturer's name, and relevant pictograms and warning signs.
- Labels must be applied to all primary and secondary containers to ensure proper identification.
- MSDS will be obtained before hazardous materials arrive on-site.
- Hazardous material storage risks will be assessed beforehand to prevent irreversible damage.
- MSDS will be provided to relevant personnel, including environmental specialists, safety officers, and emergency response teams.
- All hazardous substances will be labeled as "hazardous" and stored accordingly.
- MSDS will be regularly updated and revised as needed.
- Chemical storage risks will be identified in advance to prevent accidents.

Transportation of Hazardous Chemicals

- Hazardous chemicals transported via road, sea, air, or rail will comply with the ADR (European Agreement concerning the International Carriage of Dangerous Goods by Road), the IMDG Code (International Maritime Dangerous Goods Code), ICAO Technical Instructions (for air transport), and RID (Regulations concerning the International Carriage of Dangerous Goods by Rail).
- Hazardous material transportation will be conducted by licensed transport companies and comply with legal requirements.
- Spill prevention kits and secondary containment systems will be available at all hazardous material transfer points.
- Proper documentation for transportation will be completed by trained personnel.
- Hazardous substances will be transported in approved, labeled containers.
- Drip trays and spill containment kits will be used to prevent leaks during material transfers.

Storage of Hazardous Materials

- Chemicals will be classified and segregated to prevent hazardous reactions.
- The priority order for hazardous material storage will be as follows: infectious materials, radioactive materials, explosive materials, compressed, liquefied and dissolved gases and pressurized small gas containers, self-igniting materials, materials that emit flammable gas upon contact with water, organic peroxides, oxidizing materials, flammable solids, flammable liquids, flammable liquids, flammable toxic materials, non-flammable toxic materials, flammable corrosive (corrosive) materials, non-flammable corrosive (corrosive) materials, flammable liquids that do not fall under Class 3A or 3B, flammable solids, non-flammable liquids, and non-flammable solids.
- Flammable, oxidizing, and toxic materials will be stored separately.
- Storage areas will be fire-resistant, ventilated, and clearly marked.

- Secondary containment systems will be used to prevent spills.
- Regular safety inspections will be conducted on storage areas.
- Chemical inventory records will be maintained.
- Proper fire prevention measures (e.g., fire extinguishers, emergency exits) will be in place.

Fire Safety and Emergency Response

- Fire safety measures will include the identification of hazardous materials storage areas, the designation of safe fuel transfer locations, and the strict control of ignition sources along with smoking restrictions.
- Fire extinguishers will be strategically placed near hazardous material storage areas.
- Emergency response drills will be conducted regularly.
- Fire exits will remain unobstructed at all times.
- All personnel will be trained in hazardous material fire response procedures.
- Only authorized personnel will handle hazardous substances.

VIII. TRAINING

Upon hiring, all staff will receive structured training addressing the risks associated with hazardous material handling, storage, transportation, and disposal, as well as the corresponding mitigation strategies applicable to their responsibilities within the Project. This training will include guidance on appropriate use of personal protective equipment (PPE), spill prevention techniques, labeling and segregation requirements, and proper disposal procedures.

As part of the hazardous materials management requirements, targeted training will also be provided as outlined below:

- All personnel involved in the handling, storage, use, and transportation of chemical substances will be trained by qualified professionals and will be required to understand the potential hazards associated with these activities. Only trained and experienced personnel selected by authorized experts will be permitted to carry out these tasks.
- Individuals will not be authorized to undertake responsibilities involving chemical substances unless they have completed the required chemical handling training program in accordance with this standard.
- Chemical handling training will be provided at least once to all employees throughout the Project duration, with refresher training delivered as necessary. This training will also be mandatory for contractor and all subcontractor personnel employed on the Project.
- The training and awareness sessions will include information obtained from risk assessments; identification and recognition of hazardous chemical substances present or potentially arising in the workplace, associated health and safety risks, occupational illnesses, occupational exposure limit values, and applicable legal requirements; precautionary measures and safe practices to prevent endangering oneself or others; information on Material Safety Data Sheets (MSDS) provided by the supplier in the language understood by workers; and labeling and lockout/tag out requirements for areas, containers, piping systems, and similar installations containing hazardous chemical substances in accordance with relevant regulations.

The overall training framework will be developed by the E&S and/or H&S Manager and disseminated to all relevant Project stakeholders for implementation. Training records will be maintained, and continuous monitoring of staff competency will be ensured to verify effective understanding and application of safe hazardous management practices.

IX. MONITORING

A structured internal monitoring program will be implemented to assess the effectiveness of hazardous materials management and associated mitigation measures outlined in this Plan during the construction phase of the Project. The scope and frequency of monitoring activities will be periodically reviewed and revised where necessary, based on site-specific conditions, trends, stakeholder concerns, or updates in applicable environmental and health and safety regulations.

Monitoring activities will be coordinated by the E&S Manager, in close collaboration with the H&S Manager and General Manager. Key responsibilities will include verifying the implementation of hazardous materials storage and handling protocols, reviewing documentation on chemical inventories, and ensuring the consistent application of safety measures near sensitive receptors such as work camps, storage yards, and worker accommodation units.

Regular inspections will be conducted by E&S Specialist at designated locations across all worksites to evaluate compliance with national hazardous waste regulations and Project-specific management procedures. This will include review and control of the following:

- The list of hazardous materials and chemicals supplied, stored, and used on-site, including information on their type, quantity, and volume.
- Hazardous material management and disposal agreements with licensed companies to ensure legal compliance and traceability.
- Hazardous compartments within Storage Areas to confirm compliance with storage and containment requirements.
- Site practices related to hazardous management—including general housekeeping rules, source separation practices, container integrity, and containment infrastructure.

In addition, a daily general site overview will be conducted by the E&S Specialist to observe construction progress, site organization, and general environmental conditions. Monthly coordination meetings will also be held with project management teams to report on the key findings from monitoring activities and to provide feedback on overall environmental performance.

The performance of contractors and subcontractors in implementing hazardous materials management requirements will be reviewed through environmental audits, site supervision reports, and field observations. Any identified non-conformities will trigger timely corrective and preventive action plans. Monitoring will also include follow-up assessments to confirm the effectiveness of implemented measures and ensure recurrence is prevented.

In addition to internal monitoring, inspections may also be carried out by relevant public institutions, including the Ministry of Environment, Urbanization and Climate Change, the Ministry of Health, and the Ministry of Labor and Social Security, in accordance with Turkish legislation. The frequency and scope of these inspections will be determined by the competent authorities and may include on-site assessments, documentation review, and verification of compliance with hazardous material management standards.

Monitoring efforts will be guided by the framework provided in Table IX.1, which outlines the parameters to be monitored, the corresponding monitoring locations, frequency of inspections, and responsible parties. These monitoring activities will be essential for evaluating the effectiveness of hazardous materials management and ensuring full compliance with national regulations and Project-specific requirements.

Table IX-1 Key Monitoring Activities

Parameter	Monitoring Station / Location	Monitoring Method	Monitoring Frequency	Responsible Parties
The list of hazardous materials and chemicals supplied, stored, and used on-site, including information on their type, quantity, and volume	Camp sites, road construction sites, quarries	Site audit, document review	Monthly	SPV E&S Engineer EPC E&S Engineer
Soil contamination risk from hazardous substances (e.g., fuel	Project area and sensitive receiving environments (e.g., soil, surface water)	Visual inspection for signs of leakage or spills; inspection of storage and handling practices; SDS and training record review	Daily	AAOİAŞ / Subcontractors
General site practices related to hazardous materials management	Entire construction corridor	Field observations on container integrity, spill kits, PPE use, and storage conformity	Weekly	AAOİAŞ, Independent Environmental Experts
Environmental enforcement actions and non-compliance records	Project area	Review of regulatory audit reports, notifications, and enforcement communications	Monthly	AAOİAŞ, Independent Environmental Experts

In the event that non-compliance is identified through internal oversight or external audits, AAOİAŞ will ensure that all corrective and preventive measures are promptly implemented in coordination with the Main Contractor (Limak) and all relevant subcontractors.

All hazardous materials-related findings, including non-compliance incidents, inspection results, or grievances received, will be documented in accordance with national environmental legislation and Project procedures. In the case of significant violations—such as mismanagement of hazardous material or failure to follow approved storage practices—AAOİAŞ will ensure timely reporting to the competent authorities and initiate all necessary technical, procedural, and contractual measures to ensure legal and environmental compliance.

X. KEY PERFORMANCE INDICATORS

The following Key Performance Indicators (KPIs) will be monitored, verified, and evaluated.

Table X-1 Key Performance Indicators – Construction Phase KPIs

Monitoring Parameter / Performance Indicator	Target	Frequency	Responsible Party
Percentage of inspections completed compared to those planned	100%	Monthly	AAOİAŞ Subcontractors
Percentage of hazardous materials management training sessions completed as planned	100%	Monthly	AAOİAŞ / Subcontractors

Monitoring Parameter / Performance Indicator	Target	Frequency	Responsible Party
Non-conformities related to hazardous materials management	Less than five	Monthly	AAOİAŞ / Subcontractors
Complaints related to hazardous materials management	Less than five	Monthly	AAOİAŞ / Subcontractors
Number of legal penalties issued by authorities in relation to environmental requirement	0	Monthly	AAOİAŞ / Subcontractors
Number of training on hazardous material management for all employees	At least 1 times in a year	Yearly	AAOİAŞ / Subcontractors

XI. AUDIT AND REVIEW

The implementation of this Plan should be regularly monitored and reviewed in accordance with the ESMMP. All incidents and non-conformities related to hazardous materials management should be documented and reported as outlined in this Plan. Contractors and subcontractors should be subject to audits conducted by the Project Sponsor within the scope and schedule defined in the Supply Chain and Subcontractor Management Plan. These audits and the associated records should be managed in compliance with the Project's environmental, health, and safety procedures. Records to be reviewed during hazardous materials audits will include, but are not limited to, chemical inventory logs, MSDS, waste transfer and disposal documentation, training attendance records related to hazardous substances, inspection and maintenance checklists, non-conformity and incident reports, storage area inspection records, and relevant environmental permits. Observations and deficiencies identified during audits should be recorded in formal audit reports, and all findings requiring improvement should be registered under Corrective Actions. Project management should review audit outcomes and corrective action records, follow up on progress, and ensure that additional measures are implemented where necessary to ensure full compliance with national regulations and applicable international standards regarding hazardous materials management.

XII. REPORTING

Regular reporting will be conducted to ensure the effective implementation and continuous improvement of hazardous material management activities throughout the construction phase of the Project. Reporting will be structured to address both internal monitoring and auditing outcomes, as well as external compliance obligations and stakeholder engagement requirements.

Based on monitoring results, necessary corrective and preventive actions will be identified, and the required updates will be incorporated into this Plan. The training program will also be revised accordingly to address any observed gaps. Regular audits and visual inspections will be conducted to verify that all activities are being undertaken in accordance with the provisions of this Plan.

Quarterly Environmental and Social Monitoring Report will cover at least, but not limited to, the following items. The report will be prepared by the SPV with input data provided by EPC to evaluate the Project performance and compliance of the related plans.

- Incident reporting;
- Emergency response reporting;
- Records of annual emergency response training exercises;
- KPIs and performance trends (see Table XI.1) ;
- Current situation Key Monitoring Activities (see Table XI.2)
- Relevant training activities completed and attendance registers to be maintained;
- Legal Authorities Audit reports;
- Site Inspection logs

In addition, the following external reporting will be done:

- All environmental and social incidents will be appropriately documented, notified and reported in accordance with established procedures the terms and conditions by EPC to SPV,
- Incident notification and reporting to relevant Turkish regulatory bodies will be performed in line with applicable legislation in force and as stipulated in permits and licenses.
- The Lenders will be notified of incidents pursuant to the terms and conditions agreed upon in the Finance Agreements through SPV.

All personnel are encouraged to raise concerns, suggestions, or complaints related to this Plan through the established grievance mechanism by completing the grievance form. The communication channels available for submitting grievances are outlined in the Stakeholder Engagement Plan.

I. INTRODUCTION

Ministry of Transport and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), through the General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project, has initiated a tender process for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). Following the tendering process, KGM has awarded Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ or the Project Sponsor) with a Build, Operate and Transfer (BOT) contract for the implementation of the Project. Accordingly, AAOİAŞ will be referred as Project Sponsor[1] in the scope of this report. The main contractor for the Project has been designated as Limak and will henceforth be referred to as the Contractor (or EPC).

The Project is designed to connect the district Serik and Alanya via the Manavgat district of Antalya province will enhance the existing transportation network services with its surrounding provinces: Burdur, Muğla, Konya, Isparta, Karaman and Mersin. Various environmental, social, and technical studies have been conducted along the initial route of the Project tendered by the KGM. Based on these studies, the route was optimized, incorporating engineering practices and addressing environmental and social considerations, particularly issues of involuntary and economic resettlement, before being finalized. According to the most current design, the total length of the Motorway, which will be a dual carriageway of mostly 3 and partially 2 lanes (3x2 and 2x2) in each direction, is 117.8 kilometers including the main carriageway and the access roads[2].

This Solid Waste Management Plan ("SWMP" or "The Plan") has been prepared by Antalya-Alanya Highway Construction Investment and Operation Inc. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Highway Project ("Project") in accordance with national legislation, the Equator Principles ("EP"), the International Finance Corporation ("IFC") Performance Standards ("PSs"), and the international standards referred to in the relevant legislation section. The Plan covers the construction phase of the Project.

I.1 Project Description

The Project begins at Serik Interchange (Km: 52+000) and then proceeds eastward, following the corridor at the foothills of the Taurus Mountains within the boundaries of Serik and Manavgat districts, ending at north of Konaklı neighborhood of Alanya District (Km: 136+000). From this point onwards, the route turns southward with a 2x2 lane connection road and connects to the D400 state road at the Alanya West Interchange.

As of April 2025, the current Project design includes a total of 117.8 kilometers of roadway, comprising 84 kilometers of main road (motorway) and 33.8 kilometers of access roads. Other structures to be built as part of the project are as follows:

- 16 viaducts,
- 22 bridges,
- 305 culverts,
- 25 interchanges,
- 56 overpasses,
- 43 underpasses, and
- 5 tunnels.

The map illustrating the construction components and road route within the scope of the Project's construction activities is provided in Figure I-1.

[1] The BOT Contract uses the term "Appointed Company" to refer Project Sponsor

[2] It should be noted that the environmental and social baseline characterization, maps and scoping assessments provided in this report are based on the most current design

SOLID WASTE MANAGEMENT PLAN

II. PURPOSE AND SCOPE

This Plan has been prepared by Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Motorway Project ("the Project").

The purpose of this Plan is to identify the main sources of solid waste generated during the construction phase and to outline the measures that should be implemented to prevent, minimize, reuse, and recycle waste in accordance with applicable national legislation and international standards. This Plan aims to support sustainable waste management practices and promote circular economy principles throughout construction activities.

This management plan is a living document developed with the best available information and will be reviewed and revised as necessary due to the nature of the construction and progress.

Waste types include but are not limited to domestic/residential waste from construction personnel, excavation waste from earthworks and site arrangements (e.g., base layers, shoulders, slope shaping), construction waste from material use and installation processes, and packaging waste generated from the consumption of goods and materials (e.g., construction materials, food, clothing).

This Plan should be implemented by the Project Sponsor, AAOİAŞ, the Main Contractor (Limak or EPC) all subcontractors involved in the construction phase. Roles and responsibilities for waste management, monitoring, and reporting should be clearly defined, and this Plan should be reviewed and updated in line with changes in project activities or legal requirements.

III. LEGISLATIVE FRAMEWORK AND REFERENCE STANDARDS

The Plan has been developed in alignment with applicable national legislation and international standards to ensure that solid waste generation, segregation, collection, storage, transportation, reuse, recycling, and final disposal during the construction phase of the Project are conducted in an environmentally sound manner. The references listed below should be used as the legal and procedural basis for implementing the waste management practices outlined in this Plan.

III.1 National Requirements

The following Turkish laws and regulations should be used as the primary legal framework for solid waste management:

- Environmental Law (Law No. 2872),
- Regulation on Waste Management,
- Regulation on Environmental Impact Assessment,
- Regulation on Environmental Permits and Licenses,
- Regulation on the Control of Excavation, Construction, and Demolition Wastes,
- Regulation on the Control of Packaging Waste,
- Regulation on the General Principles for Waste Pre-Treatment and Recovery Facilities,
- Regulation on the Management of Waste Oils,
- Regulation on the Management of Waste Electrical and Electronic Equipment,
- Regulation on the Control of Waste Batteries and Accumulators,
- Regulation on the Control of End-of-Life Tires,
- Regulation on the Control of End-of-Life Vehicles,
- Regulation on the Control of Vegetable Waste Oils,
- Regulation on the Control of Medical Wastes
- Regulation on Mining Wastes,

- Regulation on Landfilling of Waste
- Regulation on Waste Incineration
- Regulation on Zero Waste Management
- Regulation on Recycling Contribution Fee
- Communiqué on the Transport of Waste by Road
- Circular on the Preparation of Implementation Project for Landfills,
- Circular on Landfill of Mining Wastes and Technical Arrangement of Other Landfills,
- Water Pollution Control Regulation,
- Surface Water Quality Regulation,
- Regulation on the Control of Pollution Caused by Dangerous Substances in and around the Water Bodies,
- Regulation Concerning Protection of Groundwater against Pollution and Deterioration,
- Ordinance on Groundwater Resources,
- Regulation on Safety Data Sheet on Harmful Substances and Mixture
- Regulation on the Preparing and Distributing Safety Data Sheets Regarding Dangerous Materials and Preparations,
- Regulation on the Classification, Labelling and Packaging of Materials and Mixtures,

Regulation on Transportation of Hazardous Goods on Highways,

These regulations should be used as the legal basis for waste segregation, temporary storage, transport, recycling, recovery, and disposal activities at all construction sites and associated facilities.

III.2 International Standards and Guidelines

The following international standards and procedures are applicable to the Project to ensure alignment with national legislation and recognize good industry practices.

AIIB is a multilateral development bank established to promote sustainable economic growth and improve infrastructure connectivity. According to the Articles of Agreement, AIIB aims to invest in infrastructure and productive sectors while fostering regional cooperation through partnerships with other development institutions. To ensure responsible operations, AIIB adheres to policies that address environmental and social impacts, outlined in its Environmental and Social Framework (ESF). The ESF, updated in June 2024, and reflects AIIB's commitment to international standards and sustainable development practices.

Also, the following international standards and reference frameworks should be used to align Project practices with international lender requirements and good practice environmental and social management:

- IFC Performance Standards (2012), specifically:
  - Performance Standard 1: Assessment and Management of Environmental and Social Risks and Impacts
  - Performance Standard 3: Resource Efficiency and Pollution Prevention
  - Performance Standard 4: Community Health, Safety, and Security
- IFC Environmental, Health and Safety (EHS) General Guidelines (2007)
- IFC EHS Guidelines for Toll Roads (2007)
- IFC Guidance Notes (2012)
- Equator Principles IV (2020)
- European Union Requirements- Waste Frameworks Directives (2008)
- Equator Principles (EPs) IV,

- World Business Council for Sustainable Development (WBCSD), December 2011

These international references provide the broader sustainability framework and technical benchmarks to be integrated into solid waste management procedures, particularly in relation to source reduction, reuse and recycling targets, occupational health and safety, and environmental protection.

IV. LINKAGE WITH OTHER PROJECT PLANS AND PROCEDURES

This Plan is supported by other management plans and procedures developed under the Environmental and Social Management System (ESMS) of the Project. The following plans and procedures are particularly relevant and should be implemented in coordination with the Solid Waste Management Plan to ensure consistency in environmental and social performance and regulatory compliance throughout the construction phase:

- Environmental Accident and Spill Response Management Plan,
- Water, Wastewater, and Storm Water Management Plan,
- Soil Management and Erosion Control Plan,
- Hazardous Materials Management Plan,
- Excavated Material Management Plan,
- Construction Camp Site Management Plan,
- Occupational Health and Safety Management Plan,
- Community Health and Safety Management Plan,
- Environmental and Social Management and Monitoring Plan (ESMMP)

The effective integration of these plans should be ensured to maintain alignment with Turkish legislation, IFC Performance Standards, and other international best practices. Cross-plan coordination is essential for minimizing cumulative impacts, supporting resource efficiency, and enhancing overall environmental and social risk management during the construction phase.

V. ROLES AND RESPONSIBILITIES

Antalya Alanya Otoyol İnşaat Yatırım ve İşletme A.Ş. (SPV) as the Project Sponsor and Limak (EPC) as the main contractor of the Project will be responsible for the following:

General Manager (SPV):

- Hold the overall responsibility and accountability for the Project, ensuring construction activities comply with national regulations, international standards, and Project commitments.
- Ensure full compliance with the SWMP and related national legislation.
- Ensure that relevant activities are carried out in accordance with this management plan and related procedures and shall ensure the provision of all sources to carry out this Plan.
- Approve and oversee procedures for segregation, collection, storage, transport, recycling, and disposal of solid waste.
- Allocate sufficient resources (personnel, budget, equipment) for effective solid waste management and emergency response related to waste.
- Ensure monitoring, audits, and inspections are carried out, and corrective actions are implemented where gaps are identified.
- Ensure that all line managers and subcontractors understand and fulfil their responsibilities with hazardous material procedures during construction phases.

E&S Manager (SPV)

- Prepare, review, update, and implement the SWMP and other project-specific E&S plans in line with national regulations, international standards, and client requirements.
- Coordinate with EPC, subcontractors, and authorities on waste management.
- Monitor compliance with the SWMP through inspections, audits, and review of records (e.g., waste transfer notes, disposal certificates).
- Ensure waste facilities and contractors are compliant and licensed.
- Deliver and validate waste management and E&S trainings for staff and subcontractors, including induction sessions and refreshers.
- Coordinate with licensed waste contractors and ensure only approved facilities are used for transport, recycling, or disposal.
- Support community engagement, ensuring concerns related to waste (odors, dust, litter, etc.) are addressed through the grievance mechanism.
- Contribute to emergency response planning for accidental releases, hazardous waste mismanagement, or fires at waste storage areas.
- Maintain documentation for audits, compliance checks, and due diligence processes; provide input for sustainability and environmental performance reporting.
- Liaise with local authorities and ensure compliance with permitting, reporting, and regulatory inspections.
- Maintain waste records, Waste Transfer Notes, and MoTAT documentation for hazardous waste.
- Promote continuous improvement by reviewing SWMP implementation, integrating lessons learned, and recommending new waste minimization or recycling opportunities.

H&S Manager (SPV)

- Prepare and implement H&S, hazardous material and waste management plans per regulations and standards.
- Provide technical support and integrate hazardous material and waste controls into daily work.
- Monitor compliance, conduct inspections, and address non-conformities related to hazardous materials waste.

- Investigate incidents involving hazardous materials or waste, implement corrective actions, and report performance.
- Oversee training and maintain records on hazardous material and waste safety.
- Coordinate with authorities and resolve hazardous material– and waste-related complaints.

Deputy E&S Manager (SPV)

- Lead environmental, social, hazardous materials, and waste management, ensuring compliance.
- Review and approve subcontractors' ESHS and hazardous material/waste documents.
- Monitor performance, incidents, and corrective actions related to hazardous materials and waste.
- Ensure EPC and subcontractors follow E&S, hazardous material, and waste procedures.
- Support training, record-keeping, and reporting on hazardous materials and waste management.
- Oversee community engagement and grievance management concerning hazardous materials and waste.
- Coordinate environmental, social, hazardous material, and waste monitoring programs.

HSE Specialist (SPV)

- Support safe site activities and compliance with the SWMP.
- Conduct inspections, audits, and hazard assessments related to waste handling, storage, and disposal.
- Monitor EPC and subcontractor compliance with waste segregation, collection, and disposal procedures.
- Maintain records of waste management activities, incidents, and corrective actions.
- Participate in investigations of waste-related incidents and implement lessons learned.
- Support and review training on proper waste handling and site-level environmental practices.
- Ensure waste storage areas are properly demarcated, labeled, and secure.
- Assist in resolving complaints or issues related to solid waste management.

Project Director (EPC)

- Define and oversee EPC execution strategy and project management plans, ensuring integration of the SWMP.
- Lead teams and coordinate EPC functions, ensuring compliance with SWMP, HSE, E&S, and QA/QC standards.
- Approve and monitor site inspections, audits, and training related to solid waste handling, storage, and disposal.
- Track KPIs, timelines, and budgets; implement corrective actions for non-compliance with waste management procedures.
- Represent EPC to SPV, clients, and authorities; address solid waste, environmental, safety, and social concerns.
- Oversee risk management, quality systems, and mitigation strategies, including waste minimization and recycling.
- Supervise subcontractors to ensure proper execution of construction activities and compliance with SWMP requirements.

E&S Manager (EPC)

- Prepare, review, and implement E&S and Solid Waste Management Plans in line with policies, standards, and lender requirements.
- Coordinate with SPV, contractors, and construction teams to ensure compliance with SWMP and effective waste management practices on-site.
- Monitor and enforce contractor/subcontractor compliance with waste segregation, storage, transport, and disposal procedures.
- Ensure proper site boundaries, traffic, utility protection, and community safety measures related to waste management.
- Oversee SWMP-related training, onboarding, toolbox talks, and awareness programs for all personnel.
- Supervise E&S staff, monitor waste management performance, lead investigations, and implement corrective actions.
- Manage waste-related grievances, emergency preparedness, and integrate social inclusion principles into site-level practices.
- Report SWMP performance to Project Director and promote continuous improvement in waste management.

H&S Manager (EPC)

- Develop, implement, and update the H&S and Solid Waste Management Plans.
- Ensure EPC and subcontractors comply with safety and solid waste handling, storage, and disposal procedures.
- Manage risk assessments, site safety controls, traffic, utilities, and community protection related to waste management.
- Lead inspections, audits, incident investigations, and corrective actions for waste management issues.
- Oversee training, toolbox talks, and emergency drills on health, safety, and solid waste practices.
- Report on SWMP performance and risks to the Project Director and foster a proactive safety and waste management culture.

H&S Specialist (EPC)

- Support the implementation of the H&S and Solid Waste Management Plans.
- Monitor EPC and subcontractor compliance with waste handling, storage, and disposal procedures.
- Conduct inspections, audits, and hazard assessments related to waste management.
- Maintain accurate records of waste activities, incidents, and corrective actions.
- Support training, toolbox talks, and awareness programs on solid waste management
- Ensure secure, properly labeled waste storage and assist in resolving related issues.

Biodiversity Specialist (EPC)

- Ensure biodiversity safeguards are applied to prevent impacts from improper waste handling on soil, water, and ecosystems.
- Oversee ecological measures (e.g., buffer zones, habitat restoration) to mitigate effects of solid waste.
- Train site teams on biodiversity risks related to waste management.
- Monitor biodiversity indicators and report non-compliance linked to waste management to the

Environmental Engineer (SPV and EPC)

- Implement and monitor the ESMP and SWMP across EPC and subcontractor activities.
- Conduct site inspections and audits to ensure compliance with solid waste handling, storage, transport, and disposal procedures.
- Maintain environmental records, support reporting, and assist in waste-related incident investigations.
- Deliver training, toolbox talks, and awareness programs on environmental and waste management practices.
- Coordinate with H&S, Social teams, contractors, and regulators to embed waste management requirements into site activities.
- Support permitting processes and ensure compliance with environmental and waste-related regulations.

Waste Management Supervisor / Officer (EPC)

- Supervise daily implementation of waste segregation at source (e.g., food waste, packaging, office waste, hazardous waste).
- Manage labeling, color-coding, and proper containerization of all waste streams.
- Ensure temporary storage areas comply with safety and security standards (fencing, gates, signage, spill kits, fire extinguishers).
- Keep inventory logs of incoming and outgoing waste and update records.
- Verify that excavated materials are reused on-site whenever possible and that excess is transferred only to designated areas.
- Oversee secure handling of WEEE, batteries, oils, and end-of-life tires

Warehouse Supervisor (EPC)

- Monitor safe storage of hazardous and non-hazardous waste containers.
- Ensure corrosion-resistant and sealed containers are available and properly labeled.
- Remove or cover old/conflicting labels to avoid confusion.
- Coordinate with licensed transporters for collection of hazardous and medical waste.

Community Liaison Officer (CLO) (SPV and EPC)

- Communicate project activities and solid waste management practices to local communities.
- Organize meetings and engagement forums to share information and gather feedback.
- Manage grievances related to solid waste through the Grievance Mechanism (GM).
- Assess impacts on vulnerable groups and ensure inclusive engagement.
- Monitor and report community feedback on SWMP implementation and contractor compliance.
- Safeguard confidentiality and handle sensitive community information responsibly.

All Personnel (including Contractor/Subcontractor Personnel)

- Comply with the SWMP and related site procedures.
- Handle, store, and dispose of waste safely during daily activities.
- Report non-compliance or waste-related incidents to supervisors or the E&S Manager.
- Participate in SWMP and safety trainings as required.
- Immediately notify supervisors in case of accidental spills or improper disposal.
- Take personal responsibility for maintaining a safe and clean working environment.

VI. SOLID WASTE MANAGEMENT AND RECYCLING APPROACH

VI.1 Waste Management Strategy

Although the primary principle of solid waste management is to prevent waste generation at the source, mitigation measures should be implemented to minimize the adverse environmental and social impacts of the solid waste generated during the construction phase. These measures are designed in accordance with the waste management hierarchy prevention, minimization, reuse, recycling, recovery, and safe disposal and are essential to ensure full compliance with Turkish legislation and international standards.

Waste management should follow the principles of the waste hierarchy, as outlined below:

- **Avoidance/Prevention:** Measures should be taken to reduce the quantity of materials used and waste generated from the outset.
- **Reuse:** Materials such as surplus construction materials, excavation soil, timber, and metal should be reused on-site or externally, where technically feasible.
- **Recycling and Recovery:** Separate collection and recycling should be done for paper, cardboard, glass, metal, plastics, tires, electronic waste, batteries, and similar materials. These should be temporarily stored in labeled containers and sent to licensed recycling/recovery facilities.
- **Safe Disposal:** Disposal should only be applied where other management options are not viable. Disposal should be conducted in line with regulatory requirements and the best environmental practices.

The fundamental principle of solid waste management is to prevent waste generation at the source and, where prevention is not possible, to minimize, reuse, or recycle waste to the greatest extent practicable. All waste management activities will be carried out in compliance with relevant Turkish legislation and applicable international standards.

VI.2 Waste Categorization

Solid waste generated during the construction phase of the Project will originate from various activities, including construction operations, excavation works, material usage, accommodation facilities, and routine consumption of goods and supplies such as paper, plastic, metal, and glass containers. All solid waste streams will be classified and managed in accordance with their physical and chemical characteristics to enable effective separation, reuse, recycling, and disposal.

Further detail on the expected waste types, their regulatory codes, and associated management considerations is provided in Table VI-1. This table presents an indicative list of potentially generated waste during land preparation and construction activities, based on the classifications in the Waste Management Regulation (Annex-4). The list includes excavation waste, construction and demolition debris, packaging materials, vehicle and equipment maintenance waste (e.g., waste oil, filters), and municipal-type waste from camp areas. Each waste stream is categorized with its six-digit waste code and marked according to whether it is classified as hazardous (A) or potentially hazardous (M). These classifications are critical for determining appropriate handling, temporary storage, transportation, and final treatment or disposal methods, in alignment with the mitigation and monitoring strategies outlined in this Plan.

Table VI-1. Indicative List of the Potentially Generated Wastes Types During the Land Preparation and Construction Activities

Waste Code	Waste Code Definition	Remarks
01	Wastes Generated During the Exploration, Extraction, Operation and Physical or Chemical Processing of Ores	
01 01	Wastes generated due to mining excavations	

Waste Code	Waste Code Definition	Remarks
01 01 02	Wastes due to non-metallic ores	
01 04	Wastes from physical and chemical processing of non-metallic minerals	
01 04 07*	Wastes containing dangerous substances from the physical and chemical processing of non-metallic minerals	M
01 04 09	Waste sand and clays	
01 04 13	Wastes from stone chipping and cutting operations other than those mentioned in 01 04 07	
01 04 99	Wastes that not otherwise specified	
13	Oil Wastes and Liquid Fuel Wastes (Excluding Renewable Oils)	
13 01	Waste hydraulic oils	A
13 02	Waste engine, transmission and lubrication oils	A
13 03	Waste insulation and heat conduction oils	A
13 04	Bilge oils	A
13 05	Oil/water separator contents	A
13 07	Wastes of liquid fuels (fuel oil, diesel, gasoline, other fuels including mixtures)	A
15	Waste Packaging and Absorbents, Wiping Clothes, Filter Materials and Protective Clothing Not-Classified Under Other Waste Types	
15 01	Packaging (including packaging material collected by the municipality separately)	
15 01 01	Paper and cardboard packaging	
15 01 02	Plastic packaging	
15 01 03	Wood packaging	
15 01 04	Metallic packaging	
15 01 05	Composite packaging	
15 01 06	Mixed packaging	
15 01 07	Glass packaging	
15 01 09	Textile packaging	
15 01 10*	Packaging containing traces of hazardous materials or contaminated with hazardous materials	A
15 01 11*	Metallic packaging material containing hazardous porous solid structures (asbestos, for example), including empty pressurized containers	A
15 02	Absorbents, filter materials, wiping clothes and protective clothing	
15 02 02*	Absorbents, filter materials (oil filters if not classified in any other way), wiping clothes, protective clothing contaminated with hazardous materials	M
15 02 03	Absorbents, filter materials, wiping clothes and protective clothing excluding 15 02 02	
16	Wastes not Classified under any other Type of Waste in the List	
16 01	Wastes generated due to vehicle maintenance (excluding 13, 14, 16 06 and 16 08), end-of-life vehicles and the dismantling of end-of-life vehicles (including construction machinery) in various transportation categories	
16 01 03	End-of-life tires	
16 01 04*	End-of-life vehicles	A
16 01 06	End-of-life vehicles that do not contain liquids or hazardous substances	

Waste Code	Waste Code Definition	Remarks
16 01 07*	Oil filters	A
16 02	Electrical and electronic equipment wastes	A
16 04	Explosive wastes	A
16 06	Batteries and accumulators	A
16 10	Aqueous liquid wastes to be sent to off-site treatment	
16 10 01*	Aqueous liquid wastes containing dangerous substances	M
16 10 02	Aqueous liquid wastes other than those mentioned in 16 10 01	
16 10 03*	Aqueous concentrated substances containing hazardous substances	M
16 10 04	Aqueous concentrates other than 16 10 03	
17	Construction and Demolition Wastes (Including Excavations Conducted at Contaminated Sites)	
17 01	Concrete, brick, tile and ceramic	
17 01 01	Concrete	
17 01 02	Bricks	
17 01 03	Tiles and ceramic	
17 01 06*	Mixtures or separated groups of concrete, brick, tile and ceramic containing hazardous substances.	M
17 01 07	Mixtures or separated groups of concrete, brick, tile and ceramic, excluding 17 01 06	
17 02	Wood, glass and plastic	
17 02 01	Wood	
17 02 02	Glass	
17 02 03	Plastic	
17 02 04*	Wood, glass and plastic containing or contaminated with hazardous substances.	A
17 03	Mixtures containing bitumen, coal tar and products containing tar	
17 03 01*	Mixtures with bitumen, containing coal tar	M
17 03 02	Mixtures containing bitumen, excluding 17 03 01	
17 03 03*	Coal tar and products containing tar	A
17 04	Metals (including their alloys)	
17 04 01	Copper, bronze and brass	
17 04 02	Aluminium

Source: Waste Management Regulation, Appendix-4

(*): Indicates that the waste is either potentially hazardous or hazardous waste.

(A): Indicates that the waste is a hazardous waste, there is no need for any further analysis.

(M): Indicates that the waste is potentially hazardous waste. In order to determine whether the waste is hazardous or not, an analysis is carried as stipulated in Article 11 of this Regulation.

Wastes ending with 99: Wastes ending with the six-digit waste code 99 define wastes that are not classified as hazardous or non-hazardous waste and are not otherwise defined in the list. "Waste Code Determination Hierarchy" and the provisions of Article 12 of this Regulation shall be applied in the use of this waste code.

Municipal Solid Wastes

According to the TurkStat data (2022), the average daily amount of municipal solid waste per capita in Türkiye is 1.03 kg, while this amount is 1.37 kg in Antalya. Most of the municipal solid waste generation due to the Project will be in the campsites. The amount of domestic solid waste to be produced in the campsites is estimated by multiplying the average daily municipal solid waste production per capita of Antalya province by the number of personnel employed due to the Project. The information on maximum number of personnel to be employed and estimated amount of municipal waste to be generated is summarized in Table VI-2. Assuming 20% (Ministry of Environment, Urbanization and Climate Change, 2020) of the municipal solid wastes (by weight) is formed of packaging wastes, estimated amount of packaging wastes within the total municipal wastes to be produced is also provided in the last column of the table. For the handling of the municipal solid wastes, municipalities' landfills and disposal sites, and licensed waste transportation trucks will be utilized. The facilities that are suitable and close to the campsites will be prioritized, if possible, for fuel and time efficiency.

Table VI-2. Estimated Solid Municipal Waste Generation of the Campsites

Number of Personnel* (cap)	Daily Municipal Waste Generation (kg/day/cap)	Daily Packaging Waste Generation (kg/day/cap)
3,300	1.37	0.27

** Maximum Project related employee number including subcontractors; provided by the Project Sponsor.*

The amount of municipal solid waste to be produced per day at the campsites is:

1.37 kg/day/cap * 3,300 cap = 4.52 ton/day

When compared to the total municipal solid waste generation of the Antalya province, which is 1,340,770 tons per year (Turkstat, 2022), the Project's contribution to solid waste generation of the province is less than one per two thousand. Additionally, it should be noted that the campsites will be present for a maximum of 3 years during the construction period of the Project. Since the waste load contribution of the Project on the existing waste management infrastructure capacity is limited in both time and impact, the overall impact of the Project is determined as negligible.

Treatment Sludge:

The total wastewater flow from all camp sites (Camp Site-1, Camp Site-2 and Camp Site-3) are approximately 0.725 m³/day. As a result of the treatment process, a small amount of sludge is generated.

The sludge production rate corresponds to approximately 0.7 kg of dry solids generated per cubic meter of influent wastewater treated.

Based on this sludge yield, the daily dry sludge production is estimated as follows:

0.725 m_3/day x 0.7 kg/m_3 = 0.5075 kg/day

Therefore, approximately 0.51 kg of dry sludge is expected to be produced daily from all camp sites combined.

The generated sludge will be collected and removed regularly by licensed waste transport vehicles, ensuring proper handling and disposal in accordance with applicable environmental regulations and standards.

Construction and Demolition Wastes

Fences, barriers, buildings, walls, former engineering structures, etc. corresponding to the Motorway route will be dismantled and removed prior to construction resulting in generation of construction and demolition wastes. Those wastes will be handled with the use of appropriate construction and demolition waste areas. The generated demolition waste, mainly consisting of rubble and other construction debris, will be transported by trucks with a capacity of approximately 40 tons each. Based on the estimated waste volume per household, it is expected that about 2 truckloads will be required to remove the demolition waste generated from one residential unit.

Preliminary estimates indicate that a total of 304 houses, 37 business structures, and 831 greenhouses will be affected by the Project. Considering an average building height of 3 m for houses and business structures, with wall thickness yielding a structural volume of 300 m^3 each, and a debris density of 2 ton/m^3, the total waste generated from houses is estimated to be approximately 182,400 ton. The business structures are expected to produce an additional 22,200 ton of waste under the same assumptions. The greenhouses, constructed with lighter materials and typically 2 m in height, are expected to generate approximately 83,100 ton of waste, with a rubble density of 0.5 ton/m^3. Overall, a total of approximately 287,700 ton of construction and demolition waste is expected to be generated by the Project. All waste will be efficiently managed, temporarily stored at designated sites, and subsequently disposed of or recycled in compliance with applicable legislation and best practices. Additionally, affected households and business owners will be permitted to salvage any materials or components of value from the demolition site following the completion of demolition activities, prior to the removal and disposal of debris.

Topsoil from sensitive areas (wetlands, slopes, agricultural lands) will be carefully removed, stored separately, and later used for site rehabilitation. Storage areas will be on gentle slopes (<5%) with protective measures against erosion, contamination, or quality loss. If stored long-term, the soil surface will be covered with fast-growing plants. Excavated waste will not be disposed into streams, in line with the 2006/27 Stream Beds and Floods Circular. The contractor will secure adequate storage capacity to avoid pressure on local disposal sites.

Construction of the Project and related structures such as the cuttings, earthworks, etc. will generate significant volumes of material from earthmoving and site clearance. The cut and fill balances along the Project route indicate that total amount of surplus material to be disposed will be around 10,8 million m3. 22 surplus material dumpsites are planned to be used for the Project which are listed below (see Table VI-3).

Table VI-3. The List of Dumpsites and Capacities

Location		Description of the Site	Capacity Information (m^3)	Planned Capacity Usage (m^3)

During the demolition phase, various types of hazardous waste, including asbestos-containing materials, may be generated. These wastes pose significant risks to human health and the environment if not properly managed. To address these risks, detailed procedures for the safe handling, transportation, temporary storage, and final disposal of hazardous materials are outlined in the Demolition Management Plan. The plan ensures that all activities comply with applicable safety standards, environmental regulations, and best practice guidelines, thereby minimizing potential hazards and environmental impacts associated with demolition activities.

Hazardous and Special Wastes

Hazardous waste shares the properties of hazardous material (e.g. ignitability, corrosivity, reactivity, or toxicity), or other physical, chemical, or biological characteristics that may pose a potential risk to human health or the environment if improperly managed. Wastes may also be defined as “hazardous” by local regulations or international conventions, based on the origin of the waste and its inclusion on hazardous waste lists, or based on its characteristics (IFC, April 2007). Waste Management Regulation specifies the hazardousness properties (explosive, oxidizing, flammable, irritating, toxic, and carcinogenic, etc.)

of wastes and lists the types of wastes that are to be handled directly as hazardous or after tests to be done if their hazardousness properties and concentrations are confirmed. Additionally, specific regulations are in force for the management of special wastes such as waste tires, medical wastes, waste vegetable oils, waste batteries and accumulators.

During the land preparation and construction phases of the Project, the following hazardous and special wastes are anticipated to be generated due to the associated activities:

- Chemical solutions used in construction and maintenance activities;
- Empty or partially full chemical containers;
- Flammable materials;
- Contaminated soil and absorbent materials;
- Contaminated materials such as used personal protective equipment (PPE), workwear, and other construction-related materials.

The hazardous storage areas will have their own spillage control bund. The areas will be protected against wind and rain, securely fenced and access to this site will be provided only for authorized people. These areas will also be labelled as hazardous storage areas. There should be a secure section to keep personal protection equipment, spill kits (e.g. absorbents), emergency equipment (for firefighting), eyewash and emergency shower and the SDSs for storage hazardous chemicals.

The total quantity of hazardous waste generated on-site though the project is estimated to be approximately 750 tons. These wastes will be carefully managed and stored in designated areas to ensure safe handling, prevent environmental contamination, and comply with all applicable regulations and safety standards throughout the construction of the Project.

Assuming that the average oil capacity of the construction machinery is 20 liters and motor oils of these machineries will be changed 4 times a year, total amount of waste oil to be produced can be estimated as given in Table VI-4.

Table VI-4: Estimated Engine Oil Waste Amounts

Machinery	Piece	Total Engine Oil Capacity (L)	Annual Engine Oil Waste (L)
Excavator	51	1,020	4,080
Grader	5	100	400
Bulldozer	14	280	1,120
Loader	20	400	1,600
Roller	10	200	800
Rock Driller	24	480	1,920
Transmixer	50	1,000	4,000
Compactor	24	480	1,920
Paver	12	240	960
Truck	147	2,940	11,760
Other (Mobile crane, injector, shotcretor, asphalt distributor, pump etc.)	115	2,300	9,200
Total	Total	Total	Total

VI.3 Waste Segregation at Source and Collection within Campsites

Project waste is collected separately at the point of generation. The EPC Contractor and its subcontractors will arrange appropriate containers and bins throughout the Camp, inside the Project construction facilities, and in the working area. Project wastes will be collected according to the types listed in Table VI-6. Suitable waste containers will be provided for each type of waste and clearly labelled according to the content of the containers. EPC will ensure that waste is effectively contained and is protected against wind, rain and vermin. There will be separate storage containers for recyclables (plastics, glass, ferrous metals, metals, and papers/cupboards etc.).

A label will appear on bins and containers stating the type of waste: inert, hazardous waste and non-hazardous waste. Wastes will be collected and transported to the Temporary Storage Area on a daily or more frequent basis, depending on the rate of production and capacity of the waste containers and bins. EPC will define the designated location of the Temporary Waste Storage Area on each Campsite.

There are some situations that are prohibited in the Temporary Storage Area. These are;

- Burning all kinds of waste at construction sites, unless otherwise specified in the contract or instructed by EPC.
- Mixing hazardous waste with non-hazardous waste;
- Throwing hazardous waste out of waste collection containers;
- Discharging hazardous wastes into sewer systems or underground and/or surface waters,
- To treat hazardous materials outside of licensed waste treatment facilities.

VI.4 Temporary Waste Storage Area

During the construction phase, if the waste generating amount reaches 1,000 kilograms or more of hazardous waste per month, a temporary storage permit from the provincial directorate for the areas/containers will be obtained. If any changes are made to the Temporary Waste Storage Areas (TWSAs), the temporary storage permit will be renewed. Excluding medical waste, hazardous waste may be temporarily stored in the temporary storage area for a maximum of 6 months, while non-hazardous waste may be stored for a maximum of 1 year.

TWSAs will have sufficient areas for handling waste containers. The areas will be concrete lined, equipped with separate drainage with spillage control channels and sumps. These areas will also be labelled as hazardous waste storage areas. There should be a security section to keep personal protection equipment, spill kits (e.g. absorbents), emergency equipment (for firefighting), eyewash and emergency shower. Waste segregation will be maintained at all times, separate storage areas/containers will be provided to ensure continued segregation of wastes. For the storage of waste at campsites, the Contractor will construct TWSA of which sketches are given in Figure VI-1 and Figure VI-2 .

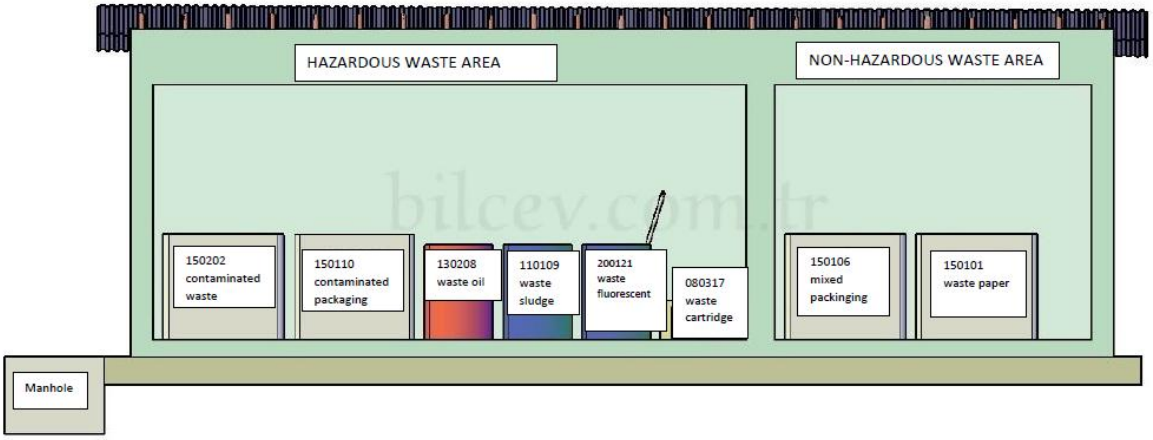

Figure VI-1: Sketch of Temporary Waste Storage Area

Figure VI-2: Sketch of Temporary Waste Storage Area for Hazardous Wastes

AAOİAŞ will ensure that, EPC will create Temporary Waste Storage Areas (TWSA) where the wastes are generated (e.g. close to construction activities). The designated areas for the temporary storage and management of both hazardous and non-hazardous wastes, including all necessary measures to ensure safe handling, segregation, and prevention of environmental contamination, are detailed and provided in the following tables (see Table VI-5**Error! Reference source not found.**).

Table VI-5. Waste Management Areas

Location	Province	District	Nearest Neighbourhood	Description of the Site / Plant
Km 64+400	Antalya	Manavgat	Taşağıl	Construction Camp Site-1 (Main)
Km 87+500	Antalya	Manavgat	Bucakşeyhler	Construction Camp Site-2
Km 124+300	Antalya	Alanya	İncekum	Construction Camp Site-3

VI.5 Technical Specifications for Storage

Containers, bins and storage areas will be labelled to show the type of waste as per the defined waste category. Appropriate containers and bins will be provided within the facilities and at the construction site to collect waste according to the types listed in Table VI-6.

Table VI-6. Storage by Type of Waste

Waste	Dangerous	Storage
Contaminated wastes, like chemical containers, oil or chemical cleaning fabrics, used spill kits, paint containers, lamps, batteries, oily cut metal parts	Yes	Container
Domestic wastes from camps and offices	No	Bin, Container
Empty Gas Cylinders	Yes	Container
Used Batteries	Yes	Container
Food Waste	No	Bin, Container
Glass (not polluted vessels, no lamps)	No	Container
Lamps	Yes	Bin, Container
Medical Wastes	Yes	Bin, Locked
Packages, plastic, paper or wood	No	Container, Store Separately
Scrap concrete, sludge sedimentation, runoff water from batching plant	No	Process in the batching plant facilities before collecting
Scrap concrete, sludge sedimentation, untreated runoff water from batching plant	Yes	Tank
Scrap Metal	No	Container, Laid on paved ground, protect from rain
Scrap Paper	No	Container
Scrap Wood	No	Container, Laid on paved ground, protect from rain
Scrap Wood	Yes	Container
Printer Cartridges	No	Bin, Container
Vegetable Waste Oil	No	Tank
Waste oil and grease	Yes	Tank
Worn out equipment (e.g. not contaminated, damaged or no longer used in machineries or equipment)	No	Container, Laid on paved ground
Worn out equipment (e.g. contaminated, damaged or no longer used in machineries or equipment)	Yes	Container, machineries and equipment
Used Tyres	No	Container, Laid on paved ground
Contaminated Soil	Yes	Container, Laid on paved ground in the

Waste	Dangerous	Storage
		Waste Storage Area, protect from rain
Sludge of Wastewater Treatment Plant	Will be analysed and decided accordingly	Will be taken from the wastewater treatment plan with vacuum truck and directly sent to relevant waste disposal area.

VI.6 Examples of containers

Description	Picture
Bins	
Containers	
Tanks for used oil	
Container for used batteries	
Bins for medical wastes including needles and sharp medical waste	

Description	Picture
Container for used gas cylinders	 Requirements: Store separately depending on the gas type. Protect water from spillage. Protect from water. Protect from unwanted access. Protect from ignition sources (heat, sparks, earthing, ATEX electrical equipment for flammable)
Equipment for dangerous liquids	 Vessels containing dangerous liquids should always be stored on containment basins, to avoid spills and leakages.

VI.7 Waste Transportation

The transportation of waste will be carried out according to its type, characteristics and composition, without preventing its further recovery. Environmental pollution and harmful effects on human health caused by the transportation of waste will be tried to be prevented as much as possible. In the case of environmental pollution resulting from the transportation of waste, the waste transporter will ensure the implementation of cleaning activities. Also, waste transportation from construction sites to recycling, treatment and waste management facilities will be according to the frequency of removal. Frequency of removal guarantees; there will be no overflow from the containers; that there will be no unpleasant odors and emissions harmful to human health; that insects, rodents, dogs or other animals that are harmful or dangerous to human health will not reproduce and that the containers and surfaces on which they are located will be cleaned regularly. Waste hauling trucks will be covered / closed properly.

Non-recyclable domestic waste that cannot be reused or recovered will be collected separately and transported to licensed landfill sites in accordance with project standards. There are four landfills in Antalya province which are given in the Table VI-7**Error! Reference source not found.**. Generated solid wastes are collected by the waste trucks of district municipalities, transferred to one of the six solid waste transfer stations, and disposed of at these landfills, which are designed in accordance with the requirements of the Regulation on the Landfill of Wastes. In this context, landfills have proper impermeability layers and the leachate collected at the landfills is treated by means of physical, chemical, and anaerobic processes.

Table VI-7. Landfills and Transfer Stations in Antalya Province for non hazardous wastes

Landfills
Patara Solid Waste Landfill
Manavgat Solid Waste Energy Recovery and Landfill Facility
Alanya Integrated Solid Waste Recycle and Disposal Facility
Kızıllı Integrated Solid Waste Recycle and Landfill Facility
Transfer Stations
Elmalı Transfer Station
Kumluca Transfer Station
Serik Transfer Station
Kemer Transfer Station
Korkuteli Transfer Station
Manavgat Transfer Station

The closest and appropriate landfills, Manavgat Solid Waste Recovery and Landfill Facility and Alanya Integrated Solid Waste Recycle and Disposal Facility, will be used for the management of Project-sourced wastes. Required agreements will be made with the municipalities and the facilities for the transfer, recovery, disposal and landfill services.

On-site and off-site transportation of waste will be conducted so as to prevent or minimize spills, releases, and exposures to employees and the public. All waste containers designated for off-site shipment will be secured and labelled with the contents and associated hazards, be properly loaded on the transport vehicles before leaving the site.

Agreements will be signed with licensed firms for transport of segregated recyclable and packaging wastes, and licensed disposal facilities will be used for transfer and disposal of hazardous wastes. Where waste is transferred for recovery or disposal, the responsibility of the original waste producer and/or waste holder will remain in force until recovery or disposal of waste is completed. Hazardous wastes will be transported off site when the storage on site reaches maximum storage capacity levels.

VI.8 Third Party Waste Management Services

EPC Contractor will evaluate the availability of local services for recycling and re-use and successfully execute available local recycling and re-use solutions for waste created on the project site. For the treatment of hazardous and non-hazardous waste streams, EPC Contractor will choose a waste management service provider with appropriate licenses and relevant authorizations.

The EPC Contractor will conduct a recorded prior audit of the treatment, storage, and recycling facilities before using third-party waste management services to ensure compliance with the current environmental and social requirements. SPV will receive a copy of the audit report.

EPC Contractor will locate and engage the services of a registered waste management firm to collect and recycle recyclable materials. Recyclable wastes will be collected on a regular basis, at least every two months, from their temporary storage places. Municipal wastes at camps will be collected daily and disposed to licensed disposal facilities.

VI.9 Waste Disposal Management

If waste materials are still generated after the implementation of feasible waste prevention, reduction, reuse, recovery and recycling measures, waste materials will be treated and disposed of and all measures will be taken to avoid potential impacts to human health and the environment.

VI.9.1 Management of Non-Hazardous Waste

Required agreements will be made with the municipalities and the facilities for the transfer, recovery, disposal and landfill services for non-hazardous waste. Municipal landfill that is to be used by EPC will be subject to a documented audit which demonstrates that the quantity and type of wastes brought by the EPC Contractor does not raise an incremental risk for the environment and community which cannot be handled by the present management of the municipal landfill. If the project develops its own landfill, then the following specifications apply. Steps to be followed for the management of non-hazardous wastes:

- Non contaminated inert waste will be removed and can be disposed of in landfill with unused backfill material. Inert waste will be disposed to the dumpsites listed in Table VI-3 with the approval of the relevant institutions.

- Non-hazardous wastes will be sent to municipality landfill, according to the following criteria: (Wastes at camps will be collected daily and disposed to lice the garbage trucks. The protocol related to the garbage trucks should be made with the municipality.)

VI.9.2 Hazardous Waste Management

All the hazardous waste generated from the site will be handled and stored as per *Hazardous Material Management Plan, and the Spill Response Management Plan* and managed through a specialized hazardous waste subcontractor.

Hazardous waste will be securely packed and labelled prior to removal from site to ensure the waste can be transported safely to the approved disposal site without risk to those handling the waste or to the environment. Before leaving the site, all waste containers intended for off-site shipment will be locked. Before transporting the hazardous waste, the waste carrier will obtain a transport certificate for the vehicle that will transport the waste, and the driver of the vehicle will keep this certificate with his/her while transporting the hazardous waste. Spills, releases, and exposures to employees and the general public will be avoided or minimized during on-site and off-site waste transportation. The waste transport will comply with IFC Environmental, Health, and Safety Guidelines. The potential licensed companies have been listed Annex- A.

Contaminated soil generated during construction activities will be managed in accordance with Turkish legislation. In line with the Regulation on Control of Soil Pollution and Sites Contaminated by Point Sources (. 27605, dated 08.06.2010), soils contaminated with hazardous substances are classified as hazardous waste. Such waste must be temporarily stored in suitable conditions to prevent further contamination and subsequently delivered to licensed hazardous waste treatment or disposal facilities authorized by the Ministry of Environment, Urbanization and Climate Change. Documentation, transportation, and final disposal of contaminated soils will be carried out through the MoTAT system (National Waste Transport Form) to ensure traceability and compliance with Turkish regulations.

.

VII. MITIGATION MEASURES FOR SOLID WASTE-RELATED RISKS AND IMPACTS

Construction and associated camp operations will generate both hazardous and non-hazardous waste streams, primarily resulting from material used during construction works, earthworks, packaging materials, and the daily activities of on-site personnel. Effective implementation of the Solid Waste Management Plan and associated procedures should be done to minimize the quantity of waste requiring off-site disposal and to ensure environmentally sound management of all waste streams.

Mitigation measures for solid waste management include the following:

- Cooperation should be ensured with licensed local service providers (private licensed waste transportation/recycling/recovery firms), and written agreements or protocols should be established regarding the regular and sound management/disposal of Project-generated wastes.
- The amount of waste to be sent to off-site management should be minimized through the implementation of the Solid Waste Management Plan based on the waste management hierarchy.
- Sites should not be located in dense forest areas with primary ecological functions.
- Proper temporary waste storage areas should be constructed.
- No waste will be burned, illegally dumped or buried on site
- Training should be provided to Project personnel regarding the proper implementation of waste management procedures in line with the requirements of national legislation and good site practices.
- All waste containers should be labeled with waste type, source, volume, and date. Containers should be corrosion-resistant, sealed, and suitable for waste characteristics. Old or conflicting labels must be removed or covered to avoid confusion.
- All waste (hazardous and non-hazardous) should be transported using licensed vehicles and delivered to authorized facilities. Transfer should be documented using Waste Transfer Notes (for non-hazardous waste) and the Mobile Hazardous Waste Tracking System (MoTAT) System (for hazardous waste).
- Annual waste declarations should be submitted by the end of March each year using the Ministry's Environmental Information System. Records of all waste movements and quantities should be retained and submitted in accordance with legal requirements.
- Temporary waste storage areas (for hazardous and non-hazardous areas) should be designed with secure fencing, lockable gates, and appropriate signage, lighting, and pest deterrents. Fire safety equipment and spill containment kits should be provided, and segregated storage zones should be established for incompatible waste types. Inventory logs and emergency response plans should be clearly documented and implemented.
- Agreements will be established with the municipalities and relevant facilities for the transfer, recovery, and disposal of non-hazardous wastes.
- Regular inspections will be conducted to ensure waste segregation, containment integrity, and overall compliance with safety and environmental requirements.
- Transportation frequency will be planned to prevent container overflow, unpleasant odors, vermin/insect attraction, and emissions harmful to human health. Containers and their surrounding areas will be regularly cleaned.
- The closest and most suitable facilities will be primarily used for the Project.
- Inert waste (e.g., uncontaminated soil or excavation material) should be disposed of in dumpsites with institutional approval.

The following are specific measures to be applied for different types of waste:

- The measures taken for solid waste management should ensure the reduction of environmental pollution and the efficient use of natural resources such as energy and raw materials by minimizing the negative effects of solid waste on the environment. Solid waste generated at

construction sites and camps (e.g., packaging, food waste, office waste) should be separated at source and sent to licensed disposal or recycling facilities. Waste types must be matched with suitable treatment and disposal options as per local legislation and site-specific waste categorization.

- Excavated materials should primarily be reused on-site. Remaining excess materials should be managed in accordance with project-specific reuse or disposal plans. Excess material, will be around 10,8 million m^3, should be repurposed where possible, including for landscape restoration or structural fill. Excavated materials should be disposed of at designated storage sites only. The amount of excavated materials to be sent to disposal should be minimized by reusing them as fill material in the construction of road bases, shoulders, side slope arrangements, etc., to the extent the quality and quantity of materials allow.
- Hazardous waste generated from construction and maintenance activities—including chemical containers, contaminated soil, solvents, oils, filters, and fluorescent tubes—should be identified, labeled, stored in compliant containers and temporary storage area, and transferred to licensed facilities in accordance with applicable regulations, such as the Waste Management Regulation (Official Gazette: 02.04.2015 – No. 29314). Management measures should include clear labeling and the use of color-coded containers for each hazardous waste type, provision of spill containment kits and fire prevention systems, establishment of secure fenced storage areas with impermeable flooring, availability of Material Safety Data Sheets (MSDS) on site, regular training of workers on hazardous waste handling, and maintaining hazardous waste liability insurance to ensure safe and compliant management practices.
- Medical waste from clinics and first aid units should be stored in red biohazard bags or color-coded rigid containers labeled with “Biohazard – Medical Waste” symbols. Bags should be double-layered if necessary and stored at ≤+4°C until transfer to authorized medical waste disposal facilities. Collection must occur within 48 hours (or one week if proper storage conditions are ensured). Waste collection and transfer must follow the Regulation on Medical Waste Control.
- Waste Electrical and Electronic Equipment (WEEE) should be stored separately and transferred to authorized recovery facilities. Waste should not be handed over to informal or unlicensed collectors. Compliance with the Regulation on the Management of Waste Electrical and Electronic Equipment (Official Gazette: 22.05.2012 – No. 28296) is mandatory.
- Waste oils generated from equipment maintenance should be collected in leak-proof containers and sent to licensed waste oil recovery/refining facilities in accordance with the Regulation on the Management of Waste Oils (Official Gazette: 21.12.2019 – No. 30985). MSDS must be available on site.
- Waste batteries should be collected in designated boxes and delivered to collection points established by municipalities or licensed distributors in line with the Regulation on the Control of Waste Batteries and Accumulators (Official Gazette: 31.08.2004 – No. 25569).
- End-of-life tires should be collected separately and delivered to authorized recycling facilities in accordance with the Regulation on the Control of End-of-Life Tires (Official Gazette: 25.11.2006 – No. 26357).
- Waste oils from catering activities should be collected in sealed, impermeable containers and stored in closed temporary storage areas before being transferred to licensed recovery or interim storage facilities.
- Sludge from wastewater treatment and concrete batching plants should be analyzed for hazardous characteristics and managed accordingly. Inert wastes (e.g., stone, processed aggregates) should be reused wherever possible and stored to prevent contamination.

The AAOİAŞ will be deemed to be the “owner” of the solid waste that will be created and will be responsible for its management in accordance with the provisions of the Environment Law and its relevant regulations.

The solid waste management measures will be implemented throughout the construction phase. The on-site specification, implementation, and supervision of these measures will follow by the responsible parties, as indicated the related part of this Play. The Project will also be required to comply with national legal requirements relating to solid waste management.

VIII. TRAINING

Upon hiring, all staff will receive structured training addressing sources of waste management hierarchy, measures of waste generation reduction,, environmental and health risks associated with improper waste handling and storage, and the corresponding mitigation strategies applicable to their responsibilities within the Project (e.g., waste segregation at source, proper use of labeled containers, safe storage practices). In addition, personnel assigned to waste management activities will be provided with specialized training to ensure the accurate, safe, and compliant execution of their duties in accordance with the Solid Waste Management Plan and relevant legal requirements.

IX. MONITORING

A structured internal monitoring program will be implemented to assess the effectiveness of solid waste management mitigation measures outlined in this Plan during the construction phase of the Project. The scope and frequency of monitoring activities will be periodically reviewed and revised where necessary, based on site-specific conditions, waste generation trends, stakeholder concerns, or changes in applicable environmental regulations.

Monitoring activities will be coordinated by the E&S Manager, in close collaboration with the Management teams. Key responsibilities will include reviewing the type and quantity of waste generated and disposed (e.g., municipal, packaging, waste oil), verifying the implementation of waste segregation at source, inspecting the condition and use of temporary waste storage areas, and ensuring the consistent application of solid waste management measures, including compliance with general housekeeping and containment practices.

Regular inspections will be conducted across all campsites to evaluate compliance with national solid waste regulations and Project-specific waste management requirements. This will include the review of waste records, control of agreements with licensed waste contractors, inspections of labeled containers and containment structures, and verification of source separation and waste handling practices.

The performance of contractors and subcontractors in implementing solid waste management requirements will be reviewed through environmental audits, site supervision reports, and field observations. Any identified non-conformities will trigger timely corrective and preventive action plans. Monitoring will also include follow-up assessments to confirm the effectiveness of implemented measures and to ensure recurrence is prevented.

In addition to internal monitoring, inspections may be carried out by relevant public institutions, including the Ministry of Environment, Urbanization and Climate Change, in accordance with Turkish legislation. The frequency and scope of these inspections will be determined by the authorities and may include review of monitoring data, on-site waste handling practices, and documentation of compliance.

Monitoring efforts will be guided by the framework provided in Table IX-1, which outlines the parameters to be monitored, the corresponding monitoring locations, frequency of inspections, and responsible parties. These monitoring activities will be essential for evaluating the effectiveness of solid waste mitigation measures and ensuring full compliance with national regulations and Project standards.

Table IX-1 Key Monitoring Activities

Parameter	Monitoring Station / Location	Monitoring Method	Monitoring Frequency	Responsible Parties
Type and amount of wastes produced/disposed of (e.g., municipal, packaging, waste oil)	Camp sites, road construction sites, quarries	Site audit, document review	Monthly	AAOİAŞ, EPC EnvironmentalExperts
Validity and completeness of waste management/disposal agreements with licensed companies	Camp sites, road construction sites, quarries	document review	Before every waste transfer	AAOİAŞ, EPC EnvironmentalExperts
Review and implementation consistency of Waste Management Plans	Camp sites, road construction sites, quarries	Site audit, document review	Yearly	AAOİAŞ, EPCEnvironmental Experts
Inspection and condition of Temporary Waste Storage Areas	Camp sites, road construction sites, quarries	Site audit, document review	Monthly	AAOİAŞ, EPC Environmental Experts
Site practices on waste management (e.g., source separation, labeling, containers, containment, housekeeping)	All active construction and camp areas	Visual inspection	Daily	AAOİAŞ, EPCEnvironmental Experts

In cases of non-compliance identified through internal oversight or external audits, AAOİAŞ will ensure that corrective and preventive measures are promptly implemented in coordination with the Contractor (Limak) and relevant subcontractors.

All solid waste-related findings, including violations of handling protocols, non-compliance, incidents, or complaints received from surrounding communities, will be documented in accordance with national environmental regulations and Project plans. In the event of serious violations—such as illegal disposal or mismanagement of hazardous waste—AAOİAŞ will ensure that the issue is reported to the competent authorities and that appropriate technical, procedural, and contractual actions are taken.

X. KEY PERFORMANCE INDICATORS

The following Key Performance Indicators (KPIs) will be monitored, verified, and evaluated.

Table X-1 Key Performance Indicators – Construction Phase KPIs

Monitoring Parameter / Performance Indicator	Target	Frequency	Responsible Party
Number of trainings conducted under the Waste Management Plan	All relevant personnel trained regularly	first acceptance of the Site and at least yearly	AAOİAŞ E&S Engineer EPC E&S Engineer
Number of non-conformities and spill/accident records	Less than five	Monthly	AAOİAŞ,
Number of complaints received related to waste management	Less than five	Quarterly	AAOİAŞ,
Compliance with Solid Waste Management Plan (recording waste types, quantities, classification, storage area management, license verification)	Full compliance with waste classification and licensed firm engagement	Quarterly	AAOİAŞ,

Monitoring Parameter / Performance Indicator	Target	Frequency	Responsible Party
Percentage of key environmental monitoring activities completed under the program	100%	Quarterly	AAOİAŞ,
Trend of hazardous and non-hazardous waste generation	Reduce hazardous waste per working hour by 2%	Semi-year	AAOİAŞ,
Percentage of reused, recycled, or recovered waste	70%	Monthly	AAOİAŞ,
Percentage of environmental audits completed and corrective actions closed	100%	Monthly	AAOİAŞ,
Obtaining a waste storage permit	100%	Quarterly	AAOİAŞ, EPC
Obtaining waste management plan approval	100%	Yearly	AAOİAŞ, EPC

XI. AUDIT AND REVIEW

The implementation of this Plan should be regularly monitored and reviewed in accordance with the ESMMP. All incidents and non-conformities should be documented and reported as outlined in the Plan. Contractors and subcontractors should be subject to audits conducted by the Project Sponsor within the scope and schedule defined in the Contractor and Subcontractor Management Plan. These audits and the associated records should be managed in compliance with the Project's established plans and procedures. Relevant records that will be reviewed during solid waste management audits may include the external grievance and suggestion tracking database related to waste management issues, the internal grievance and suggestion tracking database concerning solid waste handling and site practices, solid waste management training records, waste inventory logs, contractor waste transfer documentation, and non-conformity records related to solid waste segregation, storage, or disposal. Observations and deficiencies identified during audits should be recorded in formal audit reports, and all findings requiring improvement should be registered under Corrective Actions. Project management should review audit outcomes and corrective action records, follow up on progress, and ensure that additional measures are implemented where necessary.

XII. REPORTING

Regular reporting will be conducted to ensure the effective implementation and continuous improvement of solid waste management activities throughout the construction phase of the Project. Reporting will be structured to address both internal monitoring and auditing outcomes, as well as external compliance obligations and stakeholder engagement requirements.

Based on monitoring results, necessary corrective and preventive actions will be identified, and the required updates will be incorporated into this Plan. The training program will also be revised accordingly to address any observed gaps. Regular audits and visual inspections will be conducted to verify that all activities are being undertaken in accordance with the provisions of this Plan.

Quarterly Environmental and Social Monitoring Report will cover at least, but not limited to, the following items. The report will be prepared by the SPV with input data provided by EPC to evaluate the Project performance and compliance of the related plans.

- Incident reporting;
- Emergency response reporting;
- Records of annual emergency response training exercises;
- KPIs and performance trends (see Table XII-1) ;
- Current situation Key Monitoring Activities (see Table XII-2)
- Relevant training activities completed and attendance registers to be maintained;

- Legal Authorities Audit reports;
- Site Inspection logs

In addition, the following external reporting will be done:

- All environmental and social incidents will be appropriately documented, notified and reported in accordance with established procedures the terms and conditions by EPC to SPV,
- Incident notification and reporting to relevant Turkish regulatory bodies will be performed in line with applicable legislation in force and as stipulated in permits and licenses.
- The Lenders will be notified of incidents pursuant to the terms and conditions agreed upon in the Finance Agreements through SPV.

All personnel are encouraged to raise concerns, suggestions, or complaints related to this Plan through the established grievance mechanism by completing the grievance form. The communication channels available for submitting grievances are outlined in the Stakeholder Engagement Plan.

I. INTRODUCTION

Ministry of Transport and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), through the General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project, has initiated a tender process for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). Following the tendering process, KGM has awarded Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ or the Project Sponsor) with a Build, Operate and Transfer (BOT) contract for the implementation of the Project. Accordingly, AAOİAŞ will be referred as Project Sponsor[1] in the scope of this report. The main contractor for the Project has been designated as Limak and will henceforth be referred to as the Contractor (or EPC).

The Project is designed to connect the district Serik and Alanya via the Manavgat district of Antalya province will enhance the existing transportation network services with its surrounding provinces: Burdur, Muğla, Konya, Isparta, Karaman and Mersin. Various environmental, social, and technical studies have been conducted along the initial route of the Project tendered by the KGM. Based on these studies, the route was optimized, incorporating engineering practices and addressing environmental and social considerations, particularly issues of involuntary and economic resettlement, before being finalized. According to the most current design, the total length of the Motorway, which will be a dual carriageway of mostly 3 and partially 2 lanes (3x2 and 2x2) in each direction, is 117.8 kilometers including the main carriageway and the access roads[2].

This Environmental Accident And Spill Response Management Plan ("SRMP" or "The Plan") has been prepared by Antalya-Alanya Highway Construction Investment and Operation Inc. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Highway Project ("Project") in accordance with national legislation, the Equator Principles ("EP"), the International Finance Corporation ("IFC") Performance Standards ("PSs"), and the international standards referred to in the relevant legislation section. The Plan covers the construction phase of the Project.

I.1 Project Description

The Project begins at Serik Interchange (Km: 52+000) and then proceeds eastward, following the corridor at the foothills of the Taurus Mountains within the boundaries of Serik and Manavgat districts, ending at north of Konaklı neighborhood of Alanya District (Km: 136+000). From this point onwards, the route turns southward with a 2x2 lane connection road and connects to the D400 state road at the Alanya West Interchange.

As of April 2025, the current Project design includes a total of 117.8 kilometers of roadway, comprising 84 kilometers of main road (motorway) and 33.8 kilometers of access roads. Other structures to be built as part of the project are as follows:

- 16 viaducts,
- 22 bridges,
- 305 culverts,
- 25 interchanges,
- 56 overpasses,
- 43 underpasses, and
- 5 tunnels.

[1] The BOT Contract uses the term "Appointed Company" to refer Project Sponsor
[2] It should be noted that the environmental and social baseline characterization, maps and scoping assessments provided in this report are based on the most current design

The map illustrating the construction components and road route within the scope of the Project's construction activities is provided in Figure I-1.

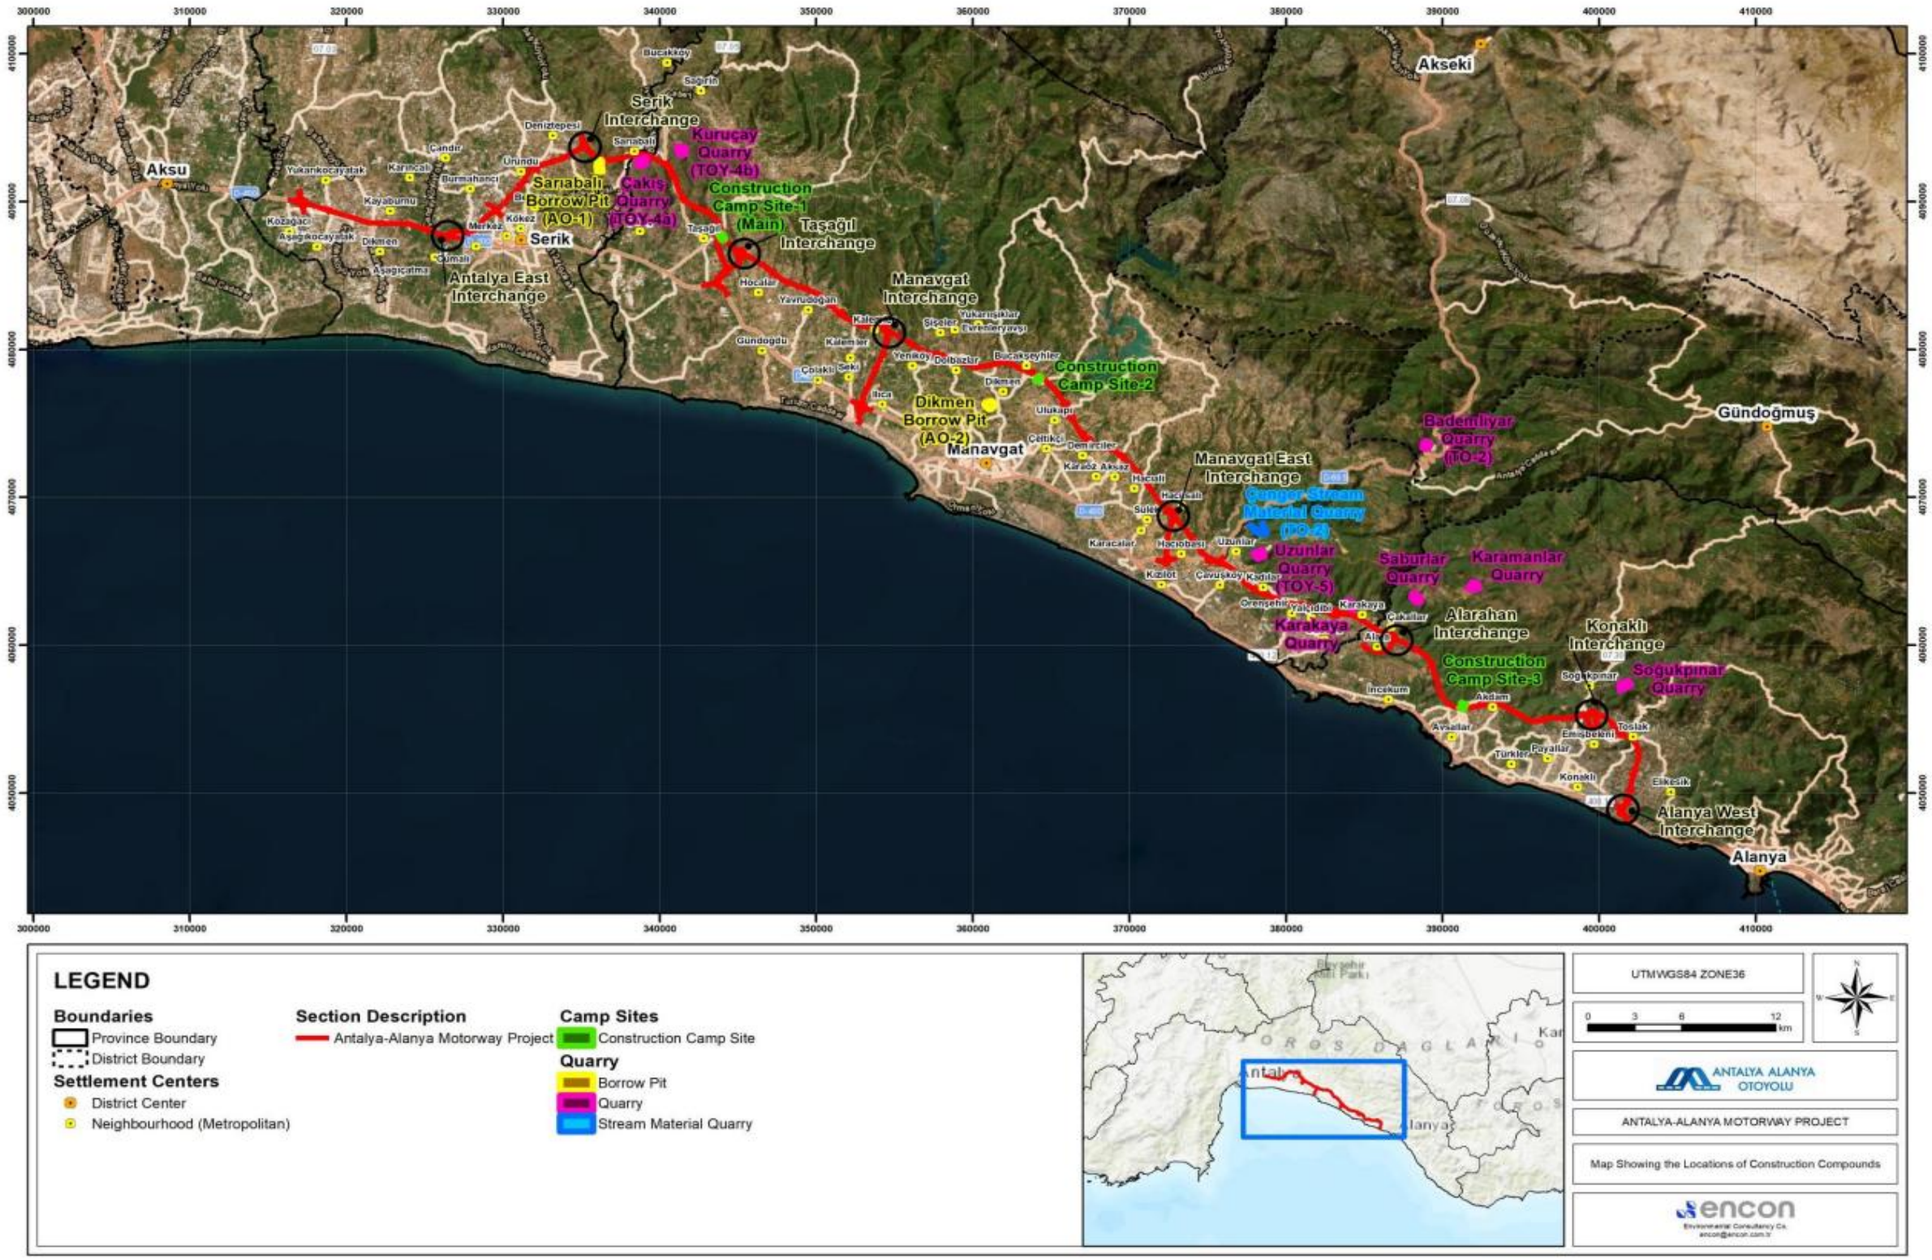

Figure I-1. Map Showing the Locations of Construction Compounds

II. PURPOSE AND SCOPE

This Environmental Accident and Spill Response Management Plan ("the Plan") has been prepared for the Antalya–Alanya Motorway Project ("the Project").

The purpose of this Plan is to define response strategies and mitigation measures for managing environmental accidents, spillages of hazardous and non-hazardous substances, and unexpected pollution events that may occur during the construction phase. This includes fuel, oil, chemicals, or process-related spills that could adversely impact human health or the environment.

This management plan is a living document developed with the best available information and will be reviewed and revised as necessary due to the nature of the construction and progress.

The Plan has been developed in alignment with applicable national environmental legislation and international standards, including those of international financial institutions. It provides a framework that should be followed to ensure spill preparedness, timely intervention, and proper containment and cleanup procedures.

This Plan should be implemented by all construction-phase parties, including the Project Sponsor (Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. – AAOİAŞ), the Main Contractor (Limak), and all subcontractors. Responsibilities related to implementation, training, monitoring, and reporting should be clearly defined and communicated across all relevant levels. In case of changes in project design, materials used, or construction methodology, this Plan should be reviewed and updated accordingly.

III. LEGISLATIVE FRAMEWORK AND REFERENCE STANDARDS

This Plan has been structured to align with applicable national legislation and relevant international standards and frameworks that govern environmental accident preparedness, hazardous material handling, and spill response during construction activities. Accordingly, the following legislative and institutional references should guide the implementation, compliance, and performance monitoring procedures throughout the construction phase of the Project.

III.1 National Requirements

The following Turkish laws and regulations provide the legal foundation for managing environmental accidents, hazardous material spills, and associated risks during the construction phase of the Project:

- Environmental Law (Law No. 2872),
- Regulation on Environmental Impact Assessment,
- Regulation on Environmental Permits and Licenses,
- Regulation on the Control of Soil Pollution and Sites Contaminated by Point Sources,
- Regulation on the Control of Pollution Caused by Hazardous Substances in Water and its Environment,
- Regulation on the Control of Water Pollution,
- Regulation on Test Methods for Determining the Physicochemical, Toxicological and Eco toxicological Properties of Substances and Mixtures,
- Regulation on Classification, Labelling and Packaging of Substances and Mixtures,
- Regulation on Registration, Evaluation, Authorization and Restriction of Chemicals,
- Regulation on Persistent Organic Pollutants,

- Regulation on Prevention and Mitigation of Major Industrial Accidents,
- Waste Management Regulation,
- Regulation on Control of Packaging Waste,
- Regulation on the Control of Waste Electrical and Electronic Equipment,
- Regulation on General Principles of Waste Pre-Treatment and Recovery Facilities,
- Regulation on the Control of Waste Batteries and Accumulators,
- Waste Oil Management Regulation,
- Regulation on the Landfilling of Waste,
- Regulation on Incineration of Waste,
- Regulation on the Control of Waste Vegetable Oils,
- Regulation on the Control of Excavation Soil, Construction and Demolition Waste,
- Regulation on the Control of End-of-Life Vehicles,
- Regulation on the Control of End-of-Life Tires,
- Regulation on the Control of Polychlorinated Biphenyls and Polychlorinated Terphenyls,
- Regulation on the Control of Medical Waste,
- Zero Waste Regulation.

III.2 International Standards and Conventions

The following international standards and procedures are applicable to the Project to ensure alignment with national legislation and recognize good industry practices.

AIIB is a multilateral development bank established to promote sustainable economic growth and improve infrastructure connectivity. According to the Articles of Agreement, AIIB aims to invest in infrastructure and productive sectors while fostering regional cooperation through partnerships with other development institutions. To ensure responsible operations, AIIB adheres to policies that address environmental and social impacts, outlined in its Environmental and Social Framework (ESF). The ESF, updated in June 2024, and reflects AIIB's commitment to international standards and sustainable development practices.

Also, the following international standards and reference frameworks should be used to align Project practices with international lender requirements and good practice environmental and social management:

- IFC Performance Standards (2012), specifically:
  - Performance Standard 3: Resource Efficiency and Pollution Prevention
  - Performance Standard 4: Community Health, Safety, and Security
- IFC Environmental, Health and Safety (EHS) General Guidelines (2007)
- IFC EHS Guidelines for Toll Roads (2007)
- IFC Guidance Notes (2012)
- Equator Principles IV (2020)
- ISO 14001: Environmental Management Systems – Requirements with Guidance for Use
- ISO 45001: Occupational Health and Safety Management Systems
- EU Seveso III Directive (2012/18/EU) on the Control of Major Accident Hazards
- Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal
- Stockholm Convention on Persistent Organic Pollutants
- European Agreement Concerning the International Carriage of Dangerous Goods by Road

These references should be utilized to ensure that environmental accident and spill response procedures are implemented in a manner consistent with international expectations and that the Project remains aligned with both domestic regulatory obligations and global environmental performance standards.

IV. LINKAGE WITH OTHER PROJECT PLANS AND PROCEDURES

This Plan is supported by other management plans and procedures developed under the Environmental and Social Management System (ESMS) of the Project. The following plans and procedures are particularly relevant and should be implemented in coordination with the Environmental Accident and Spill Response Management Plan:

- Solid Waste Management Plan,
- Water, Wastewater, and Storm Water Management Plan,
- Hazardous Materials Management Plan,
- Occupational Health and Safety Management Plan,
- Construction Camp Site Management Plan,
- Community Health, Safety, and Security Management Plan,
- Traffic Management Plan,
- Environmental and Social Management and Monitoring Plan (ESMMP),
- Emergency Preparedness and Response Plan (EPRP),
- Excavated Material Management,
- Soil Management and Erosion Control Plan,
- Stakeholder Engagement Plan,
- Blasting Management Plan,
- Demolition Management Plan,
- Quarry Management Plan.

The effective integration of these plans should be ensured to maintain compliance with national regulations and international standards and to minimize the cumulative environmental and social impacts of construction activities.

V. ROLES AND RESPONSIBILITIES

Antalya Alanya Otoyol İnşaat Yatırım ve İşletme A.Ş. (SPV) as the Project Sponsor and Limak (EPC) as the main contractor of the Project will be responsible for the following:

General Manager (SPV):

- Hold overall responsibility and accountability for the project, ensuring construction activities comply with national and international spill management standards.
- Ensure full compliance with the SRMP and related regulations.
- Approve procedures for spill prevention, handling, containment, and cleanup.
- Allocate necessary resources, including trained personnel and equipment, for effective spill response.
- Ensure professional oversight, corrective actions, and monitoring are implemented following spill incidents.

- Ensure all line managers, contractors, and subcontractors understand and fulfil their responsibilities regarding spill management throughout construction activities.

E&S Manager (SPV)

- Prepare, review, update, and implement the SRMP and related E&S plans in accordance with laws, company policies, and international standards.
- Coordinate with EPC, subcontractors, and internal teams; provide technical guidance for spill prevention, containment, and response.
- Monitor compliance, site practices, and record-keeping related to spills, incidents, and corrective actions.
- Ensure delivery and validation of spill management training for all relevant personnel.
- Investigate spill incidents, implement corrective and preventive measures, and oversee emergency response procedures.
- Prepare reports and maintain documentation for audits, regulatory compliance, and incident follow-up.
- Support community engagement and grievance resolution related to spill events, and coordinate with authorities and permit processes.

H&S Manager (SPV)

- Prepare, review, and implement Health, Safety, Community, and Spill Management Plans in line with company policies, regulations, standards, and lender requirements.
- Ensure EPC and subcontractors comply with spill prevention, containment, and response procedures, including site boundaries and method statements.
- Provide technical guidance for safe spill handling and integrate spill controls into daily operations.
- Monitor compliance through inspections, audits, and hazard walkthroughs, focusing on spill risks and storage areas.
- Track spill and safety performance, investigate incidents, determine root causes, and implement corrective actions.
- Support spill management and H&S training, maintain records, and report performance to management and stakeholders.
- Engage with regulatory authorities and ensure timely resolution of spill-related public health and environmental concerns.

Deputy E&S Manager (SPV)

- Lead spill/hazardous material management, ensuring compliance with project requirements, standards, and regulations.
- Review and monitor subcontractors' ESHS and spill/hazardous material procedures.
- Oversee implementation of spill prevention, containment, and response measures by EPC and subcontractors.
- Track incidents, corrective actions, and reporting; ensure proper record-keeping and training.
- Support community engagement, grievance management, and monitoring programs related to spills and hazardous materials.

Social Chief (SPV)

- Ensure EPC and subcontractor adherence to spill response protocols and community protection measures.
- Review and validate reports to ensure compliance with regulatory requirements and spill management standards.
- Deliver training and guidance on community engagement, grievance resolution, and spill incident awareness.
- Liaise with the E&S Deputy Manager and construction teams to address community concerns arising from spill events and ensure effective mitigation.

HSE Specialist (SPV)

- Support implementation of health, safety, environmental, and spill response procedures to ensure safe site operations.
- Conduct routine site inspections, hazard assessments, and audits, with emphasis on spill risks and containment measures.
- Monitor contractor compliance and integrate spill response protocols into daily work procedures.
- Maintain accurate records of spill incidents, permits, inspections, and training activities.
- Participate in spill investigations and ensure lessons learned are applied to prevent recurrence.
- Support and review spill response training for all site personnel.
- Ensure proper placement and maintenance of spill control equipment, barriers, and containment areas.
- Assist in addressing and resolving spill-related complaints and environmental concerns.

Project Director (EPC)

- Define and oversee EPC execution strategy and project management plans (HSE, E&S, QA/QC) with integrated spill response measures.
- Lead teams and coordinate EPC functions, ensuring compliance with site procedures, standards, and regulations for spill prevention and response.
- Approve and monitor site inspections, safety reviews, and training programs, including spill response readiness.
- Track KPIs, timelines, budgets, and implement corrective actions for non-compliance, including spill incidents.
- Serve as EPC representative to SPV, clients, stakeholders, and authorities; address safety, environmental, social, and spill-related concerns.
- Oversee risk management, quality systems, and mitigation strategies covering technical, HSE, social, and spill response aspects.
- Supervise subcontractors and ensure proper execution of construction phases with adherence to spill prevention, control, and response measures.

E&S Manager (EPC)

- Prepare, review, and implement Environmental, Social, and Spill Response Management Plans in accordance with policies, standards, and lender requirements.
- Coordinate with SPV, contractors, and construction teams to ensure compliance with spill prevention, control, and response procedures.

- Monitor and enforce contractor/subcontractor adherence to environmental, safety, and spill management requirements.
- Maintain site boundaries, traffic management, utility protection, and community safety measures related to spill risks.
- Oversee E&S and spill response training, onboarding, toolbox talks, and awareness programs for all personnel.
- Supervise E&S staff, monitor performance, lead investigations, and implement corrective actions for spill incidents.
- Manage grievances, emergency preparedness, and ensure integration of social inclusion principles in spill response planning.
- Report environmental, social, and spill response performance to the Project Director and promote continuous improvement.

H&S Manager (EPC)

- Develop, implement, and update Health & Safety and Spill Response Management Plans.
- Ensure EPC and subcontractors comply with safety and spill prevention, control, and response procedures.
- Manage risk assessments, site safety controls, traffic, utilities, and community protection related to spill hazards.
- Lead inspections, audits, incident investigations, and corrective actions for spill events and safety issues.
- Oversee training, toolbox talks, and emergency drills focused on health, safety, and spill response.
- Report performance, risks, and lessons learned to the Project Director and promote a proactive safety and spill management culture.

Warehouse Supervisor (EPC)

- Maintain accurate records of all hazardous materials and track their location to prevent accidental releases.
- Ensure safe storage with proper labelling, containment, and secondary protection to minimize spill risks.
- Conduct regular inspections of tanks, drums, and containers for leaks, damage, or corrosion.
- Immediately report and manage damaged, expired, or leaking materials, coordinating safe containment and disposal.
- Keep spill response equipment (spill kits, absorbents, fire extinguishers) accessible in storage areas.
- Coordinate with the E&S Manager and HSE team during spill-related inspections, audits, and incident investigations.
- Support training and awareness programs for staff on spill prevention, response, and safe handling of hazardous substances.

Maintenance Team / Equipment Operators (EPC)

- Conduct regular inspections of machinery and equipment to identify and prevent leaks or accidental releases.
- Collect and temporarily store oil, lubricants, and other hazardous residues following approved containment procedures.

- Ensure used oil and residues are transported to authorized recycling or disposal facilities, avoiding contamination or mixing with other substances.
- Keep spill kits and containment materials accessible during maintenance activities.
- Immediately report any spills or leak incidents to the E&S Manager and HSE team for rapid response.
- Participate in spill prevention and response training to ensure safe handling of hazardous substances.

Emergency Response Coordinator (EPC)

- Respond to major spills beyond the capacity of on-site personnel.
- Contain, control, and clean up spills according to emergency response procedures.
- Follow pre-defined safety protocols to protect personnel, community, and environment.

Emergency Response Team (EPC)

- Confirm the use of appropriate PPE.
- Identify the source of the spill.
- Assess if the spill is ongoing.
- Contain the spill using materials from spill kits (booms, bunds, absorbents).
- Recover spilled substances, contaminated soil, and absorbents into suitable containers.
- Clean up the spill while preventing environmental spread.

Environmental Engineer (SPV and EPC)

- Oversee the implementation and monitoring of spill response procedures across all site operations, including subcontractor activities.
- Conduct regular inspections, audits, and risk assessments to ensure proper containment, handling, and environmentally compliant disposal of spilled materials.
- Maintain comprehensive records and support the investigation, reporting, and corrective action of spill incidents.
- Develop and deliver training, toolbox talks, and awareness programs on spill prevention, response protocols, and environmental protection measures.
- Coordinate with H&S, E&S, contractors, and regulatory authorities to integrate spill management into operational plans and emergency preparedness.
- Ensure compliance with all relevant environmental permits, standards, and regulatory requirements related to spill prevention and response.

Community Liaison Officer (CLO) (SPV and EPC)

- Communicate potential spill risks and mitigation measures to local communities.
- Organize meetings and engagement forums to inform and receive feedback on spill incidents.
- Manage grievances related to spills through the Grievance Mechanism (GM).
- Assess spill impacts on vulnerable groups and propose tailored mitigation measures.
- Support monitoring, reporting, and documentation of spill incidents and contractor compliance.
- Maintain confidentiality and ensure proper handling of sensitive spill-related information.

All Personnel/ Spill Observer (including Contractor/Subcontractor Personnel)

- Follow the Spill Response Management Plan and related procedures during all site activities.
- Report any spills or potential spill risks immediately to the CLO and E&S Manager.

- Participate in spill response and safety training programs.
- Ensure safe handling, storage, and use of materials to prevent spills.
- Take responsibility for implementing spill prevention and response measures to maintain a safe working environment.

VI. ENVIRONMENTAL ACCIDENT AND SPILL MANAGEMENT APPROACH

VI.1 Work Sites, Location and Hazardous Materials On-Site

Environmental accidents and unintentional spills during motorway construction projects may result in the release of hazardous and non-hazardous substances such as fuel, oil, lubricants, hydraulic fluids, bitumen, chemicals, and wastewater. If not properly managed, these substances may cause contamination of soil, surface water, and groundwater, posing serious risks to both environmental and human health.

Spills may occur during storage, equipment refueling, vehicle maintenance, chemical handling, or the transportation of hazardous materials. Risk factors include improper handling practices, equipment failure, inadequate storage infrastructure, and insufficient containment systems. Adverse weather events such as heavy rainfall or flooding may further increase the likelihood of containment failure, particularly at temporary waste storage sites and fuel storage areas.

Agricultural areas, pastures, and forests are particularly sensitive to such impacts, with a high overall risk due to the potential for pollutants to degrade soil quality, harm vegetation, and disrupt agricultural productivity. In contrast, scrublands and recreational areas are considered to present a moderate risk, while artificial surfaces—such as urban fabric, industrial zones, or active construction sites—where natural soil functions are already compromised, are associated with lower risk levels. Across all land types, potential contamination is expected to remain spatially limited and short-term reversible, provided that effective spill prevention and response measures are rigorously implemented.

The Project corridor traverses a diverse landscape composed of agricultural lands (63.33%), forests and semi-natural areas (29.05%), meadow-pasture areas (4.94%), settlement areas (1.79%), water bodies (0.77%), and natural and semi-natural areas (0.12%). Given the ecological and economic value of these land use types, accidental spills, leakages, or the improper handling of hazardous materials during construction pose significant risks of soil contamination.

Spill risks during the construction phase are particularly associated with the use of heavy construction equipment, mobile fuel tanks, chemical and waste storage areas, wastewater treatment plants and processing units such as asphalt and concrete batching plants. The improper handling of waste oils, chemical solvents, and other construction-related liquid wastes can lead to contamination incidents if preventive measures are not adequately implemented. Substances such as petroleum hydrocarbons, detergents, and acids may have persistent impacts on environmental media if not promptly contained and remediated.

Through the project, there will be three construction camp sites (Main Camp Site (Manavgat), Camp Site-2 (Manavgat) and Camp Site-3 (Alanya), temporary construction camp site in Taşağıl is in use. In addition to these areas, there will be usage land for mechanic and asphalt plant and concrete plant areas which are listed below (see Table VI-1**Error! Reference source not found.**). In these areas, activities such as refueling and oil changes will be intensive, so the spill risk is highest. Additionally, construction activities along the route, in quarries, and during transportation are also at risk of environmental accidents and spills. In these areas, in addition to spill kits located in risky areas, extra kits will be kept for delivery to nearby construction sites in case of an emergency.

Table VI-1. Information on Mechanic, Asphalt and Concrete Plant Areas

Location	Province	District	Nearest Neighbourhood	Description of the Site / Plant	Area (m²)
Km 55+450	Antalya	Serik	Sarıabalı	Concrete Plant-1	13,946
Km 59+400	Antalya	Manavgat	Taşağıl	Temporary Construction Camp Site	66,450
				Concrete Plant-2	
				Mechanical Plant-1	
				Asphalt Plant-1	
Km 64+400	Antalya	Manavgat	Taşağıl	Construction Camp Site-1 (Main)	-
Km 80+400	Antalya	Manavgat	Yeniköy	Concrete Plant-3	15,000
Km 87+500	Antalya	Manavgat	Bucakşeyhler	Construction Camp Site-2	42,371
Km 87+700	Antalya	Manavgat	Bucakşeyhler	Concrete Plant-4	
				Mechanical Plant-2	
				Asphalt Plant-2	
Km 89+700	Antalya	Manavgat	Ulukapı	Concrete Plant-4a	11,665
Km 99+200	Antalya	Manavgat	Sülek	Concrete Plant-5	11,977
Km 124+300	Antalya	Alanya	İncekum	Construction Camp Site-3	85,000
				Concrete Plant-6	
				Mechanical Plant-3	
				Asphalt Plant-3	

To prevent or minimize the environmental consequences of spills, proactive strategies should be implemented. These include proper handling, storage, and transportation of hazardous substances, the provision of appropriate containment infrastructure, and the development of robust emergency response and remediation procedures that are systematically applied throughout construction activities.

In case of a spill in any area, contaminated soil, water and used spill kits will be treated as hazardous waste. These wastes will be disposed of in hazardous waste containers in the area where the work is carried out and from there they will be transferred to the Temporary Hazardous Waste Storage Areas in Temporary Construction Camp Site, Main Camp Site, Camp Site-2 or Camp Site-3 which one is the closest, considering the spill products either hazardous or non-hazardous.

VI.2 Spill Classification

Spill incidents can be classified into three categories based on the estimated volume of the released substance and the spatial extent of the impact:

- **Minor Spills:** Minor spills are localized and can be addressed solely by worksite personnel using available on-site resources such as spill kits. These may include small leaks, drips, or splashes from malfunctioning hoses, fittings, or leaking vehicles and equipment. Environmental impacts are expected to be minimal, confined within the work area, and remediable within a few days or weeks. No lasting effects on terrestrial or aquatic ecosystems are anticipated. Minor spills are generally considered to involve volumes of less than 200 liters.

- **Medium Spills:** Medium spills involve larger volumes and require additional local manpower and resources. Such incidents are typically caused by failures in safety systems, structural breaches, or significant fuel losses. These spills may cause moderate, yet reversible, impacts on the environment and typically require 1–2 months for effective clean-up and remediation. The relevant authorities should be immediately notified. Indicatively, medium spills range from 200 to 5,000 liters. Remediation and monitoring will be overseen by the Environmental Engineer of the EPC under the supervision of the E&S Manager of EPC and E&S manager of the SPV, and in coordination with regulatory agencies.

- **Major Spills:** Major spills represent large-scale or crisis-level events that exceed the response capacity of local teams and require the involvement of specialized contractors and additional equipment. These events must be immediately reported to the relevant authorities. Clean-up and rehabilitation efforts may span up to one year, and significant, potentially long-term impacts on the environment may occur. Spills involving more than 5,000 liters fall within this category. Remediation and monitoring activities will be led by the environmental engineer of the EPC with supervision of E&S Manager of the EPC and carried out to the satisfaction of E&S Manager of SPV and the competent regulatory authorities.

VI.3 Preparedness, Prevention and On-site Resources

Storage area will be designed and equipped based on the chemical and physical properties of the products, and based on the types of containers stored, the number of people requiring access, and the quantities of the substance used. The size of areas allocated for storage will be calculated based on the volume of the hazardous material that will be on site during peak construction for the relevant activity. MSDSs must be available for all stored hazardous substances and the substances must be clearly labelled. Entrances, exits and access to emergency equipment are kept clear at all times. All storage areas for hazardous substances are equipped with secondary retentions to retain any spill or leakage from one of the containers stored. The secondary retention volume is defined as a minimum of 110% of the volume of the largest container stored on the site taking into consideration the volume occupied by the stored containers. Secondary containment bunds are to be maintained empty of rainwater. Tanks are to be equipped with level detectors and safety systems to prevent overfilling. Suitable absorbents (neutralising and non-combustible) are available in the storage area to clean up any spills and leaks.

Refuelling of project vehicles and plants are to be made on dedicated refuelling stations equipped with impervious platforms. Refuelling on worksite outside the dedicated refuelling stations is not authorized unless authorized otherwise by Project Management when no other options are feasible. If authorized, refuelling of machinery on worksite will be performed using a dedicated equipment to minimize risks of leakage and soil contamination.

Hazardous substances and waste must be clearly labelled on each container and the proper container for each substance must be used. Secondary containment will be provided together with collection and treatment of runoff from areas where hazardous materials are stored. For more details, refer to Hazardous Material and Solid Waste Management Plan.

Hydrocarbon/Oil spill kits will be present at each worksite during the implementation of the Project: Spill kits will be located at each worksite and in particular appropriate spill kits will be located at:

- Storage areas for hazardous substances,
- Nearby areas where hazardous substances are used,
- Mechanical workshops where the construction equipment is repaired and maintained,
- On trucks and tank trucks (in particular, as bridges can be present, on each transportation vehicle, the spill kit should include spill pads that can be used to avoid leakages into the water stream).

VI.4 Site Inspections and Monitoring

ESHS will conduct daily visual inspections of all hazardous material storage areas and containers to look for signs of deterioration, leaks, unsecured container lids, or excess accumulation of materials in the containment areas. All visible leaks and releases will be promptly cleaned up and disposed in accordance with this Plan. Additionally, equipment operators (crane operators-high up operators, fuel tanker drivers) will conduct routine inspections on equipment to check for leaks daily to minimize the potential for spills or leaks and ensure spill kits are complete and available.

VI.5 Spill Response Action Steps

All site personnel act as spill observers. They must first ensure safety, notify the Emergency Response Team, and provide key details such as the location, type of substance, and source of the spill. If necessary, they evacuate nearby personnel, use PPE, and remove ignition sources, stop the spill, and contain it. If the substance is unknown or there is a fire/explosion risk, evacuation is required. The Emergency Response Team or Coordinator confirms the use of correct PPE, identifies the spill source, and checks if the release is ongoing.

All personnel may assist in stopping or minimizing the spill if safe to do so, for example by closing valves or moving equipment. The spill observer must notify the Emergency Response Coordinator, who then informs the E&S Manager and ESHS Manager. The Emergency Response Coordinator evacuates the area if needed and diverts traffic and people away from the hazard. The Emergency Response Team contains the spill using spill kit materials such as bunds, booms, or absorbents.

The team collects spilled products, contaminated soil, and used absorbents in appropriate containers included in the spill kits. The Emergency Response Team cleans the area carefully, avoiding spread to soil, water, or air. The ESHS Team ensures that all contaminated products, materials, and soils are disposed of following hazardous waste procedures. The ESHS Team reports the spill to the ESHS Manager and Construction Manager. Any spill response equipment used must be replaced immediately by the ESHS Team. The ESHS Team monitors environmental and social impacts and checks the effectiveness of the clean-up.

If the spill affects areas outside the worksite, the ESHS Manager and Project Manager must report it to the local authorities..

VI.6 Reporting and Recordkeeping

In an event of spill, the following general notification procedures are to be followed:

- The person who observed a spill must notify the event to the Emergency Response Coordinator and/or ESHS Supervisor.
- The ESHS Manager should also be notified immediately orally, together with the E&S Manager.
- A Spill Report Form must be filled up by the Emergency Response Coordinator and notified to the ESHS Manager and Construction Manager within 12 hrs from the event.
- The ESHS Manager is responsible for the evaluation of the extent of the spill and of immediately contacting the local and National Authorities, if deemed necessary.
- Also, a notification to the Employer ESHS Manager should be issued within 24 hrs.

VI.7 Spill Containment, Clean-up and Rehabilitation

When a spill occurs, polluted soils must be removed and managed as hazardous waste. Runoff from areas where hazardous materials are stored or handled will be collected and treated through an oil-water separator before any discharge to the environment.

After every clean-up, the area will be assessed to check if further remediation is needed. This includes identifying affected environmental components, the extent of contamination, and possible migration paths. If required, a Monitoring Plan will be developed and implemented. All used spill kits must be replaced before construction resumes, and all equipment used must be decontaminated before storage. Wastes generated from spill response will be disposed of according to national regulations and the Hazardous Material and Solid Waste Management Plan.

Spills must be restricted immediately for hydrocarbon spills. Absorbents, pads, booms, and barriers should be used to minimize contamination of soil, water, and vegetation. Contaminated soil, water, and materials must be containerized, double-bagged, and stored in a designated hazardous waste area. If spills occur near drains or streams, drains must be closed and floating product pumped into drums. Contaminated vegetation may be cut or flushed with water. Effectiveness of the clean-up must be monitored. Water must not be used to disperse chemicals. Personnel must use PPE and compatible containers. Activities must be reported to the ESHS Manager.

For all spill types, contaminated soils must be removed, spills restricted with barriers, and watercourses protected with booms and absorbents. Snow and ice are to be treated as soil. Vegetation can be protected with pads and booms; if contaminated, it may be cut or flushed.

VII. MITIGATION MEASURES FOR SPILL AND ENVIRONMENTAL ACCIDENT RISKS

The following measures will be implemented throughout the Project sites to prevent or minimize the risks and impacts associated with spills and environmental accidents during the construction phase:

Hazardous Material Evaluation & Storage

- All hazardous materials will be evaluated by the E&S Manager of the EPC prior to being brought to site, including their type, quantity, transfer location, and hazardous characteristics, in order to implement appropriate preventive and control measures.
- Any spill or leakage event will be responded in accordance with the procedures described in the Emergency Preparedness and Response Plan
- Storage areas will be designed with impermeable flooring, secondary containment (e.g., bunds, drip trays), and secure enclosures. And it will be located at least 10 m. away from drainage lines and environmentally sensitive zones to prevent the spread of contamination during accidental releases.
- All tanks, containers, and drums will be regularly inspected for damage or leakage. Any corroded, worn, or damaged equipment will be promptly repaired or replaced.
- Incompatible hazardous substances will be stored separately, and material safety data sheet (SDS) requirements will be considered in designing storage arrangements.
- Storage facilities will be covered to protect materials from rain and snow and secured with fencing and locks to restrict unauthorized access.
- Storage structures will include sufficient open space to allow for visual inspection and monitoring of stored materials.
- Fire extinguishers will be available in also all hazardous and non-hazardous material storage areas.
- All chemicals and hazardous materials will be stored in designated hazardous materials storage areas that have lean to roof, concrete floor, secondary containment of at least 110% of the stored volume and proper drainage for spills/leak.
- For the storage of liquid wastes greater than 220 liters, secondary containment will be provided with an available volume of at least 110% of the largest storage container or 25% of the total storage capacity, whichever is greater.

Refueling & Maintenance Activities

- Refueling will be carried out only by trained operators using hoses with automatic shut-off nozzles. Fueling tankers will be equipped with spill kits and/or drip trays for use during refueling. Drip trays or absorbent materials will be placed under refueling points.
- All refueling, maintenance, or chemical handling activities will be carried out with spill prevention in mind and with contingency equipment immediately accessible.
- Spill kits, absorbents (pads, socks, booms), and fire extinguishers will be located at all spill-prone locations, including fuel tanks, maintenance areas, and material storage areas.
- A trained fuel operator will maintain hose contact with the equipment during refueling. Fueling will not begin without placing drip trays under the vehicle or machinery.

Spill Prevention & Response

- Maintenance activities that may result in spills will be conducted in designated areas which will be constructed in construction site areas equipped with containment systems and spill kits.
- During any maintenance activity with spill risk, spill kits will be positioned near the work zone and equipment will be placed within containment barriers or over drip trays.
- Spill response responsibilities will be assigned to designated personnel, including environmental engineers, and the Emergency Response Team (ERT) which is specified in Emergency Response Plan.
- The ERT contact information and emergency numbers will be clearly posted at work sites and storage areas.
- In case of any emergency (e.g., spill, fire), any staff member must immediately notify the ERT and provide the following: name, location, type of incident (e.g., chemical or fuel spill), and its severity.
- If a worker detects a spill, they must alert nearby personnel, inform environmental staff, and provide a brief description of the situation to facilitate a timely response.
- In case of spills:
    - Small spills will be cleaned immediately by the operator using absorbents, which will be disposed of as hazardous waste.
    - Large or hazardous spills will be managed by the Emergency Response Team (ERT), who will assess severity, contain, and clean up.
- The severity of a spill will be assessed based on chemical type, physical state, potential for spread, weather conditions, and area affected—not solely by surface area.
- For spills on soil, the source will be shut or isolated, and the substance contained using earthen bunds, booms, or absorbent materials. Contaminated soil will be excavated and disposed of at licensed hazardous waste facilities.
- For spills into surface water, floating barriers (booms) will be used to contain the release. Free product will be collected using pumps and absorbents. Any grease, solvent, or oil spills in maintenance areas will be cleaned using sorbents and placed in appropriate hazardous waste containers. No spills will be hosed into the environment.
- Spills of dangerous substances will be reported by E&S Manager of the EPC to the E&S Manager of the SPV and documented on site.
- Contaminated materials (e.g., soil, cloth, barrels) will be transported to licensed disposal facilities using authorized vehicles.
- Used absorbents will be placed in black-colored hazardous waste containers marked appropriately.
- Absorbent pads will be placed on spills and left for 5–10 minutes. If residues remain, a second pad will be applied. Each pad can absorb up to 17 times its weight.
- Absorbent socks (“sausages”) will be used as perimeter controls to contain spreading spills. These will also be disposed of as hazardous waste.
- All spill control materials (kits, extinguishers) will be kept near high-risk locations and clearly marked.
- Fire extinguishers will be placed strategically and regularly inspected.

Training, Inspection & Documentation

- All employees will be trained on spill prevention, response procedures, and their respective responsibilities.
- Regular inspections will be carried out on tanks, bunds, supports, and connections by environmental staff. All findings will be recorded.
- Internal haul roads will be inspected for structural integrity, and repairs will be conducted promptly to minimize vehicle-related spill risks.
- All spill events will be recorded, investigated, and followed up with corrective actions. Lessons learned will be incorporated into updated response plans.
- EPC's Environmental Engineer will coordinate all major spill responses in accordance with Turkish legislation and notify the EPC's E&S Manager and SPV's E&S Manager accordingly. The SPV E&S Manager will coordinate the documentation of corrective actions for these incidents and their submission to the Antalya Provincial Directorate of Environment, Urban Planning, and Climate Change, as required.

VIII. TRAINING

All personnel will receive structured training upon hiring as part of the Project's onboarding and orientation program. This training will cover the prevention and management of environmental accidents and hazardous material spills, including identification of potential spill sources, associated risks to human health and the environment, and appropriate response actions.

The training program will include the following core elements:

- General environmental awareness and potential impacts of spills;
- Applicable national legislation and international standards related to hazardous material handling and spill response;
- Where can this Plan and other relevant procedures (e.g., Hazardous Materials Management Plan, Solid Waste Management Plan) be accessed;
- Typical sources of spills on construction sites, such as equipment failure, leaks during fuel transfer, and improper storage of chemicals or lubricants;
- Precautionary measures for spill prevention;
- Use, location, and application of spill kits and absorbent materials in various work areas;
- Spill containment and control procedures;
- Proper use of personal protective equipment (PPE) during spill response;
- Procedures for clean-up, recovery, and appropriate disposal of contaminated materials;
- Replenishment of spill kits following use or routine inspection.

Training will be primarily delivered through practical demonstrations to ensure staff understands how to respond effectively in the event of a spill. Specialized training will be provided to designated personnel, including members of the ERT, with additional focus on spill response leadership, containment strategies, clean-up coordination, and documentation.

Subcontractors will be responsible for ensuring that their employees receive equivalent training, consistent with Project requirements and aligned with the overall ESMS.

All personnel will receive refresher training at regular intervals, and additional training will be provided to newly hired staff. The E&S Manager will prepare a detailed training schedule, which will be reviewed and approved by the Project Manager.

Spill response drills will be conducted at least once annually to test readiness and build confidence among construction teams and the ERT. Before the drills, ERT team will be trained in waste disposal intervention and management in accordance with national and international standards. Drill performance will be documented in accordance with the ESMS protocols. Drill records will be submitted to the Project Manager for approval and archived as per ESMS protocols.

Attendance and completion of all training sessions will be documented through the Training Participation Form. These records will be managed and retained by the ESHS team, and subject to periodic audits to verify compliance with training and preparedness requirements.

IX. MONITORING

A structured internal monitoring program will be implemented to assess the effectiveness of environmental accident and spill response measures outlined in this Plan during the construction phase of the Project. The scope and frequency of monitoring activities will be periodically reviewed and revised where necessary, based on site-specific risks, incident trends, stakeholder concerns, or changes in applicable environmental regulations.

Monitoring activities will be coordinated by the E&S Manager, in close collaboration with the H&S Manager. Key responsibilities will include verifying the proper storage and handling of hazardous materials, monitoring implementation of spill prevention measures, checking the availability and condition of spill response kits, and ensuring that spill containment practices are consistently applied across critical work areas such as fuel storage sites, maintenance zones, and material handling areas.

Regular inspections will be conducted at designated locations across all worksites to evaluate compliance with national environmental regulations and Project-specific spill prevention requirements. This will include visual inspections for potential leaks or spill risks, control of secondary containment systems, checks on the use of drip trays and absorbent materials, and review of maintenance and inspection logs for storage tanks and hazardous material containers.

The performance of contractors and subcontractors in implementing spill management and emergency response measures will be reviewed through environmental audits, site supervision reports, and field observations. Any identified non-conformities will trigger timely corrective and preventive action plans. Monitoring will also include follow-up assessments to confirm the effectiveness of implemented measures and to prevent recurrence.

In addition to internal monitoring, inspections may be carried out by relevant public institutions, including the Ministry of Environment, Urbanization and Climate Change, in accordance with Turkish legislation. The frequency and scope of these inspections will be determined by the authorities and may include review of monitoring data, inspection of hazardous material storage practices, and verification of response protocols and documentation.

Monitoring efforts will be guided by the framework provided in Table IX-1, which outlines the parameters to be monitored, the corresponding monitoring locations, frequency of inspections, and responsible parties. These monitoring activities will be essential for evaluating the effectiveness of spill prevention and response measures and ensuring full compliance with national regulations and Project standards.

Table IX-1. Key Monitoring Activities

Parameter	Monitoring Station / Location	Monitoring Method	Monitoring Frequency	Responsible Parties
Number of trainings conducted	Project site offices	Tracking the number of trained personnel	Quarterly	AAOİAŞ, EPC,
Reported spill/leak incidents or non-compliance records	Site-wide	Review of non-compliance, accident, and spill records	Daily	AAOİAŞ, EPC
Number of complaints related to environmental accidents	Project site offices	Logging and reviewing records as per the Stakeholder Engagement Procedure	Quarterly	AAOİAŞ, EPC,
Hazardous materials storage conditions	Storage and handling areas of hazardous substances	Maintaining records in accordance with the Spill Response Management Plan	Monthly	AAOİAŞ, EPC,
Spill kits number and conditions	All construction and maintenance areas and vehicles, chemical storage areas	Visual check and control list	Weekly	AAOİAŞ, EPC, Subcontractors
Number of spill/leakage	All construction site	Visual check and incident reports	Daily	AAOİAŞ,EPC,
Fire extinguisher check	Storage and handling areas of hazardous substances	Visual check and control list	Monthly	AAOİAŞ,EPC,
Spill response drills	Storage and handling areas of hazardous substances	Audit – Drill reports review	At least semi-annually	AAOİAŞ,EPC,
Spill prevention and response training	All employees	Audit – training records review	Monthly	AAOİAŞ,EPC,

In cases of non-compliance identified through internal oversight AAOİAŞ will ensure that corrective and preventive measures are promptly implemented in coordination with the Contractor (Limak) and relevant subcontractors.

All spill-related findings, including incident reports, non-compliance records, or complaints received from workers or community members, will be documented in accordance with national environmental regulations and Project plans. In the event of serious violations—such as significant releases of hazardous substances or repeated failure to implement mitigation measures—AAOİAŞ will ensure that the issue is reported to the competent authorities and that appropriate technical, procedural, and contractual actions are taken.

In cases of any medium and major spills will be reported immediately. All reporting will be conducted in accordance with the requirements of local and national authorities.

X. KEY PERFORMANCE INDICATORS

The following Key Performance Indicators (KPIs) will be monitored, verified, and evaluated.

Table X-1. Key Performance Indicators – Construction Phase KPIs

Monitoring Parameter / Performance Indicator	Target	Frequency	Responsible Party
Number of spill response trainings conducted	All personnel to receive training, 100%	Monthly	AAOİAŞ,EPC,
Number of non-compliances with applicable standards	Less than five	Monthly	AAOİAŞ, EPC,
Number of complaints related to spills	Less than five	Monthly	AAOİAŞ, EPC,
Compliance with Spill Response Management Plan procedures	Less than five deviations	Monthly	AAOİAŞ, EPC,
Contamination on soil and/or water	0 (zero)		AAOİAŞ, EPC
Number of spill drills	All personell to attendance drill,100%	Semi-annualy	AAOİAŞ, EPC

XI. AUDIT AND REVIEW

The implementation of this Plan should be regularly monitored and reviewed in accordance with the ESMMP. All environmental accident and spill-related incidents and non-conformities should be documented and reported as outlined in this Plan. Contractors and subcontractors should be subject to audits conducted by the SPV within the scope and schedule defined in the Contractor and Subcontractor Management Plan. These audits and the associated records should be managed in compliance with the Project's environmental management system and applicable regulatory requirements. Records to be reviewed during environmental audits will include, but are not limited to, incident and non-compliance records related to spills, spill response and investigation reports, training attendance logs for spill prevention and response, inspection and maintenance records of hazardous material storage areas, spill kit inventory checklists, and corrective action logs. Observations and deficiencies identified during audits should be recorded in formal audit reports, and all findings requiring improvement should be registered under corrective actions defined in Section VI. Project management will review audit outcomes and corrective action records, follow up on progress, and ensure that additional measures are implemented where necessary to ensure full compliance with national legislation, international standards, and Project-specific environmental requirements.

XII. REPORTING

Regular reporting will be conducted to ensure the effective implementation and continuous improvement of solid waste management activities throughout the construction phase of the Project. Reporting will be structured to address both internal monitoring and auditing outcomes, as well as external compliance obligations and stakeholder engagement requirements.

Based on monitoring results, necessary corrective and preventive actions will be identified, and the required updates will be incorporated into this Plan. The training program will also be revised accordingly to address any observed gaps. Regular audits and visual inspections will be conducted to verify that all activities are being undertaken in accordance with the provisions of this Plan.

Quarterly Environmental and Social Monitoring Report will cover at least, but not limited to, the following items. The report will be prepared by the SPV with input data provided by EPC to evaluate the Project performance and compliance of the related plans.

- Incident reporting;
- Emergency response reporting;
- Records of annual emergency response training exercises;
- KPIs and performance trends (see Table XII-1) ;
- Current situation Key Monitoring Activities (see Table XII-2)
- Relevant training activities completed and attendance registers to be maintained;
- Legal Authorities Audit reports;
- Site Inspection logs

In addition, the following external reporting will be done:

- All environmental and social incidents will be appropriately documented, notified and reported in accordance with established procedures the terms and conditions by EPC to SPV,
- Incident notification and reporting to relevant Turkish regulatory bodies will be performed in line with applicable legislation in force and as stipulated in permits and licenses.
- The Lenders will be notified of incidents pursuant to the terms and conditions agreed upon in the Finance Agreements through SPV.

All personnel are encouraged to raise concerns, suggestions, or complaints related to this Plan through the established grievance mechanism by completing the grievance form. The communication channels available for submitting grievances are outlined in the Stakeholder Engagement Plan.

WATER QUALITY, WASTEWATER AND STORM WATER MANAGEMENT PLAN

WATER QUALITY, WASTEWATER AND STORM WATER MANAGEMENT PLAN

I. INTRODUCTION

Ministry of Transport, and Infrastructure (former Ministry of Transport, Maritime Affairs and Communications), General Directorate of Highways ("KGM" or "the Administration"), as the owner of the Antalya-Alanya Motorway Project, has tendered for a contract in accordance with the Law on Implementation of Some of the Investments and Services in the Framework of Build, Operate and Transfer Model (Law No: 3996). Following the tendering process, KGM has awarded Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. (AAOİAŞ or the Project Sponsor) with a Build, Operate and Transfer (BOT) contract for the implementation of the Project. Accordingly, AAOİAŞ will be referred as Project Sponsor[1] in the scope of this report. The main contractor for the Project has been designated as Limak and will henceforth be referred to as the Contractor (or EPC).

The project is designed to connect the districts of Serik and Alanya via the Manavgat district of Antalya province. The Project will enhance the existing transportation network services with its surrounding provinces: Burdur, Muğla, Konya, Isparta, Karaman and Mersin. Various environmental, social, and technical studies have been conducted along the initial route of the Project tendered by the KGM. Based on these studies, the route was optimized, incorporating engineering practices and addressing environmental and social considerations, particularly issues of involuntary and economic resettlement, before being finalized. According to the most current design, the total length of the Motorway, which will be a dual carriageway of mostly 3 and partially 2 lanes (3x2 and 2x2) in each direction, is 117.8 kilometers including the main carriageway and the access roads[2].

This Water Quality, Watewater and Storm Water Plan ("Plan") has been prepared by Antalya-Alanya Highway Construction Investment and Operation Inc. ("AAOİAŞ" or "SPV") for the Antalya-Alanya Highway Project ("Project") in accordance with national legislation, the Equator Principles ("EP"), the International Finance Corporation ("IFC") Performance Standards ("PSs"), and the international standards that reference the relevant legislative sections. The Plan covers the construction phase of the Project.

I.1.Project Description

The Project starts at Serik Interchange (Km: 52+000) and then proceeds eastward, following the corridor at the foothills of the Taurus Mountains within the boundaries of Serik and Manavgat districts, ending at north of Konaklı neighborhood of Alanya District (Km: 136+000). From this point onwards, the route turns southward with a 2x2 lane connection road and connects to the D400 state road at the Alanya West Interchange. As of April 2025, the current Project design includes a total of 117.8 kilometers of road, comprising 84 kilometers of main road (motorway) and 33.8 kilometers of access roads.

The map showing the construction components and road route within the scope of the Project's construction activities is provided in *Figure I-1.*

[1] The BOT Contract uses the term "Appointed Company" to refer Project Sponsor

[2] It should be noted that the environmental and social baseline characterization, maps and scoping assessments provided in this report are based on the most current design

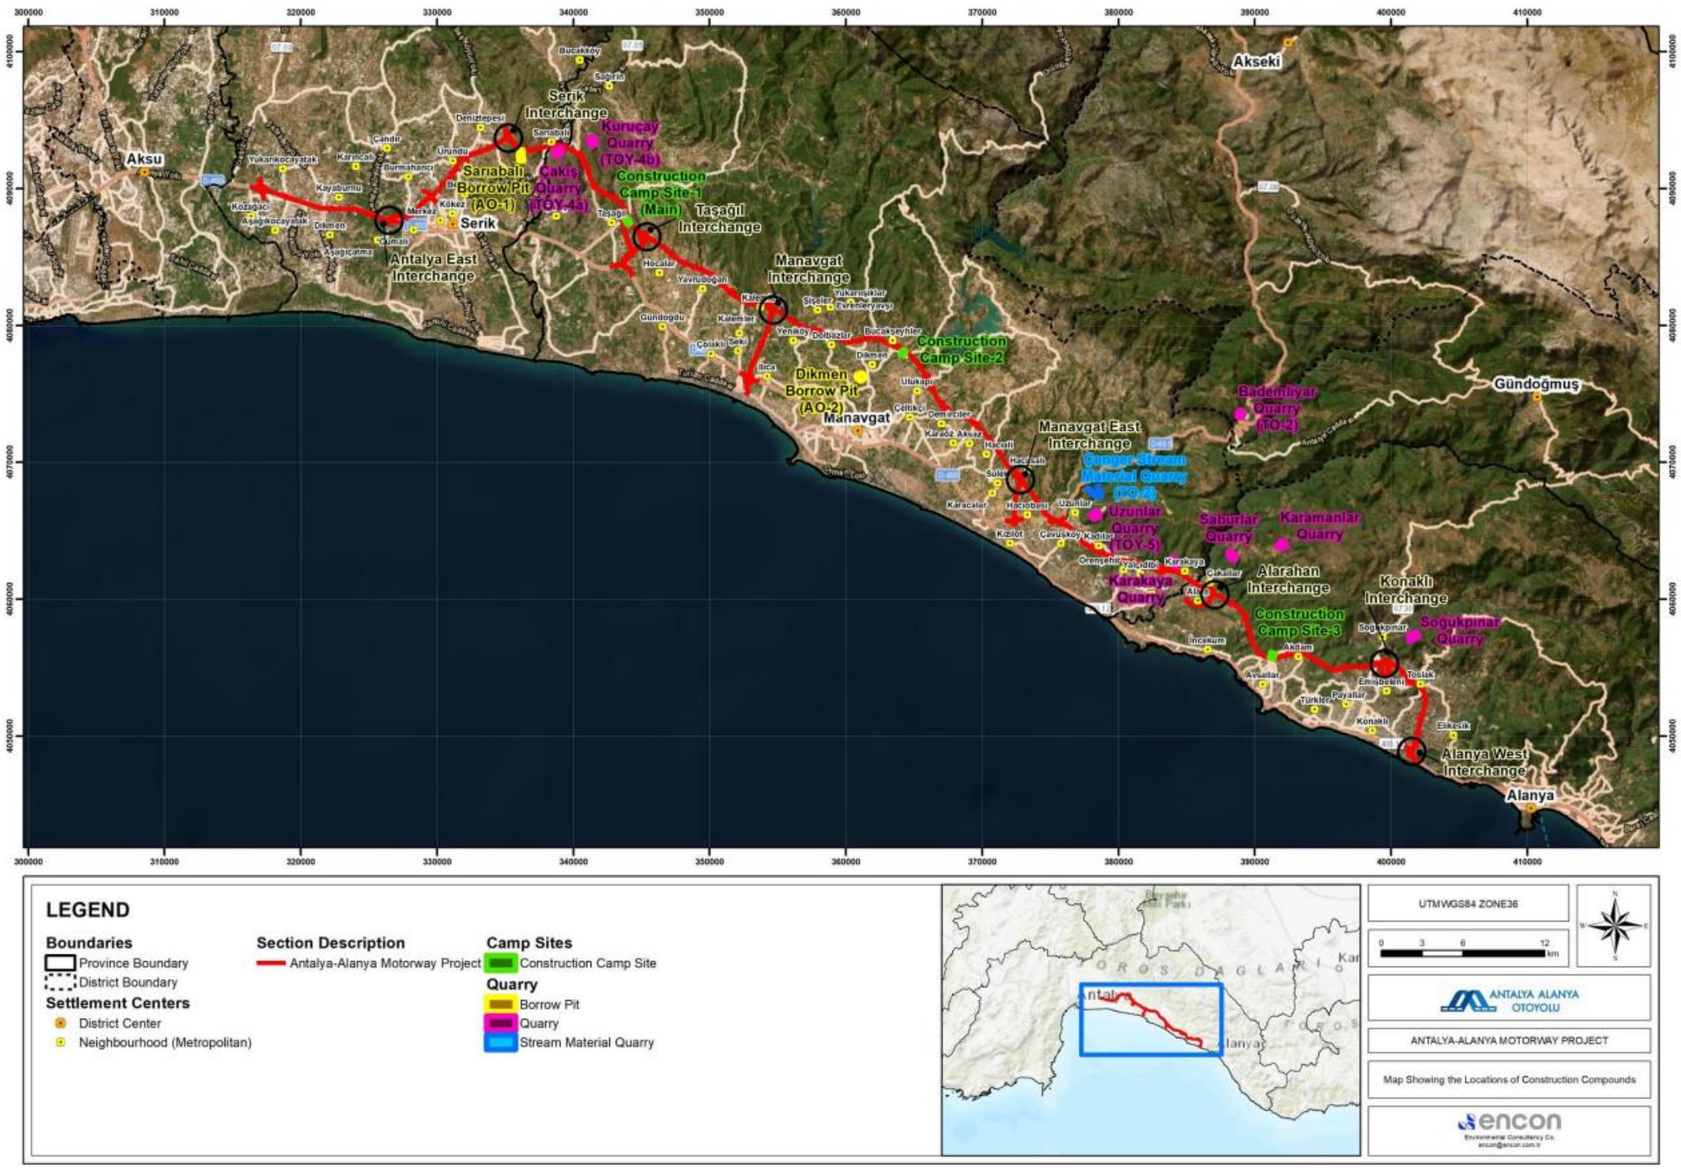

Figure I-1. Map Showing the Locations of Construction Compounds

Other structures to be built as part of the project are as follows:

- 16 viaducts,
- 22 bridges,
- 305 culverts,
- 25 interchanges,
- 56 overpasses,
- 43 underpasses, and
- 5 tunnels.

The activities to be carried out within the scope of the Project that are likely to have an impact on water resources are as follows:

- Excavation
- Soil stockpiling
- Quarry activities
- Plant and wheel washing
- Road construction
- Washing of finished road surfaces to remove accumulated soil

I.2. PURPOSE AND SCOPE

This Water Quality, Wastewater and Storm Water Management Plan ("the Plan") has been prepared for the Antalya-Alanya Motorway Project ("the Project").

The aim of this Plan is to establish effective procedures and control mechanisms for managing and monitoring water use, wastewater and storm water generated throughout the construction phase, including those arising from construction zones, maintenance areas, rest facilities, and toll booth operations. The Plan has been developed in line with relevant national legislation and international standards, including requirements set by international financial institutions.

This management plan is a living document developed with the best available information and will be reviewed and revised as necessary due to the nature of the construction and progress.

The ultimate responsibility for its implementation resides with AAOİAŞ, Limak and AAOAİŞ's sub-contractors & suppliers will be required to demonstrate compliance of their activities against this plan.

The Special Purpose Vehicle (SPV) (AAOİAŞ) will have the main role in monitoring of E&S performance of all project participants during implementation of works and services.

This Plan outlines procedures, responsibilities, and control measures that should be done to minimize adverse impacts on water resources, water consumption, safeguard water quality, and ensure environmentally sound wastewater and storm water handling. It serves as a guiding framework for identifying potential risks, implementing mitigation measures, and establishing monitoring protocols throughout construction activities.

The Plan should be adopted by all construction-phase stakeholders, including the Project Sponsor (Antalya-Alanya Otoyolu İnşaat Yatırım ve İşletme A.Ş. – AAOİAŞ), the Main Contractor (Limak), and all subcontractors. Each party should ensure compliance with the procedures defined in this Plan. Adequate training, infrastructure, source, equipment, and capacity should be provided to

ensure effective implementation. Regular reviews and updates should be conducted to reflect changes in design, construction approach, or applicable legislation.

During the construction phase of the Project, the following types of wastewater are expected to be generated:

- Black water (sewage) from flushable toilets and portable/chemical toilets;
- Grey water from sinks, showers, canteens and laundry facilities (at the worker camp);
- Other wastewater from equipment/vehicle washing, concrete washout, wastewater from concrete batch plants, Quarry and Material Extraction Activities deep excavation, blasting, blockage of permeable layers etc.; and
- 'Dirty' run-off water from impermeable surfaces (e.g. concrete paved areas).

This Plan covers the various aspects pertaining to the water consumption (uses, quantities, source and quality etc.) of water, the safe and environmentally acceptable handling, treatment and discharge of wastewater and management of ambient water quality during the Site construction and related humanitarian activities ("the Project Activities"). The following key objectives apply:

- Identify potential water sources
- Identify potential water users with the required quality and amount
- Identify potential sources of wastewater and any key risks to the environment;
- Identify and control key potential pollution risks;
- Cover both accidental and intended impacts on the aquatic environment;
- Identify and ensure that the relevant requirements of national and international standards are complied with during the project (i.e. IFC Performance Standards);
- Outline actions and measures necessary for the effective management of wastewater;
- Define measures to address potential pollution or contamination of the aquatic environment should this arise from the Project Activities or accidental incidents;
- Define the duties and responsibilities of the key personnel involved; and
- Ensure that the necessary equipment, training, capacity needs are known and provided to ensure efficient implementation of the plan.

II. LEGISLATIVE FRAMEWORK AND REFERENCE STANDARDS

The Plan has been structured to align with both national and international requirements, including legislation, guidelines, and sectoral standards that define permissible emission levels and water quality thresholds. Accordingly, the following sources of reference should be used to guide the implementation and compliance procedures:

II.1 National Requirements

The following Turkish laws and regulations should be used as the legal basis for managing water quality during construction:

- Environmental Law (Law No. 2872)
- Regulation on Control of Water Pollution,
- Regulation on Protection of Groundwater Against Pollution and Deterioration,
- Regulation on Surface Water Quality,
- Regulation on the Protection of Drinking Water Basins,
- Regulation on the Collection, Storage, and Discharge of Storm water Systems,
- Regulation on Urban Wastewater Treatment,

- Regulation on Wetland Conservation,
- Regulation on Drinking Water Intended for Human Consumption,
- Regulation on the Control of Pollution Caused by Hazardous Substances in Water and the Environment,
- Regulation on Waste Management,

- Regulation on Environmental Permit and License,
- Groundwater Law (Law No.167)
- Waste Water Treatment Plant Registration Certificate (Numbered 2015/06) and

II.2 International Standards and Conventions

To ensure responsible operations, AIIB adheres to policies addressing environmental and social impacts as outlined in its Environmental and Social Framework ("ESF") document. Updated in June 2024, the ESF reflects AIIB's commitment to international standards and sustainable development practices. The ESF includes the Environmental and Social Policy (ESP), which sets mandatory requirements for all projects, supported by Environmental and Social Standards ("ESSs"):

Moreover, the following standards, guidelines and directives should be used to align Project practices with international lender requirements and good practice environmental and social management:

- IFC Performance Standards (2012), specifically:
  - Performance Standard 3: Resource Efficiency and Pollution Prevention
  - Performance Standard 4: Community Health, Safety, and Security
- IFC Environmental, Health and Safety (EHS) General Guidelines (2007)
- IFC EHS Guidelines for Toll Roads (2007)
- IFC EHS Guidelines for Cement and Lime Manufacturing: Occupational Health and Safety (2007)
- IFC General EHS Guidelines: Wastewater and Ambient Water Quality
- IFC General EHS Guidelines: for Construction Materials Extraction Construction and Decommissioning
- Equator Principles IV (2020)
- EU Urban Wastewater Treatment Directive (2024/3019/EC)
- World Health Organization (WHO) Guidelines for Drinking-Water Quality (2022 and 2024)

These references should be used to guide the implementation, monitoring, and performance evaluation of water pollution and mitigation on-site throughout the construction phase.

II.3 Project Domestic Waste Water Standards

To determine the discharge limits for domestic wastewater, the limit values specified in national and applicable international standards are provided below (see Table II.1). It is stated in the IFC EHS General Guidelines, Wastewater and Ambient Water Quality document, "Compliance with national or local standards for sanitary wastewater discharges or, in their absence, the indicative guideline values applicable to sanitary wastewater discharges shown in Table 1.3.1". Accordingly, domestic wastewater discharge standards are determined as follows.

Table II.1 Project Discharge Standards for Domestic Wastewater

Parameter	Turkish Legal Requirement ([a])	IFC ([b])	Project Standards
Biochemical Oxygen Demand (BOD_5) (mg/L)	50	30	50
Chemical Oxygen Demand (COD) (mg/L)	160	125	160
Total Suspended Solids (TSS) (mg/L)	60	50	60
pH	6-9	6-9	6-9
Total Nitrogen (mg/L)	-	10	10
Total Phosphorus (mg/L)	-	2	2
Oil and Grease (mg/L)	-	10	10
Total Coliform Bacteria MPN([c])/100 ml	-	400	400

([a]) Water Pollution Control Regulation, Table 21.1 Domestic Wastewater Discharges (Class 1: BOD load 5-120 kg/day, Population: 84-2000)
([b]) Table 1.3.1-Indicative Values for Treated Sanitary Sewage Discharges, IFC Environmental, Health, and Safety General Guidelines, April 30, 2007.

III. Water Usage

III.1 Potential Water Sources

- The Project will supply water from groundwater and surface water resources. The water use of project activities would be planned to be limited and would be done only after getting relevant permissions from the authorities. Periodical potable water analysis will be conducted by independent parties according to relevant standards for human usage. In any case of noncompliance with parameters for potable water, appropriate water treatment facilities will be furnished to comply with relevant standards. Drinking water will be supplied as bottled water for all site areas. If water is to be procured through suppliers for usage purposes, the suppliers' water availability and capacity should be confirmed via official letters.

III.2 Potential water users with the required quality

- Considering that groundwater could be used as domestic water needs at campsite facilities the nearest groundwater resources were studied within the Project ESIA.

Table III.1 General Water Usage

Water User	Water consumption amount
Humanitarian	806.2 tons/day
Dust Suppression	26.4 m^3 /day

Table III.2 Water Consumption in Concrete Plants and Mechanical Plant Manufacturing

Motorway Km	Facilities Name	Area (m^2)	Maximum Hourly Capacity (m^3/h)	Water Consumption in Concrete Plants and Mechanical Plant Manufacturing (m^3)
55+450	Concrete Plant-1	13,946	140	66,667.05
59+400	Concrete Plant-2	66,450	140	81,020.94
	Mechanical Plant		550	73,601.07
	Asphalt Plant-1		240	-
80+400	Concrete Plant-3	15,000	140	56,391.94
87+700	Concrete Plant-4	42,371	140	42,943.78

	Mechanical Plant-3		550	86,669.95
	Asphalt Plant-3		240	-
				-

IV. LINKAGE WITH OTHER PROJECT PLANS AND PROCEDURES

This Plan is supported by other management plans and procedures developed under the Environmental and Social Management System (ESMS) of the Project. The following plans and procedures are particularly relevant and should be implemented in coordination with the Water Quality, Wastewater and Storm water Management Plan:

- Solid Waste Management Plan
- Community Health and Safety Management Plan
- Hazardous Material Management Plan
- Construction Campsite Management Plan
- Environmental and Social Management and Monitoring Plan (ESMMP)
- Environmental Accident and Spill Response Management Plan

The effective integration of these plans should be ensured to maintain compliance with national regulations and international standards and to minimize the cumulative environmental and social impacts of construction activities.

V. ROLES AND RESPONSIBILITIES

Antalya Alanya Otoyol İnşaat Yatırım ve İşletme A.Ş. (SPV) as the Project Sponsor and Limak (EPC) as the main contractor of the Project will be responsible for the following:

General Manager (SPV):

-Define and implement the overall business strategy and direction of the SPV in alignment with stakeholder expectations.

- Ensure the provision of necessary resources and organizational support for the implementation of Water Quality, Wastewater and Stormwater Management Plan.

-Supervise and coordinate EPC contractors and subcontractors to ensure proper execution of construction phase.

-Support the E&S Manager in preparing, disseminating, and implementing this plan

E&S Manager (SPV):

-Review and ensure the preparation, revision, and implementation of the Plan in accordance with national laws, regulations, company policies, applicable international standards, and lender requirements.

-Ensure the development, revision, and execution of project-specific plan, including the Environmental and Social Management and Monitoring Plan (ESMMP), with a focus on water quality, wastewater, and stormwater.

-Monitor the environmental and social performance of EPC and subcontractors to ensure compliance with water-related requirements

H&S Manager (SPV):

- Ensure the conditions and obligations specified in health, safety, community, and water-related management plans are implemented and adhered to by EPC and subcontractors in accordance with company policies, regulatory obligations, international standards, and lender requirements.

-Ensure that all construction site activities impacting water resources are carried out safely by EPC and subcontractors.

Deputy E&S Manager (SPV):

-Lead the development, implementation, and continuous improvement of the Water Quality, Wastewater, and Stormwater Management Plan (WQWSMP).

-Review the ESHS documents of subcontractors and suppliers and ensure that they comply with the Project's water management requirements.

-Monitor performance through Key Performance Indicators (KPIs), reports, audits, and meetings related to water use, wastewater treatment, and stormwater management.

-Oversee incidents and non-compliances regarding water quality, wastewater, and stormwater, including investigations, corrective/preventive measures, and stakeholder communication.

-Support E&S Manager (SPV) in executive decision-making by providing timely reports and insights on water-related E&S performance, risks, and emerging trends.

-Lead community engagement strategies in collaboration with the Environmental Engineer and Social Chief to address concerns related to water supply, wastewater discharges, or stormwater impacts, and ensure effective grievance management and positive relations with project-affected communities.

-Ensure that EPC and subcontractors provide the necessary water-related training through the review of training records and relevant training documents.

Social Chief (SPV):

- Supervise and mentor CLOs, ensuring their work aligns with project priorities and the stakeholder engagement strategy, particularly regarding water use, wastewater management, and stormwater issues.

-Develop and implement work plans and schedules for the CLO team to ensure proactive communication with communities about water-related project impacts.

-Ensure that complaints regarding water quality, wastewater discharges, or stormwater management are recorded, processed, and resolved in a timely and transparent manner.

-Ensure accurate, timely, and complete reporting of CLO activities, stakeholder interactions, and grievance outcomes related to water issues, and inform the Deputy E&S Manager about the complaints. Coordinate the assessment and resolution of grievances with the EPC team.

-Coordinate with the Deputy E&S Manager, CLOs, Environmental Engineer, and construction teams to address community-related impacts on water resources and stormwater systems.

Project Director (EPC):

-Define and oversee the implementation of the overall EPC execution strategy in alignment with contract objectives and company standards.

-Lead interdisciplinary project teams, coordinating EPC functions to achieve key milestones.

-In case of non-compliance regarding to air quality, ensure appropriate corrective and preventive actions are taken in coordination with the E&S Manager and H&S Manager

E&S Manager (EPC):

- Coordinate with the SPV's E&S Manager to ensure alignment on water quality, wastewater, and stormwater management requirements, including compliance audits, reporting, and corrective action follow-ups.

-Implement water protection measures through site practices, method statements, and construction activity planning.

-Monitor compliance of EPC and subcontractors with The Plan requirements, including proper handling, treatment, and discharge of wastewater.

-Ensure all water consumption on-site (drinking, sanitation, dust suppression, concrete production) follows the approved permits, quality standards, and project-specific limitations.

-Supervise the operation and maintenance of temporary and permanent WWTP, ensuring treated effluent meets regulatory and project standards.

-Support water quality monitoring programs, including routine inspections, sampling, and measurement of key water parameters.

-Identify, report, and manage water-related incidents, spills, or non-compliances, and coordinate corrective and preventive actions with site teams and SPV.

-Provide guidance and training to site personnel on The Plan implementation, including safe wastewater handling, stormwater management, and pollution prevention measures.

-Ensure that documentation, records, and reporting for water quality, wastewater, and stormwater management are accurate, complete, and readily available for audits or inspections.

-Incorporate lessons learned, site observations, and regulatory updates into ongoing The Plan updates and improvements.

H&S Manager (EPC):

-Integrate water, wastewater, and stormwater management measures into site risk registers and method statements.

-Supervise Contractors/Subcontractors to implement water management measures and monitor compliance.

-Coordinate with SPV H&S Manager on water-related incidents and risks.

Line Manager:

- Oversee daily watering, dust suppression, and other measures to control runoff and sediment.

-Monitor the condition and maintenance of site equipment and vehicles to prevent leaks or spills.

-Ensure proper operation and maintenance of temporary treatment facilities, drains, and sediment controls.

Environmental Engineer (SPV and EPC):

- Conduct routine inspections of water handling systems, drainage networks, and temporary treatment facilities.
- Maintain accurate records of water use, wastewater discharge, stormwater management, and monitoring results.
- Support training, toolbox talks, and awareness sessions for site personnel on proper water management practices.
- Coordinate with EPC and SPV E&S Managers to report non-compliances, incidents, or environmental risks.
- Liaise with external laboratories, regulators, and consultants for water quality monitoring and reporting.
- Assist in the preparation of environmental performance reports, including corrective and preventive actions.
- Ensure that subcontractors implement water management measures and comply with The Plan obligations.
- Support continuous improvement of The Plan based on field observations, monitoring results, and lessons learned.

Community Liaison Officer (CLO)(SPV and EPC):

- Inform project-affected communities about construction activities, including potential impacts on water quality, wastewater, and stormwater management.

-Log, track, and follow up on community complaints or grievances related to water pollution, wastewater discharge, or stormwater issues, ensuring timely resolution via the Grievance Mechanism (GM).

-Support monitoring and documentation of WQWSMP implementation at site level, including subcontractor activities that may affect water resources or wastewater handling.

-Facilitate equitable community engagement and consultations, ensuring vulnerable or sensitive groups are informed about water-related impacts.

-Coordinate with E&S Manager and other project teams to integrate community feedback into WQWSMP updates and corrective actions.

VI. WATER QUALITY, WASTEWATER AND STORM WATER MANAGEMENT APPROACH

The Antalya Basin, within which the Project is located, is one of Türkiye's richest regions in terms of water resources, with a usable water potential of 12,283.44 hm³. A total of 155 surface water bodies have been identified in the Antalya Basin, including 109 rivers, 32 lakes, 11 transitional water bodies, and 3 coastal water bodies.[3] Accordingly, water quality risks related to Project activities will be managed with particular sensitivity, given the ecological importance and diversity of these resources.

Among the major rivers and streams in proximity to the Project corridor are Köprüçay Stream, Manavgat River, Alara (Ulugüney) Stream, and Karpuz Stream. These water bodies are already under pressure from point and diffuse sources such as domestic wastewater, tourism facilities, agriculture, fish farming, and sand and gravel extraction. Table V.1 below summarizes these pressure factors and their types based on regional water protection studies.

Table VI.1 Pressures and Impacts on Rivers/Streams on the Route

River name	Pressure Factor	Pressure Type
Köprüçay Stream	Domestic Wastewater Discharges Tourism Facilities Fish Farms	Point, Diffused
Manavgat River	Domestic Wastewater Discharges Agriculture Activities	Point, Diffused
Alara (Ulugüney) Stream	Pollutants from agricultural activities Water use for agricultural purposes	Diffused
Karpuz Stream	Sand and gravel purchase	Diffused

Given these existing pressures, it is critical that all project-related activities are planned and executed in a way that prevents further deterioration of these already sensitive and impacted water bodies. In this context, the following sections outline the overall approach of the Project to the management of water, wastewater and storm water during the construction phase, in line with applicable environmental standards and best practices.

Water-related impacts associated with motorway projects primarily involve the generation and management of wastewater, storm water runoff, and potential risks to both surface and groundwater quality. During the land preparation and construction activities, wastewater will be generated from construction sites and accommodation facilities for workers (campsite, kitchen, cafeteria, etc.).

Throughout the project construction phase, package WWTPs will be used for domestic wastewater management during construction phase of the Project. In addition, impermeable septic tanks also will be utilized at the campsites, if/when necessary. Although it is accepted that 1,100 people are planned to work in a campsite during the construction period of the project, each package WWTP will have a capacity equivalent to the maximum number of people, 1,250 people (including personnel of contractor and sub-contractors).

[3] *MoEUCC, April 2024, River Basin Management Plan Strategic Environmental Assessment Scoping Report*

The basic approach will be to reuse the wastewater generated by project activities in the activity cycle during construction. This approach will not require any water discharge to environmental media. Especially for the reuse of wastewater generated in concrete batching plants, three-compartment settling ponds will be constructed. In order to reuse the water used during vehicle washing operations, vehicle washing stations will be established and the necessary settlement pools and installations will be constructed for the reuse of water at these stations.

Treated wastewater will be analyzed to ensure compliance with relevant quality limit as defined in regulatory frameworks. The Project's approach to water management focuses on minimizing adverse environmental impacts and ensuring that all discharges meet established regulatory thresholds.

To prevent or minimize the environmental consequences of spills, proactive strategies should be implemented. These include proper handling, storage, and transportation of hazardous substances, the provision of appropriate containment infrastructure, and a roof for large-scale chemical storage areas and waste storage areas to prevent stormwater contamination. The robust emergency response and remediation procedures are systematically applied throughout construction activities.

Additionally, the completed motorway structure will increase impermeable surface area, leading to elevated surface runoff rates. This may result in erosion, localized flooding, and increased water flow in receiving bodies, especially during periods of heavy rainfall. Infrastructure components such as bridges, culverts, and diversion channels may alter natural water flows and cause localized increases in upstream water levels during flood events.

The construction of viaducts, bridges, and culverts may temporarily alter the hydrological regime, leading to effects such as scour, erosion, and sediment deposition in riverbeds and banks. Improper design and installation of temporary structures (e.g., culverts or roadways) may further exacerbate such impacts by disrupting natural stream flows. Measures will be taken to ensure that surface water management complies with national and international standards, mitigating both temporary and permanent risks.

Groundwater resources may also be at risk, particularly in areas with shallow overburden, where accidental discharges of hazardous substances could contaminate aquifers. Construction activities such as site clearance, earthworks, vehicle refueling, and wastewater discharge (both sanitary and industrial) pose potential threats to groundwater quality if not properly managed. Some excavation works may require groundwater dewatering, which could have implications for local aquifer levels. Additionally, earthworks in bedrock or shallow overburden areas may lead to blockage of fissure permeability by infiltrating fines or sediments.

The increase in impermeable surface area will raise runoff rates, and high storm water flows may cause erosion and flooding. During flood events, infrastructure elements like bridges and culverts may impede water flow, resulting in increased upstream water levels. Accordingly, mitigation measures will be developed and implemented to manage drainage and flooding risks throughout the construction phase.

VII. MITIGATION MEASURES FOR IMPACTS ON WATER QUALITY and CONSUMPTION

This Plan focuses exclusively on measures applicable to the construction phase. The following measures should be implemented to manage wastewater, control storm water, minimize sedimentation and pollution, and protect both surface and groundwater resources during construction activities.

General Implementations

- No direct discharge of wastewater or water containing waste to the environment is permitted unless legally allowed and allowed by Project Standards (See Section I) and in this case all wastewater discharges (all domestic) from all construction components must comply with all relevant legal requirements;
- During site planning and arrangement, the potential wastewater sources from camp/site and facilities, and quarries will be defined;
- All wastewater discharges must comply with relevant Turkish legal requirements (Water Pollution Control Regulation 2004, No. 25687) and Project Standards before disposal, and relevant permits and monitoring shall be in place
- The AAOİAŞ will have responsibility for the full chain of custody and will retain original invoices for any and all wastewater collection and disposal by third-party service providers;
- All appropriate permits need to be sought by AAOİAŞ from the local authorities; notifications filed, and discharges need to be made within the conditions of the permit; conditions;
- Precautionary measures must be taken to minimize possible impacts to surface water infrastructure. Any damage caused to surface water infrastructure such as supply systems, irrigation systems, flood defenses and drainage ditches must be rectified by the AAOİAŞ;
- All construction equipment, vehicles and plant will be cleaned away from surface waters and wash water captured for reuse or treatment off site (only authorized discharge to permitted standards of treated wastewater to be allowed as per local permit/license conditions);
- All facilities and structures will be regularly inspected and maintained to ensure proper and efficient operation at all times.

Domestic Wastewater

- Depending on the availability of wastewater treatment facilities, these sources can be connected to the local sewerage system where possible;
- Wastewater from all construction compounds and the associated buildings will either be discharged into the local/municipal sewage network or treated on site before discharge to a suitable receiving environment (as allowed for under permit conditions) or collected on site and transported by tanker for disposal at the local sewage treatment works;
- Where wastewater is to be produced and treated at camp sites, this will be treated via a suitable wastewater treatment plant system, to comply with the limit values for wastewater quality given in IFC General Environmental, Health and Safety Guidelines and/or the "Average Discharge Standards to Receiving Environment for Domestic Waste Water" given in "Regulation on Water Pollution Control (RWPC)" numbered 25687 and dated 31.12.2004, whichever standard is strictest will be followed;
- For onsite wastewater treatment plants/units, an approval will be obtained as per Wastewater Treatment/Deep Sea Discharge Project Approval Circular dated 04.03.2014 and numbered 2014/07;
- Additionally, a wastewater discharge permit according to the provisions of the "Environmental Permit and License Regulation" (Official Gazette: 10.09.2014-29115) will be secured before operation of the plant;
- Permit Register was established and permits will be tracking.
- Wastewater accumulated in the septic tank on site will be transported to packaged wastewater treatment plants using vacuum trucks.
- AAOAİŞ will retain a licensed and approved management service for the collection and transportation of wastewater generated and temporarily stored onsite in conservancy tanks, to be transported to a licensed treatment/disposal facility;

- All wastewater produced during construction activities will be temporarily stored on site in suitable, leakage-proof and spill-proof above-ground storage tanks or similar containers based on available technology (non-corrosive and suitable for storing wastewater) and periodically collected by licensed companies appointed by AAOAİŞ and trucked to appropriate and licensed wastewater treatment/disposal facility authorized according to national regulations;
- Portable chemical toilets will be provided during construction as necessary and will be maintained and serviced by an external contracted service provider on a regular basis;
- The AAOİAŞ will appoint local authorized transport companies to collect and transport all sewage and grey water to offsite facilities as well as any other wastewater under its responsibility.
- Rain water harvesting/recovery off of rooftops for example, for domestic use (e.g. for toilet flushing/washing, soil wetting, etc.) is permitted;
- AAOİAŞ will implement technically and financially feasible and cost-effective measures for improving efficiency in its consumption of water, with a focus on areas that are considered core business activities (where benchmarking data are available, a comparison to establish the relative level of efficiency will be made).

Waste Water Treatment Plant (WWTP) Maintenance

Maintenance intervals may be shortened based on the results of the previous maintenance and the characteristics and quantity of the wastewater.

General cleaning and maintenance

- Regarding general cleaning and maintenance: the environmental engineer on site will check daily for leaks, and the maintenance staff will check the pump, motor, etc. monthly. In addition, the company that installed the treatment system will check it annually.
- This interval may be shortened depending on the pollution and density of the incoming water.
- No chemicals that may damage the system equipment should be used during cleaning.
- If the pumps remain unused for a long time, the suction and discharge lines should be checked before operation, and the pump should be dismantled, cleaned, and then operated.
- The accumulation of dirt or residue inside the pump must be prevented; no residue or debris should be left inside the pump.
- For cleaning the manometer, Solvents and chemicals that could damage the acrylic material should not be used. It should be cleaned using only water and soap.

Routine Inspection and Maintenance

Whenever routine inspections are performed, the following steps should be followed:

- Electrical cable connections should be checked.
- Check for any abnormal noise or vibration.
- Check for any leakage in the pump and pipeline.
- Check for any corrosion on the pump or its components.

The following checks should be performed every three months in accordance with the instructions below:

- Connections should be inspected.
- O-rings and gaskets should be checked to ensure that there are no leaks.

Yearly Inspection and Maintenance

- Pump capacity is checked (as specified on the equipment nameplate).
- Pump pressure is checked (as specified on the equipment nameplate).
- Pump power is checked (as specified on the equipment nameplate).

If the system requirements have not changed and the discharge or wastewater pump performance does not meet the process needs, follow the instructions below. Same control and steps will be followed up for the aeration and disinfection pump etc.

1. Remove the pump from its installation location.
2. Inspect the pump.
3. Replace any worn-out parts.

In addition to general risks during operation, there are specific risks associated with the characteristics of this system.
The system may create conditions that adversely affect human health, particularly due to chemical (such as chlorine) and electrical hazards. To minimize these risks, attention should be paid to the following points:

- Considering the possibility of exposure to chemicals, appropriate protective clothing and equipment must be used during chemical refilling, equipment inspection, or any work involving the container.
- Individuals other than authorized personnel must not interfere with the facility, especially the dosing system, and must not be allowed to climb onto the tank under any circumstances.
- No intervention should be made inside the electrical panel without the knowledge and approval of the manufacturer.

Industrial Wastewater (Sourced from Concrete Batch Plants)

- To reuse of wastewater generated in concrete batching plants, three-compartment settling ponds that each compartment will be 1 m depth, 2 m width and 3 m length should be constructed The sedimentation amount in the sedimentation tanks will be monitored through daily inspections and cleaned according to the fill level... In order to reuse the water used during vehicle washing operations, vehicle washing stations will be established and the necessary pools and installations should be constructed for the reuse of water at these stations.
